THE ELECTRICIAN

ESTABLISHED 1861.

THE OLDEST WEEKLY ILLUSTRATED JOURNAL OF

Electrical Engineering, Industry, Science and Finance.

No. 2277. [No. 1. Vol. LXXXVIII.] FRIDAY, JANUARY 6, 1922. Prepaid Subscription U.K., £2 12s. per ann.; Abroad, £2 14s. Price 1/-

CONTENTS.

Notes of the Week.

An I.E.E. Commemoration.

Readers of The Electrician will be interested to hear that the first meeting of the Society of Telegraph Engineers, which was held on Feb. 28, 1872, will be commemorated by the Institution of Electrical Engineers holding a series of functions on dates approximately corresponding to that of the original meeting These functions will include the gastronomical exercise which is inseparable from a celebration of any sort, or, in other words, the annual dinner will take place at the Hotel Cecil on Tuesday, Feb. 21. To emphasise the popular appeal not only of electricity, but of the Institution, a lecture on "Michael Faraday and the Foundations of Electrical Engineering" will be delivered by Prof. J. A. Fleming on Tuesday, Feb. 21, at 4 p.m., and will be repeated on Wednesday, Feb. 22, at 8.30 p.m. To these lectures admission will be by ticket, and a limited number of these will be reserved for guests.

The Industry Historically Considered.

On Thursday, Feb. 23, matters of more particular interest to electrical engineers will be dealt with when, from 4 to 6 p.m., and again from 8 to 10 p.m., a number of members of the Institution, and others closely connected with the early development of electrical engineering, will "reminisce" and discourse on their experiences. The speakers will deal with matters of both scientific and technical interest, as well as with the effect of legislative action on the progress of the industry. No better method of celebration could have been devised. The functions will be anticipated with the greatest interest, and the Council are to be congratulated on the way in which they have felt the pulse of the industry in this matter. It is a great occasion, to which we hope all concerned will do their best to make a success by their attendance.

Scottish Electricity Supply Reorganisation.

Having made a survey of the electricity supply resources in the principal industrial areas of England and Wales, and having provisionally determined the boundaries of thirteen electricity districts, the Electricity Commissioners have now turned their attention to Scotland, where a start is being made with the West of Scotland district, the home of the Scottish shipbuilding and engineering industries, including the city of Glasgow, the county of Renfrew, and parts of the counties of Ayr, Dumbarton, Lanark, and Stirling. From the electrical point of view, this is a most promising area to deal with, for, apart from the staple industry of shipbuilding, there are important coal mines, textile mills, engineering works and factories in certain portions of the district, and, although electricity supply has already reached an advanced stage of development, especially in Glasgow, there is room for still greater progress. The majority of the existing generating stations are owned and operated by municipal authorities, but there are three supply companies, apart from the Clyde Valley Electrical Power Company; and, as might be expected, a variety of systems, pressures and frequencies

Existing Organisation Inadequate.

We are not, therefore, surprised to learn that the Commissioners are not satisfied with the existing organisation, and notify that they will hold a local inquiry. The unusually long period of twelve months is allowed to the authorised undertakers and others interested for submitting improvement schemes, including proposals for the formation of a Joint Electricity Authority or for altering or adjusting the boundaries of the district. In view of the numerous interests involved, and particularly when we consider the outstanding position of the Glasgow Corporation and of the Clyde Valley Electrical Power Company, the time allowed may not be too long; at all events, the experience gained from some of the Lancashire and Midland districts proves that the technical, administrative and financial details of a Joint Authority cannot be prepared and adjusted in three or six months. If this is the case where preliminary schemes have for long been under consideration, it is the more likely to be true where fresh ground has to be broken.

Electric Traction and the Designer.

In the early days of electric traction it was not unnatural that any discussion of its qualities should be prefaced by a statement of the advantages which its employment would make possible as compared with the older methods of operation. But now that electric traction is firmly established, the same policy, unfortunately, still too often holds, and time that might be more usefully employed is wasted in dealing with a question which, seeing that human nature is what it is, must always be more or less a matter of opinion. The time taken up by Sir Vincent Raven in the Paper on "Railway Electrification," which he read recently before the North-East Coast Institution of Engineers and Shipbuilders, is, therefore, welcome, both as a new departure and as an example. For, while he discussed at some length the relative advantages of electric and steam traction for British railway working, he went on to deal with questions of the design of electric traction equipment and to give full details of the electric passenger and goods locomotives which are being built at Darlington by British labour from British designs. As we have pointed out before, British electric traction has up to now depended for its development on the activity of foreign brains. That must be changed, and Sir Vincent Raven has shown that there is no reason why it cannot be changed.

1921.

The year 1920 was remarkable for the sharp change from boom to depression which occurred during its summer months. Nevertheless the repeal of the Excess Profits Duty gave rise to the opinion that trade would revive, probably slowly but none the less surely. Events in 1921 proved that optimism unjustified. With a few exceptions the year, industrially speaking, was the very worst within living memory.

1921 in Prospect.

It is only fair to add that optimism of early 1921 was not quite so unjustifiable as it now appears. At the beginning of the year under review the slump had apparently reached bottom, Government control was slackening, and prices were falling. But all hopes of recovery were soon killed by the coal strike, which, beginning on April 1, lasted no fewer than thirteen weeks, and brought in its train an unparalleled amount of human suffering and industrial depression, of which we are still feeling the effects.

A Bad Year for the Electrical Industry.

Under these conditions it is not surprising that the electrical industry has had far from a good year. In fact, the best that can be said is that it has not suffered so much as many other industries. There has never been a complete cessation of output, as in the coal industry, nor has it reached those depths of depression which have been prevalent in the iron and steel industry. At the same time, the coal strike, by cutting off a vital commodity, imposed great expense and required much ingenuity from those working on the supply side of the industry, while the general uncertainty as regards the future has placed a considerable check on development on the manufacturing side. It is therefore not surprising to find that outstanding electrical events during 1921 have been few and far between.

The Reorganisation of Electricity Supply.

The passing of the Electricity Supply Act at the end of 1919 encouraged the hope that an early reorganisation of the electricity supply industry would be followed by wide developments on the manufacturing side and in the making available for the general public a convenient commodity whose wider use would have been equally beneficial to them and to the electrical industry itself. Unfortunately, progress in this direction has been slow in spite of the almost superhuman efforts of the Electricity Commissioners. These Commissioners have now been in office for nearly two years. They have up to now provisionally delimited thirteen of the districts in England and one in Scotland, thus practically covering the whole of industrial England with the exception of the North-East Coast, which, in many ways, is already operating as an electricity district.

The Enquiries.

During 1921 six enquiries were held into the various schemes that were put forward for the engineering and financial conduct of these districts, beginning with the abortive West of England scheme in January, and including the Mersey and West Lancashire district, the Aire and Calder district of Yorkshire, the North Wales and Chester district, the London and Home Counties district, and the South-West Midlands district. In all of these, except the West of England and South-West Midlands, the provisional decisions of the Commissioners have been published, but so far little progress has been made with the settlement of the necessary orders. Enquiries have still to be held into the schemes put forward for the South-East Lancashire, the North Lancashire and South Cumberland, and the East Midlands districts, while schemes are still awaited for the Mid-Lancs, the North-West Midlands, the North-East Midlands, and the West of Scotland districts, in the last of which the area has only just been delimited.

The Commissioners' Duties.

At first sight, therefore, it appears unnecessary delay is taking place in bringing about the required reorganisation, and much criticism on these lines has been directed against the Commissioners. The fault, however, cannot be entirely laid at their door. The annual report of their work, which was published in October, shows that, whatever else they may be, they are not idle, for, in addition to their more spectacular duties, all the other legislative work connected with electricity supply, formerly carried out by other Government Departments, is now undertaken by them, and under these headings alone a large amount of official work has been necessary to meet post-war conditions.

On the other hand, delay has been caused by the inability of those concerned in the various areas to reach a decision. This has not been the fault of the engineers, who, in nearly every case, have produced an agreed scheme. There has, however, been a regrettable tendency on the part of some municipalities to play for their own hands and for their own aggrandisement rather than for the good of the district.

Agreemen[illegible]sential.

It has been pointed out with a good deal of justice that upon the reorganisation of electricity supply depends the development of the industry as a whole. That development is held in check until we know what is going to happen, and unemployment and poor trade are the inevitable results. Agreement with regard to this question is therefore, from all points of view, highly desirable, and in this connection the Commissioners themselves have set a good example, for the decisions which they have so far published show that they are adopting a policy of compromise in nearly every case, and that they show no inclination to favour either a pure municipal policy or to permit the uncontrolled expansion of private enterprise.

Technical Progress.

Technically speaking, progress has been slow. Extensions in most places were unnecessary, the additional plant added to meet war-time conditions being amply sufficient to deal with the load during the past year. What will eventually be a large station was, however, opened at Blackburn in October, with a preliminary capacity of 20 000 kW, while the Mersey Power Company also began operations with a station at Runcorn with a present capacity of 25 000 kW. A new station at Sheffield, with a present capacity of 35 500 kVA, was opened by the Duke of York in November, though it had already been working for some time. In many places obsolescent plant was replaced by larger and more efficient machinery, as, for instance, at Bolton, Bury, Darlington, Halifax, Hull, Salford, Sunderland, Warrington and Wigan; while satisfactory progress was made with the Barton station of the Manchester Corporation, the Nechells station of the Birmingham Corporation, and the Portobello station of the Edinburgh Corporation. Plans are in readiness for a large station at Agecroft, Salford, and for the famous Barking station, a start on which we hope will shortly be made. Progress has also been made in linking up the London stations, while additional plant has been installed at Hackney, Hammersmith, Marylebone, and Stepney.

Water-Power Resources.

Much attention was paid during the year to the problems of water-power utilisation for the generation of electrical energy. This examination was stimulated in the early months of the year by the publication of an extraordinary scheme by the Minister of Transport for employing the tidal power of the Severn for this purpose. The scheme as it stood was too grandiose and wanting in engineering soundness to receive much approbation in technical circles, but it is obvious that the utilisation of this source of power is a question which must be examined side by side with that of the employment of waterfalls.

The Water Power Resources Committee, which was appointed in 1918 by the Board of Trade, published its final report during the year, and details were given in a recent issue. Among other important conclusions they called attention to the necessity of discovering exactly what water power is available in Britain and how this can best be utilised. The obstacles to doing this are well known, but, at the same time, the difficulties with regard to present methods of coal utilisation are, in their way, almost equally profound. There are certainly cases where the employment of water power, even when it is situated in remote parts of Scotland, will be an undoubted advantage. In countries like Switzerland, Austria, Norway, Sweden, France, Spain, India, New Zealand, Tasmania, Canada, certain parts of the United States and South America, matters are far otherwise. Here coal is often unobtainable, or, where available, is very expensive, while water power is found sufficiently contiguous to industrial areas to make its employment highly desirable. For these reasons considerable development in the use of water power may be expected shortly, and it is therefore necessary that British electrical engineers shall be ready to play their part in dealing with the technical problems which will arise.

Distribution and Utilisation Problems.

The public work of the Commissioners has naturally drawn the greatest attention to the generation side of the electricity supply problem, but on the distribution and utilisation side the difficulties are just as important and equally interesting. Those responsible for electricity supply in most towns are faced with a growing demand from domestic consumers and with the problem of supplying that demand over an inadequate distribution system. These conditions will soon have to be met either by increasing the copper employed in the cable network, by the use of mercury vapour rectifiers, or by a return to the house-to-house system of supply. As a matter of fact, all three solutions are being employed with success in various parts of the country, and it remains to be seen which will receive the widest application.

Finance and Tariffs.

The financial devastation caused by the war has had a disastrous effect on the fortunes of the smaller electricity supply undertakings, especially where these are in private hands. To improve this a determined effort has been made to obtain the Commissioners' consent to a compulsory two-rate tariff. We hope this consent will not long be withheld, as it is most inequitable that these pioneer undertakings, which operate mainly in residential areas and have never paid their promoters for the work and money that has been sunk in them, should continue to be conducted on a non-paying basis.

The question of the best tariff for domestic purposes is one which can only be solved locally, but in general it is agreed that a two-part scale with a fixed charge depending on the amount and class of apparatus installed, together with as small a running charge as possible per unit, is one which is not only most favourable to the undertaking itself, but is likely to give the consumer most encouragement to develop the use of domestic electrical apparatus.

The Domestic Field.

In entering 1922 it must be reiterated that it is in the domestic field that the electrical engineer must look for much of his success in future. It is a field that is almost illimitable, and though as yet many difficult problems have to be solved before it is fully developed, if electricity is really to be an aid to civilisation, it is here that it can give the greatest help and provide the greatest comfort. In supply circles this is now generally recognised, and such enterprises as the electric restaurant of the Brompton and Kensington Accessories Company, and the interesting and up-to-date showrooms and energetic business methods displayed in such places as Newcastle and Glasgow, are sufficient examples of a realisation of present difficulties and a guerdon of future success.

Electric Traction.

From the point of view of actual accomplishment, stagnation was as complete in the electric traction world as in that of electricity supply. The Advisory Committee appointed by the Minister of Transport at the beginning of 1920 issued a final report in 1921, in which certain details of the equipment were standardised. Until the latter part of the year no schemes for the electrification of the railways of this country were even suggested, though it was understood that the North-Eastern Railway were working on the electrification of their main line between York and Newcastle. In November, however, a number of schemes which had been under consideration by the directorates of the various railways saw the light, principally as a result of the Government's proposals for dealing with unemployment by putting in hand work which was likely to be in the national interest. In this way we were made acquainted with the plans of the South-Eastern and Chatham Railways for the electrification of their London suburban lines within a radius of 20 miles of Charing Cross, and for a further scheme for ultimately including such towns as Chatham, Tonbridge, and Dorking within the electrified area. The

London, Brighton and South Coast Railway also put forward a scheme for the electrification of their main lines as far as Eastbourne, while details of the proposed electrification of the Great Eastern Railway's main and suburban lines in the London area were published. In addition to the electrification of trunk systems the City and South London tube railway is to be widened and connected to the London Electric Railway at Camden Town. The Hampstead and Highgate Railway is to be extended to Edgware, and the Central London Railway is to be connected to the London and South-Western Railway at Shepherd's Bush.

All these schemes, we are told, merely await the coming of easier financial conditions. They are, in fact, a tribute to the economic and engineering advantages of electric traction—advantages which are equally recognised not only in Continental countries such as Switzerland, Austria, and Norway, where electrification is to be pushed on as quickly as possible, but in South Africa, India, and South America, where comprehensive schemes have reached a stage when work could be started at any time.

No Agreement as to System.

On the technical side no agreement has been reached as to the best method of operation to employ. Working results largely obtained from the United States show that there is not much to choose, either financially or technically, between the various systems. In this country we are now apparently committed to high-tension direct current, but in France and in Switzerland the single-phase system is favoured. In most other countries no definite decision has been reached, though both India and South Africa are following our example, and the same is true of the Argentine and Chile.

Tramway Troubles.

It is common knowledge that the results obtained by employing electric traction on railways have been generally most satisfactory. Unfortunately, the same thing cannot be said of tramways, where bad finance and an uninspired policy are now bearing fruit in the generally depressed condition of these undertakings. In an attempt to counteract this fares were increased, with the result in many cases of making matters worse. So much has this been the case that the London County Council have adopted the wise policy of reducing their fares, and although it is a little early to say what the result of this will be, we hope that it will be most successful. Improved results are also expected from the use of the railless trolly system, trailer cars and the carriage of parcels and goods. With more attention to improved methods, more careful finance and general reorganisation, a great deal can be done to put these undertakings on a sounder basis.

The Institution of Electrical Engineers.

The outstanding event in the history of the Institution of Electrical Engineers during the past year has been the granting of a Royal Charter. It is interesting to note that this grant took place during the Jubilee year of the Institution. A further event of the past twelve months was the return to the building on Victoria Embankment, which was temporarily vacated in 1917 owing to Government requirements. The war and pressure of recent events have led to a general realisation that if the Institution is to serve electrical engineers in the best possible way it can no longer confine itself solely to technical problems. It must play its part in impressing on the Government and the people of the country the views of electrical engineers in matters which concern them. Its increased status should be of great benefit from this point of view, and it has made an excellent start by its representations to the Prime Minister on the question of German reparations in kind. On the more domestic side it has still to consider the question of professional conduct, the admission to its ranks only of duly qualified men, and the abuse of the term electrical engineer by those who are not entitled either by education or experience to apply that name to themselves. The Institution of Electrical Engineers is now the largest and most progressive of the great technical bodies in this country, and its democratic character was further exemplified by the meeting which took place early in the year on the question of increasing the subscriptions.

Telegraphy.

In the Diamond Jubilee issue of The Electrician we gave an account of telegraphic development during the past sixty years, and it is therefore hardly necessary to deal with the events of the past twelve months except to say that both commercially and technically progress was satisfactory. In subsequent issues we shall review wireless telegraph and telephone developments during the past twelve months and deal with the advances that have taken place in electrical science.

Telephony.

In the telephone world a superficial glance would make it seem impossible to say that progress in that field has been great. As usual, there was much criticism of Post Office methods and much comparison of its methods and their results with what was being done in other countries. Nevertheless, some interesting developments took place, notably the inauguration of the London Toll Exchange, and, as in other fields, a good deal of preliminary work has been carried out, which, during the coming months, should give satisfactory results. Censure was mainly directed to administrative work, but in the discussion which took place on Mr. E. S. Byng's Paper on "Telephone Line Work in the United States," which was recently read before the Institution of Electrical Engineers, the same sort of criticism was made on what the Engineering Department of the Post Office are doing or not doing. The unbiassed view, however, is that, in spite of numerous difficulties, satisfactory progress is being made. When no profit has to be earned enterprise and self-examination are difficult. Still, however, some advantage is being taken of improved apparatus and methods, and there is no doubt that the result will be a more efficient telephone service, if not one that is ideal.

In the Labour World.

Disorganisation from labour disputes was less in evidence and, except for the coal strike, its effect during 1921 was less serious than during the preceding two years. Though at one time it seemed as if strikes would actually occur among the organised engineering trades, in the tramway industry, and in sections of the electrical industry, fortunately, in every case, an actual stoppage of work was averted, and it now seems as if the pressure of economic conditions and the regaining of control over their organisations by the saner elements in the trades union world will bring about a greater employment of collective bargaining, with the relegation of the strike weapon to the background.

A Co-operative Success.

The success of Joint Industrial Councils was not equal in all trades, but in the electrical industry the work of these bodies was highly satisfactory, so much so that on at least one occasion they were able to go outside the specific purpose and as a body make representations to Government authorities on matters which, though not directly connected

with conditions of labour, were likely to have a great effect on those conditions, if not wisely dealt with. This was particularly the case in the representation made to the Chancellor of the Exchequer on the proposals that the German reparations should be paid in kind.

Organisation of the Middle Classes.

Another interesting development in the organisation of workers was the recognition amongst the salaried classes that they, like both employers and employed, must combine for their individual and class good. After a good deal of preliminary work the Society of Technical Engineers put forward a policy which in general was greatly to be commended, while smaller bodies, such as the National Association of Supervising Electricians and the Electrical Power Engineers' Association, are equally concerned in maintaining the status of the middle-class worker against aggression both from above and from below.

Legal Decisions.

The past year's legal actions were above the average in number and importance. The most important commercial case was the appeal to the House of Lords against a decision of the Court of Appeal which pronounced the well-known Langmuir gasfilled lamp patent of 1913 invalid on account of ambiguity in the statement of claim and of insufficiency in the directions. The appeal was heard by a strong bench, headed by Viscount Haldane, and the result was a unanimous judgment in favour of the validity of the patent. Whatever views may be held of the noble lord's capacity to expound the Einstein Theory, there can be no doubt of his ability to construe correctly a patent which involves the application of an abstract principle to a method of manufacture, and to reconcile the conflicting interests of law and equity. His lucid and convincing judgment in the gasfilled lamp case will be read with pleasure by those interested in patent law, and it will undoubtedly be looked upon as a leading case. Another interesting patent was dealt with in the application made in March for the prolongation of the Poulsen arc patent of 1903. The history of the patent was somewhat involved. It had expired in July, 1917, but it was only in 1920 that the petition for the prolongation was filed. Owing to this lapse of time and to the practical amalgamation of the company with their rivals, the Marconi Company, the petition was dismissed.

An Important Electricity Supply Judgment.

A judgment of the greatest interest to electricity supply consumers was given by a Divisional Court in November on the appeal of the Hackney Borough Council against a decision of the North London magistrate. The latter had convicted the Council of having made default in giving a supply of electricity to an intending consumer named Dore, who had had his house wired by non-union labour. In consequence of this the Council's jointers refused to connect the house to the supply mains, and the magistrate held that the plea of *force majeure* urged on behalf of the Council failed, although he found that the *probable* effect of the dismissal of the jointers would be a strike of the whole of the employees of the electricity department. The Divisional Court agreed with the magistrate's views and dismissed the appeal. Throughout the case the term *force majeure* was much discussed, but no general principle can be extracted from it, and the decision of the Divisional Court is only of limited authority. The case has undoubtedly created a prejudice against municipal electricity supply, as well as against the autocratic methods of the Electrical Trades Union.

Municipal Trading and Activities.

An important point in municipal trading was raised in the action brought by the Attorney-General on the relation of several local contractors to restrain the Liverpool Corporation from carrying on business as wiring contractors and dealers in electrical fittings. The Corporation acquired in 1896 and 1902 two local electricity supply companies which had carried on electric wiring and fitting, and the transfer acts contained specific power to carry on this business. Under the circumstances, the judge distinguished the Leicester and Sheffield cases, which decided that a local authority working under a provisional order had no power to undertake wiring. He therefore dismissed the action.

In January the Stepney Borough Council failed in their appeal against a judgment granting an injunction to restrain them from committing a nuisance by the discharge of grit and ashes from their Limehouse power house. The Court felt bound by the judgment in Shelfer's case, and the appeal was entered mainly with a view to a further appeal to the House of Lords. The case has, however, been settled in the meantime, and the Council are now applying for a special order to exempt them from the liability for a nuisance in the ordinary use of the station.

In Sheppard *v.* Glossop Corporation, the Court of Appeal allowed the appeal of the Corporation against a judgment of Mr. Justice Greer, awarding the plaintiff damages for personal injuries sustained owing to their failure to light a lamp on private land for illuminating a dangerous place on a public highway. The Court held that as Sec. 161 of the Public Health Act, 1875, gave the Corporation authority to light their district, but created no obligation to do so. This decision is unsatisfactory and has aroused considerable criticism.

Valuation of Tramways.

The method of assessing the value of tramway buildings in Bristol was raised in February in a special case on an arbitrator's award. In 1875 the Bristol Tramways and Carriage Company leased buildings from the Corporation, and the point at issue was the meaning of "the then value" of the buildings, which the Corporation covenanted to pay on the expiration of the term. The company contended that the proper value was the cost of the construction of the buildings less depreciation, but Mr. Justice Sankey held that the value was what anyone would pay for them in the open market, and that the matter did not come under Sec. 43 of the Tramways Act, 1870. The question of the "then value" was also raised in the arbitration on the value of the Oldham, Ashton and Hyde Electric Tramway, and the Court of Appeal decided that there must be allowed as part of the then value (1) the remuneration of the engineer, subject to depreciation; (2) interest on capital during construction, subject or not to depreciation according to whether the money was spent on depreciating things such as rails, or on non-depreciating things such as excavation work; and (3) preliminary expenses, but the cost of raising capital was disallowed.

Obituary.

The obituary list for 1921, though not quite so lengthy as in previous years, is sufficient indication that the pioneers of the electrical industry are gradually passing away, and that the after effects of the war are also making themselves felt in a most unfortunate manner among the younger men. We may mention among those whose loss will be felt by a wide circle of friends and whose work has left a lasting impress on electrical progress. Lord Moulton of Bank, Sir James Pender, Dr. E. A. Budde, Mr. T. E. Gatehouse, Mr. A. E. Mavor, Dr. E. B. Rosa, and Mr S. A. Varley.

Electric Winding Engines and Mine Hoists.*

Some Notes on Double Helical Gearing.

By H. H. BROUGHTON.

The author has collected a series of notes on the strength of helical gearing, as well as particulars of a number of individual gears, with the idea of providing the user of such gears with data by which he can check the designs of the gearing manufacturers. In the first part of the article published below typical calculations of the working loads and a chart for determining the horse-power rating of gearing are given.

Accurately-cut solid gears of the double helical type have played an important part in the development of the three-phase geared winder, and in the application of the three-phase motor to heavy engineering.

Such gears are applicable to cases involving large velocity ratios and high speeds, and are well suited for withstanding heavy and rapidly fluctuating loads. Denoting the maximum permissible speed of machine-cut spur-gearing by unity, then a double-helical solid gear may be run at a speed of 1·7, and for a herring-bone gear the permissible speed is 2·0. The maximum gear ratio with ordinary spur wheels is 6 : 1. With double-helical gears a ratio of 10 or 12 : 1 may be used, and for herring-bone gears this can be increased to 15 : 1.

Strength of Helical Gearing.

It is the purpose of this article to place before the reader in a convenient form notes on the strength of helical gearing

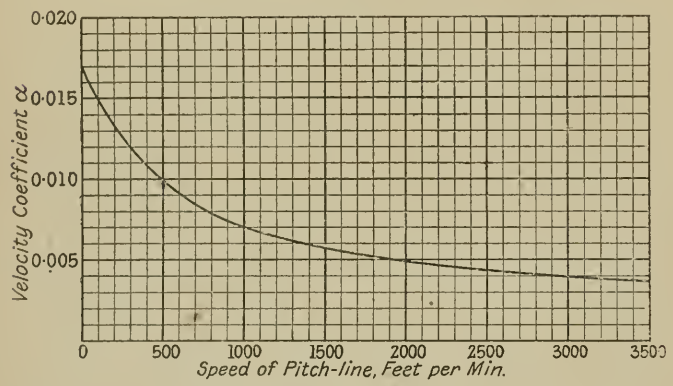

Fig. 1.—Curve Connecting Velocity Coefficient α and Pitch-line Speed S.

as well as particulars of a number of typical gears. Theoretical discussion has been eliminated in order to make room for matters likely to be of immediate assistance to those who, like the author, have to consider proposals put forward by the gear specialists and to give decisions upon them at short notice. At the outset it should be mentioned that the manufacture of double helical gearing is in the hands of half a dozen or so specialist firms and, although the design is best left to the specialist, the user should, nevertheless, be in a position to make a few simple check calculations for himself, so as to determine the relative merits of different designs.

Working Load.

The safe load that may be applied to a pinion or wheel depends upon and is proportional to the circular pitch and width of the teeth. It is also a function of the number and shape of the teeth and depends upon the material of which the pinion is made. The pitch-line speed has an important bearing on the allowable working load. Although often neglected, both accuracy of workmanship and ratio of maximum load and average load are factors for which proper allowance has to be made in order to secure durability. Another factor to be taken into consideration is the intermittency of the load.

The effect of speed on the allowable load can best be shown by means of an example. If a certain gear when running at a pitch-line speed of 500 ft. per min. will transmit 250 H.P., then the same gear run at a pitch-line speed of 2 000 ft. per min. will transmit 500 H.P. In other words, at the higher speed the allowable load on the teeth is only *one-half* that at the lower speed.

A convenient expression for determining the horse-power which a double helical pinion will transmit is that recommended by D. Brown & Sons. It is of the modified Lewis form, and reads :—

$$\text{H.P.} = P\,b\,S\,\beta\,v\,\alpha \quad \ldots\ldots\ldots\ldots\ldots\ldots (1)$$

wherein P is the circular pitch in inches, b is the width of the gear in inches, S is the speed of the pitch-line in feet per minute, β is a constant depending upon the material, v is a velocity coefficient, and α is a coefficient depending on the shape and number of teeth.

Suitable values of β are : 1·0 for cast iron ; 1·6 for phosphor bronze ; 2·2 and 3·0 respectively for cast steel and mild steel ; 3·7 for 0·4 per cent. carbon steel ; and 4·0 to 5·0 for special pinion steel.

The relation between the velocity coefficient v and the speed is plotted in Fig. 1. The rapid variation of the coefficient at low speeds up to 1 000 ft. per min. will be noted. At higher speeds, from 1 000 ft. per min. to 3 500 ft. per min. the variation is less rapid, but the reader is warned against extending the curve for obtaining the coefficients for higher speeds† than those given in Fig. 1. For winders and haulage gears, however, the pitch-line speed of the gearing is well within the limits given in the diagram.

Values of the tooth-shape coefficient α, between wide practical limits, are set out in Table I.

Table I.—*Values of Tooth-shape Coefficient α.*

No. of Teeth.	14½ deg.	20 deg.	No. of Teeth.	14½ deg.	20 deg.
12	0·67	0·78	27 to 29	0·99	1·20
13	0·71	0·84	30 „ 33	1·01	1·24
14	0·75	0·89	34 „ 37	1·04	1·27
15	0·78	0·93	38 „ 42	1·06	1·30
16	0·81	0·97	43 „ 49	1·08	1·33
17	0·84	1·00	50 „ 59	1·10	1·36
18	0·86	1·03	60 „ 74	1·13	1·39
19	0·88	1·06	75 „ 99	1·15	1·42

23 „ 24	0·94	1·14	300 „ 400	1·22	1·51
25 „ 26	0·97	1·18	Rack	1·24	1·54

Example.—A cast-steel double-helical pinion, running at 380 revs. per min., has 20 teeth of No. 1½ diametral pitch (2·1 in.) of 20 deg. obliquity, and is 13½ in. wide. It is required to determine the horse-power such a pinion will transmit.

Knowing the number of teeth and the pitch, the diameter of the pinion can be found. From this diameter and the speed, the pitch-line speed S is determined. Having found the pitch-line speed, the corresponding velocity coefficient v is ascertained from Fig. 1. Thus :

$$\text{Diameter} = 20 \div 1\tfrac{1}{2} = 13{\cdot}33 \text{ in.}$$

$$\text{Pitch-line speed } S = \pi \times 13{\cdot}33 \times 380 \div 12$$
$$= 1\,310 \text{ ft. per min.}$$

From Fig. 1, when $S = 1\,310$ $v = 0{\cdot}006$; β for cast steel $= 2{\cdot}2$; and, from Table I, for a 20-tooth pinion of 20 deg. obliquity $\alpha = 1{\cdot}08$.

† In certain applications, outside the scope of this article, the pitch velocity may be as much as 7 000 ft. per min.

Inserting these values into equation (1) we get :

$$\text{H.P.} = 2{\cdot}1 \times 13{\cdot}5 \times 1\,310 \times 2{\cdot}2 \times 0{\cdot}006 \times 1{\cdot}08$$
$$= 530.$$

This figure must not be confused with the maximum allowable horse-power. For winder service, not only is the duty intermittent but the peak load is usually about 1·5 times the normal load and, moreover, the peak load occurs for only a relatively small fraction of the total running time. The pinion under consideration would give excellent service on ordinary winder duty for a cycle requiring a 500 H.P. motor provided that the peak load does not exceed 700 to 750 H.P.

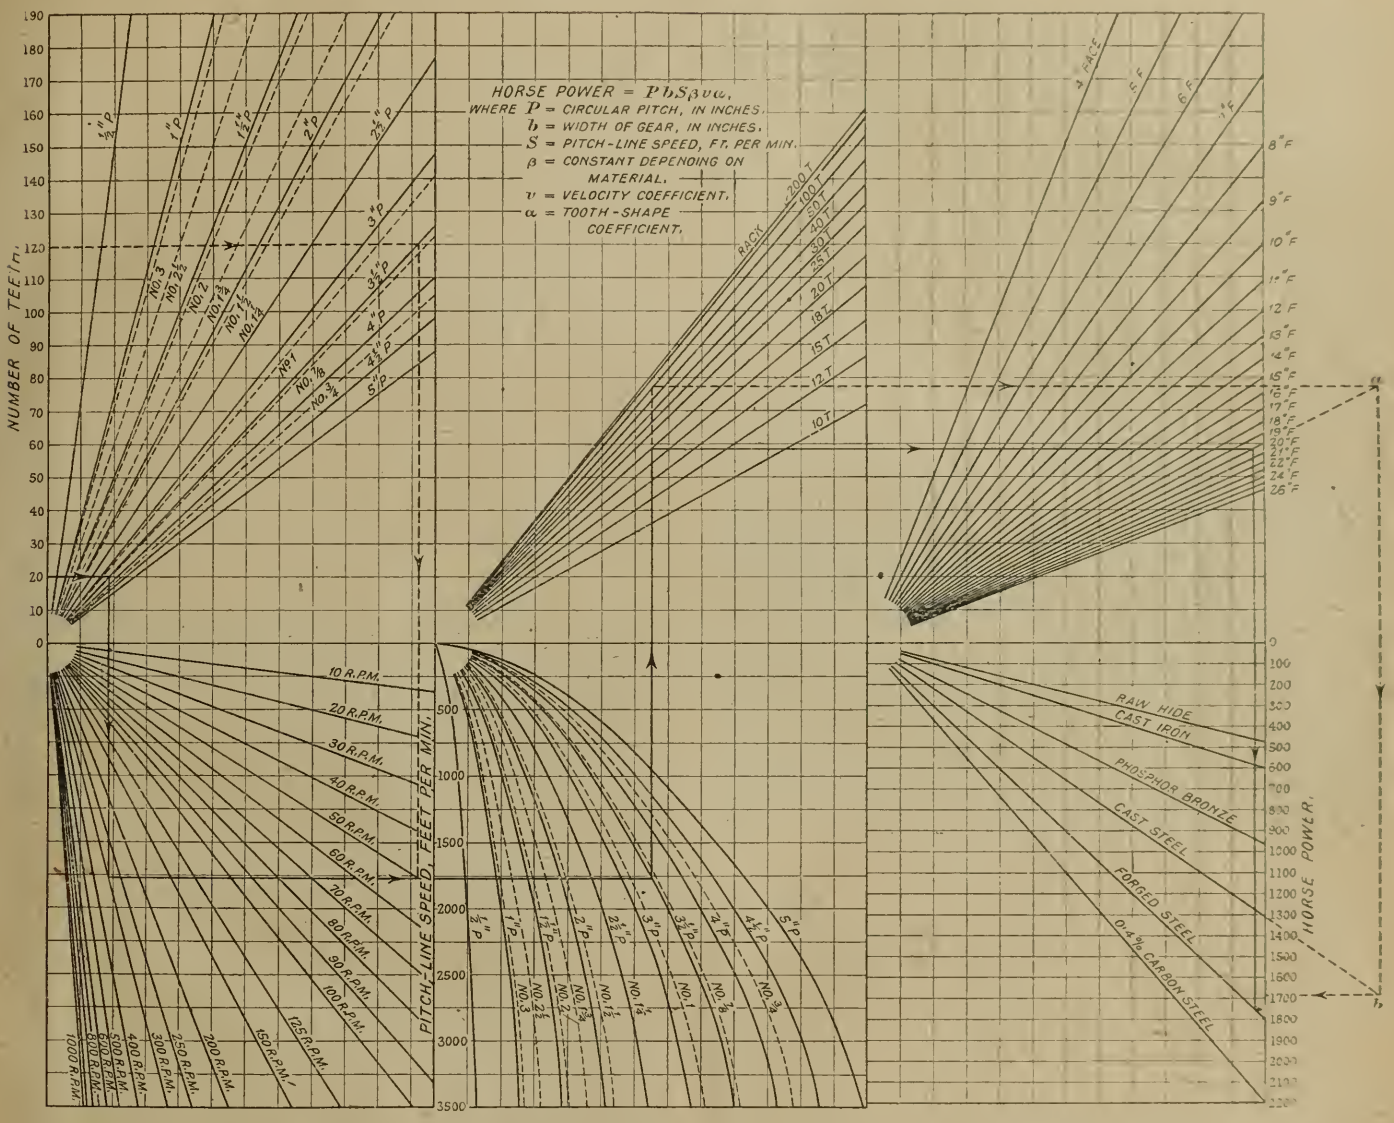

Fig. 2.—Chart for Determining the Horse-Power Rating of Double Helical Gears having 14½-deg. Involute Teeth.

Chart for Determining Horse-Power Rating.

From an inspection of equation (1) it is evident that the form is such as to lend itself to the construction of a simple chart from which the rating of any pair of wheels can be read off by inspection.

Such a chart for 14½ deg. involute gears is depicted in Fig. 2. In the first group of curves, teeth are plotted vertically and circumferences horizontally for wheels having teeth of various pitches. In the second group of curves, immediately below the first group, pitch-line speeds are plotted downwards on the first base line for the several angular speeds indicated. The third group takes velocity coefficient and pitch into account, and the fourth group of curves, immediately above the third group, applies the tooth-shape coefficient. Width is taken into consideration in the fifth group, and material in the sixth group. Finally, the horse-power rating is indicated by the vertical scale on the extreme right of the diagram. The reader should have no difficulty in constructing the diagram for himself, and, making use of the figures given in Table 1 and Fig. 1, he is advised to prepare a chart for 20 deg. involute gears.

To show how the chart is intended to be used, take, for example, a pair of gears running at 300 and 50 revs. per min. and having 20 and 120 teeth, 3½-in. pitch, 20 in. wide, forged-steel pinion and cast-steel wheel. Taking the pinion first, a full zigzag line, marked with arrowheads, will be observed in Fig. 2, which takes into account, progressively, each of the constants of the pinion. This line terminates on the horse-power scale and indicates that the pinion will transmit 1 760 H.P. The dotted zigzag line on the diagram refers to the wheel, and on the extreme right it will be noticed that the diagram has been extended by lengthening two of the vectors to a and b, the horse-power rating of the wheel being 1 690.

It should be noted that the drawing from which the diagram, Fig. 2, has been prepared is about 30 in. in length, and in actual use a sheet of tracing paper is pinned to the drawing, and the rating lines are drawn on this paper and not on the diagram itself.

(To be concluded.)

An American Arc Radio Transmitter.

By C. R. LEUTZ.

This article describes a panel type of arc transmitter which has been designed by the Liberty Electric Corporation for either ship or land work. Details of a 5 kW transmitter which has been installed at the New York Radio Station, Babylon, N.Y., are given. It is claimed for this apparatus that it is much more compact than the earlier models.

Last November the first panel type arc transmitter was placed on the American market by the Liberty Electric Corporation. Two sizes are made, 2 kW and 5 kW (input rating), adapted to either ship or land installation. Fig. 1 shows a 5 kW complete

Fig. 1.—5 kW Transmitter at the New York Radio Station, Babylon.

transmitter installed at New York Radio Station (WSE) Babylon, N.Y. Fig. 2 shows the rear view of the same transmitter. Fig. 3 gives a complete wiring diagram of the high frequency and direct-current equipment.

Ordinarily the motor generator is self contained and mounted within the frame at the bottom, but in the station a separate source of high voltage direct-current is used. The panel occupies a space of 6 ft. high, 2 ft. wide, and 20 in. deep, and contains all the apparatus with the exception of the cooling water tank and lightning switch. The low voltage direct-current leads are confined to the lower control panel as far as possible, the upper panel handling the high potential direct-current and high frequency leads.

Sending Arrangements.

Referring to Fig. 3, it will be noted that the ship's mains are brought to the main switch. To transmit it is only necessary to throw the "send-receive" switch to the send position. This automatically starts the motor generator, closes the main line contactor, closes the generator field circuit and operates the arc striking mechanism through an arc striking relay. This arc striking relay has a current coil and a potential coil. The potential coil first operates, drawing the armature and working the auxiliary contacts, which, in turn, operate the mechanism which strikes the arc mechanically. As soon as the arc is struck, current passes through the current coil of the relay, drawing the armature on the opposite side and releasing the arc-striking mechanism. It is obvious that if the arc does not stay ignited, current will stop flowing through the current coil of the relay, the potential coil will operate again, and the performance repeated over and over again until the arc stays ignited. The carbon cathode can be regulated for distance in relation to the copper anode while the relay is in operation. The cathode is drawn to the anode very quickly by the electro-magnetic mechanism and returns slowly, as an oil dash-pot is provided for that purpose.

Protective Devices.

An overload relay is provided in the low tension direct-current lines for protection. In case of heavy surges the relay operates and stops the motor generator automatically. To start the machine again it is first necessary to open the main line switch.

Another overload relay is provided to protect the high voltage direct-current line in a similar manner. However heavy surges instead of shutting down the motor-generator, simply open the generator line through the main line contactor. A blow-out magnet is provided at the contacts of the contactor to help extinguish a short circuit. A field rheostat is provided to vary the generator voltage, and can be regulated from 200 to 600 V normally. These various devices can be plainly seen on the lower panel in the front of Fig. 1.

Another function of the arc striking relay and striking mechanism is to place the arc starting resistor in series with the arc circuit when the anode and cathode are struck, otherwise there would be a dead short circuit. The striking mechanism automatically attends to this, and after the arc is burning the starting resistor is again short circuited. In addition to an overload relay protecting the generator there is also a fuse in the circuit.

The Arc Chamber.

To the right centre of the panel can be seen the arc chamber, which is a casting, in two pieces, split where the cathode is shown. The field coils are wound with asbestos-covered square section wire allowing space between coils and castings for ventilation. The upper section has one field coil and the lower section three field

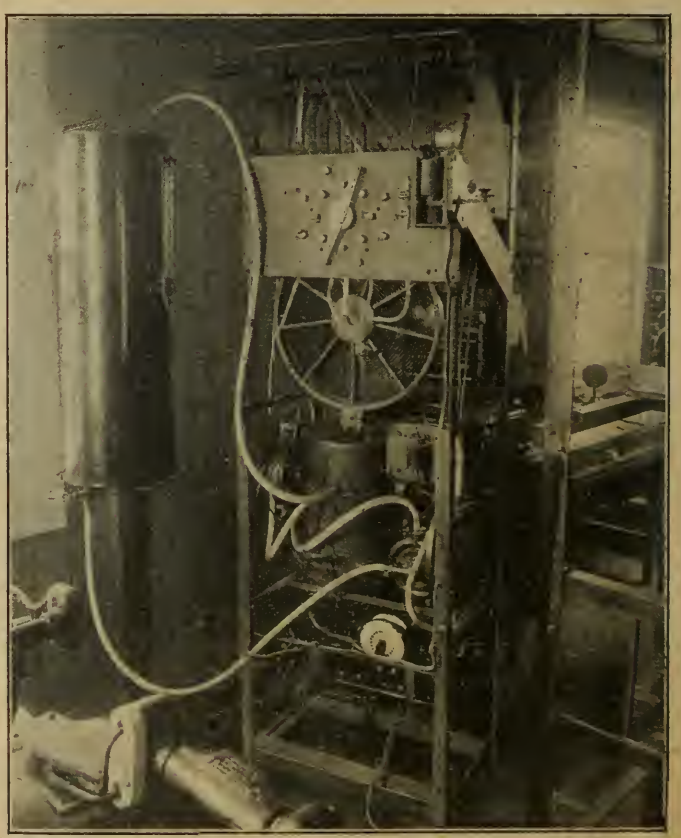

Fig. 2.—A Rear View of the Transmitter.

coils; all these are connected in series. To the left may be seen the poppet valves which protect the arc chamber from explosions and the pipe running to the pressure regulator which keeps the gases in the arc chamber at a constant pressure and insuring a steady flame. The motor which drives the water circulating pump also drives the cathode rotating mechanism through worms and worm

gears. The cathode makes one revolution in three seconds and keeps the tip burning off even. The cathode is earthed to the arc chamber. The anode is, of course, insulated from the chamber and consists of a solid copper tip inserted in a large copper tube. A smaller copper tube squirts a steady stream of cool water into the inside of the tip, and the water returns through the larger tube. From there the water is circulated through a duct making one complete turn around the arc chamber; this duct is cast right in the chamber. The water then returns to the top of the cooling tank and back to the centrifugal pump. The cooling tank holds approximately 2 cub. ft. of water, and during the winter alcohol is mixed with the water to prevent freezing, and, of course, salt water can never be used as it would short circuit the anode to earth through the rubber connecting hoses carrying the salt water.

To maintain the arc steadily and prevent bubbling in addition to the field magnets, alcohol is fed into the arc chamber and quickly vaporises, giving a supply of hydro-carbon, and, besides making the arc very steady, allows a greater amount of power to be handled, in some cases as much as 50 per cent. more. The hydro-carbon supply is automatic, as the alcohol valve is

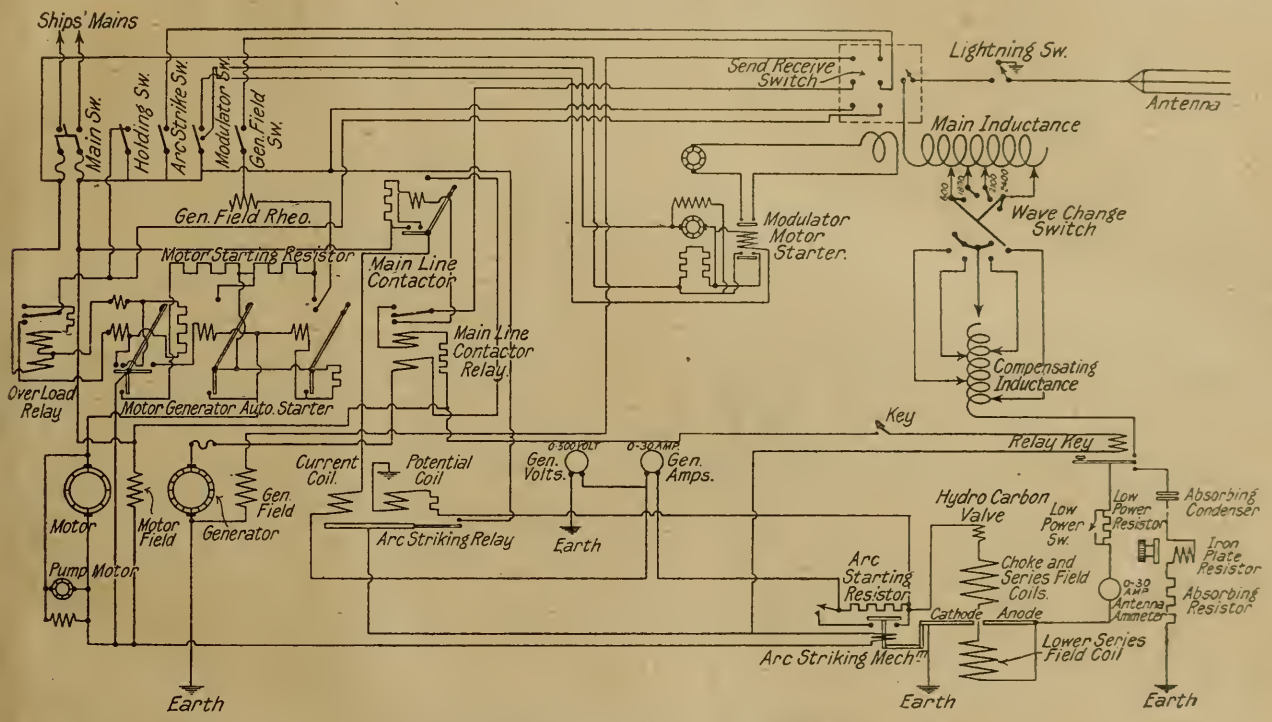

Fig. 3.—Wiring Diagram of the Equipment.

controlled electro-magnetically when current flows to the arc electrodes, likewise when the arc is shut down the supply of alcohol is stopped and the chamber does not flood.

The Absorbing Circuit.

This transmitter was designed to have no compensating wave and an absorbing circuit was used. This consists practically of an artificial antenna, having approximately the same characteristics as the ship's antenna with which the transmitter was installed. A special two-way key was provided, in the down position connecting the arc to the antenna and in the up position connecting it to the absorbing circuit. It is, of course, obvious that when this key is working the centre contact must never be disconnected from both the antenna and absorbing circuit, or the arc would go out. In other words, when passing from the absorbing circuit to the antenna the centre contact first touches the antenna contact and then leaves the absorbing circuit or lower contact. The potentials at this point of the circuit are not very high, being of the order of 3 000 V, and easily broken with a $\frac{1}{32}$ in. gap. With proper adjustment of the arc there is no flaming over at the contacts. The key is operated electro-magnetically, but an auxiliary handle protrudes through the panel for hand operation in case of an emergency. The absorbing circuit consists of a mica condenser, resistor bank of heavy current carrying capacity, and an iron plate resistor, so that the characteristics of the circuit can be varied to allow the same power consumption on the absorbing circuit as on the antenna. In practice, this can be made exactly the same in both positions, and there is no variation in the meter readings when sending, except possibly in the antenna current.

Main Inductance.

The main inductance consists of heavy Litzendraht nearly $\frac{1}{2}$ in. in diameter. This is bankwound in three layers and in sections of 15 turns. A compensating inductance is also provided for close adjustments. Referring to the wave-change switch, it will be noted that there are two positions of each wave length. When the switch is on a half-way tap, the compensating inductance is thrown into the circuit and the wave length adjusted closely, using the lower wheel on the panel. The switch is then returned to the permanent position and a permanent lead substituted in exactly the same place as the variable contact was on this compensating inductance. This inductance can be seen in the rear view, and consists of a spiral of copper strip at right angles to the main inductance.

The usual wave lengths are 600, 1 800, 2 100, and 2 400 m. To provide a decrement for the 600 m wave length, allowing reception with a non-oscillating receiving circuit, a rotary modulator is used. This consists of a motor-driven commutator which has every sixth bar short-circuited. The two brushes from this commutator run to a three-turn loop of inductance which is coupled to the main inductance. When the loop is short-circuited periodically, the resultant note is approximately 400 cycles, the wave length is thrown off about 7½ per cent., the decrement is very small and gives extremely sharp tuning. The modulator is provided with a special starting device, and it is impossible to short-circuit the loop without having the motor running. Three meters are provided: a 0 to 500 voltmeter to read the generator voltage; a 0 to 30 direct-current ammeter, which is in the generator arc electrode circuit, and a 0 to 30 radio frequency ammeter to read the antenna current. In practice with a 5 kW installation, 20 A is a fair antenna current at 1 800 meters on an antenna having a high frequency resistance of 5 Ω at that wave length.

In case it is desired to run the motor generator while receiving, a holding-switch is provided which keeps the machine running even, though the antenna switch is thrown to the receive position. It is also possible to close the generator field switch and arc-striking device from the panel independent of the antenna switch contacts. This transmitter is considerably more compact than early models, and is gaining great favour with the steamship companies. The writer will be glad to give European engineers any additional data they may be interested in.

The current number of the Industrial League and Council Journal contains a special article by Lord Burnham on "The Coming of an Industrial World Parliament." Lord Burnham, who presided at the International Labour Conference held at Geneva, quite frankly admits that things which during his thirty years' experience as a Member of Parliament he regarded as impossible in his time are coming to pass if only good sense and good temper prevail on those issues which are not vital in a political sense, but vital having regard to the well-being of humanity and the improvement of social conditions not only in Europe, but in all the continents which are now being brought so much closer together in industrial competition. He predicts that in the International Labour Conference, by reason of it being so democratic in character and representative of Capital and Labour, there are the germs of a world-wide parliament of industry.

Recent Progress in Electric Locomotive Design.

This article, which is an abstract from a Paper read by Sir Vincent Raven before the North-East Coast Institution of Engineers and Shipbuilders, is principally interesting from the details it gives of the electric freight and passenger locomotives which are now being built for the North-Eastern Railway. Comparative tests between the latest type of heavy goods steam locomotive and the electric locomotives used on the Shildon and Newport line are also given. These tests indicate that the electric engine handled the load more economically than the steam, and in other ways was more advantageous.

In the course of a Paper on "Railway Electrification" read before the North-East Coast Institution of Engineers and Shipbuilders last Friday, Sir Vincent Raven, chief mechanical engineer of the North-Eastern Railway, said there was a great advantage in being able to build a locomotive which, by its tractive effort, would keep a more even speed over the railway. In order to do this it was necessary to design a machine which would give the power required within the limits of the present load gauge. He showed the difficulty of increasing the power of a steam locomotive without exceeding present limits, though an electric locomotive capable of exerting a pull of 15 tons which would haul a train of 1 000 tons up a gradient of 1 in 100 at 30 miles per hour would fall within the limits. Although electric traction would not get over the difficulty of dealing with larger coaches, it would therefore overcome the difficulty of designing more powerful locomotives without increasing the gauge. Continuing, he gave some details of the design of electric freight and passenger locomotives for the North-Eastern Railway and of comparative tests between them and steam locomotives which have recently been undertaken.

Modern Electric Freight Locomotive.

The electric freight locomotives on the North-Eastern Railway are arranged to haul trains weighing 1 400 tons at a speed of not less than 25 miles per hour on the level. They may be described as articulated truck locomotives in which the tractive effort is transmitted through the truck frames. The motor equipment of each locomotive consists of four totally-enclosed motors, each driving an axle through single reduction twin gearing. The motors are suspended by means of a cross beam suspension bar with bearings and reaction springs. These, with the motor suspension bearings on the axle, provide the motors with four points of suspension.

The four main motors are fitted two on each bogie, and are wound for 750 V each, the pair of motors on each bogie being connected permanently in series. The four main motors of each locomotive thus form two units, which are controlled on the usual series parallel system. Each motor is capable of developing 275 B.H.P. at a speed of 20 miles for one hour with forced ventilation. The motor equipment is capable without injury of exerting a torque sufficient to skid the wheels on any conditions of rail, and will exert an average pull of 28 000 lb. at the tread of the wheels when starting under normal conditions of rail. The maximum pull at the tread of the wheels is, of course, considerably greater than this. The driving wheels are eight in number, measuring 4 ft. in diameter; wheel arrangement, 0—4 + 4—0; length of fixed wheel base 8 ft. 9 in. per truck; total of both trucks 27 ft. There are four axles and the total weight is 75 tons. The horse-power of motor for one hour rating is 275, and for continuous rating, 182. This design of locomotive appears to be generally suitable for dealing with goods and mineral traffic up to the necessary speed.

Equivalent Steam Locomotive.

The latest type of heavy mineral and goods steam locomotive built on the North-Eastern Railway in 1919, usually known as the 0—8—0 class, is a three-cylinder engine with 200 lb. boiler pressure. It has a maximum tractive effort at 85 per cent. boiler pressure of 41 070 lb. or 18·3 tons. Weight on coupled wheels, 71 tons, 12 cwts. Total weight ready for running, 115 tons, 14 cwts. This engine was brought before the public by trials carried out on the North British Railway, between the Bridge of Earn and Glenfarg, where a load of 755 tons was hauled up a gradient of 1 in 75 at an average speed of 12·8 miles an hour, through a distance of 7 miles.*

Comparative Tests.

Some trials have been made between this engine and the electric locomotive. These were carried out on the Shildon and Newport line with the following results: The heaviest gradient was 1 in 103, and the total weight hauled in each case was 1 003 tons, as shown in the accompanying diagram. These tests were arranged with a dynamometer car attached to the load as follows: (1) A through run without a stop; (2) three stops at the bottom of the heaviest gradient; (3) made with three stops with the whole train up on the heaviest gradient. The results are shown below:

	Steam.	Electric.	Average Draw Bar Horse Power. Steam.	Electric.
Distance	17½ miles	17½	—	—
1st Test (time) ..	56¼ minutes	54	862	870
2nd „ „ ..	77 „	53	602	883
3rd „ „ ..	68 „	66	682	716

* Full details of these trials were given in the "Railway Gazette," September 9th, 1921.

The relative maximum strength of the two engines is in proportion to the weight on the driving wheels: Weight on drivers of electric locomotive, 75 tons; weight on drivers of steam locomotive, 72 tons. It will be seen that the two are practically equal so far as adhesive force is concerned, and the adhesion determines the maximum possible pull. The turning effort of the motors on the electric locomotive produces tractive effort up to the limit permitted by the adhesive weight. In the case of the steam engine, the steam pressure, acting on the piston, produces similar results.

It may, therefore, be said that the two locomotives were designed to be of equal strength. From the tests made, it will be seen that the electric locomotive handled the load better than the steam; there was less time taken. The steam engine was not able to maintain itself, owing to the fact that it was not able to keep up steam. The fire had to be cleaned out after the second trip, consequently terminal time was wasted. The electric locomotive, after completing the three trips, could have gone on doing this work indefinitely.

Electric Passenger Locomotive.

The North-Eastern Railway have also designed an electric passenger engine which is being built and erected in their Locomotive Works at Darlington, the electrical equipment being provided by the Metropolitan-Vickers Company. This engine is arranged to haul a 450-ton express passenger train at an average speed of 65 miles per hour. The running gear is designed for a maximum safe speed of 90 miles per hour, without doing damage to the mechanical portion of the locomotive, which is of the 4—6—4 type, and consists of main frames mounted on three driving axles with three pairs of driving wheels 6 ft. 8 in. in diameter, and a four-wheel bogie at each end; cab and sloping ends are rigidly fixed to the main frames, and are provided with the necessary supporting members for carrying the auxiliary and control equipment. The current is collected from the overhead trolley by means of pantagraphs mounted on the roof at each end of the centre compartment.

The main traction motors, which are of the twin armature type, are rigidly fixed to the main frame of the locomotive, and transmit the torque to a gear wheel mounted on a hollow shaft or quill drive. The high tension apparatus is located in one of the sloping ends; the other sloping end contains an electric boiler for supplying steam for train heating. The capacity of the locomotive will be 1 800 H.P. one hour rating, or 1 260 H.P. continuous rating.

DISCUSSION.

In the course of the discussion on the above Paper, Mr. Roger T. Smith (Electrical Engineer, Great Western Railway) said that the electric passenger locomotive referred to in the Paper, now being built at Darlington, was the first passenger locomotive to be constructed for running at a speed of above about 65 m.p.h. The comparison of steam and electric locomotives undoubtedly left a large balance in favour of the latter, but it was necessary for each railway to consider its own case. The pooling of electric locomotives would be essential if full advantages of their increased running time were to be obtained. With an electric passenger locomotive it was possible to obtain an annual mileage of from 40 000 to 60 000 miles, whereas a steam passenger locomotive mileage never reached 30 000 miles. In the case of freight locomotives, the annual mileage of steam locomotives was more than doubled with electric locomotives. The power of an electric locomotive was only limited by the temperature of the motors, and its overload capacity could, therefore, be utilised considerably to increase the average train speed. The practice of direct coupling or gearing the motors to the axles had been standardised in this country because it had been found less troublesome and much cheaper than the connecting-rod design. The latter design was developed because the use of a single-phase a.c. supply necessitated larger motors than could be accommodated between the wheels on the standard gauge. The strength of the present standard draw gear imposed a limit on the power of the locomotive, in view of which locomotives were not likely to be required of more than 1 500 to 2 000 H.P. for many years, and, with this size, it was an easy matter to accommodate the motors in the space available between the wheels. On the North-East coast a cheap supply of electricity could be obtained. The North-Eastern Railway were, therefore, in a favourable position to consider electrification, which it was to be hoped would soon be proceeded with.

Mr. J. Dalziel (Midland Railway) agreed that electrification would make enormous savings on running, maintenance, and operating costs, but it was difficult to show sufficient advantage to warrant the present capital costs of conversion. Undoubtedly there were many direct savings which would be effected which it was

difficult to estimate, but it was necessary to proceed with caution. The direct or gear drive was much preferable to the connecting-rod drive, and it was much less complicated. It was difficult to see the object of converting the rotary motion to reciprocating motion and then back again. With a d.c. system it was possible to use a 750 H.P. motor to drive direct or through gearing one axle, whilst, with single-phase a.c., a 600 H.P. motor could be so accommodated. The use of single-phase a.c. was not the sole cause for the development of the connecting-rod drive, because gear-driven locomotives were already operating on single-phase a.c. on American railways.

Induction-Type Synchronous Motors.*

By LAURENCE H. A. CARR, M.Sc. (Tech.).

In this Paper the author compares the characteristics and construction of the induction type synchronous motor with those of other polyphase motors. He deals particularly with the self-synchronising feature of the machine so as to present a full conception of the phenomena which occur. A mathematical expression is deduced for the limiting conditions beyond which synchronising is uncertain, and the considerations which determine the selection of the excitation voltage and the method of control are discussed.

The correction of the power factor of a system, to a value approaching unity has attracted much attention. Owing to present high capital costs, it is necessary to utilise existing cables to the fullest extent by obtaining currents as nearly as possible in phase with the pressure. The induction-type synchronous motor, which facilitates power-factor correction, and has also good starting characteristics, therefore merits attention.

Theory of the Motor.

This motor is essentially an induction motor coupled to a d.c. exciter. It is started up as an induction motor. When the exciting

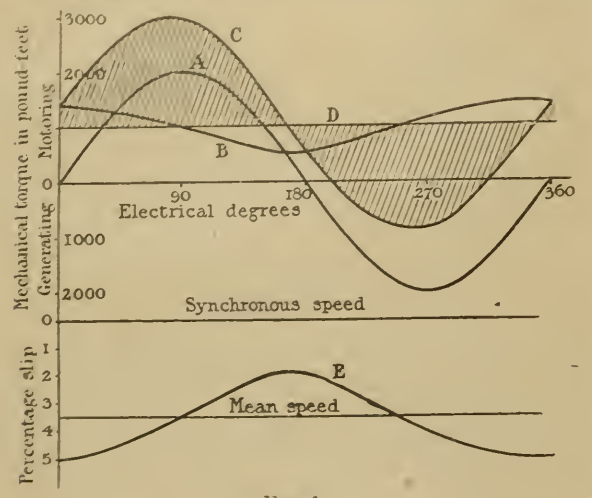

Fig. 1.

current is switched on it synchronises itself and then runs as a synchronous machine whether the machine operates as an induction motor or as a synchronous machine; both stator and rotor must carry "power currents" proportional to the torque; also a magnetising current must be carried by either stator or the rotor, or by both. In the induction motor the secondary carries only power current, which current automatically increases with load, providing within limits a certain overload capacity.

In the synchronous motor the secondary may carry both the "power current" and a part or the whole of the magnetising current; an over-magnetizing current giving a leading component to the primary current may even exist. The secondary current in this case, however, is controlled by external means, and does not increase automatically on overload, which must be met by the normal full-load excitation in either of two ways.

The economical method is to run the motor normally at a leading power factor of about 0·9, thus utilising the extra excitation to

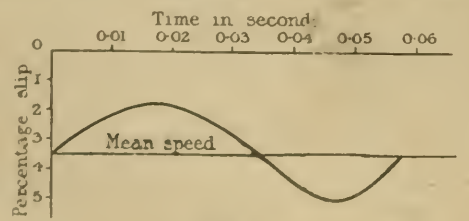

Fig. 2.

correct the power factor of other parts of the system. The uneconomical method is to increase the air-gap of the machine, thus wasting the excitation by using it to drive the flux through this increased air-gap. This method has a further disadvantage in a synchronous induction motor. It impairs the performance of the machine as an induction motor during the starting period, since the magnetising current drawn from the line is increased. As a rule there will be little difference in first cost between a synchronous induction motor arranged for unity power factor and one arranged for 0·9 leading power factor, since, in order to allow for the necessary overload capacity, the same exciting member has to be used in each case.

Comparison with Other Types of Machines.

The principal advantage of the synchronous induction motor over the plain synchronous motor lies in its starting characteristic. The synchronous motor with damper windings for starting will only start against 40 to 50 per cent. of full-load torque, and even then requires a large current at a low power factor for an appreciable time. The synchronous induction motor starts from rest like an induction motor and easily synchronises itself almost instantaneously against full load or over.

Compared with the corrected induction motor, *i.e.*, the induction motor fitted with a phase advancer or vibrator, the synchronous induction motor possesses the following advantages:

(*a*) It may be corrected not merely to unity power factor, but to a leading power factor, for which it is even more suitable.

(*b*) It delivers a leading component of current, which increases slightly as the load decreases; whereas with a corrected induction motor the power factor lags as the load decreases, until at no load the motor takes as much lagging current as a plain induction motor.

(*c*) The action of a phase advancer increases the slip, but the synchronous induction motor runs at constant speed; it has zero slip.

(*d*) The synchronous induction motor commutates low-voltage d.c. instead of a.c. in the case of the phase advancer or vibrator.

In the original Paper the author illustrates, by a vector diagram, the advantages of the synchronous induction motor with leading power factor.

Construction.

Two different types of motor are at present made, both involving a standard induction-motor stator, with semi-closed slots, and either concentric or diamond winding.

In one type the rotor is of the three-phase type with barrel winding

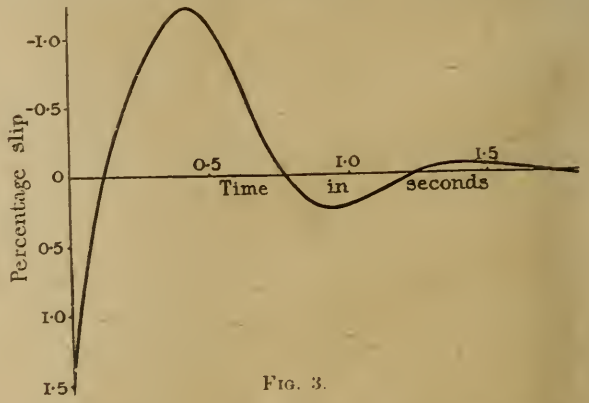

Fig. 3.

of diamond-shaped coils. Two or four bars per slot may be used, but in many cases a higher excitation voltage is provided by winding the rotor with diamond coils each containing several turns of rectangular wire. In this case the slots are of the fully open type. It is usual to make all the conductors of the same size. When running synchronously this three-phase winding has an exceedingly good damping effect.

In the other type, the main rotor winding consists of concentric coils of flat copper ribbon wound in open slots, covering about two-thirds of the rotor periphery. This may be the only winding, the rotor thus being single phase, or the remaining third of the rotor periphery is wound with a second phase of reduced cross-section for starting. In both types each motor has its own exciter.

Starting and Synchronising.

Synchronous induction motors readily start up with a resistance in the rotor circuit and are capable of accelerating against from 2 to 2½ times full-load torque. The self synchronising feature of these machines is their only unusual characteristic, and they can exert a large torque while synchronising.

When direct current is switched on the machine develops torque as a synchronous machine. As the rotor slips back through a pole-pitch, this torque is alternately motoring and generating, and

* Abstract of Paper read before the Institution of Electrical Engineers.

below synchronous speed there exists in the rotor an induced alternating current varying both with time and the speed of the rotor. The resulting varying torque must be added to the synchronous torque to obtain the total torque (*see* Fig. 1). With a cylindrical rotor, the synchronous torque is a sine wave (curve A), the fluctuating induction torque is represented by curve B, and the sum of curves A and B gives the total torque C. If the constant load torque is plotted above the datum line D, the difference between curves C and D (shown cross-hatched) gives the torque causing acceleration and deceleration of the moving masses. The variation in speed produced and the slip are shown by E. The mean speed occurs with maximum synchronous torque, so that only half of the positive lobe of the torque curve is available for acceleration above mean speed. In Fig. 2 the speed curve is transferred to a time basis. If the machine is to synchronise, the oscillation must be large enough to allow the rotor to swing right up to synchronous speed. The position of the rotor relative to the synchronous field at the moment of switching on the excitation has an influence on the commencement of the oscillation and on the sequence of the phenomena. The worst case in practice is that in which the mean speed is passed through when the synchronous motoring torque

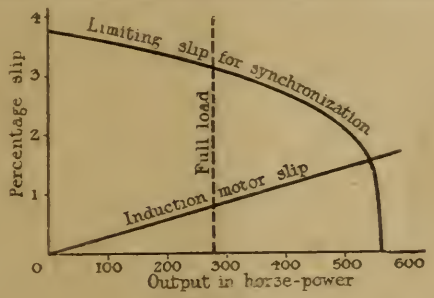

FIG. 4.

is a maximum. If the machine will synchronise under these conditions it will always synchronise.

This case is accordingly assumed in subsequent calculations. A diagram is presented for a motor having constants similar to those assumed in Fig. 1, but lower rotor resistance giving 2½ per cent. slip at full load, The conditions are considered in the original Paper in detail. Fig. 3 is interesting as showing a speed curve when the initial slip is 1½ per cent., and indicates how quickly the oscillation occurring after synchronous speed is reached dies down.

Limit of Synchronisation.

In the subsequent section of the Paper the limit of synchronisation is considered. This is illustrated in Fig. 4. The curve of speed is asymptotic to synchronous speed, the machine synchronising after an infinite time with a pole-lag such that synchronous

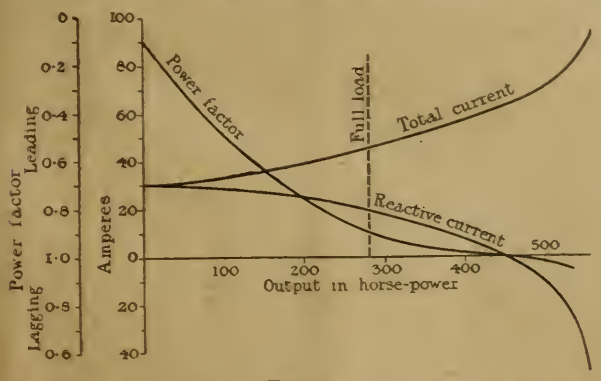

FIG. 5.

torque is just equal to load torque. A mathematical expression for the condition is derived in the appendix to the original Paper, namely :

$$\omega = \sqrt{(1{\cdot}2\phi T_m \mathrm{I})}$$

where ω is the limiting slip in mechanical radians per second ;

T_m is the maximum torque in pound-feet exerted as a synchronous motor with the excitation considered, *i.e.*, torque corresponding to maximum "synchronising kilowatts" ;

I is the moment of inertia $Wr^2 g$ in pounds, feet, and seconds ;

ϕ is the mechanical angle of lag of the rotor pole from the maximum-torque position, measured in radians, when it is exerting a torque equal to T_l, *i.e.*,

$$\phi = (1{\cdot}p) \text{ arc cos } (T_l\ T_m)$$

where p is the number of pairs of poles and T_l is the steady load torque in pound-feet.

Results of practical tests confirm the values for limiting slip calculated from the formula. Fig. 5 gives the performance curves of a 3 300 V three-phase 50 period 250 H.P. motor.

Owing to increased leakage single-phase rotors give rather less starting torque than that obtained with a three-phase rotor. There is also a marked drop in torque at half-synchronous speed ; if rotor starting resistance is cut out too rapidly the machine may "hang" or "crawl" at half speed. It is, however, only necessary to switch in some resistance to enable the motor to pick up speed again. Motors can be arranged for any desired pull-out torque, 75 to 100 per cent. overload being an economical figure for a machine with a leading power factor of 0·9. The pull-out torque for a machine running as synchronous motor may be increased by extra excitation.

Control and Switchgear.

Each motor is provided with its own exciter. The author, in the original Paper, shows in skeleton form the usual arrangements of switches and control for various types of secondary windings. The sequence of operations is as follows : (1) The main switch is closed. (2) The rotor starting resistance is gradually cut out and short-circuited. (3) The rotor circuit is momentarily interrupted. (4) The rotor circuit is closed on the exciter. (5) The exciting current is adjusted, if necessary, to give the desired leading power factor. A special single switch has been designed to provide the right sequence of operations with single-phase motors. With three-phase motors switchgear is built up of standard apparatus comprising liquid starter, rotor change-over switch exciter shunt regulator, &c. It is usual to fit interlocks on both starter and change-over switch so that the main switch cannot be changed unless these are in the starting position. Automatic starting by contactors has also been applied.

Inverted Machines.

Inverted machines, *i.e.*, with supply connected to the rotor and the stator used as secondary have been developed and have certain advantages. The efficiency with 0·9 leading power factor is only slightly (about 1 per cent.) below that of a plain induction motor. The cost would, however, be about 25 to 40 per cent. higher. In view of the power-factor correcting properties of the motor, it is very suitable for use with continuous but varying loads. Amongst drives favoured are compressors, pumps, fans, &c. ; also the driving of generators, line shafts, &c. Although machines of 60 H.P. have been put into commercial use the chief field is for sizes from 150 H.P. upwards. The largest at present in use appears to be 1 125 H.P., though there is practically no limit to the size.

DISCUSSION.

In opening the discussion in London Dr. S. P. SMITH said it was not clear whether the advantages of the synchronous induction motor were due to the large starting torque or to the high power factor. It still, however, possessed the fundamental disadvantages of the ordinary induction motor, small air gap, and the low voltage commutator. The latter trouble could be overcome to some extent by using series parallel arrangements, but the rotor on the induction motor had inherently a fairly low resistance, so that the same satisfactory design for the exciter as on the synchronous motor could never be obtained. An alternative to the induction motor excited by continuous current was the synchronous motor with salient poles wherein the cross flux became roughly equal to the main flux and gave a good starting torque, while laminating the rotor circuits allowed the pulsating flux to traverse the whole circuit. Another alternative was a salient pole machine with a very wide polar arc and a low resistance damping winding, and the rotor connected through the slip rings to a resistance during starting. A second set of slip rings were used for exciting the winding. He wondered whether Mr. Carr had studied the effect of pulling the rotor out of synchronism to rather a slow speed, and then finding out how it behaved with direct current excitation. The salient pole type of motor would run up to speed and would synchronise itself, but it might not pull in correctly.

The Economies of Power Factor Improvement.

Mr. H. M. SAYERS said that the author's methods would lead to an improvement in the power factor, a matter which was of outstanding importance at the present time. On the other hand, a purchaser would want to be convinced that the improved power factor would off set the 33 per cent. increase in cost. The commutator was another disadvantage, and it followed as a result that these machines were hardly commercial in sizes below 100 H.P. In his opinion the use of condensers for power factor should be further considered. He objected to the employment by the author of "designer's shorthand," and also to the title, which he considered a contradiction in terms. A synchronous motor was not an induction motor.

A Comparison of Methods.

Mr. W. E. BURNAND pointed out that while the author's motor was cheaper than a non-synchronous motor with a phase advancer, its sphere was limited by the fact that it was synchronous, so that

if the load pulled out of synchronism there would be bad effects on the line. It was also more expensive than the ordinary synchronous machine, while both its efficiency and pull out torque were lower. Like any other synchronous machine there was a severe rocking when it pulled into synchronism. On the other hand it could start at full load. The author was a little lukewarm towards phase advancers which he (Mr. Burnand) thought could be improved so that a shunt characteristic was imposed on the top of the usual series characteristic, thus giving a perfect power factor compensation over the whole range on load.

Supporters of the Motor.

Mr. M. Ayres criticising Dr. Stanley Parker Smith said that the history of the machine was sufficient guarantee of its future. Its success was in fact due to its high power factor and starting torque. The machine had a considerable compound characteristic, and, with a certain amount of overload, a power factor of unity could be obtained. Motors of the type dealt with were made in many designs, and at least two patents had been taken out which proposed to leave the exciter in circuit during starting. He did not agree with Mr. Carr that the exciter voltage and currents were disconcerting factors. Figures given by the author were not of general application and the cost of such a motor should not be anything like 33 per cent. in excess of the equivalent in induction motors.

Mr. J. H. Johnson thought that the advantage of the motors described by Mr. Carr chiefly resided in their high power factor, and he gave examples showing how an expenditure of about £500 on new feeders had been avoided by their use. To say that they cost 33 per cent. more than the induction type motor was to give too high a figure; the increase might not be more than 3 or 4 per cent.

Mr. W. M. Selvey confirmed Mr. Johnson's opinion that the troubles which speakers had suggested might occur with these motors were not generally experienced.

The Author's Reply.

The Author, in reply, rather damaged his reputation as an original inventor by saying that the motor was of quite an old type, and that the Paper ought to have been read six or seven years ago. He thought that high starting torque was the thing to go for in the design, as improved power factor could be obtained just as well by other means. It was usual for the air gap in these machines to be slightly larger than in an ordinary induction motor. The answer to Mr. Sayers' question as to whether it would pay the customer to give 33 per cent. more for his machine in order to get a leading power factor depended upon the sort of tariff available. He did not think anyone had yet experienced trouble from the rocking strain to which Mr. Burnand had referred.

Manchester Discussion.

Mr. L. H. A. Carr's Paper was also read and discussed in Manchester, and we give below an account of the various speakers' remarks.

Mr. E. P. Hill said that the synchronous induction motor scored over the ordinary synchronous motor on account of the additional starting torque and because the combined induction motor and synchronous torque gave a pulsating effect about mean induction motor speed which enabled it to be pulled into step. With reference to inverted machines, he asked whether the starting performance would be improved by constructing the field system with polar spaces. The low core losses of the synchronous induction motor warranted further investigation. A bibliography would be useful to students.

Should Power Engineers Bear Part of Cost?

Mr. A. B. Mallinson thought that the machine would be installed where big power users who made their own power had cables overloaded due to low power factor, and where supply authorities compelled power users to improve the power factor. He suggested that supply authorities should encourage users to instal these machines by reducing the power bill to the extent of the slightly higher efficiency incurred, and by meeting the difference in cost between this and an ordinary induction motor.

Mr. G. A. Juhlin cited a case in which a rolling mill underestimated the amount of power taken by an induction motor, and thus reduced the power factor below the guaranteed figure of 0·8. An exciter was added and on running the machine as a synchronous induction motor the power factor was brought to 0·9 leading, for which the client should have had a rebate from the supply company. The air gap of the ordinary induction motor was less than that of the synchronous type, and this was the answer to criticism of the small air gap of the latter. He would have liked a comparison between the induction motor with condensers and the synchronous induction motor. He believed the latter would show a saving in first cost and space occupied.

Rotor Widenings.

Mr. W. Stansfield, in a written contribution, said that synchronous induction motors had been made in this country for thirteen years. For some duties 0·8 leading power factor was as high as it was desirable to go, and for others 0·9 was quite suitable; but as low a figure as 0·3 leading had been obtained. For low starting torque, where damper windings were not required, plain single phase winding was applicable. For high starting torque without damper windings the rotor could be wound for two phases out of three, with no winding in the pole portion of the core, the motor being provided with three slip rings and starting as a two-phase motor.

Mr. V. Mallalieu said that some industrial users had put in ordinary synchronous motors for power factor connection, and he thought it would pay much better to instal a machine which would correct power factor and also do useful work as a motor. Some systems had very low power factors, for which oversize and slow-speed motors were responsible in some cases. The systems of charging for power were out of date.

Mr. Browning asked for further information on the effect of damping and thought that power factor should not be allowed to become low, and Mr. D. S. Paxton commented on the absence of power engineers.

Cheapening the Synchronous Induction Motor.

Mr. R. Townend compared the salient pole machine with the induction synchronous type and questioned whether, if a synchronous induction motor were designed as such, it would still be 30 to 40 per cent. dearer than the induction motor. The cost of the machine would be appreciably reduced by using bigger and open slots. He asked whether the author had tried connecting the exciter permanently in one leg of the rotor.

Mr. J. Frith pointed out that, as the rolling mill had been spoken of as a very suitable load, the mill was almost always dependent on a flywheel effect, and a synchronous constant speed motor could not be employed.

Mr. R. G. Kilburne said that with the Kapp vibrator the power factor led in many cases down to quarter load and, with the induction motor, greatly increased the overload capacity. He suggested that induction motor slots might be widened, the motor cheapened and the performance corrected by a phase advancer. He asked whether the cascade motor could be made into a synchronous induction motor.

Mr. T. Baxendale raised some difficulties in applying synchronous induction motors to power station auxiliaries and asked how the principle could be applied to totally enclosed motors.

Discussion at Leeds.

In the course of the discussion on Mr. Carr's Paper at Leeds, Mr. W. B. Woodhouse said that this type of motor was of interest to supply authorities, as idle current not only loaded up the mains, but also had a bad effect on the pressure regulation. It was best to deal with the idle current where it was produced, at the motor. In the early development of this type of motor, troubles had been experienced with the exciter, which was dealing with heavy currents. But recent patterns were very satisfactory. Such a motor was applicable for use for mine fan engines, and installations of this kind benefited the user rather than the supply authorities, because in most instances the founder was paying on a kVA basis, and hence by improving the power factor he reduced his bill.

Mr. W. H. Brown said the price of the machine described varied from 40 to 20 per cent. in excess of that of the ordinary induction machine, so the user had to pay either for the machine or increased charges to the power company. If a cheap supply was to be given it was necessary to improve the power factor of the smaller motors.

Mr. M. Wadeson said that probably more installations of this nature would have been put in had all supply authorities been charging on a kVA basis; but, as legislation now stood, such a charge could only be made by agreement with the user. He had recently been concerned in improving the power factor of a rolling mill motor, and, after consideration of various methods, it was decided to adopt an installation of the type described in the Paper. The motor was a 3 000 V induction motor of 300 h.p. with a pull-out torque of three times full load and an overload capacity of twice full load. The average load on this motor was found to be somewhere about 70 h.p. The alteration consisted in changing the rotor winders to delta, installing a belt-driven exciter and injecting therefrom a direct current into one phase of the delta winders. The machine was found to pull easily into synchronism, and when pulled out on a heavy load pulled back instantaneously as soon as the load fell off. While running synchronously the motor had a leading power factor of 0·9, and when it pulled out and ran as an induction motor on the heavy load it had a power factor of 0·85.

Mr. R. M. Longman said that with a Kapp phase advancer on a machine taking about 200 kW a power factor of 0·95 leading could be obtained.

Mr. Carr, in reply, said with regard to the application of the system to motors under 100 h.p., since the Paper had been written a year ago, smaller motors had been equipped, and they were now made of 50 h.p., or even smaller. The increased cost was proportionately the same with these smaller sizes.

Some Essentials of Automatic Stokers.

By CHARLES ERITH, A.M.I.Mech.E.

In the course of a report to the French Government Commission on the Utilisation of Fuels, Mr. Rauber makes the following interesting comments on the various types of automatic stokers in use. The report has been published in full in "Chaleur and Industrie." We have added the subheadings.

After Mr. Rauber (who is one of the principal Engineers of Union d'Electricité, Paris) had visited England to inspect the Erith multiple-retort stokers, his Company, for their new power station at Gennevilliers, Paris, had four 5-drum double-ended Fives-Lille boilers, specially designed with 45 deg. angle of the tube banks above its single furnace, to suit a pair of 18-retort French-built stokers, identical with the two 18-retort Erith's stokers employed for similar duty at the Edinburgh Corporation Westbank Station, on a pair of three drum Stirling boilers.

The Edinburgh arrangement involves two furnaces for the two boilers; but both stokers are supplied from a central overhead coal bunker.

Two of the four 36-retort stokers are now completely erected on two of the double-ended Fives-Lille boilers at Gennevilliers, and these are expected to start working in February. A detailed description of the Gennevilliers plant will appear in the French technical papers.

Very shortly after the adoption by Union d'Electricité of these huge double-ended boilers, each with 36-retort stoker, teh Cie Parisienne de Distribution Electrique ordered four identical units.

Multiple-retort stokers constructed by Erith's Engineering Company, Ltd., are actually used for all grades of coal having 12 per cent. volatile matter and upwards, and having an ash content up to 40 per cent.

The translation of Mr. Rauber's article in "Chaleur and Industrie" follows:

During the last twenty years mechanical stokers have gradually been introduced into boiler houses. After having been for a long time inferior in working to hand-fired furnaces, they have been so improved that it can be said that at present they meet every requirement. At the same time that they make a notable saving in labour, they ensure, when they are properly regulated, a better combustion in every-day working.

General Arrangements.

Speaking generally, the coal is supplied to the hopper of a mechanical stoker, where it is required to perform as automatically as possible, the following operations: To feed and spread on the grate the coal required for all rates of working; to burn this coal as perfectly as possible, so as to secure good combustion; to discharge the clinker, which, in principle, should be entirely deprived of its carbon.

Further, the stokers should be flexible and easily regulated, and should be able to function with coals as different as possible in quality. This last desideratum is not, however, always realised.

The most widely employed mechanical stokers can be divided into two classes:

Endless Chain Grate Stokers.

In certain endless chain-grate stokers the links of the chain form the grate surface. In other types, the grate bars are supported by transversal articulated bars. The variation of the grate speed is still one of the most important methods of regulating the fire. The grate carries forward by its movement a regulated thickness of coal, and the combustion ought to be completed at the end of its travel, so that the grate should then evacuate, as far as possible, ash alone, without admixture of unburnt fuel.

The regulation of the suction draught, and of the forced draught under the stoker, if used, constitute the other variables, permitting the working to be adapted to the necessities of the load. A good grate should allow for local air regulation under the different parts of the grate, either by dividing the wind boxes or by employing individual dampers.

The ignition of the coal is produced by an arch of refractory material placed above the front part of the grate, this arch being itself heated by the stoker. The form of this arch is of capital importance for ignition, and may vary by over 10 per cent. the amount admissible in volatile matter, all other things being equal. Horizontal and very low arches require the employment of a higher volatile coal than inclined arches.

Advantages of Chain Grates.

Summarizing the results which can be obtained by good industrial regulation of these chain grates: On natural or suction draught chain grates, one can burn with 8 to 10 per cent. CO_2, 100 to 150 kg. hourly per square metre of grate surface (say, 20 to 30 lb. per sq. ft.), of coal having at least 17 per cent. of volatile matter and 5 to 20 per cent. of ash. On forced draught chain grates, but without divided wind boxes, one can burn with 8 to 12 per cent. CO_2, 150 to 200 kg. per hour per square metre of grate surface (30 to 40 lb. per sq. ft.), of coal having 8 to 25 per cent. volatile matter and 10 to 35 per cent. of ash. On forced draught grates, with wind boxes, one can burn with 10 to 15 per cent. CO_2, 150 to 200 kg hourly per square metre of grate surface (say, 30 to 40 lb. per sq. ft.), of coal having from 5 to 25 per cent. of volatile matter and 10 to 35 per cent. ash.

In all cases, excepting with coals or rates of working which are entirely unsuitable, one can succeed in discharging clinker not containing more than 10 to 20 per cent. of carbon, say, 2 to 7 per cent. of the coal supplied.

The Drawbacks of Chain Grates.

This type of grate has the drawback of requiring a screened coal, not exceeding 30 to 40 mm. (1·2 in. to 1·6 in.). The ignition arches and the regulation of fire-bed thickness, although they are constituted of refractory materials, are weak points on account of their sometimes rapid deterioration. Further, for very large boilers, a number of separate grates must be used, the width of such a grate necessarily remaining very limited for mechanical reasons.

The most serious drawback of this system of stokers is in the fact that the transition from a very low to a very forced duty requires an appreciable time. One is obliged, in fact, so as to be sure of a good ignition, not to push too far the lineal speed of the grate. This involves a somewhat long period for changing to a new rate of working. The flexibility, nevertheless, is fairly great, and it may be considered that chain grates constitute a very satisfactory solution, though not yet a perfect one, of the problem of mechanical stoking.

Stokers Fed from Below ("Underfeed").

The raw coal delivered into the hopper is pushed into the stoker below the ignited fuel, generally by means of a mechanically actuated ram. The grate is composed of bars, either fixed or moving, arranged in steps, along which steps the ignited coal progressively descends, being pushed onward by the freshly introduced coal. Very often the bars have a slight reciprocating movement, which assists this travel. On arriving within the furnace, the coal becomes heated, distilled and burnt as it progressively enters the hot zone. The clinker, as it forms, descends along the inclined bars, and is broken up according to the movement of the moving bars. It should arrive at the lower part practically free from carbon.

Here there is no occasion for an ignition arch, as this is formed in the heart of the mass of ignited fuel. With this class of apparatus it is necessary to have on the grate a thick bed of coal, which involves a great resistance to the travel of the air for combustion. Thus the stokers usually employ forced draught, the air pressure sometimes going to 100 mm. (4 in.) water gauge. To vary the rate of duty of the stoker one regulates the quantity of forced draught air, the speed of the charging ram, and also of the suction draught, when required.

These stokers are widely employed in America, and excellent makes are available. It seems, however, that up to the present not quite so extended a range of fuels can be utilised as is the case for forced draught chain grates. Hitherto, "underfeed" stokers have succeeded in burning 150 to 200 kg. hourly per square metre of grate (say, 30 to 40 lb. per sq. ft.). But the coal should have more than 15 per cent. volatile matter, and less than 25 per cent. ash. The combustion can be regulated so as to have 12 to 15 per cent. CO_2 in the gases, as they leave the boilers. The clinker produced will also have from 10 to 20 per cent. of carbon, just as with chain grates.

Advantages of Underfeed Stokers.

The principal advantages which this type of stoker offers, at least with the improved types are as follows: No ignition arch and no regulation by a gate of the thickness of the fire-bed, which are the weak points of the chain grates. Further, fewer cast-iron parts are subject to the heat of the fire; great flexibility of working due to the fact of the large mass of coal carried in the furnace, either ignited or hot and ready to burn. It is sufficient to increase or to diminish the volume of forced draught air to obtain instantly the variation of duty required.

All banking of the fire is done by introducing fresh coal in sufficient thickness to cover the grate and shutting off forced draught. The stoker is quickly ready for work.

When a stoker on this system is constituted of adjacent units arranged all along the front of the boiler, the dimension of the stoker in width is unlimited, which allows the use of enormous stokers without any great difficulty. This type of stoker is very suitable for present conditions, in either large or small central stations. It will be excellent when a more extended range of fuels can be utilised in it.

Reviews.

Motor and Dynamo Control. By W. S. Ibbetson, B.Sc., A.M.I.E.E. (London: E. & F. N. Spon, Ltd.) Pp. viii.+487. Price 21s. net.

This book is an attempt to combine an explanation of the theoretical principles underlying the design and manufacture of the various types of electrical machinery, with such practical information as is requisite for their efficient control and operation. As a general rule, the task is not an easy one, and rarely is it satisfactorily accomplished.

The author in this case has achieved a fair measure of success, though in the process he has laid himself open to the criticism that his treatment is somewhat superficial; and from the point of view of the student it is, though presumably the book is not intended so much for students as for those who have to supervise the installation and operation of electrical machinery. It is an intensely practical work, and might almost be described as a cross between a text-book and a pocket-book.

It covers a wide field, and describes in pithy paragraphs the main characteristics of the various types of electrical machines, explains the fundamental principles underlying their construction, and compares them from the point of view of operation and reliability.

Like other books by the same author, it commences with the consideration of the electric and magnetic circuits, the production of an E.M.F. in the simple generator, and the salient features of the various types of dynamos. The function which series windings and inter-poles perform in a dynamo is explained, boosters and balancers are described, and diagrams given showing how they are connected. Alternating current generators are next treated, together with rotary convertors, and a chapter is devoted to a consideration of their parallel operation and the various methods of synchronising. The common types of d.c. and a.c. motors are also described and compared, and several typical motor calculations are supplied.

The practical engineer will find a mine of useful information in Chapters 10 and 11, in which the author has tabulated the faults usually found in electrical machinery, together with the best methods of detecting and remedying them. There are also numerous practical hints on the installing of plant. A useful chapter on secondary batteries completes the book.

The author adopts with considerable advantage the method of question and answer, and the latter, though in many cases brief, are very lucid.

It will be seen that, though there is not much which is new in the book, it covers practically every point upon which the ordinary motor and dynamo attendant is likely to require information in connection with the machinery under his control from the time he receives it from the manufacturer. It contains also sufficient practical data to enable the engineer to decide the type of motor, whether d.c. or a.c., which it would be most advisable to install.

In a word the book tells the attendant or engineer-in-charge what to do, how to do it, and the reasons why. It does not simply explain how to cure, but how to prevent trouble, and thus enables him to run his plant more efficiently. It should therefore prove a useful book to those ex-Service students who are taking an intensive course at technical colleges prior to taking positions as sub-station attendants and junior engineers. The diagrams are well printed and on a scale sufficiently large to be quite clear to those whose knowledge of draughtsmanship is limited. A fairly comprehensive index enables the reader easily to put his finger on the information that he requires. We would recommend that in future editions the author should alter the symbols employed in order to bring them into line with the recommendations of the International Electro-Technical Commission. To the practical electrician the kind of symbol used may not matter, but to the student who is familiar with other text-books those employed in the present edition are liable to lead to confusion.

Correspondence.

THE ELECTROSTATIC WATTMETER AND MEASUREMENT OF LOW-POWER FACTORS.

To the Editor of THE ELECTRICIAN.

Sir,—In a letter published in your columns a short time since I alluded to a zero method of making measurements of this kind described by Mr. Herbert Parry, which I thought a previous suggestion of mine had anticipated.

On looking into the matter further, I find that though both methods were founded on balancing the direction by suitable connection to points on a shunt across the circuit, Mr. Parry's is otherwise quite different and superior to mine, and, as far as I am aware, original, and he is to be congratulated on a very pretty and, I think, useful suggestion.

As very little has appeared in the Press or otherwise on the working of the electrostatic wattmeter for a good many years, perhaps you will give me an opportunity a little later to say something more on the subject generally.—I am, &c.,

London, W., Dec. 27. G. L. Addenbrooke.

THE THERMAL OHM.

To the Editor of THE ELECTRICIAN.

Sir,—In your issue of Sept. 9, 1921, there is an article by Capt. Dunsheath on the Heating of Cables, in which he suggests and recommends using the "thermal ohm" as a new unit of thermal resistance, based on the watt instead of the caloric per second, in calculations concerning electrically produced heat flows. You also refer to it editorially.

The impression one obtains is that the suggestion is thought to be a new one. Permit me to call your attention to the fact that over ten years ago I urged the adoption of exactly this same unit and with that same name, and I can vouch for the fact that it saves much time and effort in calculations when the flow of electric heat is concerned, as it eliminates troublesome conversion factors. In "Metallurgical and Chemical Engineering" (New York), Jan., 1911, Vol. IX., p. 13, and in the "Journal Franklin Inst." (Philadelphia), Dec., 1911, Vol. 172, p. 569, I published articles devoted entirely to this thermal ohm, and giving the conversion factors into other units. In numerous other articles that I published at about that time involving the flow of heat, I used this same unit. The second one of the above was abstracted at some length in your journal, Feb. 23, 1912, p. 786.—I am, &c.,

Philadelphia, Pa., Dec. 15. Carl Hering.

"THE NEGLECT OF FRENCH PRODUCTS."

To the Editor of THE ELECTRICIAN.

Sir,—With further reference to my letter to you, which appeared in the Oct. 14 issue of The Electrician, the result has been quite interesting to me, for I have been favoured with letters from a good many French manufacturers, and in some cases have had a visit from their representative, whom I have been able to help by suggesting names of engineers to call upon and correspond with.

The engineer representing one firm in particular, on a return journey, informed me that he had been extremely well received, and from his conversation I gathered that there is evidently a strong desire to do business with our French friends. Further, I think if French manufacturers were to appoint a resident local representative for this particular district they would get into quicker personal touch with their customers.

I believe some of our own firms do not yet realise the extent of potential engineering business in South Wales, from the very largest structures and machines down to the smallest. Moreover, when a customer or prospective customer has to visit a neighbouring country to inspect works and products, I think he would as soon go to France as any other country. Many of our countrymen visit France for pleasure, and would like to visit it for business, and perhaps by combining the two make both pleasurable.—I am, &c.,

C. T. Allan,

Cardiff, Dec. 30, 1921. Assistant Manager South Wales Electrical Power Distribution Company.

An Electric Gas Lighter.

A short time ago we called attention to a German device for lighting gas from the public electricity supply in a house or building which contained certain elements of danger. Such an apparatus is, however, useful in certain cases, and we are therefore glad to find that an English device has been patented which overcomes the disadvantages to which we called attention. The lighter, which is made by Lord & Shand, Ltd., consists of a specially made condenser, fixed in a convenient handle. One element of the condenser is connected by a single flexible wire through an adaptor or ceiling rose to the supply circuit, and is controlled by an ordinary switch. The other element is connected to a metal brush at the striking end of the lighter. When this latter element is charged it emits a series of sparks which are sufficient to light the gas. There is, it is claimed, no possibility of earthing the supply system by the use of this arrangement, and the energy consumed is, of course, infinitesimal.

The Latest B.T.-H. Showroom.

In our issue of Dec. 9 we gave an illustration of a corner of the new Manchester Showroom of the British Thomson-Houston Company. The accompanying photograph shows the large showroom which the firm have recently opened at 155A, St. Vincent-street, Glasgow.

New B.T.-H. Showroom at Glasgow.

Light and Publicity.

The advertising value of light is wonderfully exemplified by the illuminated hoarding illustrated below. Formerly this hoarding was unlighted at night, and its printed (or lithographed) sapience was only readable during daylight. Realising that the period of display in the winter and autumn was very short, the three advertisers concerned combined and arranged with the British Thomson-Houston Company for an installation of floodlight projectors. The area occupied by the three posters is 55 by 15 ft., and it is lighted by five projectors fixed on a blank wall on the opposite side of the road. The projectors are so disposed and directed that the five separate beams of light cover the area with an intense and uniformly distributed illumination. Type 786 projectors, fitted with powerful mirror reflectors and Mazda gasfilled lamps, and mounted on universal brackets, are employed. This form of mounting allows the projector to be swivelled in any horizontal or vertical direction. These projectors are completely weatherproof, and are intended for use in exposed positions.

Night Illumination by B.T.-H. Floodlight Projectors.

The floodlighting of hoardings must, however, be considered as something more than a means of extending the period of visibility, as it has also the effect of making the advertisement stand out with an individual distinction not otherwise attainable. Floodlighting has been developed in this country by the illuminating engineers of the British Thomson-Houston Company, who have designed a range of projectors for various purposes and conditions. For example, they can be used for the illumination of factory yards, dockyards, goods yards, &c., while for the spectacular lighting of monuments and buildings floodlighting is at once the simplest, the most economical, and the most effective method. Further particulars may be obtained from the B.T.-H. Illuminating Engineers' Dept.

West of Scotland Electricity District.

The Electricity Commissioners have been investigating the position of electricity supply in Scotland, and they have provisionally determined the area of the West of Scotland Electricity District as under :—

The counties of the City of *Glasgow* and of *Renfrew*.

So much of the county of *Ayr* as is included in the Royal burghs of Ayr and Irvine; the burghs of Ardrossan, Darvel, Galston, Kilmarnock, Kilwinning, Largs, Newmilns and Greenholm, Prestwick, Saltcoats, Stewarton and Troon; the parishes of Ardrossan, Ayr, Beith, Coylton, Craigie, Dalry, Dalrymple, Dreghorn, Dundonald, Dunlop, Fenwick, Galston, Irvine, Kilbirnie, Kilmarnock, Kilmaurs, Kilwinning, Largs, Loudoun, Mauchline, Monkton and Prestwick, Ochiltree, Riccarton, Stair, Stevenston, Stewarton, Symington, Tarbolton and W. Kilbride.

So much of the county of *Dumbarton* as is included in the Royal burgh of Dumbarton, the burghs of Clydebank, Kirkintilloch and Milngavie; the parishes of Bonhill, Cardross, Dumbarton, Old Kilpatrick, New Kilpatrick and Kirkintilloch.

So much of the county of *Lanark* as is included in the Royal burghs of Lanark, Renfrew and Rutherglen; the burghs of Airdrie, Coatbridge, Hamilton, and Motherwell and Wishaw; the parishes of Blantyre, Bothwell, Cadder, Cambuslang, Cambusnethan, Carluke, Carmunnock, Dalserf, Dalziel, E. Kilbride, Glasgow, Glasford, Hamilton, Lanark, Old Monkland, New Monkland, Rutherglen, Shotts and Stonehouse; and

So much of the county of *Stirling* as is included in the parishes of Baldernock, Campsie, and Strathblane.

Objections or representations on account of the inclusion in or the exclusion from the district of any area must be made in writing to the Secretary, Electricity Commission, Gwydyr House, Whitehall, S.W. 1, by Dec. 30, 1922. In the opinion of the Commissioners the existing organisation for the supply of electricity in the district should be improved, and a public inquiry will be held into the matter. Schemes for effecting such improvement, including the formation of a Joint Electricity Authority, may be submitted on or before the same date.

Legal Intelligence.

Damages for Tramcar Accident.

In the Second Division of the Court of Session on the 23rd ult. Mr. John Kirk sued the Greenock and Port-Glasgow Tramway Company for damages for personal injuries. The pursuer was an inside passenger on one of the company's tramcars on July 17th last, when the car jumped the points at a loop line, ran across the road and collided with a lamp-post. Pursuer was thrown against the side of the car and sustained a nervous shock.

The company pleaded that pursuer's account of his injuries was exaggerated, and they tendered £50 and expenses.

The jury, however, assessed the damages at £175.

Illegal Electrical Connection.

Messrs. Williams and Williams, casement makers, of Chester, were summoned at Chester Police Court on Friday last by Chester Corporation for illegally taking electric current from the Corporation main. There were also summonses against two members of the firm for an alleged assault on Dec. 2 upon the Corporation Electrical Engineer, Mr. S. E. Britton, while there was a cross summons against Mr. Britton for assault.

The Corporation case was that owing to a change being made in their supply of power it was necessary to cut off their customers temporarily, Messrs. Williams Bros. being among the number. Two of defendants' firm interviewed the Town Clerk on Dec. 2 and appealed for an extra supply of current as a special concession. This was agreed to, but when an official of the Electricity Department visited defendants' works later they found that they had connected up two cables with the Corporation supply mains and the current was not being metered. When Mr. Britton visited the works in order to seal up the illegal supply he was tackled by one of the Williams brothers, who refused to let him leave the works through the gate, and he had to climb a wall in order to get out.

The defence was that only a technical breach of the law had been committed in order to avoid closing their works and throwing about 5 000 men out of work.

A great deal of evidence was given on both sides, but ultimately, for illegally taking the current the firm was fined £5, with 3 guineas costs, and for assaulting the Corporation Electrical Engineer one of the partners was fined 10s., the summons against Mr. Britton being dismissed.

Electricity Supply.

Owing to the failure of the electricity supply on Tuesday at the METROPOLITAN-VICKERS works, Trafford Park, Manchester, the employees enjoyed a half-day's holiday.

SHOREHAM AND DISTRICT ELECTRIC LIGHTING AND POWER COMPANY, LTD., give notice of intention to apply to the Electricity Commissioners for a Special Order to authorise the company to supply electrical energy in Southwick.

The Home Secretary has made an Order authorising the employment of two women of eighteen years of age and over as attendants at the LANGLAND-STREET SUB-STATION OF KILMARNOCK Electricity Department on two day shifts, on condition that neither of them is employed on Shift II. in consecutive weeks.

CHICHESTER Corporation have applied to the Electricity Commissioners for a Special Order to revoke the Chichester Electric Lighting Order, 1898, and the Chichester Electric Lighting (Extension) Order, 1911, to authorise the Chichester Electric Light and Power Company to sell and the Corporation to purchase the undertaking and works of the company, &c.

Following a conference between the Lighting Committees of Montrose and Brechin Councils in regard to the Special Order being promoted by the North of Scotland Electric Light and Power Company, which seeks power to revise charges every three instead of five years, MONTROSE Council, on the recommendation of their Committee, have decided not to join with Brechin in obtaining the opinion of counsel on the matter, as they consider that their interests and those of the consumers are amply safeguarded under the present arrangement.

New Schemes and Mains Extensions.

Sanction is being sought by SHREWSBURY Town Council to a loan of £2 650 for electricity purposes.

MAIDENHEAD Town Council contemplate the purchase of additional generating plant and a new balancer.

HASTINGS Town Council have decided to duplicate the high-pressure cable to St. Leonards at a cost of over £8 000.

WITNEY Urban Council have decided to apply for sanction to borrow £1 000 for the extension of the mains on the Woodstock-road.

Application is to be made to the Electricity Commissioners by HARROGATE Corporation for sanction to borrow £3 250 for electricity works extensions.

PERTH Electricity Department have authorised the borough electrical engineer to invite tenders for a new boiler, required in connection with the extension of the electricity works.

The North Metropolitan Electric Power Supply Company have asked the consent of the CHESHUNT Urban Council to their supplying electricity to the town. A report on the matter is to be prepared by the Council's legal adviser.

WORCESTER City Council have received the sanction of the Electricity Commissioners to the extension of the generating station by the installation of 3 000 kW set, three boilers, and auxiliary plant, and by the construction of the necessary buildings.

DOUGLAS (Isle of Man) Corporation have instructed HANDCOCK & DYKES to proceed with the plans for an electricity supply station for the borough in accordance with the Douglas Corporation Electricity Act, which has just received the Royal assent.

A committee has been formed to canvas BRACKLEY with a view to ascertaining the probable number of consumers of electricity and likely supporters with capital. The proposal is to form a company to carry out a scheme, at a cost of about £5 000.

As a result of complaints regarding the supply of electricity in WOLSTANTON, the engineer has been instructed by the Electricity Committee, Stoke, to submit a report for additional supply, with comparative estimates of the cost of the different methods of supply.

ABERRAYRON Urban Council has decided to make a grant of £100 towards the cost of obtaining a Special Order to enable a company to provide a supply of electricity for the town. The company has undertaken to apply for the order forthwith, and to proceed with the scheme without further delay.

ACCRINGTON Corporation, in accordance with the understanding arrived at with the Electricity Commissioners recently, have decided to proceed with their application for sanction to borrow £100 000 for extensions of plant at the electricity station. The revised figures show a decrease on the original of £30 000.

The scheme of the LYME REGIS Town Council to purchase the local electric light company's undertaking, and to supply electricity in Lyme Regis and Uplyme, narrowly escaped being held up last week. A motion to seal a new contract on modified terms was only carried by the casting vote of the Mayor, Councillor H. Ellis.

The BOSTON Deep Sea Fishing Company have offered to supply the town and district with electricity, and the Council have intimated that they would look favourably upon such a scheme. At present a Provisional Order for supplying the town is held by the National Electric Construction Company, but nothing has been done to comply with its provisions.

TRURO Town Council has broken off negotiations with the Cornwall Electric Power Company for a supply of electricity in bulk, on account of the high price asked, which would, it is contended, make the scheme a burden on the customers or the ratepayers. The Council will now proceed to draw up a scheme based on the original idea of erecting their own generating station at Newham.

Terms have been arranged between the Gas, Electricity, and Housing Committees of GLASGOW Corporation for laying down mains and supplying gas and electricity to the various housing schemes. It is understood that under the agreement the Housing Department will pay £20 000 and the Electricity Department £10 000 towards the cost of laying electric supply mains.

CONNAH'S QUAY Urban Council have decided to oppose the application of Chester for a Special Order under the Electricity Acts to extend the area of supply. They have also decided to prepare a distribution scheme consequent upon the North Wales Electricity Power Company being constituted authorised suppliers, and have agreed to arrange a loan in respect of a distribution network for the district.

Cable extensions at Hillside-avenue, Plymouth, and at Beresford-terrace, Beauchamp-crescent, and Fairfield-avenue Devenport, have been authorised by the PLYMOUTH Electricity and Street Lighting Committee. It has also been decided to apply for sanction to borrow £1 467 for laying new feeder cables from Raglan Barracks to Fore-street, and £3 161 for a new feeder cable from the Newport-street Station to New Passage Hill.

Exeter Town Council have intimated that they are not prepared to extend their area of supply to include CREDITON, but, subject to a satisfactory arrangement as to terms, they would furnish a supply of electricity in bulk at the city boundary at Cowley Bridge. Under the circumstances, Crediton Council consider it would be better to form a company in the town, and the matter has been referred to the General Purposes Committee.

It is stated that NOTTINGHAM Electricity Committee is at last seriously tackling the steadily increasing number of applications for current. Good progress is being made with the laying of the new double electric cable along London-road and Pennyfoot-street, and the work is to be extended along Manvers-street in order to serve the Carlton-road and Sneinton Market areas, from which the demand for installations has been imperative for some time past.

Application is to be made by KEIGHLEY Town Council for sanction to borrow £5 000 for laying the necessary feeder cables and other work for the added area covered by the Keighley Electric Lighting (Extension) Order, 1915. The area comprises the urban districts of Oakworth and Oxenhope, and part of the rural district of Keighley. Application is also to be made to the Unemployment Grants Committee for a grant towards the cost of carrying out the works.

In order to provide for the anticipated demand for electricity for industrial purposes on the south side of the River Aire, LEEDS Electricity Department are laying further mains from the works on the north side of the river. The present mains have been carried under the streets in the centre of the city and over Victoria Bridge, but as an economy the new mains are being laid in a trench below the bed of the river. It is expected that the work will be completed at the end of this month.

AYR County Council have decided to withdraw their objection to the Kilmarnock Electricity Extension Order, 1921, on condition that Kilmarnock Corporation lay mains in the southern portion of the extended area if the County Council call upon them at any time to do so, and there is a reasonable prospective return. The Kilmarnock Corporation have agreed to this proviso on the understanding that should a difference of opinion arise as to a "reasonable prospective return" the question should be referred to the Electricity Commissioners.

BROMLEY Electric Light and Power Company have applied to the Town Council for their assent to change the existing system of electricity supply in the districts of Bromley Common, Bickley and Elmstead from d.c. at 210 and 420 volts to a.c. at 210 V for lighting and 420 for power at a frequency of 50 cycles per second. In order to do this it will be necessary to lay a new 3 300 V cable from the company's works in West Street through the districts mentioned, and to build four small transforming stations at various points. The Council are recommended to consent to the change.

LEYTON Urban Council have this week approved of a scheme for providing additional feeders to meet the increased demands for power in the Lea Bridge-road area, and also for the L.C.C. trams in Leyton. The present scheme has been prepared by Mr C. H. Wordingham and the Council's electrical engineer, Mr. F. H. Lewis, and will, it is estimated, cost about £34 500, including a new sub-station at the junction of Church-road and Waterloo-road, five new feeders, additional switchgear, &c. Walthamstow Council could give a supply in the district under certain conditions, but their terms were too high, and the present scheme represents the most economical method of solving the problem.

Alteration of Charges.

The FLEETWOOD Electricity Committee is now giving a discount of 5 per cent. to electricity consumers, consequent upon the improved position of the electricity undertaking.

CROYDON Council has arranged to supply electricity to works in Morland-road at 2d. per unit for the first 100 000 units a year, and 1½d. above this figure, with a minimum payment of £2 000 a year.

At the coming meeting of WARRINGTON Town Council the Electricity Committee will present a resolution for the withdrawal, as from Dec. 31, of the last three increases in the price of electricity,

amounting in all to 30 per cent. above pre-war prices, for lighting and traction, and 60 per cent. for power.

SALFORD Corporation is reducing the charges for electricity for lighting from 90 per cent. over the pre-war rate to 75 per cent., and from 115 per cent. to 100 per cent. over the pre-war rate for heating and power.

WEST BROMWICH Town Council has decided to lower the charge for electricity for power by 12½ per cent. from the December reading of the meters, and, alternatively, to offer power consumers current at £9 per kW demanded, plus 1d. per unit consumed. The lighting charges remain at 100 per cent. above the pre-war figures.

The following reductions have been made by WHITEHAVEN Town Council in the charge per unit for electricity :—Lighting from 7½d. to 7d.; maximum demand from 3½d. to 3¼d.; heating and cooking from 1⅞d. to 1½d.; power from 3·15d. to 2⅜d.; power (flat rate) from 2·05d. to 1⅞d.; factory power, the addition of 60 per cent. to be reduced to 50 per cent., with a minimum charge of 1¼d.

In order to stimulate the demand for electric heating and cooking, BEDFORD Town Council have reduced the price of electricity from 2d. to 1½d. per unit. For new combined lighting and heating services no charges will be made for laying the service mains provided the consumer agrees to pay in advance a minimum revenue for the first year, calculated at the rate of £5 per kW installed for heating, and that this be not less than 1 kW. A consumer who already takes energy for lighting and requires a heating service will be supplied on similar terms.

Electric Traction.

The relaying of BOURNEMOUTH tramway track along some of the main roads is now completed.

Sanction to borrow £450 000 for track renewals, &c., is to be applied for by BRADFORD Tramways Committee.

ACCRINGTON Tramways Manager has been instructed to report on economies to be effected on the tramway services so as to minimise the present losses.

Coatbridge Town Council have approved the agreement with regard to the purchase by the Corporation of Glasgow of the AIRDRIE AND COATBRIDGE tramway system.

It is announced that some of the outer LONDON TRAMWAY authorities have arranged with the London General Omnibus Company not to reduce fares without conferring with one another on their proposals.

The new luggage bridge at the CARDIFF Great Western Railway Station spans seven lines, and is connected with each platform by electric lifts. The electrical work is under the supervision of Mr. R. T. Smith, the Company's electrical engineer.

Penny fares were revived on all the BRIGHTON tramway routes on Sunday. Slight alterations in distances have been made on several branches, but pratically the system is the same as that abandoned in July last in favour of the 2d. minimum charge.

SALFORD Tramways Committee, being faced with omnibus competition, has issued a strongly-worded resolution of protest, in which it advocates the legal regulation of private passenger-carrying enterprises. The motion has been endorsed by the Borough Council.

The BLACKPOOL Electricity and Tramways Committee has instructed the Borough Electrical Engineer (Mr. C. F. Furness) to invite tenders for four single-deck saloon motor omnibuses in order that they may be ready for the summer season traffic.

The president of the MUNICIPAL TRAMWAYS ASSOCIATION has stated that of 102 undertakings, representing a capital of nearly sixty million pounds, only five succeeded last year in paying their way after meeting the obligation to provide adequately for renewals.

After a long discussion at a special meeting of EDINBURGH Town Council last week it was agreed by 51 votes to 18 that the electrification of the tramway system should be proceeded with, and that the overhead system should be adopted generally. It was decided also, by 41 votes to 26, that the overhead system should be adopted for Princes-street, with span wires.

We understand that the Geddes Economy Committee regard as unnecessary the rule requiring LONDON TRAMCARS to be painted and varnished before the annual renewal of the licence. It is calculated that by reducing the frequency of RENEWAL OF PAINT AND VARNISH, &c., to once in twenty-one months, £35 000 a year would be saved in the cost of labour alone, and a capital sum of £175 000 by a consequent reduction of the number of cars required for the service. Three and a half per cent. more cars would be freed for work.

It is probable that the SCARBOROUGH electric tramway service may not be shut down, as reported in our last issue, for three offers have been made for the purchase of the system. These include one from some London and Yorkshire tramway engineers, which the directors have accepted, subject to the approval of the tramway company shareholders. Mr. H. Seaton will act as managing director of a new company which will run an omnibus service in conjunction with the tramways to every part of the town. Mr. Moinet, the local manager of the tramways, has received instructions to continue running the cars.

In his annual report Mr. C. Furness, the BLACKPOOL TRAMWAYS Manager, states that the year affords evidence that the attempt to avoid any appreciable alteration in fares and stages was a mistaken policy. Last year the reserve balance was practically depleted, the sum available being only £36, and the revenue account will now be called upon to provide expenditure formerly met out of reserve. Increase in capital expenditure would also require further contributions for interest and redemption charges, and the restoration of the finances of the department to their former level would require careful consideration. An abstract of the accounts appeared in our issue of Dec. 2.

The official report of the Ministry of Transport Inspector (Major A. Mount, R.E.) on the BURTON-ON-TRENT TRAMCAR ACCIDENT on Nov. 3 was issued on Saturday. The car was passing from a single to a double line when the leading wheels took the left track and the trailing wheels the right track, the rear of the vehicle swinging round, and the car overturning at right angles to the road. The trailing axle fractured. The car was one of four new ones which had been running less than two years. On three of these cars eight axles had broken, after an average life of only 18 000 miles. Before the war only two axles were broken per annum on twenty cars, and Major Mount is of opinion that the post-war material is not so good. He considers that the driver was going nearer six miles than four per hour at the time, and suggests rigorous compliance with the speed regulations; also that all axles be tested before purchase.

Telegraph and Telephone Notes.

A new telephone exchange was opened at WALLASEY last Saturday to replace with up-to-date apparatus the existing Wallasey Exchange.

The Bridlington correspondent of the "Manchester Guardian" states that the gale over the week-end tore down miles of wires in EAST YORKSHIRE. Overhead telegraph and telephone wires in other parts of the country have also suffered severely.

Permission to erect telephone kiosks in Market-street, Deansgate, and Albert-square has been granted to the Post Office authorities by the MANCHESTER Highways Committee. These will be the first telephones to be set up in the streets of Manchester.

A correspondent of the "Railway Gazette" states that he has recently seen a copy of a letter, dated April 4, 1878, from Mr. W. Langdon, then Telegraph Superintendent of the Midland Railway, to Mr. W. L. Newcombe, the Goods Manager at Derby, intimating that "Should he feel interested in testing its capabilities, he begged to acquaint him that he had now a telephone communication in operation between his (Mr. Langdon's) office and the Stores in Siddals Road." This letter is of interest as it refers to the FIRST TELEPHONE USED ON THE MIDLAND RAILWAY, and one of the first on any railway.

During the current month the following TELEPHONE JUNCTIONS AND TRUNK LINES have been brought into use in SCOTLAND :—A new line between Aberdeen and Dundee, Dundee and Kirriemuir, Dundee and Brechin, Eassie and Forfar, Aberdeen and Ellon, Aberdeen and Inverness, and Brechin and Laurencekirk, and two new lines between Dundee and Arbroath and Aberdeen and Glasgow. In the north, new call offices have recently been established. There has been a considerably increased demand for the extension of the telephone system in Caithness-shire, especially in the Wick and Thurso districts.

Wireless Notes.

The FRENCH UNDER-SECRETARY for Posts, Telegraphs and Telephones announces that he is prepared to receive applications for the installation of the wireless telephone on private premises. Over a distance of thirty miles the cost of a complete station will be about 17 000fr. (approximately £340).

A Central News message from Washington states that the Far East Committee has decided that wireless stations operated by foreign Governments in CHINA shall be left in existence, but be restricted to the use of official messages. All private dispatches will be handled exclusively by the Chinese wireless companies. The Committee decided to call a conference of the world Powers to regulate the wave length to be used at Chinese stations.

In a letter to the "Northern Whig" Mr. W. Guy, of Tyrone, asks what safeguards have been provided in the Irish Peace Treaty for the AMATEUR RADIO-TELEGRAPHIST and the experimenter in WIRELESS TELEGRAPHY AND TELEPHONY. At present, he states, "the freedom of the amateur and the experimenter in this science is so limited in Great Britain as to be the butt and the jest of every other nation. Owing to the P.O. regulations we have very little to our credit in this country in the field of radio science, simply because the experimenter is to a great extent bound down to certain antiquated apparatus with which little can be added to the sum total of radio knowledge."

Obituary.

The death has taken place, in London, at the age of seventy-one years, of COMMANDER FREDERICK JOHN LOBB, R.N. (retired), late Inspector of Imperial Lighthouses in the Bahamas.

The death is announced of Mr. JOHN MILTON, of 7, Frogmoor-street, High Wycombe. Mr. Milton was forty-three years of age, and for over thirteen years was chief assistant engineer to the Wycombe (Borough) Electric Light and Power Company.

We regret to announce the death on Monday, at the age of thirty-eight, of Mr. ERNEST HOLT, manager for the past nine years of the Ashton-under-Lyne Corporation tramways undertaking. Mr. Holt went to Ashton as chief tramways clerk from Halifax in 1905, and he succeeded Mr. Dugdale as manager in 1912. Under his management the borough tramways have been completely reorganised.

Personal and Appointments.

Sir George Perley is retiring from the High Commissionship of Canada.

Mr. W. E. H. Berwick has been appointed Reader in Mathematical Analysis at Leeds University.

Mr. C. C. Paterson has been appointed the Member of Council of the Institution of Electrical Engineers to act as consultative member of the London Students' Committee for the session 1921-22.

The following firms of electrical engineers are among the latest admitted to membership of Glasgow Chamber of Commerce :—Anderson & Munro, Fraser & Borthwick, Haddow & Company, Andrew Hutcheson, Osborne & Hunter, and Underhill & Ritchie.

Mr. W. T. Kerr, electrical engineer to the Hereford Corporation, has sent in his resignation to the City Council. As we stated in our issue of Dec. 16, he is forming a company to acquire the Bleachley Power Station at Chepstow, from which it is proposed to supply power for industrial purposes in the Forest of Dean coalfield.

Mr. Lionel Jenkins, of Bury St. Edmunds, who has been recommended for the appointment of borough engineer and surveyor to the Newport Corporation, carried out the construction of the Middlesex Light Railway and Tramway system, at a cost of nearly £1 000 000. He saw service with the Royal Engineers during the war, and was mentioned in dispatches.

Capt. J. R. Birch, London Electrical Engineers, has been transferred to the general list of the Reserve of Officers of the Territorial Army; Lieut. A. W. Mawby, London Electrical Engineers, has been promoted to major in the Territorial Reserve of Officers; and Lieut. A. C. Stacey, from the same corps, has been transferred to the Territorial Reserve of Officers.

Among the New Year Honours conferred by the King, the following may be of interest to those engaged in the electrical industries :—

Baronet.—Sir Edward Mortimer Mountain (Chairman of Eagle, Star and British Dominions Insurance Company), for public services in connection with schemes for revival of trade, &c.

G.B.E. (*Knight Grand Cross of the Order of the British Empire*).—Prof. Chas. Scott Sherrington, M.A., M.D., F.R.S., D.Sc., President of the Royal Society.

Knights.—Prof. Wm. Abbott Herdman, C.B.E., D.Sc., President of British Association; Albert John Hobson, President of Association of Chambers of Commerce, 1920-21, and Pro-Chancellor of University of Sheffield; Cyril R. S. Kirkpatrick, Chief Engineer to Port of London Authority; Alfred S. Mays-Smith, President of Society of Motor Manufacturers and Traders; Alex. Richardson, M.P., Managing Director of Engineering, Ltd., and Vice-President of the Junior Institution of Engineers.

C.B.—Frank Jas. Brown, C.B.E., Head of Telegraph Branch, G.P.O.

C.I.E.—John Willoughby Meares, Electrical Adviser to the Government of India, and Chief Engineer of the hydro-electric survey.

Business Items, &c.

The Union Cable Company have become members of the Cable Makers' Association.

Stirling Town Council has appointed Henderson Brothers as electricians for the ensuing year.

The title of the Dubilier Condenser Company is now the Dubilier Condenser Company (1921), Ltd.

Mansfield Guardians have appointed the Mansfield Engineering Company electricians for the ensuing six months.

The new telephone number of Measurement, Ltd., 34 and 35, Provost-street, City-road, N. 1, is Clerkenwell 3157.

It is stated that Guest, Keen, & Nettlefolds propose to undertake the electrification of the whole of their Dowlais works and collieries.

The business of J. Owen and Sons, of Blackheath, has been taken over by Mr. T. A. Keating, electrical engineer, of 186, Westcombe-hill, Blackheath.

Baughan & Company, Ltd., electrical engineers, of Reading, who are having their premises rebuilt, are carrying on business temporarily at 175, Friar-street.

The Hoover Electric Suction Sweeper has been greatly reduced in price as from Jan. 2, and it can now be purchased at the same price as many ordinary vacuum cleaners.

The Automatic Telephone Manufacturing Company, manufacturers of "Xcel" electric heating and cooking appliances, announce a 16 per cent. reduction in the prices of these appliances as from the new year.

Moorgate-street and Finsbury-pavement are now officially known as Moorgate, and the numbering of the old Moorgate-street is to be continued to the beginning of Finsbury-place, which marks the City boundary. No. 1, Finsbury-pavement, on the west side, now becomes No. 75, Moorgate; No. 2, Finsbury-pavement, on the east side, No. 66, Moorgate, and so on.

The business of Mr. Justus Eck will, from January 1, be carried on under the title of Justus Eck & S. Brook. Mr. Brook has been Mr. Eck's colleague for many years, and will now become, together with Mr. Eck, proprietor of the new firm. Owing to the increased business the offices have been transferred from Central Hall, Southall, to Palmer Street, Westminster, to which address all correspondence should be sent.

We understand that Ransomes, Sims, & Jefferies, Ltd., of the Orwell Works, Ipswich, have been appointed sole manufacturers and licensees in the United Kingdom, the Colonies and Dependencies, South America, Dutch Indies and China, for the Patent Kestner Water-Tube Boiler. This boiler has had a great success in France, where it is manufactured by Schneider & Cie., of Le Creusot, and is in use at many of the large municipal power stations.

It is announced in the "London Gazette" that the following firms hold Royal Warrants of Appointment :—*To the King.*—Burt, Escaré & Denelle, electrical fittings, &c.; Edison, Swan Electric Company, electric lamps; Hart Accumulator Company, accumulators; A. P. Lundberg & Sons, electrical accessories; Perry & Company, electric light fittings; C. A. Vandervell & Company, manufacturers of electrical equipment for motor-cars. *To the Queen.*—Tredegars, Ltd., specialists in decorations and lighting. *To Queen Alexandra.*—Edison, Swan Electric Company, electric lamps and fittings; India Rubber, Gutta Percha & Telegraph Works Company, manufacturers of electric cables and wires, &c.

Educational.

As usual, young and old alike have crowded to the Christmas juvenile lectures at the Royal Institution. Prof. J. A. Fleming has chosen for his subject "Electric Waves and Wireless Telephony," and the fifth lecture of the series will be held to-morrow (Saturday) at 3 p.m.

Bristol University, known as the University of the West, is making an appeal for funds, the idea being to raise within five years the sum of one million pounds. The University is still without any endowment for many of the Chairs it maintains, including the chair of electrical engineering, and these are absorbing revenue from general sources which is urgently needed for other purposes.

The closing of the winter term of Finsbury Technical College was marked by an interesting cinema lecture, given on Dec. 9, before the staff and students of the engineering faculty. The chair was taken by Mr. J. K. Catterson-Smith, chief electrical lecturer. The film and projector were loaned by the British Thomson-Houston Company, and showed the manufacture at Rugby of a B.T.H. Curtis turbo-alternator, illustrating step by step the various processes in the manufacture of both turbine and alternator, until the complete turbo-alternator was seen under working conditions. The film included scenes in the manufacture of a 40 000 h.p. turbo-alternator, the largest power unit yet constructed in Great Britain. At the close of the lecture the chairman, on behalf of those present, thanked Mr. B. E. Williams, third year electrical student, as the originator in the college of cinema lectures, for his painstaking efforts in bringing about what had been a most instructive and interesting afternoon.

Institution Notes.

The next Annual Dinner of the Institution of Electrical Engineers will be held on Tuesday, Feb. 21, at the Hotel Cecil.

Arrangements are being made for a Summer Meeting of the Institution of Electrical Engineers to be held at Glasgow and the Western Highlands in May or June next. The programme will be similar to the one arranged for the meeting which was to have been held in 1921.

The Electrical Engineers' Ball, 1922, will be held this season at the Hotel Cecil on Friday, Feb. 10. Tickets may be obtained from the joint secretaries, Messrs. A. M. Sillar and W. S. Lonsdale, at 104, Victoria-street, Westminster, S.W. 1; or from any member of the committee on personal introduction.

Finsbury Technical College Old Students' Association are holding a smoking concert at the Engineers' Club, Coventry-street, W., on Friday, Jan. 27. The chair will be taken by the president, Mr. W. G. Head, at 8 p.m. (Tickets 2s. 6d. each.) An informal dinner at 7 p.m. has been arranged. Tickets must be applied for seven days beforehand. (Dinner 5s. 6d., payable at the club.)

The Committee of the Scottish Centre of the Institution of Electrical Engineers has decided to resume the annual dinner, which has not been held since 1913. The dinner will take place on Tuesday, February 28, at the Grosvenor Restaurant, Gordon Street, Glasgow. Tickets 17s. 6d. each—exclusive of wines—can be obtained from the Convener of the Entertainments' Committee, Mr. W. L. Winning, 166, St. Vincent Street, Glasgow, or from the Hon. Secretary, Mr. J. Taylor, 153, West George Street, Glasgow.

There will be a general meeting of members of the Golf Circle of the Engineers' Club on Wednesday, Jan. 18, at 6.30 p.m., in the Kelvin Room, followed by a dinner in the Stephenson Room at 7.45 p.m. It is hoped to have six regular meetings from March to October, leaving out July and August, and suitable courses are being arranged. The Waldie Cup and the Club Challenge Cup will be played for in medal and bogey rounds respectively at these meetings. Other prizes are being arranged for, and full information will be given at the meeting on Jan. 18.

In future the Council of the Institution of Electrical Engineers will award each year a maximum of six students' premiums of £10 for papers read before the Institution, provided they are of sufficient merit. The papers will be divided into the following

six classes :—(1) Design and manufacture of electrical plant; (2) generation and distribution of electric power; (3) utilisation of electric power (traction, power and lighting, and electro-chemical); (4) telegraphy and telephony; (5) wireless; (6) unclassified. In the event of a premium not being awarded in any section, two premiums may be given in another section.

The undermentioned have been appointed presidents and recorders (to whom all communications should be sent) of the following sections of the BRITISH ASSOCIATION for the meeting to be held at Hull on Sept. 6-13 next, under the presidency of Prof. C. S. Sherrington :—SECTION A (*Mathematics and Physics*) : President, Prof. G. H. Hardy; Recorder, Prof. A. O. Rankine, Imperial College of Science and Technology, S.W. 7. SECTION B (*Chemistry*) : President, Principal J. C. Irvine; Recorder, Prof. C. H. Desch, University of Sheffield. SECTION G (*Engineering*) : President, Prof. T. Hudson Beare; Recorder, Prof. G. W. O. Howe, Elmswood, Malden, Surrey. SECTION L (*Education*) : President, Sir Richard Gregory; Recorder, Mr. D. Berridge, 1, College Grounds, Malvern.

Imperial Notes.

WINDSOR (Queensland) Council has decided to apply for an Order-in-Council for electricity supply in the town.

BLACKHALL (Queensland) Council has been granted a loan of £1 600 by the Government for the completion of the Council's electric supply works.

The erection of the transmission line, 52 miles in length, from the Great Lake to the Northern end of TASMANIA has been commenced.

NARRANDERA (N.S.W.) Council is acquiring the electrical generating plant of Messrs. Wise Brothers. The plant is to be used to provide electric power for water pumping.

The distribution system in connection with the supply of electricity in LITHGOW (N.S.W.) from the works of the Hoskins Iron & Steel Company is now being carried out by Messrs. Ramsay, Sharp, & Company.

LISMORE (N.S.W.) Council has adopted a scheme by Mr. J. E. Donoghue for establishing a municipal electricity undertaking at an estimated expenditure of £32 153. The plant will include two 150 kW steam-driven alternators.

The Hobart correspondent of the "Industrial Australian" states that the Marine Board have been asked to lease a site near the Ocean Pier, HOBART, for the ELECTROLYTIC MANUFACTURE OF PIGMENTS. It is stated that 500 H.P. of electrical energy will be used in the process.

A WIRELESS TELEPHONY SERVICE BETWEEN TASMANIA AND VICTORIA is contemplated. A temporary station is being erected at Launceston, and will be equipped with American apparatus. Mr. G. Apperley and Mr. W. H. Conray are superintending the experiments.

Mr. C. B. Davies, who has been engaged to report on the desirability of transmitting electricity to ZEEHAN (Tasmania) from the Lake Margaret station of the Mount Lyell Company, has expressed the opinion that a large demand can be anticipated and that the line could be constructed within nine months.

After long discussion of the subject and many negotiations, WOLLONGONG (N.S.W.) has at last secured its supply of electricity from the Public Works Department's power house at Port Kembla. The supply was inaugurated early in November. The installation of the distribution system was carried out by Ramsay, Sharp & Co., of Sydney, the contract price being £12 000.

According to a Reuter's message from JOHANNESBURG, the Chamber of Mines has notified the South African Industrial Federation of the termination of certain wage agreements, and their intention to withdraw from the *status quo* in connection with the differentiation in the employment of white and coloured labour. The electrical power companies have declined to enter into further conference with the federation, or to discuss the increased minimum rates of pay recently demanded by the trade unions.

The New South Wales Government proposes the following terms in connection with the raising of a district loan to enable the NYMBOIDA HYDRO-ELECTRIC SCHEME to be carried : Currency, 10 years; interest not exceeding 5½ per cent.; deposit, 25 per cent.; balance payable in three quarterly instalments; bonds not to be negotiated during the currency of the loan. A special prospectus will not be necessary, as in October last a prospectus was issued calling for subscriptions for a loan of £3 000 000 for hydro-electric and other public works.

The annual report of the TASMANIAN STATE HYDRO-ELECTRIC DEPARTMENT shows the capital expenditure to date to be £2 055 043. Compared with 1918, the units generated increased from 16 500 000 to 38 486 000, and those sold from 14 256 000 to 32 593 000; the total connexions numbered 14 705, against 9 205. During the year the consumers connected increased by 29 per cent., units sold by 26 per cent., working costs by 25 per cent., and revenue by 26 per cent. Taking the department as a whole, it has been able to balance its accounts after providing for all interest charges, working and management expenses, and also providing £10 610 for the depreciation account (1½ per cent. on capital investment), which is regarded as ample in present circumstances. It is estimated, the "Times Trade Supplement" states, that the Great Lake scheme, which will increase the power to 58 000 h.p., can be completed by the middle of 1 922 for an additional £800 000.

Foreign Notes.

Increased tramway and omnibus fares are to come into operation in PARIS on the 22nd inst.

Improved lighting for PARIS streets is provided for in the Municipal Budget of Paris for 1922.

The MANILA RAILROAD COMPANY contemplates the utilisation of the water power of the Agno River in Central Luzon for generating electric current for traction. It is estimated that from 12 000 to 15 000 h.p. is available.

Official telegraphic communications, which were broken off when the revolution broke out, have been opened again between SOVIET RUSSIA and SWEDEN, without any restrictions whatsoever, and at a lower rate than before the war.

Last week's "Manchester Guardian Commercial" contains an article on RUSSIAN RECONSTRUCTION by Herr Felix Deutsch, managing director of the Allgemeine Elektricitats Gesellschaft Berlin, who recently propounded a scheme for Anglo-German co-operation in the re-habilitation of Russian trade.

An Exchange Telegraph message from BERLIN states that the Siemens-Schuckert Werke, which is part of the Stinnes electro-mining trust, has concluded an agreement with a Chinese concern for the erection of works at Shanghai and for the formation of a new company which will push the sale in China of goods produced by the Stinnes companies.

The SOUTH SWEDISH ELECTRIC POWER COMPANY has negotiated a 12 000 000 kronor 6 per cent. bond loan, with five Swedish banks, at an issue price of 100·5 per cent. The loan is repayable between 1926 and 1945, and the bonds are in denominations of 10 000, 5 000, and 1 000 kronor. The company has a share capital of 10 592 400 kronor, reserve fund of 2 468 000 kronor, and a redemption fund of 1 198 000 kronor. The last three dividends have been 8, 10, and 8 per cent respectively.

The formation of a big HYDRO-ELECTRIC GROUP in the neighbourhood of St. Etienne and Grenoble is being considered by the French Ministry of Public Works. According to present proposals the firms concerned will be the Cie. Electrique de la Loire et du Centre, the Cie. Hydro-electrique de l'Auvergne, Soc. des Forces Motrices de la Loire, Aciéries et Forges de Firminy, the Union Electrique, and the Soc. des Forces Motrices de la Truyère. The chief need for such a combination is the difficulty experienced by individual members in dry years owing to irregularity of supply. To guard against this eventuality there will be four main transmission lines passing respectively through St. Etienne, Roanne, and Commentry : St. Chély d'Apscher, Firminy, and St. Etienne; Grenoble, St. Chamond, and St. Etienne; Roanne and Villefranche-s.-Saône.

As a result of the abolition of Government subsidies in AUSTRIA the price of goods and various services has risen considerably. There has been an increase in electricity charges, in railway and tramway fares, and in postal and telegraph rates. As already announced, a scheme is being launched to develop the country's water power. This provides for the combined working of all the valuable water powers in Styria and of the steam-driven plants near the Crown coal pits. The total concessions will provide 450 000 H.P. The financing of the scheme has been undertaken by a syndicate of the large Vienna banks and the credit institutions of Styria. The Government have received offers from the Vickers and Armstrong companies for the purchase of the great Woellersdorf arsenal, which would be converted into works for the manufacture of locomotives for the Balkans.

The freight locomotives recently shipped by the Westinghouse Electric and Manufacturing Company to the PAULISTA RAILWAYS OF BRAZIL are now in service between Jundiahy and Louveira. These are claimed to be the first electric locomotives to be used in Brazil. The new locomotives, the "Railway Gazette" states, haul trains of from 43 to 45 units over grades as steep as 1·5 per cent. The so-called "unit car" is of 10 tons gross weight, and the term refers to the old wooden car of thirty years ago. Modern cars are said to be two, three, or four units, according to their size and load. Thus a train of 45 units represents 450 tons weight, and is approximately 675 ft. in length. Under former steam operation such trains could not be carried over a 1·5 per cent. grade at a speed greater than 15 km. per hour. The Westinghouse locomotives negotiate such grades at 45 km. per hour, which means tripling the capacity of the track and greatly increasing the speed of handling freight.

The project for linking the RHINE WITH THE DANUBE is now taking definite shape, according to a Berlin correspondent of the "Times Trade Supplement." The preparatory organisation is almost complete, and a joint stock company is to be floated to carry out the work. The scheme adopted involves the construction of a waterway from Aschaffenburg-on-the-Main, *via* Bamberg, Nuremberg, and Regensburg, to Passau, the improvement of the Upper Danube between Kelheim and Ulm, construction of junction canals for navigation to Munich and Augsburg, and the development of hydro-electric power on a large scale. Forty hydro-electric power stations are to be installed along the new waterway with an estimated capacity of 400 000 H.P. It is hoped to complete the entire scheme within twenty years. The construction company will be known as the Rhein-Main-Donau A.G., and will have a total

capital of 900 000 000 marks (nominally £45 000 000). As soon as sections of the waterway are available for navigation they will become State property, but the company will retain the power stations for 100 years, after which they will be taken over by the Government.

A message from Rome, dated Dec. 29, states that the continuous drought is causing an "electric famine," which will probably render the winter one of the most disastrous in the history of ITALY. Already reservoirs which supply electric power for the industries of Lombardy, Piedmont, and Liguria are reduced 50 per cent. The Mont Cenis reservoir, it is stated, will be dry in twenty days. This will cause the stoppage of supplies to nearly all the factories in Turin. Factories have reduced working hours to thirty-two a week. Tramway services have been cut down, and steam has replaced electricity on many lines. At the Fiat works this temporary difficulty has been met by the installation of 25-35 H.P. agricultural tractors for driving machinery. More than 150 of these tractors are being used, the power developed by them totalling more than 5 000. The use of agricultural tractors for driving machinery is not new, but this appears to be the first time they have been employed on such an extensive scale. No special installation is necessary for the use of tractors. Belt connection is made from the tractor driving pulley to the overhead shafting for a group of machine tools, or, if necessary, direct to the machine tool, and the change speed mechanism of the tractor is made use of if necessary. In order to avoid the repetition of a temporary shortage of the hydro-electric supply, extensive work is being carried out in the Italian Alps to form artificial reserves of water which can be brought into use on such occasions as this.

Latin-American Engineering Progress in 1921.

While several IMPORTANT ENGINEERING CONTRACTS were arranged during 1921 in Latin America, little new construction was actually commenced; railway building fell off owing to the high cost of labour and disputes; modified wages, however, were agreed upon and many labour difficulties arranged during the last months of the year, leaving a clearer field for 1922.

Electric Railway Progress.

The Buenos Aires Great Southern Railway completed the line from Stroeder to Patagones; progress was made with the electrification of the Buenos Aires Western Moreno branch; an important contract valued at £1 500 000 (7 000 000 dollars) was placed for the Santiago-Valparaiso State line. In Brazil preliminary work proceeded in connection with the Central Railway electrification. Small branch constructions were carried out in Bolivia, Colombia, Mexico, Honduras, and El Salvador.

A small amount of railway construction took place in Cuba, together with the erection of two or three additional sugar factories electrically equipped. Port and harbour works, additional railway mileage, and an electrically equipped sugar factory (the largest of its kind) were carried out in the Central American States.

Brazil.

A concession for the development of the waterfalls on the Preto River, State of Rio de Janeiro, Brazil, and the waterfalls of the Ayruocha River, State of Minas Geraes, was granted to a company organised for the purpose.

An electro-metallurgical company was authorised to construct a steel mill with electric furnaces, exemption from export duties on machinery, motors, furnaces and equipment for the project being granted for thirty years. The Brazil Electro-Metallurgical Company was formed, with a capital of 6 000 contos of reis, to install two electric furnaces at Ribeirao Preto with a daily output capacity of 60 tons of structural iron.

An official investigation of the waterfalls of Brazil showed that they can produce electric energy of over thirty million H.P.

Argentina.

A commencement was made upon the erection of the first Argentine power fibre-plant at a cost of 5 000 000 dollars (moneda nacional)

Chile.

A contract was entered into for the erection at Valparaiso of an iodizing copper plant by the Compania Yoduradora de Cobre, capitalised at £200 000 sterling. A British-Chilean Syndicate, capitalised at £12 000 000, was formed to carry through important engineering contracts. Important irrigation schemes are to be carried out.

Colombia.

An iron bridge was erected at La América section of the Medellin (Antioquia) tramway.

A proposal for the irrigation of 40 000 hectares of land in the Plains of Tolima was adopted by the Ministry of Agriculture and Commerce.

Mexico.

Large irrigation schemes were also authorised in this State. Authority was given for the construction of a pipe line and oil refinery at a point near Rio Tuxpan, with powers to lay branch pipelines, water and gas-lines, telegraph and telephone lines, and electric light and power cables, and to build a refinery near Mexico City.

Reuter's Trade Service Special.

Activities in China.

The following electrical activities in CHINA are reported from official sources :—

Specifications for power-house machinery, rails, rolling stock, and workshop equipment for the Peking Electric Tramway Company are now in preparation.

The China Electric Company propose to build the Harbin Electric Railway, and a contract has been signed with an American engineering company.

Preparations are in progress for the establishment of a company to undertake the construction of tramways in Hankow.

Petitions have been addressed to the Ministry of Agriculture and Commerce by a Tsinan merchant for the construction of tramways in the city. The Ministry has dispatched representatives to make investigations before official approval is granted.

The authorities of the Peking-Suiyuan Railway are drawing up plans for the installation of electric brakes along the entire line.

The Yau Hua Electric Company at Hsu Shih-kwan, Soochow, started business on Oct. 1. The company has just ordered a larger plant from a Shanghai firm to be installed in Hsu Shih-kwan.

The Kwang Hwa Electrical Light Company, established at Laohokow (Hupeh) with a capital of $70 000, has been registered at the Ministry of Agriculture and Commerce.

The Ministries of Interior, Agriculture and Commerce, and Communications have approved of an electric company at Peitaiho.

The Lee Hua Electric Light Company in Tsing Kiang-pu, Kiangsu, is to be opened almost immediately. 2 000 lamps have been installed.

Li Chia-ju and others have organised the Hanyang Electric Company and requested the Ministry of Agriculture and Commerce and the Ministry of Communications for registration.

South African Contracts.

The "Financial News" reports that German goods are coming into the SOUTH AFRICAN market in increasing quantities, and recently German firms or agencies secured some important contracts for electrical and hydraulic plant from the Rand Water Board. The National Trading Company (on behalf of the Mannesmann Tube Company, of Dusseldorf) obtained a contract for 229 300 ft. of steel pipes at £276 223. Stewarts & Lloyd (S.A.) Ltd., submitted the lowest tender for steel pipes of British manufacture at £392 476. An order for electric pumping plant and an overhead crane was given to Mr. C. Kleudgen for plant made in Germany, the amount being £7 828. The next tender (for Swiss pumps and English electrical plant) was £9 307; but the lowest tender for all British plant was £9 853, or £2 025 more than the German price. The pumps are being made by Amag-Hilpert of Nürnberg, and the electric motors by the Siemens Schuckert Company, and the crane by the Findeiden firm of Chemnitz. In respect of the pumps, the chief engineer found that the firm had fully grasped the Board's requirements. Regarding the electrical plant, the engineer reported that the offer was a complete one in every way. "The electric motors were larger and heavier, the insulation of the windings was of a better quality, and the temperature rise at full load less than that put forward by any British manufacturer." Moreover, the whole of the Board's general conditions and specification, including penalties, terms of payment, &c., and the whole of the prices were firm, and not subject to any variation in exchange, freightage, &c.

Exceptions taken to the Board's Conditions.

Hubert Davies & Company tendered for Swiss pumps and English electric motors, but certain exceptions were taken to the Board's conditions, while Messrs. Webber & Gillham, who sent the lowest all-British tender, stated that they were not prepared to accept the following :—(1) Guarantee the insulation resistance, (2) full penalties for low efficiency, (3) to test plant at their works under load, (4) responsibilities for mistakes under a certain clause of the conditions, (5) penalty for late delivery, (6) Board's engineer as sole arbitrator, and (7) Board's terms of payment, and (8) they also required some modification of the tests to be applied to the plant after erection. According to the Board's engineer, the alterations to the general conditions and specification were of such magnitude that it made it impossible for the Board to consider the tender.

Other tenders accepted by the Board are as follow :—Blane & Company, for a Paterson rapid gravity filter plant, £15 458; Webber & Gillham, two turbo-centrifugal pumps having a normal capacity of 5·5 million gallons per day against a head of 570 ft. (£19 652); and two Allen steam turbines and Metropolitan-Vickers electrical generators (£16 971).

Customs and Tariff Alterations.

According to the latest amendments to the AUSTRALIAN CUSTOMS TARIFF, the British Preferential Tariff on electrical machines and appliances, including electric heating and cooking appliances; electric fittings, consisting wholly or partly of metal, viz., switches, fuses, and lightning arresters, n.e.i.; regulating, starting and controlling apparatus for all electrical purposes, including distributing boards and switchboards, n.e.i.: dynamo electric machines; static transformers and induction coils for all purposes, unless otherwise expressly provided, electric fans, is to be 27½ per cent. *ad val.* The intermediate tariff on these articles is 35 per cent. and the general tariff 40 per cent.

Miscellaneous.

The address of the TRADE FACILITIES ACT Advisory Committee is now 17, Throgmorton-avenue, E.C. 2.

As from Dec. 30 the rate of interest to be allowed on sums deposited with the Inland Revenue Commissioners for the purpose of satisfying any EXCESS PROFITS DUTY will be 3 per cent per annum.

Electrical plant valued at several thousands of pounds was destroyed by a FIRE which broke out last week in an armature workshop at PORTSMOUTH DOCKYARD. The cause of the fire is unknown.

NEW COMPANIES REGISTERED IN SCOTLAND in 1921 numbered 424, with a total capital of £7 020 801. Seven were gas and electricity companies with a combined nominal capital of £75 000, against four in the previous year with a total capital of £25 000.

In the course of a visit of inspection to the Underground Railways last week, the members of the JAPANESE delegation of business men were taken to the Lots-road, Chelsea, power house, which has a capacity of 78 000 kW.

We are asked by Mr. C. P. Kininmonth to state that the coal-handling plant of the City of London Electric Lighting Company, described in last week's issue of THE ELECTRICIAN, was made by HENRY SIMON, LTD., MANCHESTER.

The first five COMMERCIAL RESEARCH FELLOWSHIPS instituted by the executive council of the British Empire Exhibition for competition among the Chambers of Commerce in the United Kingdom have been awarded to the Chambers of Commerce of London, Glasgow, Norwich, Warrington, and Oldham.

The December number of "THE BOMBSHELL," the house organ of Thos. Firth & Sons, contains, among other interesting articles, a short history of the firm since its establishment in 1850. The pamphlet, which consists of forty-two pages, is well illustrated, and makes good reading for outsiders as well as for the firm's employees.

With the January issue the "Journal of Industrial Welfare" has changed its name to "Industrial Welfare." The number contains many interesting articles, including one on "Industry Humanised," by Mr. Arthur Henderson, M.P., and another by Mr. Albert Barratt, chairman of Barratt & Co., on "Making Co-Partnership a Success."

Hughes and Young, Patent Agents, London, state that the number of APPLICATIONS FOR PATENTS FILED DURING 1921 will show a slight decrease compared with the 1920 figures. The number will exceed 35 000 against 37 000 last year. The principal inventions for which patents have been obtained are electrical appliances. These also head the list in numbers.

The late Sir CHARLES DOUGLAS FOX, J.P., civil, mechanical, and electrical engineer, one of the joint engineers of the Mersey Tunnel, the Liverpool Overhead Railway, the Metropolitan Division of the Great Central Railway, the Great Northern and City Railway, and the Hampstead Tube, has left estate valued at £45 766 (net personalty £44 988).

The B.T.-H. AMATEUR OPERATIC AND DRAMATIC SOCIETY (amateur theatrical section of the B.T.-H. Recreation Club) recently produced at Rugby Hippodrome, by kind permission of Mr. Rupert D'Oyly Carte, "The Yeoman of the Guard." This is the eighth play the society have produced, six of which have been by Gilbert and Sullivan. The play ran for a week, and was very successful.

Mr. C. F. MUSGRAVE, secretary of the London Chamber of Commerce, advocates the appointment of COMMERCIAL EXPERTS to the staffs of British Embassies and legations to act in liaison with the Consulates; and urges that the Consuls should be empowered to engage the services of qualified commercial experts in preparing reports and making inquiries on trade matters outside judicial or routine work.

The Industrial League and Council has issued a syllabus of LECTURES AND DISCUSSIONS ON INDUSTRIAL SUBJECTS to be held every Wednesday evening at 7.30 p.m. at Caxton Hall, Westminster, S.W. 1, from Jan. 4 to March 29. Admission is free to all meetings, and no tickets are necessary. The League will be pleased to supply further particulars on application to the General Secretary, Grosvenor-mansions, 82, Victoria-street, S.W. 1.

The newly formed TRANSPORT AND GENERAL WORKERS' UNION began operations in large offices at Central-buildings, Westminster, on Tuesday. Fourteen unions concerned with road and water transport are represented, and two others are balloting on the question of joining. The total membership is about 420 000. The president is Mr. Harry Gosling, and the general secretary and chief adviser of the whole scheme is Mr. Ernest Bevin.

A recent publication of the Bureau of Standards, Washington, contains a brief description of the occurrence, collection and preparation of CRUDE RUBBERS, of the manufacture of a number of rubber goods, such as tyres, inner tubes, hose, sundries, and moulded goods. The Bureau's methods of physical and chemical testing are described in detail. This publication is now ready for distribution, and anyone interested may obtain a copy by addressing a request to the Bureau until the free stock is exhausted.

At the fifth SMALL-POWER ENGINEERING AND SCIENTIFIC EXHIBITION, to be held at the Horticultural Hall, Westminster, early this month, besides the exhibits of the makers of models and scientific machinery and appliances, there will be shown the handiwork of amateur engineers and inventors, entered for the championship cup for the best exhibit in the show. These include three electric motor launches, the work of a Thames policeman.

The action of the MANCHESTER Corporation in REDUCING the WAGES of the maintenance workers of the Tramways and Gas Departments by 2d. an hour in the case of the skilled men, and 1½d. an hour in the case of the semi-skilled and the unskilled, has been endorsed by the Industrial Court, to which the matter was submitted for arbitration. The Corporation also reduced at the same time the wages of the maintenance workers of the Electricity Department by these amounts, but this department has an Industrial Council of its own, to which the dispute so far as it affects the electricity men has been referred.

At the Guildhall, recently, Ald. Sir T. Vansittart Bowater fined Frederick Alex. Oppenheim, assistant manager of the Trade and Finance Syndicate, for unlawfully GIVING A BRIBE OF £3 to Harold W. Camp, an officer of the London Telephone Service. It was stated that in consequence of complaints about the firm not getting calls from Switzerland, Mr. Camp went to the offices of the syndicate, where he explained that all calls were taken in rotation, and it was impossible for any preference to be shown. As he was leaving, Mr. Oppenheim remarked, "See that we get our Swiss calls through the same as other people," and put in his hand an envelope containing three £1 notes.

In addition to the reduction in rates announced in our issue of Dec. 23, the ENGLISH AND WELSH RAILWAY COMPANIES have decided to revert to the free periods allowed in pre-war days for the loading and unloading of wagons, and the use of sheets used in the conveyance of merchandise other than coal, coke, and patent fuel. The effect of this concession, which will operate as a temporary measure for twelve months as from Jan. 1, is that traders will save charges for demurrage to the extent of one million days per annum. The question will be reviewed at the end of 1922. The companies also announce a reduction in the charges for shipping coal and coke at the North-East and Humber ports. South Wales ports have already introduced lower charges.

The charge of "profiteering" is one that is easily launched, and in many cases no evidence is given in support of it. However, the following letter in the "Daily Mail" of Friday—assuming the facts are as stated—gives a clear case of "profiteering": "Sir,—We tendered to a firm in Manchester for 20 000 electrical fittings and offered them a keen price. As a trial order we undertook to make 5 000 of these articles. When the work was partly done the question arose as to our taking an order for the balance of the 20 000, but we declined as the price was too fine. Our customers then informed us that they could not possibly pay more, but later when our representative called at their retail shop he was asked 3s. 6d. each for the articles for which we were charging 3s. per dozen. This is 1 300 per cent. profit. Do not you agree that the sooner the law is amended to stamp out this sort of thing the better it will be for all concerned? We think that this will prove to your readers that it is not the manufacturer but the retailer who is profiteering.—NORTHUMBRIAN."

Hydro-Electric Power in Argentina.

The scheme for the utilisation of the great FALLS of IGUAZU, on the borders of Argentina and Brazil, is not progressing very rapidly, and efforts are being made to interest American financiers in the subject, though it is probable that the work will eventually be carried out either by the Waterworks Department of the Argentine Government or by a Joint Commission of the Argentine and Brazilian Governments. About twelve months ago a committee of engineers reported that there were no insuperable engineering difficulties to be overcome, and that during ten months of the year 125 000 kW, allowing for transmission losses, could be delivered in Buenos Aires. For that purpose twelve Francis turbines, of 23 000 H.P. each, would be required, two being held in reserve, while the power could be increased by the construction of dams, which need not necessarily interfere with the scenic beauties of the falls. During two months of the year, however, the power delivered at Buenos Aires would be only 76 250 kW. The question of distributing power along the route to Buenos Aires and also of constructing a branch transmission line to Rosario de Santo Fé, is regarded as of minor importance, since 80 per cent. of the power would be absorbed by Buenos Aires. The plans provide for the development of 150 000 H.P., to be increased lated to 300 000 H.P. Four transmission lines would be built, and to guard against interruption of the supply each would be of sufficient capacity to carry all the power needed. It is estimated that between six to eight millions sterling would represent the cost of the scheme, the actual work requiring perhaps two and a half years. Auxiliary power could be obtained from the Uruguay River and 30 000 H.P. could be generated by a hydro-electric plant at Salto Grande. Before the commercial practicability of the scheme can be settled, a careful examination of the question of labour is necessary. The temperature at the falls is about 45°C., which not only prevents European or American labour from being employed, but also favours the rapid propagation of disease. There are also transport and other difficulties to be surmounted.

Tenders Invited and Accepted.

UNITED KINGDOM.

Maldens and Coombe Urban Council. Jan. 10.—Two 10 b.h.p. horizontal electric motors, starting gear, &c., and electric lighting in the subsidiary pumping station at Blake's-lane; one 2½-ton electric lorry with tipping body; and mercury vapour rectifier outfit. Particulars from the Engineer and Surveyor, Municipal Offices, New Malden.

Dublin Electricity Committee. Jan. 11.—30 h.p. three-phase motor. Particulars and forms of tender from the City Electrical Engineer, Fleet-street, Dublin.

London County Council. Jan. 12.—Electric passenger lift, to lift a load of 11½ cwt., at Geoffrey House, Tabard Estate, Bermondsey, S.E. 1. Specification from the Chief Engineer, Gloucester House (Room 91), 19, Charing Cross-road, W.C. 2.

Peterborough Corporation. Jan. 12.—One 3 000 kW turbo-alternator, with condensing plant, two 750 kW rotary converters, two 100 kW motor converters, e.h.t. and l.t. switchgear; steam, water and drain pipes, &c. Specifications from the City Electrical Engineer.

Leeds Electricity Department. Jan. 12.—Single-phase wattmeters, minimum number required 2 000. Particulars from Mr. C. Nelson Hefford, Manager, Electricity Department, 1, Whitehall-road, Leeds.

East Ham Corporation. Jan. 12:—Extension No. 4. Sec. A: 1 500 kW rotary or motor converter, for converting 3-phase 50 period 6 600 V to d.c. 480-500 V; Extension No. 4 S. Sec. A: e.h.t. and l.t. switchgear and connections. Particulars from Mr. W. C. Ullmann, Nelson-street, East Ham, E.

Edinburgh Corporation. Jan. 19.—Electric lighting installation in Public Washhouse, Causewayside, Edinburgh. Specification, &c., from the City Electrical Engineer, Dewar-place, Edinburgh.

Worthing Corporation. Jan. 23.—One Diesel engine and c.c. dynamo; and vulcanised bitumen-sheathed paper-insulated concentric and triple concentric cable. Specifications, &c., from the Borough Electrical Engineer.

Metropolitan-Vickers Electrical Company, Cardiff.—Wiring for the electric lighting and heating of their new premises in Custom House-street.

AUSTRALIA.

City Electric Light Company, Ltd., Brisbane.—Feb. 10, 1922.—*Supply and delivery of six miles of three-core 0·15 by 0·15 paper insulated cable, suitable for 5 500 V, with a non-earthed system. Tenders, accompanied by a preliminary deposit of £100, to the Engineer and Manager, Boundary-street, Brisbane.

Australian Commonwealth Government, Feb. 15:—30 tons approximate Wheatstone tape paper white (Schedule 544). Particulars from the Supply Officer, Australia House, Strand, London, W.C. 2.

Victorian Government Railways.—Feb. 15.—*Supply and delivery of: (1) Fifty track relays, four front and two back contacts, fifty track relays, eight front and two back contacts, fifty line relays, six front and two back contacts (Contract No. 34 739); (2) 100 three-position line relays (Contract No. 34 740); (3) 100 electric signal mechanisms (Contract No. 34 738); (4) electro-mechanical interlocking apparatus (Contract No. 34 822); (5) fifty miles insulated copper wire (Contract No. 34 823). Local representation is essential.

New South Wales Government Railways and Tramways Department (Electrical Engineer's Branch).—Feb. 22, 1922.—*Supply, delivery, erection and maintenance of one 5 000 kW 50 cycle turbo-alternator with condenser and accessories, at Zarra-street power house, Newcastle. (Contract No. 556.) Tenders, on proper forms and accompanied by a preliminary cash deposit, to the Secretary for Railways, Phillip-street, Sydney, N.S.W. Local representation is essential.

Municipal Council of Sydney (Electricity Department). April 24.—*Supply, delivery, and erection of two 2 000 kW rotary converters; one 10 000 to 12 000 kW turbo-alternator.

NEW ZEALAND.

Post and Telegraph Department. Jan. 17.—*25 000 dry cells for telephone work.

Borough Council of Palmerston North. Original closing date Sept. 24. Extended date not yet decided.—*Service meters: (a) Single-phase, 230 V, 400 5 A, 150 10 A, 50 15 A; three-phase, balanced load, 400 V, 100 10 A, 30 25 A, 15 50 A, 10 75 A, 5 100 A. (b) 19 50 kVA single-phase transformers, with oil, complete; 1 complete winding h. and l. tension, for one l g; spare parts and accessories.

Lyttelton, Public Works Tenders Board of New Zealand. Jan. 31.—*Two complete sets of 3 phase automatic oil circuit breakers suitable for 6 600 V, 1 200 A capacity, four sets of disconnecting switches for isolating the oil switches, and one 6 600 V air break lever operated switch for main transformer switches at Lake Coleridge power house. Tenders to the Secretary, Public Works Tenders Board, Government Buildings, Wellington.

Public Works Department, Wellington. Feb. 28.—*Supply and delivery, ex ship's slings Lyttelton, of a bank of three 11 000 V reactances, complete, for the Lake Coleridge electric power scheme.

Public Works Tenders Board, Waikato Power Scheme. March 6.—*(Section 45) two 2 500 kWa alternators, three-phase, 50 cycle, 5 000 V, at 166⅔rds rev. per min., with a power factor of ·8. Excitation at 220 V. (Section 46) two 3 100 h.p. water turbines of the double-runner Francis type to operate the generators mentioned in Section 45. (Section 47) two exciter sets, each consisting of one 200 kW d.c. generator, and one 350 h.p. asynchronous motor, together with a Tirrill regulator. The generator shall have an output of 220 V, with a full-load current of 7 000 A. The motor shall be of 350 h.p., with a power supply of 400 V, three-phase, 60 cycle. The synchronous speed of the sets shall be 750. (Section 48) four Stoney sluice gates for the pits, appertaining to the turbines mentioned in Section 46. Tenders to the Secretary, Public Works Tenders Board, Government Buildings, Wellington.

Auckland Harbour Board. April 25.—Four double-barrel electric winches for the Central Wharf, Auckland. Specifications from W. & A. McArthur, 18-19, Silk-street, Cripplegate, London, E.C. 2.

SOUTH AFRICA.

Municipal Electricity Supply Undertaking of the City of Port Elizabeth. Jan. 31.—Supply of electrical plant.

Public Works Department of the Union of South Africa. Feb. 1.—Conduit and conduit fittings. Particulars from the Electrical Engineer, Public Works Department, Pretoria.

SOUTH AMERICA.

Chilean State Railways, Feb. 4, 1922*:—1 electric compressor; 1 air storage drum and 1 continuous current electric motor (70 h.p.); 1 300 electric filament lamps for locomotives; 38 wall telephones.

Argentine Ministry of Public Works. Feb. 21, 1922.—*Nine electric motors, 36 tip waggons, 1 centrifugal pump with electric motor. Specification expected at the Department of Overseas Trade by Dec. 28.

BULGARIA.

Bulgarian Direction of Posts, Telegraphs and Telephones. Jan. 10, 1922.—Supply of sixty 50-line and fifteen 100-line telephone exchanges. Particulars and drawings may be obtained from the Bulgarian Legation, 3, Queensberry-place, S.W. 7.

Bulgarian Department of Posts, Telegraphs and Telephones. Jan. 25.—*100 000 porcelain insulators.

Bulgarian Department of Posts, Telegraphs, and Telephones. January 30.—*Supply of the following parts for telephone exchanges: 2 200 subscribers' line indicators, 600 indicators (end of conversion), 2 500 jacks, 1 500 plugs, 2 000 connecting pieces, 20 000 switchboard connecting pieces.

Bulgarian Department of Posts, Telegraphs and Telephones. Feb. 8. *Supply of the following telegraphic accessories:—Twenty terminal boxes for 40-pair cable, 1 000 combined lightning arresters and 1 A fuses, 500 combined lightning arresters in fuses (different type), 300 transformers, 700 condensers (2 micro-farad), twenty junction-boxes with protective devices for 40-pair cable.

Bulgarian Department of Posts, Telegraphs, and Telephones. February 20.—*2 000 telephone instruments for table use, with local battery and magneto. Also for spare parts for these instruments.

Bedford Town Council has accepted the tender of C. & A. Parsons & Company for a 1 500 kW turbo-alternator, with circulating pumps, &c., at £17 976.

Cannock Urban Council have accepted the following tenders for the supply of cables, switchboards, and transformers: British Insulated and Helsby Cables, Ltd., £5 899; Ferranti, Ltd., £4 084 10s.; British Electric Transformer Co., £3 954 10s.; and Reyrolle and Co., £973 10s.

Bermondsey (London) Council have accepted the tender of Ferranti, Ltd., for d.c. meters at the following prices.— 24 2½ A, £3 10s. each; 12 10 A, £4 15s. each; 12 20 A, £5 12s. 9d. each; two 5 A two-rate, £7 13s. each; two 10 A two-rate, £8 5s. 6d. each; two 20 A two-rate, £8 15s. each.

Eastbourne Corporation recently received the following tenders for a 2 500 kW single-phase turbo-alternator with condensing plant:—W. H. Allen, Sons & Company, £19 598 (*accepted*); Escher, Wyss & Company, £20 417; Ateliers de Construction Oerlikon, £21 333; British Thomson-Houston Company, £23 753; Frazer & Chalmers' Engineering Works, £23 839; Belliss & Morcom, £23 893; Brush Electrical English Company, £23 965 (for 2 000 kW set); English Electric Company, £23 990; Richardsons, Westgarth & Company, £24 091; J. Howden & Company, £24 317; Metropolitan-Vickers Electrical Company, £24 470; and C. A. Parsons & Company, £25 540.

The following tenders were received for the condensing plant only:—Mirrlees, Watson & Company, £5 703; Cole, Marchant & Morley & Company, £5 815; Hick, Hargreaves & Company, £5 834; Richardsons, Westgarth & Company, £6 379; Worthington, Simpson, £6 623; and G. & J. Weir, £7 567.

For a water-tube boiler, with mechanical stoker, economiser, coal bunkers, chimney, induced-draught fan, and engine and pipework, the following submitted tenders—Stirling Boiler Company, £16 765 (*accepted*); British Niclausse Boiler Company, £17 000; Spearing Boiler Company, £17 746; John Thompson Watertube Boilers, £17 910; Babcock & Wilcox, £18 124; and Clarke, Chapman & Company, £20 542.

---

* *Particulars from the Department of Overseas Trade.*

Companies' Meetings, Reports, &c.

The net profits of DURELCO, LTD., for the year ended Sept. 30 amounted to £10 191.

The BELL TELEPHONE COMPANY OF CANADA has declared a dividend of 2 per cent. on the capital stock.

The directors of EDGAR ALLEN & COMPANY announce an interim dividend at the rate of 6d. per share, tax free, for the half year ended Sept. 30.

At an extraordinary meeting of shareholders of CLAUD HAMILTON, held in Glasgow last week, special resolutions relating to increase of capital, &c., were confirmed.

The SHANGHAI ELECTRIC CONSTRUCTION COMPANY announce a second interim dividend at the rate of 6 per cent. actual (12s. per share), less tax, in respect of the year 1921.

The directors of RUSTON & HORNSBY, LTD., are unable to authorise the payment of the half-yearly dividend on the 5 per cent. and 6 per cent. cumulative preference shares, due on Jan. 1.

The STOCK EXCHANGE Committee have granted official quotations to 507 897 £1 fully paid ordinary and 530 067 £1 fully paid 7 per cent. cumulative preference shares of Tube Investments, Ltd., and £130 000 5½ per cent. redeemable debenture stock of the Yorkshire Electric Power Company.

The report of the CANADIAN WESTERN NATURAL GAS, LIGHT, HEAT & POWER COMPANY for the year ended Sept. 30, with which is incorporated the accounts of the Calgary Gas Company, shows a net loss of $213 512. The net loss in the previous year amounted to $101 607. The balance sheet now shows a total debit balance to profit and loss of $60 650.

The profit of ISLE OF THANET ELECTRIC TRAMWAYS AND LIGHTING COMPANY for the year ended Sept. 30, 1921, was £31 448, and the total receipts amount to £105 628. Allocations to the various reserve funds total £16 078; written off cost of motor vehicles, £864. The half-year's dividend, due in July, 1908, was paid on the preference shares, leaving to be carried forward £3 972, against £4 284 brought in.

The report of the SOCIÉTÉ INDUSTRIELLE DU RADIUM for the year ending June 30 states that the shareholders' response to the issue of £25 000 10 per cent. cumulative participating preference shares was much too small to justify going to allotment, and the directors are therefore obtaining requisite funds from a syndicate which is being formed for the purpose of developing the mine, installing additional plant and treating the ore. The mine was once more unwatered a few weeks ago, and is being worked with satisfactory results. The accounts show a loss of £201, making debit balance £14 834.

Presiding at the annual meeting of the LOW TEMPERATURE CARBONISATION COMPANY, in London, last week, Sir Hy. Goold-Adams said that a large quantity of coal had been carbonised. All this smokeless coal had been sold. No fewer than 30 000 gallons of oil had also been dealt with. Negotiations with a view of fixing up contracts were now being carried on with colliery firms here and abroad. With a plant of twenty retorts they had proved that it was possible to put up a low carbonisation plant that would pay. They also considered they had successfully solved the problem of by-products. The result of the experiment at Barnsley was absolute and conclusive.

In moving the adoption of the report and accounts at the annual meeting of the SOUTH AFRICAN CARBIDE AND BY-PRODUCTS COMPANY, held in London last week, the chairman said that the power station and the carbide factory were now practically completed, and that it was anticipated that production would commence next month. Owing to increases in cost of materials and labour, the cost of the works had proved greater than anticipated, and it had become necessary to raise additional capital for working expenses; for this purpose it was proposed to make an issue of £75 000 8 per cent. debenture stock, of which the directors and their friends were prepared, if necessary, to take up approximately £55 000. With the object of maintaining efficient control of affairs in South Africa, a local board of management had been appointed, consisting of Prof. Lawn, Mr. Hallett and Mr. D. D. Drury.

The accounts of S. SMITH & SONS (MOTOR ACCESSORIES) for the year ended July, 1921, show, after writing off £28 572 for depreciation on plant and machinery, &c., writing down stock-in-trade to market prices, and providing for income tax and adjustment in connection with excess profits duty, a loss of £295 437. From this has to be deducted £91 452 brought in, leaving a deficit of £203 985 to be carried forward. At the annual meeting on Tuesday Mr. W. H. Swift, who presided in the absence, through illness, of Mr. Samuel Smith, stated that at the late Olympia Show out of 227 British cars fitted with speedometers 115 were of Smith's make, while their nearest competitor fitted 53. With motor watches, 148 British cars were fitted, 99 being Smith's and the nearest competitor 39. At the Motor Cycle Show at Olympia "M-L" magnetos were fitted to 53 motor-cycles, against the nearest competitor's 31.

Presiding at the annual meeting of ALLDAYS & ONIONS, LTD., held in Birmingham last week, Mr H. Marks said that for the year ended July 31 there was a loss of £108 303. This was largely accounted for by the writing down of the vast stock owing to the fall in the price of materials. He thought the property and plant of the company, if realised, would sell at materially more than what appeared in the balance-sheet. There was nothing organically wrong with the business—it had a thoroughly sound constitution. One thing that had hampered resumption of full-blast activity had been the Government sales of material. There was every reason to expect the overseas trade would be resumed when the money market became more stabilised. Given something approaching normal conditions, or even a continuance of the present ones, with no violent upheaval in the labour world, they could look forward with confidence to the business resuming its place as a steady dividend-paying concern. At an extraordinary meeting that followed a resolution was passed authorising the alteration in the articles of association so as to extend the borrowing capacity of the company.

In the course of his speech at the annual meeting of the NORTHERN NIGERIA (BANCHI) TIN MINES last week, Mr. G. Temple Harris, chairman of the company, said that it was in cheap power that the future of their property lay. Electricity generated by water was the cheapest form of power, and he understood that several other Nigerian mining companies were paying attention to the same point. Their company were now shut down so far as the hydro-electric scheme was concerned, pending being able to obtain the necessary additional capital, but the plant and work so far done was fully protected, and should suffer no harm. They had just applied for State assistance from the £25 000 000 voted by Parliament to assist trade and unemployment. After providing for depreciation, interest, &c., the accounts for the last year show a loss of £18 221. Mr. Mackness, head of the hydro-electric department of Vickers, Ltd., has been elected a director.

New Companies.

The following list is compiled from information supplied by Messrs. Jordan & Sons, Ltd., company registration agents, 116-118, Chancery-lane, London, W.C. 2.

CONVEYOR AND ELEVATOR COMPANY, LTD. (178 621), Croft Street, Accrington, Lancaster. Registered Dec. 23, 1921. Conveyor and elevator manufacturers and erectors. Nominal capital, £15 000 in 15 000 ordinary shares of £1 each. Directors: J. J. Stevenson and Margaret Stevenson. Qualification of directors, £100.

JESSHOPE, LTD. (178 565), Dale Street, Burslem, Stoke-on-Trent. Registered Dec. 21, 1921. Mechanical, electrical, and general engineers. Nominal capital, £2 000 in 2 000 shares of £1 each. Directors: S. Malkin, J. R. Malkin, L. G. Stevenson, and A. P. Jesshope. Qualification of directors, fifty shares.

NATILITE (SOUTH AMERICA), LTD. (178 571), Lennox House, Norfolk Street, Strand, W.C. Registered Dec. 21, 1921. To carry on the business of making, using, exercising, and vending the motor spirit for internal combustion engines and for power, heat, and light, known as Natilite or Natalite. Nominal capital, £30 000 in 28 000 ordinary shares of £1 each and 40 000 founders' shares of 1s. each. Directors: Sir W. Alexander, A. E. Leonard, and Sir T. D. Nicol. Qualification of directors, £500. Remuneration of directors, £500.

J. RUSSELL & CO., LTD. (178 637), 5, Credon Road, Plaistow, E. Registered Dec. 23, 1921. General engineers and pump makers. Nominal capital, £1 000 in 1 000 shares of £1 each. Directors: J Russell and J. Walford. Qualification of directors, £50C.

A. SMETHURST & SONS, LTD. (178 542), 16, Bernard Street, Southampton. Registered Dec. 21, 1921. Electrical engineers. Nominal capital, £6 000 in 6 000 shares of £1 each. Directors: A. A. Smethurst and Mrs. Beatrice Smethurst. Qualification of directors, fifty shares. Remuneration of directors, A. A. Smethurst, £500 per annum.

VARDAS ET CIE, LTD. (178 648), Finsbury Pavement House, Finsbury Pavement, E.C. Registered Dec. 23, 1921. Electrical, mechanical, and sanitary engineers. Nominal capital, £1 000 in 1 000 shares of £1 each. Directors: J. E. Bembaron, R. W. Sellers, G. O. Nevile, A. V. Vardas. Qualification of directors, one share.

Forty Years Ago.

(THE ELECTRICIAN, JAN. 7, 1882.)

THE AMOY CABLE REPAIRED.—The Eastern Telegraph Company (Limited) notifies the repair of the Amoy-Shanghai cable, thus restoring telegraphic communication with China and Japan.

THE BERLIN ELECTRIC RAILWAY.—It is said that Messrs. Siemens are carrying out experiments at Berlin to ascertain the effect of winter weather, snowstorms, frost, &c., on the conducting wires, &c., of their electric railway.

ROYAL INSTITUTION.—The following Papers have been settled for reading before Easter next, viz.:—Jan. 20, "On Comets," by W. Huggins, F.R.S.; March 10, "Electric Lighting by Incandescence," by J. W. Swan; March 24, "Electric Railways," by Professor W. E. Ayrton, F.R.S.

ELECTRIC LIGHT FOR THE SUEZ CANAL.—There is a fair prospect of the Suez Canal being lighted by electricity, so that ships may pass through it at night, instead of coming to an anchor, as at present. Major Strutt, managing director of the Eastern Electric Light Company, is in Egypt, arranging with M. Lemasson, the engineer-in-chief of the Canal Company, for the lighting of parts of the canal by the Brush system, so that dredging operations may be carried on at night, instead of in the day time. There is some prospect also of the lighting of the Suez Dock by electricity for the Peninsular and Oriental Company.—*Homeward Mail.*

Catalogues, Price Lists, &c.

Higgs Bros. have sent us their monthly magazine containing their stock list of a.c. and d.c. motors and dynamos.

The "Sunic" deep therapy apparatus is the subject of Bulletin 41S., published by Watson & Sons (Electro-Medical), Ltd.

A pamphlet illustrating the Hotpoint electric grills, toasters, and hollow-ware appliances has just been issued by the Hotpoint Electric Appliance Company.

Particulars and prices of the new C.A.V. Motor-cycle Dynamo Lighting Sets are contained in an illustrated folder ("H") just issued by C. A. Vandervell & Company.

Metropolitan-Vickers Electrical Company have issued a pamphlet of Cosmos nursery rhymes, and in connection with the same they have arranged a colouring competition for children between the ages of five and twelve, and are offering a number of attractive prizes.

Medway's Safety Lift Company have issued a new illustrated pamphlet in connection with their "Britain's Best" electric lifts, which include invalid lifts, passenger lifts, motor-car lifts, goods lifts, restaurant lifts, &c. The firm have a specially trained staff of engineers exclusively engaged in inspection, maintenance, and repairs of the lifts.

Tramways Supplies Ltd., of Leeds and London, are circulating a pamphlet (o. 102/1) which gives particulars of their h.t. and l.t. oil switches. These are suitable for voltages up to 3 000 V, and for capacities up to 300 A; they can be supplied in non-automatic and automatic patterns, d.p. or t.p., and they comply fully with Home Office requirements.

No. 3 of the series of Transformer Abstracts has been issued by Johnson & Phillips, Ltd. This describes and illustrates seven out of the eight tests carried out by the firm on their power transformers before delivery to customers. As there are several alternative methods of carrying out the eighth test—heat runs—this will form the subject of a separate memorandum.

Reavell & Company have sent us a copy of their Pamphlet No. 101 illustrating and describing their turbo compressors and exhausters. The great advantage of these machines over others of this type is the improved design of the diffuser blades fixed in the stator, which have a large bearing on the high efficiency obtained, and successfully solves the problem of overload on the prime mover, should there be such a tendency at any time.

A well got up pamphlet has been issued by Nalder Bros. & Thomson, Ltd., illustrating their N.C.S. "Ideal" instruments for use in connection with the generation and distribution of electricity. These include the "ideal" moving iron ammeters, three-phase voltmeters, power factor meters, rotary synchronisers, leakage indicators for alternating current, relays, insulation testing sets, &c. The firm's complete illustrated catalogue, giving prices and other information, will be sent on application.

The Societe Industrielle d'Electricite (France), manufacturers of patent safety cartridge fuses, have recently opened a British, Irish and Colonial Department at 23, Queen Anne's-gate, Westminster, London, S.W. The safety fuse system manufactured by them is called "Eternos," and while it differs somewhat from what in England is known as the "Z" system, and on the Continent as the "Diazed" system, it is interchangeable with these systems, and can, therefore, be used for all existing installations of these systems without any alteration of the fuse bases. In addition to the "Eternos" system, the firm manufacture other safety cartridge fuses which are interchangeable with all Continental and American systems, such as the "A.E.G." and "American Edison Screw."

Calendars, Diaries, &c.

The Saxonia Electrical Wire Company have issued a calendar for 1922 consisting of twelve monthly sheet mounted on a stout card.

A very useful calendar has been sent us by Francis Polden & Company, consisting of twelve monthly sheets mounted on a stout card. Each sheet contains the calendar for the entire year, with the particular month running printed in large black letters with a small adjustable red frame to indicate the date required.

Books Received.

"The Swedish Year Book, 1921." (London: Williams & Norgate.) Pp. 170. 7s. 6d. net.

"Electrical Engineers' Diary and Year Book, 1922." (London: S. Davis & Company.) Pp. 534. 10s. 6d. net.

"The Practical Electrician's Pocket Book and Diary, 1922." (London: S. Rentell and Co.) Pp. lxxx. + 558. 3s. net.

"The Fundamental Basis of Dynamo Electric Machine Design." By Tatsuo Tanaka. (Tokyo: Maruzen Co., Ltd.) Pp. 140.

"Universal Exchange and Interest Tables." By A. J. Lawson, M.Inst.C.E. (London: Thomas Skinner and Co). Pp. 242. 15s. net.

"La Propagation des Ondes Electromagnetiques à la Surface de la Terre." By L. Bouthillon. (Paris: Librarie Delagrave.) Pp xv+340.

Arrangements for the Week.

FRIDAY, Jan. 6th.

Institution of Mechanical Engineers.

6 p.m. At Storey's Gate, London, S.W. Joint meeting with the Society of Chemical Industry. Paper on "The Co-operation of the Engineer and Chemist in the Control of Plants and Processes," by Mr. G. M. Gill.

Royal Institution.

At Albemarle-street, London, W. Christmas Lectures on "Electric Waves and Wireless Telephony," by Prof. J. A. Fleming, F.R.S.

SATURDAY, Jan. 7th.

3 p.m. Lecture V., "Electric Waves."

TUESDAY, Jan. 10th.

3 p.m. Lecture VI., "Wireless Telephony."

MONDAY, Jan. 9th,

Institution of Electrical Engineers. Informal Meeting.

7 p.m. At Savoy-place, Victoria Embankment, London, W.C. Discussion on "Co-operative Advertising in Relation to the Electrical Industry." To be opened by Mr. J. W. Beauchamp.

Institution of Electrical Engineers.
(North-Eastern Centre.)

7.15 p.m. At Armstrong College, Newcastle-on-Tyne. Paper on "Induction Type Synchronous Motors," by Mr. L. H. A. Carr.

Institution of Electrical Engineers.
Dundee Sub-Centre.

7.30 p.m. At University College, Dundee. Paper on "Electrical Distribution," by Mr. Charles Lamb.

TUESDAY, Jan. 10th.

National Association of Supervising Electricians.

6.45 p.m. At St. Bride's Institute, Bride-lane, Ludgate Circus, London, E.C. Lecture on "A Talk Round the Thermionic Valve," by Major T. Vincent Smith.

Institution of Electrical Engineers.
North-Western Centre.

7 p.m. At the Engineers' Club, Manchester. Paper on "Telephone Line Work in U.S.A.," by Mr. E. S. Byng.

Institution of Electrical Engineers.
Scottish Centre.

7 p.m. At the North British Station Hotel, Edinburgh. Paper on "Induction Type Synchronous Motors," by Mr. L. H. A. Carr.

Röntgen Society.

8.15 p.m. At the Institution of Electrical Engineers, Savoy-place, London, W.C. Paper on "The Structure and Dimensions of Molecules," by Prof. A. O. Rankine, O.B.E.

WEDNESDAY, Jan. 11th.

Institution of Civil Engineers.
(Students' Meeting.)

6 p.m. At Great George-street, London, S.W. Lecture on "The Economic Aspects of Various Methods of Power Transmission," by Mr. E. W. Monkhouse.

Industrial League and Council.

7.30 p.m. At Caxton Hall, London, S.W. Lecture on "A Fair Day's Work for a Fair Day's Pay," by Mr. R. Stelling.

Liverpool Engineering Society.

8 p.m. At the Royal Institution, Colquitt-street, Liverpool. Paper on "Wireless Telegraphy in the Mercantile Marine." by Capt. J. A. Slee, C.B.E.

THURSDAY, Jan. 12th.

Institution of Electrical Engineers. Extra Meeting.

6 p.m. At Savoy-place, London, W.C. Cinematograph films on "Investigations and Tests on High-tension Switchgear," by Mr. P. Torchio, with explanatory notes by Dr. C. C. Garrard; "Telephone Inventors of To-day," "The Audion," and "Electricity in the Home," by Mr. F. Gill.

Optical Society.

7.30 p.m. At the Imperial College of Science, South Kensington, London, S.W. Papers on "The Manufacture of Optical Glass," by Dr. C. J. Peddle, M.B.E.; "The Barr and Stroud 100-ft. Self-contained Base Rangefinder," by Dr. J. W. French; and "The Optical Three Apertures Problem," by Mr. T. Smith.

Institution of Mechanical Engineers.
Midland Branch.

7.30 p.m. At the University, Edmund-street, Birmingham. Paper on "Dr. Leonard Hill's Katathermometer," by Mr. H. C. Young.

FRIDAY, Jan. 13th.

Institution of Electrical Engineers.
Scottish Centre. (Students' Section.)

7.30 p.m. At the Royal Technical College, Glasgow. Paper on "The Protection of Alternating Current Circuits." by Mr. E. T. Pounds.

COMMERCIAL INTELLIGENCE.

The following information is taken from printed reports, but we cannot be responsible for any errors that may occur.

London Gazette.

Partnership Dissolved.

HONE, Henry Percy Greenwood, and DAYIAN, Paul, electrical contractors, 46, Malden-road, New Malden, Surrey, under the style of Greenwood Hone & Company, by mutual consent as from Dec. 25, 1921. Debts received and paid by P. Dayian.

Bankruptcy Information.

DEPLEDGE, Robert Adrian, Scunthorpe, Lincolnshire, electrical engineer. Receiving order, Dec. 30. Debtor's petition.

LANGSFORD, Edwin Growdon, Burnley, electrician. Receiving order, Dec. 30. Debtor's petition.

Companies Winding-up Voluntarily.

PLANET ELECTRIC COMPANY, LTD. Meeting of creditors at the offices of Dollman & Pritchard, 52, Tavistock-square, London, W.C. 1, on Jan. 9, 1922, at 12 o'clock noon.

TAMPICO ELECTRIC LIGHT, POWER & TRACTION, LTD. (in voluntary liquidation). Meeting of creditors at liquidator's office, Jan. 17, 3 p.m. Particulars of claims by Feb. 7, to the liquidator, J. S. Evernden, 47, Parliament-street, Westminster.

County Court Judgments.

[NOTE.—The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debts. They may be for actions. But the Registry makes no distinction of the cases. Judgments are not returned to the Registry if satisfied in the Court books within twenty-one days.]

ARMATURE REPAIRING & SUPPLY COMPANY, LTD., Pipe House Wharf, Swansea, electrical engineers. £17 4s. 10d. Oct. 28.

BATE, Mr. D. C., 16, John Dalton-street, Manchester, electrical manufacturer. £25 13s. Oct. 27.

BOLLEY & LEESON, 28, Bond-street, Hinckley, electrical engineers. £66 11s. 4d. Nov. 2.

EVANS, Mr., Salubrious-passage, Swansea, electrical engineer. £15 8s. 2d. Oct. 31.

KNIGHT, Wilfred, Sen., 6, Oak-end, Waye, Gerrards Cross, electrical engineer. £22 3s. Oct. 11.

SOUTHERN COUNTIES PLATING COMPANY, LTD., 164A, Friar-street, Reading, electro platers. £17 19s. 5d. Oct. 26.

STRONG, Henry, 157, Chester-road, Hulme, Manchester, electrical engineer. £10 0s. 6d. Nov. 1.

WALTON, Mr. C. W., 33, Keelings-road, Dudley Port, electrician. £14 1s. 7d. Nov. 2.

Mortgages and Charges on Limited Companies.

[NOTE.—The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, created by a Company after the commencement of the Act, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges which would, if created after the commencement of the Act, require registration. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced since such date.]

COATBRIDGE & AIRDRIE ELECTRIC SUPPLY COMPANY, LTD. Registered Dec. 20, further charge (supplemental to mortgate dated March 31, 1904, securing £5 500, additional), to County of London Electric Supply Company, Ltd., Moorgate-court, E.C.; general charge, and Coatbridge and Airdrie undertakings, and benefit of certain agreements, contracts, &c. *£179 812 8s. 11d. March 17, 1921.

JESMOND ELECTRICAL & GENERAL ENGINEERING COMPANY LTD. Registered Dec. 16. £300 debentures, to J. Sharp, 29, Armstrong-avenue, Heaton; general charge.

TARANTO TRAMWAYS & ELECTRIC SUPPLY COMPANY, LTD., London, E.C. Registered Dec. 21. £20 000 charge, to Commercial Bank of Scotland, Ltd.; charged on certain concession and rights granted by Municipality of Taranto (Italy), also general charge. *£72 000. Dec. 31, 1920.

Satisfactions.

DAWLISH ELECTRIC LIGHT & POWER COMPANY, LTD. Satisfaction registered Dec. 22, £300, part of amount registered Oct. 4, 1920.

ENGLISH ELECTRIC COMPANY, LTD., London, W.C. Satisfaction registered Dec. 23, £30 100, part of amount registered Oct. 3, 1919.

Deed of Arrangement.

HARRIS, Sydney Henry, trading as the MANCHESTER MAGNETO REPAIRING COMPANY, 191, Chapel-street, Salford, and 7, Brideoak-street, Cheetham Hill, Manchester, electrical engineer. Trustee, J. F. Warburton, 28, Queen-street, Manchester, accountant. Filed Dec. 24. Liabilities unsecured, £522; assets, less secured claims, £210.

PRIVATE MEETING.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

WILLIAMS & BEVAN, electrical and general engineers, Aberdare. Creditors were called together recently, when a statement of affairs was presented, which disclosed liabilities of £1 753, all due to the trade. The assets, consisting of stock £300, and book debts £316, were estimated to realise £616, a deficiency of £1 137. It was stated that the debtors commenced trading some two to three years ago, after leaving the army. The bank allowed an overdraft to the extent of £700, which had now been reduced to £312, and was secured. The present position was attributed to want of capital, competition, and taking contracts at too low a price. The creditors decided that the estate should be dealt with under a deed of assignment with Mr. S. E. Clutterbuck, of Messrs. Clarke, Dovey, & Co., accountants, Cardiff, as trustee. The principal creditors are: English Electrical Company, London, £331; General Electric Company, Ltd., Cardiff, £110; Simpson & Baker, Bristol, £147; Siemens Bros., Ltd., Woolwich, £112; McWhirter & Sons, Ltd., Cardiff, £65; St. Helens Cable & Rubber Company, Ltd., Warrington, £47; British Thomson-Houston Company, Ltd., Cardiff, £54; Engineering Equipments Company, Ltd., Swansea, £22; Chloride Electric Storage Company, Ltd., Manchester, £21; India Rubber & Tile Works Company, Ltd., London, £28.

Benn Brothers' Journals.

,, (Roll-Brimstone).—Per ton £12 10s.
Sulphuric Acid (Pyrites, 168°).—Per ton, £9 17s. 6d.
Copper Sulphate.—Per ton £28 10s.
Boric Acid (Crystals) —Per ton £65.
Sodium Bichromate.—Per lb. 6d.
Sodium Chlorate.—Per lb. 3½d.
Rubber.—Para fine, 1s. 1¾d.; plantation 1st latex, 11¾d.

The metal prices are supplied by British Insulated & Helsby Cables, Ltd.

Patent Record.

APPLICATIONS FOR PATENTS

August 29, 1921.

22 825 Halden. Electric photographic printing or copying machines.
22 838 Moxham. Switch.
22 857 Allan. Wireless telegraph and telephone apparatus.
22 858 Automatic Telephone Mfg. Co. Telephone systems. (15/3/21, U.S.)
22 860 Sykes. Electro-magnetic apparatus for recording sound.
22 861 Harris, Horton, Preston & Hodgson. Direction-finding apparatus for wireless telegraphy.
22 870 Pride. Electric light fittings with bowl shades or reflectors.
22 875 Igranic Electric Co. (Cutler-Hammer Mfg. Co.). Electric motor control.
22 893 Wilson. Wireless telegraph apparatus.
22 897 American Radio & Research Corporation. Electrical apparatus. (30/8/20, U.S.)
22 906 Nishimoto. Incandescent lamp.

August 30, 1921

22 930 Cooper. Alternating current dynamo.
22 964 Robertson. Combination electric radiator and hot-water circulator.
22 990 Metropolitan-Vickers Electrical Co. & Field. Devices for balancing currents in parallel connected conductors for heavy alternating currents.
22 999 Pullin, Goolden & Greatbatch. Rectifiers for high potential alternating currents.
23 001 Koolhaas. Electric maximum automatic cut-out. (30/8/20, Holland.)
23 004 Westinghouse Brake & Saxby Signal Co. & Peter. Alternating current track signalling.
23 013 Scott-Taggart. Signalling systems.
23 018 Brougham (Walker Accessories Co.). Commutators for ignition apparatus.
23 020 G. E. Co. & Eden. Holders for electron discharge devices, &c.
23 021 B. T.-H. Co. (G. E. Co.). Electric motor starters.
23 034 & 23 040 Wacker. Circuit closers for electrically operated alarms.
23 044 Levi & Rottenburg. Electric lamps.

August 31, 1921.

23 066 Ashton. Accumulator battery.
23 075 Moyle. Electrical bonding junction boxes for metallic sheathed wires, &c.
23 080 Ely. Well-globe fittings for electric lamps.
23 091 Fairweather (Diehl Mfg. Co.). Motor-driven sewing machines.
23 103 Becherraz. Electric light switches.
23 138 Gordon. Electric motor, &c., controllers.
23 144 B. T.-H. Co. (G. E. Co.). Current limiting devices.
23 149 A. C. Cutting & Welding Co., Smout & Flood. Electrodes for welding, &c.
23 154 Akt. Ges. Brown, Boveri et Cie. Rapid energising of magnets. (9/9/20, Switzerland.)
23 157 Allmänna Telefonaktiebolaget L. M. Ericsson. Control clocks for trunk line switchboards. (20/5/21, Sweden.)
23 168 Corrico & Hughes. Method of mending resistance elements. (11/9/20, U.S.)

September 1, 1921

23 223 Armstrong. Galvanic batteries.
23 229 Thompson. Electric wire union.
23 232 Juchli. Production of insulating material. (1/9/20, Switzerland.)
23 234 Westinghouse Air Brake Co. Automatic electric couplings. (1/6/21, U.S.)
23 241 Fuller's United Electric Works & Beswick. Storage battery electrodes.
23 246 Metropolitan-Vickers Electrical Co. Liquid rheostats. (18/10/20, U.S.)
23 253 Automatic Telephone Mfg. Co. Telephone systems.
23 261 B. T.-H. Co. Electron discharge amplifiers. (29/10/13, U.S.)
23 264 Albrecht. Electrically-heated soldering iron. (10/5/21, Switzerland.)
23 281 Palmer. Accumulator battery.
23 285 Eckersley, Round & McLellan. Aerials for wireless signalling.
23 434 Exley. Electric batteries or accumulators.

September 2, 1921.

23 291 Sayer. Electric traction.
23 302 Griffiths. Incandescent lamp holders.
23 314 Fairweather (Diehl Mfg. Co.). Electric motor.
23 317 Fairweather (Singer Mfg. Co.). Electrically controlled sewing machine.
23 318 Fairweather (Singer Mfg. Co.). Lighting attachment for sewing machine.
23 319 Fairweather (Singer Mfg Co.). Electrically lighted sewing machine.
23 320 Fairweather (Singer Mfg. Co.). Electric sewing machine.
23 321 Fairweather (Singer Mfg. Co.). Electrical connectors and terminal blocks.
23 340 Callender's Cable & Construction Co. Clips for testing purposes.
23 349 Boudou. Electric apparatus for waving hair. (26/3/20, France.)
23 376 B. T.-H. Co. (G. E. Co.). Electric discharge devices.
23 377 Frith. Means for rectifying l.t. alternating currents.
23 379 Higgs. Starters for squirrel cage motors.
23 404 Paddon. Electrically operated brakes for self-propelled vehicles.
23 419 Graham. Telephone systems.
23 434 Handasyde. Accumulators.
23 437 Ges. für Drahtlose Telegraphie. High frequency telegraphy and telephony. (29/9/20, Germany.)

September 3, 1921.

23 451 Bratt. Electrically heated utensils.
23 452 Proprietary Smallwares, Ltd. Insulating block for lamp holders.
23 453 Proprietary Smallwares, Ltd. & Goldsmith. Electric lamp holders.
23 469 Thompson (Splitdorf Electrical Co.). Combined connection and terminal block.
23 476 Wilson. Testing points for use in electrical work.
23 501 Dufaux. Permanent magnets. (7/9/20, Switzerland.)
23 518 Kirk & Milliken. Terminal blocks for electric conductors.
23 523 Pritchett. Switch.
23 535 Reynolds. Composition for screening X rays and for electrical insulating.

September 5, 1921.

23 537 Bentley-Humphries. Cycle electric lighting sets
23 539 Baker. Commutators or distributors for ignition systems.
23 579 Radio Communication Co. & Scott-Taggart. Signalling systems.
23 594 Ford. Miners' electric safety lamps.
23 604 Metropolitan-Vickers Electrical Co. & Fletcher. Armatures of d.c. machines.
23 610 & 23 617 Vickers, Ltd., Astington & Flann. Frictional driving gear for electric machines in railway vehicles.
23 612 B. T.-H. Co. (G. E. Co.). Switches.
23 633 Every. Electric switches for railways, &c.
23 639 Norsk Hydro-Elektrisk Kvaelstofaktieselskab. Production of ammonia from nitrogen and hydrogen. (7/9/20, Norway.)
23 640 Suter. Electric heating apparatus for waving hair.

September 6, 1921.

23 648 Besford. Dimming devices for electric lighting on vehicles, &c.
23 668 Polson. Fittings for electric conduits, &c.
23 676 Electro Dynamic Construction Co. & Pensabine. Electric machines
23 686 Pemberey. Commutators.
23 710 Metropolitan-Vickers Electrical Co. & Orange. Electric radiators, &c.
23 725 Haddan (Meier). Galvanic cells and batteries.
23 730 B. T.-H. Co. & Given. Motor control.
23 731 B. T.-H. Co. (G. E. Co.). Flexible conductor connectors.
23 760 Rivers-Moore. Automatic selectors, &c., for wireless systems.

September 7, 1921.

23 782 Thompson (Nelson Tuner Co.). Timing switches or commutating devices.
23 790 Crowther, Grenfell, -Erskine-Murray, Robinson & Gill. Directional wireless systems
23 791 Whitehead. Accumulators.
23 796 Automatic Telephone Mfg. Co., Smith & Jordan. Telephone instruments.
23 836 Houston, Sleeman & Schmidt. Magneto ignition for engines (7/9/20, Australia.)
23 861 Palmer. Telephone junction or terminal boxes, &c.
23 869 Barcn (Oldendorff). Automatic switching arrangements.
23 872 Watson & Sons (Electric Medical), G. E. Co., Gough & Gossling. Circuits and electro-medical apparatus for transforming and utilising electric currents.
23 891 Taylor. Arrangement of cables and transformers in h.t. transmission lines.
23 895 Taylor. Electrical transmission systems.

September 8, 1921.

23 898 Glover & Unwin. Electrical automatic clock.
23 912 Silcock. Electric rotary contact maker
23 938 Denny. Electric irons.
23 952 Metropolitan-Vickers Electrical Co. & Ross. Protective devices for transformers.
23 954 Vickers, Ltd. & Etchells. Electro-magnetic regulating devices for electric machines.
23 962 Akt. Ges. Brown, Boveri et Cie. Damping out third harmonics in 3-phase transformers. (15/9/20, Switzerland.)
23 971 B. T.-H. Co. (G. E. Co.). Tensioning devices.
23 972 B. T.-H. Co. (G. E. Co.). Furnaces.
23 974 Signal Ges. Acoustic apparatus for telephone communication. (27/9/20, Germany.)
23 980 Runbaken & Torrance. Testing devices for electric ignition systems.
23 982 Zagury (Buscha Ges.). Operating from h.t. d.c. mains apparatus operated by l.t. current.

September 9, 1921.

23 996 Tucker. Fuse-boards.
24 026 Western Electric Co. Vacuum tubes.
24 035 White. Mounting and driving magneto-electric machines.
24 045 G. E. Co. & Bartlett. Circuits for electric heating.
24 057 B. T.-H. Co. (G. E. Co.). Electric arc devices.
24 062 Kindliman & Co. Portable electric heating apparatus. (13/12/20, Switzerland.)
24 063 Dalsgaard-Anderson. Electric bicycle bell.
24 064 Schweizerische Magneta A.G. Electric clock and signal installation. (11/9/20. Switzerland.)
24 071 Schott & Gen. Electrode for electricity meters in which gases are electrolytically dissolved and eliminated. (17/9/20, Germany.)

September 10, 1921.

24 076 Ellis. Trolly heads for tramcars, &c.
24 094 Morgan. Bulb and battery tester.
24 098 Hippisley & Milham. Incandescent lamp holder.
24 099 Hippisley & Milham. Shade retainer for electric lamp holders.
24 136 Midgley. Switches or switch boards for controlling electric circuits.
24 140 Woods. Electric motors.
24 143 Peirce. Enclosed cartridge fuses.
24 146 Hepworth. Electric generators for road vehicles.

September 12, 1921.

24 179 Western Electric Co. Electro-magnetic step-by-step mechanism.
24 180 Radio Communication Co. & Scott-Taggart. Signalling systems.
24 194 Rosenkrantz. Electric water heaters.
24 202 Paul. Circuit breakers. (10/9/20, Germany.)
24 206 Metropolitan-Vickers Electrical Co. Clamps for trolly conductors. (29/10/20, U.S.)
24 207 B. T.-H. Co. (G. E. Co.). Photo-electric devices.
24 227 Watson & Sons (Electric Medical) & Phillips. Electrical indicator.
24 240 Hancock. Electric furnaces.
24 241 Warburton. Mining type switchgear
24 250 Porscke. Depolarizers for galvanic elements.
24 251 Porscke. Electrolytes for galvanic elements.
24 266 Smith. Electrical or mechanical hand or chain control.

September 13, 1921.

24 285 Western Electric Co. Telephone exchange systems.
24 303 Lyon. Adaptors or wall plugs for electrical connections.
23 331 Ellison. Unidirection electric generator set.
24 332 Metropolitan-Vickers Electrical Co., Brooks & Hall. Electric traction systems.
24 333 Metropolitan-Vickers Electrical Co. & Cameron. Sealing electrical conductors in glass, &c
24 340 Haddan (Automatic Temperature Control Co.). Electrically operated vale regulators.
24 345 Whittaker-Swinton. Control apparatus for wireless waves.
24 349 Johnston & Schwuchow. Electrical etching machines.
24 352 Marks (Siemens-Schuckertwerke). Electric lifting gear.
24 356 Bignamy. Electric circuit controlling devices.

The Editorial, Advertisement and Publishing Offices of "The Electrician" are at 8, Bouverie Street, London, E.C. 4. Telegrams: Benbroctic, Fleet, London. Telephone: City 9852 (5 lines).

The subscription to "The Electrician" is £2 12 0 per annum in the United Kingdom, and £2 14 0 per annum Abroad. Advertisement Rates can be obtained on application to the Manager. Advertisement copy and blocks should be received on the Friday preceding date of publication.

CONTENTS.

Notes of the Week.

A.C. Commutator Motors.

In these troublous days the work, and therefore the outlook, of the electrical engineer is so likely to become obscured by a mass of detail, that he is in danger of losing sight of those fundamental problems whose solution is essential to real progress. For that reason alone the Institution of Electrical Engineers is to be congratulated on arranging for a lecture on "Single and Three-Phase Alternating Current Commutator Motors with Series and Shunt Characteristics," and Dr. Stanley Parker Smith is to be felicitated on the way in which he marshalled and delivered his arguments. The fact that there is nothing new about these motors, that they were indeed invented, among others, by Mr. Alexander Siemens, Mr. Llewylyn Atkinson, and Prof. Ernest Wilson as long ago as the 'eighties and 'nineties, is an added reason for such an exploration as was conducted last week into the work of these pioneers, to discover whether some of their results, long forgotten because too often before their time, could not usefully be adapted to present-day conditions. Only within the past few weeks we have noted in our own columns two examples of such "re-discovery." This sort of thing is not only waste of the "re-discoverer's" time, but leads to conflicting claims to priority which are always unfortunate, and sometimes acrimonious.

A Necessary Clarification of Ideas.

There is no doubt from the course both of the lecture and the subsequent discussion that the development of alternating current supply, both for power and traction, has made the use of alternating current motors a necessity. A re-statement of the properties of these machines, and a candid discussion of their drawbacks (which they certainly received from Dr. Smith) is therefore advisable for the clarification of our ideas. Though at first sight it seems that we have in these motors all the disadvantages of both the d.c. and the induction motor, with a few peculiar ones thrown in, it has been demonstrated that nevertheless they are quite a commercial proposition. As Mr. Creedy showed (and no one is better able to demonstrate the facts than he) there is little to choose between alternating and direct current commutator motors on the scores of efficiency and price, while on the scores of weight and size the former has the advantage. It is to be hoped this lecture will be the forerunner of others, as well delivered, on equally interesting subjects.

Standardisation à la Mode.

In the course of the discussion at the Institution of Electrical Engineers on Dr. Stanley Parker Smith's lecture, Sir Philip Dawson let the cat out of the bag. He had only, he said, signed the report of the Railway Electrification Advisory Committee because it left a loophole for any railway company which did not wish to use the "standard" 1 500 V direct current system to apply to the Minister of Transport for permission to employ something else. From the very nature of things such standardisation as was recommended by the committee could only hope to be illusory, and we have always suspected that this standard system was no standard at all. Now our suspicions are confirmed. At the same time we are relieved to learn that even in official circles the door has not been shut to the admission of any system which future experience shows to be the best for particular conditions. As has often been pointed out, there is at the locomotive stage little to choose between the various systems available, while as regards the reduction in the number of sub-stations and the direct employment of high voltages the single-phase system has distinct advantages. As Sir Philip Dawson remarked, he and his system had been severely criticised for many years. Is the tide turning?

The Locomotive Drive Question.

An important question for designers is raised in Sir Vincent Raven's recent Paper before the North-East Coast Institution of Engineers and Shipbuilders. As in the case of the Paper which he read before the Engineering

Conference last summer, Sir Vincent was content to state the pros and cons of the various methods available, and to leave it at that. But it is interesting to note that on the new North-Eastern passenger locomotive the power is transmitted to the road wheels through a quill and gearing in accordance with British standard practice. On the other hand, as Dr. Stanley Parker Smith recently showed the connecting rod design is favoured in Switzerland, probably owing to the employment of the single-phase system, in which the use of larger motors than can be accommodated between the wheels is necessary. This, like many other similar matters, is a question to which, we feel, the answer must depend on the conditions present in each particular case. Are we, in fact, sure that British standard practice is the best, or are its presumed efficiency and simplicity illusory? This is a type of query, of which there are many connected with electric traction, which should receive full discussion in technical circles. In the meantime more polemical matters can well be relegated to the background.

The Present Financial Obstacle.

So great and obvious are the improvements which would follow the electrification of many sections of railway in this country that the only obstacle which prevents their conversion is finance. It is now well known that the electrification of suburban lines is justified by the increased revenue obtained. Unfortunately, though everything points to a similar result following the electrification of a steep gradient line over which heavy trains have to be hauled, there are no actual British figures that show that this would be the case, though American statistics are definite enough in this respect. It is perhaps only natural, then, that railway directorates should show a little hesitancy in these uncertain times to spend large sums of money without being assured that they will obtain satisfactory results. This, however, is but a passing phase. Conditions during 1922 will, we hope, lead to an extension of enterprise of this character. It is well that electrical engineers and manufacturers should be prepared for it.

The Physical Society Exhibition.

The annual exhibition of scientific apparatus jointly organised by the Physical Society of London and the Optical Society was held at the Imperial College of Science, South Kensington, on Wednesday and Thursday in last week. The account of the various exhibits, which we begin on another page of this issue, while it shows the influence of the war on the scope and design and manufacture of scientific instruments, also indicates that satisfactory progress is being made in the paths of peace. The organisers are to be congratulated on the collection of equipment they were able to bring together, and still more on the interest they were able to excite in the minds of those who cater for the public through the columns of the daily Press. Nearly all the London dailies had a shorter or longer account of the exhibition, and though these ranged from grave to gay, and from the inane to the dull, they were at least an indication of the growing realisation in the great world of the influence that scientific endeavour has on human existence. This in itself is a step forward. But much more remains to be done. We therefore hope that now a breach has been made in the wall, the attack will be quickly followed up.

The Marconi Marine Alarm.

As is well known, recent legislation has imposed upon shipowners the necessity of either providing an alarm which can be operated wirelessly by a second ship, in distress or desiring communication for other reasons, or of having an operator constantly in attendance to pick up such emergency messages. Except on the largest ships, the latter solution is obviously economically impossible, and much time has been spent, notably by the Marconi Company, in devising an arrangement which shall be efficient from both the wireless and seafaring point of view. On another page of this issue we describe the emergency alarm which was shown by the Marconi Company at the Physical Society Exhibition.

Details of the Alarm.

This alarm consists of an ingenious combination of the four electrode valve with electrical relay and clockwork time devices of the kind familiar in ordinary telegraphy to produce an apparatus which, if demonstrations are any guide, is amply capable of performing the duties imposed upon it. The problem to be solved, at first sight, seems to present no difficulties. But an alarm, to be an alarm, must only operate on certain definite occasions, and, in the case of a wireless alarm, must, therefore, be impervious to the effect of atmospherics and to a variety of other messages and signals of different wave lengths and strengths. It is these desiderata that introduce all the complications, and the Marconi Company are to be congratulated on the enterprise with which they have tackled, and the ingenuity with which they have overcome, the various problems involved.

An Error in Organisation.

In carrying out the electrification of British railways, work which we hope will soon be begun and continued at an accelerated pace, it is axiomatic that the railway companies should follow the advice of men closely acquainted with electrical progress and properly equipped with the necessary technical knowledge. The best way of doing this is to appoint a qualified electrical engineer directly responsible to the directorate, with the general manager as the only connecting link, and to give weight to his opinions at least equal to that which would be accorded to those of, say, the chief goods manager. For a railway is a complicated organisation whose affairs are not conducted in an atmosphere entirely free from jealousy and controversy, especially when matters affecting several departments come up for review.

A Retrograde Step.

We are therefore sorry to see that this essential has been forgotten in the reorganisation of the London and North-Western and Lancashire and Yorkshire Railway, which took place at the beginning of the year. Col. F. A. Cortez Leigh, lately chief electrical engineer of the former company, is now placed under Mr. Geo. Hughes, who combines the posts of chief mechanical and electrical engineer of the two systems. Col. Leigh also becomes a junior to Col. O'Brien, who has for some years been Mr. Hughes's electrical assistant on the Lancashire and Yorkshire Railway. Placing the personal aspect entirely on one side, we feel it is the greatest mistake to combine the mechanical and electrical departments under one head, and even greater to place an expert electrical engineer in a position where his talents cannot fail to lack their full utilisation. The result will be extremely harmful to a progressive department, and still more so to the railway companies concerned.

Amalgamation of Electricity Undertakings.

The announcement that the Liverpool Corporation have acquired the Electricity Supply undertakings of the Bootle

Corporation and the Liverpool District Lighting Company is an interesting item of news, and is a clear indication of the present trend of things in the supply branch of the electrical industry. Amalgamation and co-operation are found to be as advantageous in electricity supply as in other business undertakings, and, consequently, it is not surprising that the larger municipal and company undertakers are acquiring their smaller neighbours and extending their powers of supply into the rural areas. No doubt this will lead to economy in administration, and it will also assist the movement for reorganisation initiated by the Electricity Commissioners.

Electrical Details of the Areas.

The step taken by Liverpool should aid the negotiations for the creation of a Joint Electricity Authority for the West Lancashire and Mersey District, and, provided the Commissioners give their sanction to the purchase, arrangements can be made at once for unifying the supply in the whole of the Corporation's new area. This will not be a difficult matter, for supply is given in both Liverpool and Bootle on the d.c. three-wire system at 230 and 460 V, and a.c. at 230 and 400 V, while in the Liverpool District the supply is d.c. 220 and 440 V. At Liverpool energy is generated on the three-phase system at 6 600 V, 50 periods, and at Bootle the generation voltage is 3 300 V, three-phase, 50 periods; but at the Liverpool District Lighting Company's station there is only direct current plant.

Terms of Purchase.

Few details of the terms of purchase have been published, but as these have been approved by the Liverpool and Bootle Corporations by large majorities, there is likely to be little opposition to the scheme. As consideration for the transfer of the Bootle undertaking, the Corporation of Liverpool will pay in perpetuity an annuity of £7 500, and for the Liverpool District Company the annuity will be £4 000; but in the latter case the annuity can be commuted by paying £60 000 in cash, or by the issue of mortgages producing £3 600 a year. As the paid-up capital of the company is £60 000, and as a dividend of 5 per cent. was paid in 1919, it will be seen that the Corporation have acquired a progressive undertaking for a very reasonable figure.

Finance and Education.

The proceedings at recent meetings of those associations that have been established in the interests of the scholastic profession have been overshadowed by the Geddes report (as yet unpublished) hovering menacingly in the background. Taught by long experience, educationalists know only too well that the economy axe will fall first and with the sharpest strokes on their activities, and much objection and even panic are naturally the result. We feel, however, that much of the criticism of the new economic policy of the Government is being conducted from the wrong standpoint. No one (not even the politician when he thinks about it) wants to limit the scope or usefulness of education, but everyone, at least in his or her taxpaying capacity, wants to limit its cost. Such limitation need not necessarily reduce either its efficiency or its scope, for the expensive thing is not always the best.

No Reduction in Teachers' Salaries or Grants.

It is, moreover, common knowledge, especially among teachers, that far the greater proportion of the money spent on education finds its way into the pockets of the bureaucracy. It is that expenditure which should be cut down, and teachers would do well to assist in the operation. On the other hand, it is in the highest degree unwise that any reduction should be made in teachers' salaries. These are even now too low for efficiency. They should rather be raised sufficiently high to attract the best men and women into the profession, and the remainder should be ruthlessly weeded out. This is especially necessary in technical education, where, if real improvement is to be obtained, the emoluments of those engaged in this important work must equal those obtainable in commercial life. We see no reason why a better education cannot be obtained at a less cost than at present, and teachers, whether individually or through their associations, are working against their best interests in taking up any other standpoint. A memorandum to the Prime Minister from the Universities of Birmingham, Durham, Leeds, Liverpool, Manchester and Sheffield—a memorandum which is concurred in by the Vice-Chancellors of the Universities of Oxford, Cambridge, London, Bristol, Glasgow, Aberdeen, and Wales—urges the dangers of any reduction in the grants made by the Government to the Universities and University Colleges of Great Britain, and shows in no uncertain way that, to obtain efficient instruction, adequate financial support is necessary. We hope the Government will ponder well the arguments put forward.

French Products and British Engineers.

In a letter which we published in our Correspondence columns some weeks ago, Mr. C. T. Allan pleaded for the greater recognition of French products by British users, not to the exclusion of our own goods, but, rather, in preference to the output of other foreign countries. We are glad to learn that Mr. Allan's appeal has not been unsuccessful. French manufacturers are anxious to do business with English engineers, and the anxiety is reciprocated. It is a state of mind that is worth exploiting. The fine characteristics of our French neighbours in warfare were sufficiently well demonstrated during the years when their armies fought side by side by ours. But it is not sufficiently well recognised that those same characteristics are equally present among French engineers and commercial men; that, however, is the truth of the matter, and it is a point which in these days of national reconstruction should be used to mutual advantage.

Compensation for Loss of Employment.

It was early realised that the reorganisation of the electricity supply industry might mean loss of employment or reduction of status to certain individuals. For this reason Section 16 of the Electricity (Supply) Act provides that compensation may be given to those affected, and electricity supply engineers will therefore be interested in the decision which has just been come to by the Arbitrator in the Morley case—the first of its kind. At Morley the generating station was recently shut down, and a bulk supply taken from Leeds. Mr. J. E. Ellis, the chief engineer, and his assistant, Mr. J. Crisp, therefore claimed compensation for loss of status, and Mr. Ellis also claimed for the loss of fees for premium pupils. The Arbitrator, Sir Wm. Mackenzie, K.C., rejected the status claims, but allowed Mr. Ellis £140 compensation for the loss of pupils. The decision, which apparently was based on the fact that both claimants continued in the Corporation service at the salaries they were receiving when the generating station was shut down, does not err on the side of liberality. As the amount of the award is in the dis-

cretion of the Arbitrator, we suggest that an independent engineer would make a better arbitrator in such cases than a lawyer.

Electrical Engineers and the Election.

While electrical engineers are not primarily concerned with politics, a decision on the date at which we are to be troubled with a General Election will nevertheless be awaited with interest by our readers. At its best such an event does no good to trade, and at the present time matters are complicated by the difficulty of deciding how most efficiently by means of the vote to make the requirements of the electrical industry known to those who govern us. There is, however, one paramount interest which overrides every other—the reduction of taxation. So much is this recognised, that economy will certainly be a plank in every election platform. But the business men will take at its true value this sudden change of heart, and not overlook the fact that politicians have a way of trimming their sails to the wind when an election is imminent. Incidentally, the necessity for economy will conveniently be forgotten as soon as the ballot-boxes close. Electrical engineers would, therefore, do well to go warily and to select from the candidates before them the one who, irrespective of political complexion, can be most trusted to take the greatest interest in this serious matter. Past words and personal predilections are in these circumstances not a bad guide, and in any case it is the duty of every electrical engineer to impress on every candidate over whom he exercises any influence the terrible seriousness of failure to bring the national budget within a figure that the taxpayer can afford.

Radio Telegraphy and Telephony in 1921.

In contradistinction to other fields of electrical progress, 1921 was a very active year in wireless telegraphy and telephony, but the activity has chiefly taken the form of commercial progress. It was, like 1920, a year of consolidation. Full use, even now, has not been made of the great developments of the war period, but radio engineers have begun to select from amongst the hundreds of alternative arrangements those which may be applied most successfully to meet practical requirements. Few new inventions brightened the year. For some reasons, there is something to be thankful for in this; wireless designers are only just catching up with the technical progress that has been made during the last few years.

Wireless Societies.

The Wireless Section of the Institution of Electrical Engineers continued to be very successful, and the Papers read during the session were of a type which appeals to those actually engaged in wireless work. There has, ever since the section was formed, been a tendency to terminate the discussion hurriedly. Possibly this speaks well for the success of the meeting, but if a short discussion is imperative, it would appear that some means of lessening the abruptness of the adjournment might be devised without making the last few speakers feel they are unnecessarily prolonging the proceedings.

Amateur wireless societies have increased greatly in number, and there are now about eighty in existence, most of them being affiliated to the Wireless Society of London. Very interesting tests have recently been carried out, during which signals have been received in this country from American 1 kW valve sets.

Patent Litigation.

The past year saw a recommencement of patent litigation in connection with wireless telegraphy. The matters under dispute were of interest, but, with one exception, of only secondary importance. The air will, no doubt, be very much clearer when these cases are decided. Perhaps, for this reason, the litigation will have its beneficial effects. In the meanwhile, the various actions emphasise the great importance of patent work, which, though usually unproductive in itself, has a vital connection with a company's prosperity when competition is keen and litigation constantly in the air.

We cannot help feeling that much patent litigation could be saved if there were a more general dissemination of technical knowledge.

Patents and Monopolies.

The importance of patents has probably had a greater effect on wireless progress, not only in this country, but throughout the world, than on any other industry. For very many years the early basic patents enabled a monopoly to be maintained. No doubt the advantages resulting from such a monopoly were the just reward for much research and expenditure. Nevertheless, monopolies tend to stifle progress, and this has tended to some extent to be the case in this country. Within the last few years the basic wireless patents have expired, and the immediate result of the inevitable competition has been a general improvement of wireless apparatus and communications. The reaction has found expression in no half-hearted manner, and it is due not a little to the lapsing of important patents that the field of wireless in this country has been thrown open to competition to the benefit not only of shipowners, contractors and wireless engineers, but of the art of wireless itself.

The Need of Greater Publicity.

If more information were circulated throughout the world, there would be far fewer valid patents. Many a patent in this country would operate against an inventor from another country, where he may have used his invention for years, simply because he did not publish his results.

During the past year there have been a very large number of patents published in this country. Most of them have been from foreign countries, and date as far back as 1913. Some of them are very interesting, and corroborate our views that remarkably few basic inventions in connection with three-electrode valves have originated in this country. The early work of Langmuir and his colleagues is unfolded, and there is no doubt that the great bulk of the credit for early work in connection with valves must go to America. The reason for this is probably that from the very nature of the commercial position of wireless here before the war, there were very few investigators. The advent of these various patents, dating from early periods, will fortunately not affect most manufacturers in this country, as the patents are only granted on condition that they will not operate against those who were cognisant of the inventions during the war. It is to be regretted that very many of the 1921 patents were for mere details, or clearly obvious arrangements. Such patents hinder rather than assist progress, and are probably filed either to intimidate others, or to prevent intimidation.

New Inventions.

There were few inventions of importance published during the last year. One which has aroused considerable interest is the so-called "Negration," which, as its name implies, is a negative resistance valve. We understand that this valve, used as a continuous wave generator, has found a wide commercial application, particularly on board vessels of the mercantile marine. More recently, much has been heard of magnetic control thermionic valves for producing oscillations, although it is too early to say if they will find a practical application.

The Admiralty carried out a great deal of very valuable work in connection with high-powered valve transmitters. They successfully used multi-phase currents for supplying the anodes of transmitting valves without the use of rectifying valves. The installation at Horsea was very successful. It seems likely that the experience gained at that station will lead to a very much wider use of high-powered valve sets.

Automatic Call Devices.

The need for automatic call devices, particularly for S.O.S. calls, was greatly felt, but no national or international regulations have yet been put into force. It is undoubtedly necessary that smaller ships, which cannot afford to carry more than one operator, should be in possession of an automatic apparatus which will give an alarm on receipt of an S.O.S. signal. The Radio Communication Company have put on the market an apparatus which will respond to a ship's call letters or the letters S.O.S. The Marconi Company have more recently devised a very effective call device which responds to a series of dashes; this apparatus was shown at the Physical Society's exhibition last week, and is described in this issue of The Electrician.

Imperial Chain Communications.

The first station of the Imperial Wireless Chain, namely, Leafield, was opened towards the end of last year. The station is fitted with Elwell arcs, and is to work with a similar station near Cairo. The construction of these stations is in the hands of the British Post Office. Full details have been given in The Electrician.

There seems some little doubt as to the future of the chain of wireless stations, as some of the Dominions are in favour of direct communication with England, instead of through a number of relay stations. Australia, fortunately, is in favour of direct communication. The Marconi Company have offered to subscribe £500,000 towards a £1,000,000 company to be formed in partnership with the Commonwealth Government for erecting and maintaining a high-powered station in Australia; the Radio Communication Company have offered to undertake the erection of a station on an ordinary contracting basis. Whichever scheme is adopted, it seems likely that direct communication with Australia will soon be an accomplished fact. Even at present, the signals from the stations at Leafield and Carnarvon can be received for limited periods in Australia.

High-Power Valves.

In connection with the Imperial Chain, it will be remembered that the Technical Committee recommended the use of high-powered valve installations. A considerable amount of very valuable work has been carried out in the past year by the British Admiralty, working in conjunction with the Mullard Radio Valve Company. Much progress has been made in the construction of silica valves, which have now been made in 10 kW sizes. The result of this work will undoubtedly be seen in the forthcoming year. We may expect to see a large number of land stations operating on valves of large power.

Direction Finding.

During the past year there were few published developments in connection with direction finding. The British Post Office is becoming interested, and it is likely that in the near future coast stations will be fitted with D.F. gear. Slow progress was made in the mercantile marine, but it is likely that when general business prospects are brighter there will be many more ships fitted than at present. The Robinson direction-finder system proved as successful on board ship as for the navigation of aircraft.

Land Stations.

Turning to the consideration of land stations, the most important development was undoubtedly the opening of the Long Island station, near New York, which is equipped with Alexanderson alternators. This station will be a central station, having a number of radial antennæ and several alternators which may be connected in parallel. When complete, it will be the most powerful in the world. At present only a portion of the station is complete and working, but communication with Europe is already proceeding satisfactorily.

The Marconi stations at Clifden and Carnarvon are both fitted with valve sets which have given very good results. In connection with high-powered installations, this company has carried out some remarkably good work in connection with "earth screens," which is the name they give to what most people have called "balanced capacity" earths. Although the idea of these "earths" is old, yet we cannot help but admire the work of those who have shown us the great advantages which attend the use of these earth connections in modern high-powered installations.

Turning to the smaller-powered stations, it seems likely that some of the apparatus of the British coast stations will be replaced by modern and up-to-date sets. The Marconi transmitter at North Foreland (probably the hardest-worked coast station in the world) has already been replaced by one of the Radio Communication Company's standard sets.

Radio Telephony.

Wireless telephony made, in some quarters, great strides, but very little was heard of any general progress. Although there is always a strong appeal to the imagination of the public, wireless telephones will probably find few applications in this country, apart from aircraft. Communication with foreign countries may, however, soon become an accomplished fact, and some kind of a service has already been tried between London and Holland. Experiments in using wireless telephony in conjunction with ordinary land lines have given good results, and by using two different wave-lengths speech has been carried on as effectively as if the ordinary land line system were in use.

Possible Future Developments.

As regards future developments, the problem of atmospheric elimination has not yet been solved, or, at any rate, there has been no publication of any results, except, of course, the perennial announcements of transcendental developments in connection with wireless research. Whatever has been achieved, there are no signs yet of the very high powers still used in longe-range communication being materially cut down. We are hoping that this—the greatest modern problem in wireless communication—will be solved in the very near future.

Electric Winding Engines and Mine Hoists.*

Some Notes on Double Helical Gearing.

By H. H. BROUGHTON.

The author has collected a series of notes on the strength of helical gearing, as well as particulars of a number of individual gears, with the idea of providing the user of such gears with data by which he can check the designs of the gearing manufacturers. In the second part of the article published below the properties of typical gears are described and compared.

(*Concluded from page 7.*)

Typical Gears.

For a considerable time the author has been collecting data on large gears with the object of being able quickly to prepare rough estimates and to check the gears called for in various specifications. Although the actual design of the gears is best left to the gear specialist it is, nevertheless, highly desirable that the user should be in a position to compare proposed gears with those which are known to have given satisfaction on similar duty.

In Tables II. and III. are set out technical data of a number of helical gears that have been used during recent years for winders and haulages. The gears given in Table II. are of Citroen make, and those in Table III. are of the Power Plant Company's make.

To facilitate transport, and to admit of easy erection, large wheels are often made in two or more pieces. A typical split wheel is illustrated in Fig. 3, and attention is directed to the method of registering the two halves by means of tool-steel ferrules, located as shown, at opposite ends of a diameter.

Inertia.

For a helical or herring-bone gear of given dimensions the moment of inertia of the teeth may be figured as 40 per cent. of a hollow cylinder of the limiting dimensions, and the rim (exclusive of teeth) may be figured as a hollow cylinder. Adding 25 per cent. to the sum of these two moments of inertia will make the necessary allowance for the hub and arms of the wheel.

If the weight and pitch diameter only are given, the moment of inertia may be considered to be the moment of inertia due to 60 per cent. of the total weight concentrated at the pitch circle.

Example.—It is required to determine the approximate value of the equivalent moment of inertia (reduced to the wheel shaft†) of the pair of wheels given under Ref. No. 6 in Table III.

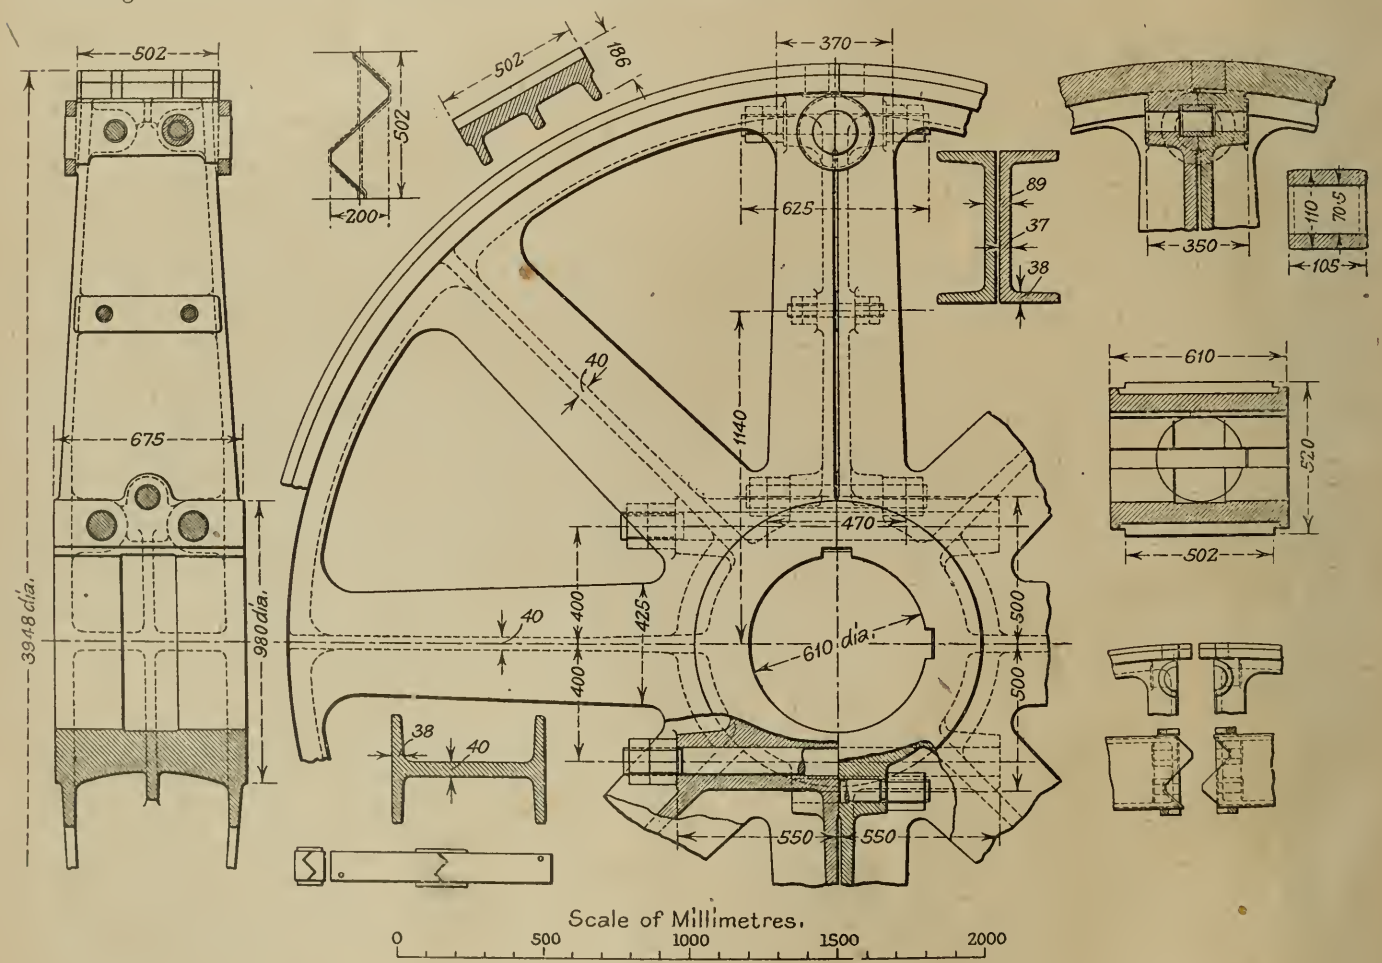

Fig. 3.—Typical Split Double-Helical Wheel.

The constants are:

Diameter of wheel	$= 131 \div 12 = 10{\cdot}92$ ft.
Weight of wheel	$= 8{\cdot}85 \times 2\,240 = 19\,000$ lb.
Diameter of pinion	$= 22 \div 12 = 1{\cdot}83$ ft.
Weight of pinion	$= 0{\cdot}65 \times 2\,240 = 1\,460$ lb.
Gear ratio	$= 6$ to 1

The moment of inertia of the wheel about its own axis is:

$$I_\omega = 0{\cdot}60 \times 19\,900 \times \left(\frac{10{\cdot}92}{2}\right)^2 \div 32{\cdot}2$$
$$= 11\,000$$

As the pinion is a solid forging having a pitch diameter of 1·83 ft., it follows that the radius of gyration will be

† In winders calculations it is usual to "reduce" inertia moments, &c., to drum shaft.

Table II.—*Particulars of "Citroen" Gears.*

approximately 0·66 ft., and the inertia about the axis of the pinion will therefore be :

$$I_p = 1\,460 \times 0{\cdot}66^2 \div 32{\cdot}2$$
$$= 19{\cdot}8.$$

Since the gear ratio is 6 to 1, the *equivalent inertia* about the axis of the wheel will be :

$$I = 19{\cdot}8 \times 6^2 = 710.$$

Hence, the total equivalent inertia

$$I_e = 11\,000 + 710 = 11\,710.$$

Comparison of Gears for a Given Duty.

It may be thought that for a pair of wheels transmitting a given amount of power at a definite speed the tooth pitch and width would be more or less standardised ; in other words, that the weights of gears by different makers would be approximately equal.

That such is not the case is evident from an inspection of Table IV., in which are set out the principal particulars of a pair of wheels for which four specialist firms were asked to quote. The enquiry called for 6·89 to 1 gears capable of transmitting a maximum load of 1 780 H.P., the motor rating being 1 150 H.P. at 365 revs. per min. ; and makers were asked to state the pitch and width of gears covered by their quotation. It will be noted that as one extreme we have a tooth of relatively coarse pitch (3 in.), and narrow in width (12¼ in.), and as the other extreme, a tooth of relatively fine pitch (1·57 in.), and 25 in. in width. Other things being equal, the load which can be carried by a tooth is proportional to the product of pitch and width. Thus, in the case of the wheel first mentioned, Firm A, the product is 36·75 ; and in the wheel put forward by Firm B the product is 67·5, or 84 per cent. higher than A.

In addition to the effect of the formula to which the teeth are designed, the product of pitch and width varies directly as the factor of safety. It may be of interest to mention that it was the practice of Firm A till quite recently to allow a factor of safety of 10 on *peak loads*. In the case under notice this corresponds to a factor of safety of 15·5 on the rated H.P. of the motor. It should be remembered that such high factors are necessary for securing durability, and not for securing strength or safety. In other words, the factor is a *factor of durability* as distinct from safety. By adopting improved methods of manufacture and by careful selection of pinion material, a factor of safety of 5 or 6 reckoned on peak loads may be regarded as sufficient to ensure satisfactory service.

Table IV.—*Comparison of Gears by Different Makers for a Given Duty.**

Rating : 1 150/1 780 H.P. ; Speeds, 365 and 53 r.p.m. ; Gear ratio, 6·89 : 1.

* The figures given in this table are taken from estimates obtained in March, 1920.

Equally interesting are the costs. These cover the supply of unmounted wheel and pinion. One of the gears is of French manufacture and the remainder are of British make.

Specifications.

One of the best specifications for heavy gears of which the author has knowledge is that recommended by a committee of the American Electric Railway Engineering Association. The specification is as follows :

Wheels.—Castings to be of open-hearth steel or other approved process. They must be free from shrinkage cracks and spongy portions. The design of wheel must be such as to minimise shrinkage stresses. The unfinished surfaces must be reasonably smooth and free from sand and scale. The finished surface of the teeth and the finished rim below the teeth should be reasonably free from sand holes or blow holes, and must not fall below specifications as given below. No tooth or finished surface between teeth should have sand holes or blow holes which will reduce the strength of the tooth more than 10 per cent. on motors of 100 H.P. or under, or more than 7½ per cent. for motors of 100 H.P. or over. When sand holes are detected in a tooth, a chisel with $\frac{3}{16}$-in. cutting edge should be used to determine the depth and extent, as frequently a hole which appears on the surface to be very small will be found to contain a great deal of sand. In case of blow holes the chisel should be used to open them up if possible, and then a small piece of flexible wire inserted to find the extent of the cavity to which they lead. If this cavity enlarges under a tooth or between teeth in such a manner as to affect the strength of the tooth to the extent mentioned above, the gear will be rejected. The other portions of the wheel must not contain gas, shrinkage or sand holes to affect the strength of these portions more than 10 per cent. It is the practice of some manufacturers of gears to fill gas or shrinkage holes with a mixture or compound which greatly resembles the metal itself.* This does not add to the strength of the tooth or wheel, and prevents the above inspection being made. The committee, therefore, recommend that any wheels so treated be rejected . . . The thickness of the teeth, compared one with another, must not vary more than 0·01 in. and thickness at correct pitch line must not exceed the correct thickness and must not be below the correct thickness by more than 0·010 in. . . . All gears should be stamped with the name of the manufacturer and date of manufacture in a place not subject to wear and where the same can be seen without removal of the gear.† The steel must not contain more than 0·06 per cent. of sulphur or of phosphorus, and must have the following physical properties : Tensile or ultimate strength not less than 60 000 lb. per sq. in. ; elastic limit or yield point not less than 27 000 lb. per sq. in. ; elongation in 2 in. not less than 15 per cent. ; reduction of area not less than 20 per cent.

Pinions.—Finished surface of teeth must be absolutely free from flaws of any kind. The thickness of teeth, compared one with another, must not vary more than 0·010 in., and thickness at correct pitch line must not exceed the correct thickness and must not run below correct thickness by more than 0·010 in. . . . The name of the manufacturer and date of manufacture should be stamped on the pinion in a place not subject to wear.† . . . Their physical characteristics should be as follows : Tensile strength, 110 000 lb. per sq. in. (minimum) ; elastic limit, 70 000 lb. per sq. in. (minimum) ; elongation in 2 in., 15 per cent. ; reduction of area, 20 per cent.

* No blow-holes or cracks should be filled up by electric welding before the castings have been inspected, and then only with the entire approval of the inspector.

† The correct pitch circles should be clearly marked on each side of the gear faces.

Notes on the Duplex Balancing of Long Submarine Cables.

By E. S. HEURTLEY.

The duplex balancing of long submarine cables has been made more difficult in recent years by the introduction of "magnifiers." These, in raising the speed constants from a maximum of 600 up to 1000 and over, have, in effect, necessitated the employment of a receiving instrument of much greater sensibility than has hitherto been used. This sensibility has reached such a point at the present time

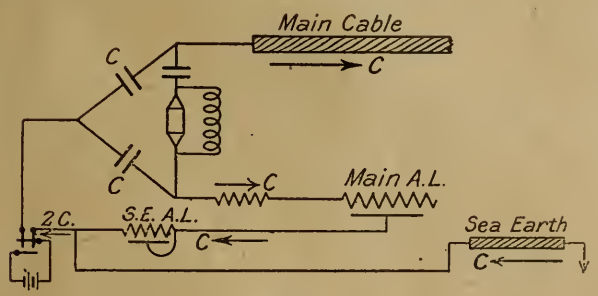

Fig. 1.

that difficulty occurs with the stability of the balance, and, even allowing for the marked improvement in this respect due to the introduction of non-temperature co-efficient artificial lines, yet the number of times that the balance needs adjustment in the twenty-four hours frequently places a limit on the degree of amplification which can be beneficially employed.

The modern practice in the case of cables of high KR is to employ a sea earth of considerable length, say ten nautical miles, in order to overcome disturbances. The earth conductor is usually twinned up with the main cable conductor, the two being covered with the protecting sheathing.

Connections for Use of Sea Earth.

The question arises as to the best method of employing this sea earth in the duplex balance, and, in considering this matter, the following points must be borne in mind :—

1. Freedom of the receiving instrument from extraneous disturbances.
2. Stability of balance.
3. Interference of the circuit on other circuits in the vicinity.

Normal Method.

The normal method of connecting up a duplex cable working "double block" is shown in Fig. 1, the arrows denoting the relative direction of the currents in the various circuits. The following points should be noted :—

1. The currents in the cable and in the sea earth are in opposite directions.
2. The earth acts as a return path for the current in the cable, and consequently any change in the resistance of the sea earth has the same effect on the balance as a similar change of resistance at the beginning of the cable.
3. The battery earth lead being part of the balanced circuit, it is absolutely essential that the sending battery and all apparatus should be maintained in a permanent state of insulation.
4. The currents in the cable and in the sea earth leads being equal in intensity and opposite in direction, the cable is neutral in its effect on other circuits in the vicinity for the distance covered by the sea earth

Alternative Method.

Fig. 2 shows an alternative method of utilising the sea earth. In this arrangement the sea earth is connected direct to the earth plate of the artificial line, and a local earth is used on the sending apparatus. This system is by no means

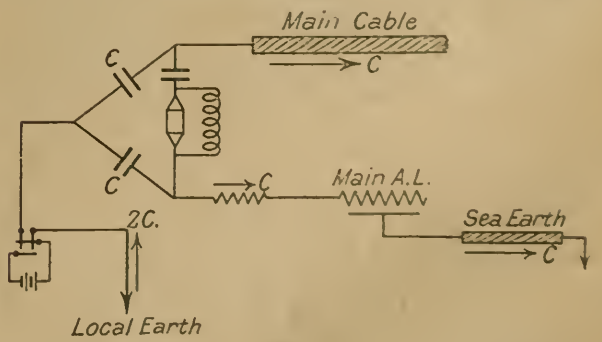

Fig. 2.

novel, having been used for a considerable period for various reasons by certain telegraph companies.

Its particular merits are not, perhaps, clearly understood, and it may be useful to mention the following points in regard

to this method of connection as compared with that depicted in Fig. 1 :—

1. The currents in the cable and in the sea earth are in the same direction.

2. The sea earth acts as a direct lead for the earth plate of the artificial line, and all the current which enters into the artificial line passes through the sea earth. Consequently, any change in the resistance of the latter affects the balance in an opposite sense to a similar change of resistance at the beginning of the cable.

3. The battery earth lead not being in a balanced circuit, good insulation of the battery and sending circuit is not important, and its variation has no effect on the steadiness of the balance.

4. When balance is obtained, and assuming equal R/S values for cable and artificial line, the currents in the cable and sea earth are equal in intensity, but, being in the same direction in both cores, the circuit

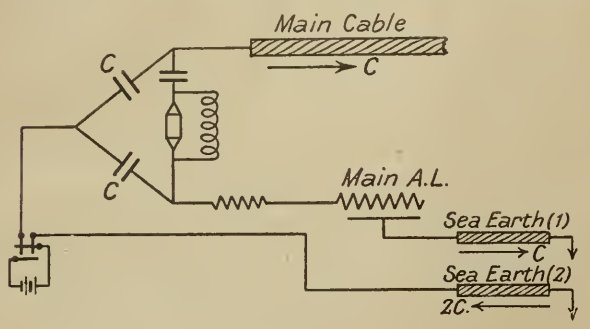

Fig. 3.

is not neutral in its effect on other circuits, and the disturbing effect *due to induction* is double that given by a single cable using a local earth.

5. Any variations in E.M.F. in the local earth enter the apex of the bridge in the same way as the current from the sending battery, and if balance is maintained it has no effect on the receiving instrument at the near station.

In the above points, paragraphs 2 and 3 outline very valuable assets in the maintenance of a stable balance on a long submarine cable.

Merits of Alternative Method.

Referring to paragraph 2, we have here an automatic compensation in the balance for changes of resistance due to temperature changes in the first part of the cable covered by the sea earth. For any change of resistance in the cable due to this cause means a similar change in the earth lead (assuming the cores to be of the same dimensions). Paragraph 3 secures that the state of the insulation of the part of the circuit which is undoubtedly the most difficult to maintain in good order (viz. :—the sending battery and apparatus)

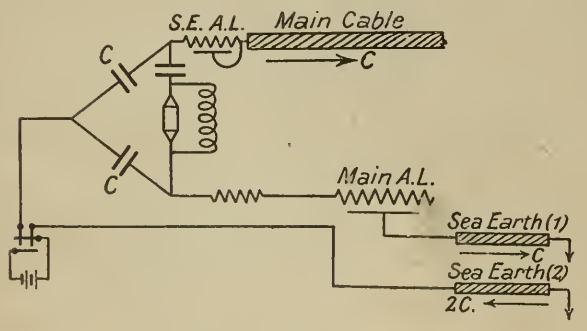

Fig. 4.

is immaterial to the maintenance of the duplex balance. Paragraph 4 is the only serious disadvantage to the use of this system as compared with that outlined in Fig. 1, and whether or not it makes the system impracticable depends on the proximity of other circuits and the sensitiveness of the receiving instruments used on them. In many cases it has been found to be of no practical importance, but where cables run in close proximity to each other for long distances, especially in underground connections, there is a probability that induction troubles would be serious.

With regard to a method of overcoming this difficulty, the best plan would undoubtedly be to earth the battery on a second earth return, which need not necessarily run the whole distance covered by the sea earth, but simply through the locality where induction troubles are likely to be met. The current in this lead will be the sum of the currents in the cable and the artificial line, and, if the capacity per nautical mile is the same as that of the other leads, the inductive effect on outside circuits should be completely neutralised. Fig. 3 shows these connections. It is interesting to note that this second sea earth being in the battery circuit, neither its resistance nor its insulation has any effect on the duplex balance, and the benefits outlined in reference to Fig. 2 are maintained without the inherent disadvantage of that system.

Compensation Arrangements.

An interesting point arises as to how the resistance and capacity of the artificial line sea earth can be compensated for in the case of systems outlined in Figs. 2 and 3; for the sea earth being in series between the earth plate of the artificial line and earth, the sea earth artificial line shown in Fig. 1 should theoretically be placed between the sheathing of the cable and the earth, which is obviously impossible.

So long, however, as the same current passes through this sea earth artificial line as passes through the cable, and so long as this artificial line is located in series with the cable and on the cable side of the receiving apparatus, its effective impedance on the outgoing current and, therefore, its effect on the balance will be the same, whether it is placed before the cable or between the earth plate of the cable and actual earth. In this way a practical means of compensating for the sea earth in the duplex balance is obtained, the artificial line for the sea earth being placed immediately before the cable as shown in Fig. 4. The writer has no hesitation in expressing the opinion that this form of duplex connections, where long sea earths are involved, will give the most stable balance, and he recommends that where cables are laid in a congested area tricore shore ends should be used, two cores being utilised for earths as explained above, and the third core for the main cable.

Leakage in Cross Circuit.

An adjustment which has been found useful in connection with balances such as these referred to and may be mentioned here, is to reduce artificially the insulation on the cable side by a high resistance, say, in the neighbourhood of 100 000 O, connected from the head of the cable to earth, which is balanced by an adjustable leak from the beginning of the artificial line. Not only has this been found a useful adjustment, but, in addition, it artificially lowers the insulation of the cross circuit, and, in this way, makes the balance less susceptible to variations due to leakage in the cross circuit.

Proposed Duty on Lighting Glassware.

Sir W. Ashley's Committee is inquiring into the application for the imposition of a tariff on imported German and Bohemian glass under Part II. of the Safeguarding of Industries Act. The application is opposed by the Glassware Section of the London Chamber of Commerce, for whom Sir A. Colefax, K.C. (and Capt. Ernest Evans, M.P.) urged that a great deal of the evidence asking for the duty was irrelevant under Part II. The object of the Act was not to stop imports from one country in order to promote them from another. Primarily the object was to help British industry, and they were not to consider helping a new manufactory to get on to its feet. The evidence clearly showed that there was no established manufactory in this country of some of the articles about which evidence had been given. He submitted that there was no importation of electric bulbs from Germany, and in regard to domestic glass, the bulk of it came from Belgium, to which country the Act did not apply.

Mr. C. G. Brooks said that the large firms in Bohemia gave quotations in English sterling. If a duty was imposed, unless the British manufacturer changed his methods he would not be able to compete successfully with Continental manufacturers.

Mr. Fernand R. Lang (proprietor of Messrs. Jules Lang & Son) thought the exchange did not affect the situation to any appreciable degree. The German exchange had collapsed, but it had not made any difference to them. His firm started making scientific glass and trained many disabled soldiers and some local labour, but they steadily lost money. He attributed that simply to the fact that the Germans were better equipped for making that kind of glass; and even if his firm got adequate protection it would take years to train their people, without reckoning the loss in the meantime.

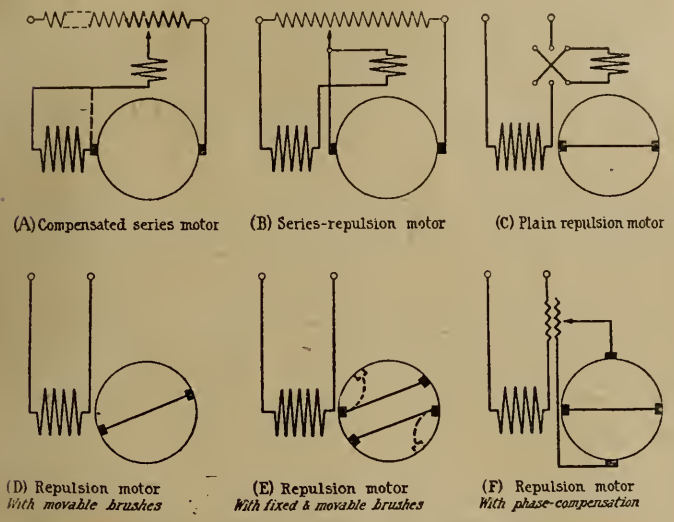
On Tuesday Mr. B. L. Cohen, Mr. J. Collyer and Mr. P. C. Gunningham also gave evidence against the duty.

"Single- and Three-Phase Alternating-Current Commutator Motors with Series and Shunt Characteristics."*

By STANLEY PARKER SMITH, D.Sc.

In this lecture Dr. Smith deals succinctly with the electrical and mechanical characteristics of single-phase and three-phase series and shunt alternating current commutator motors. These machines, though interesting theoretically, possess certain grave practical difficulties from both the designer's and manufacturer's point of view. Though, therefore, they were invented some years ago, their commercial development has been slow, until recent demands for alternating-current motors have lead to their possibilities being further considered. The lecture was, therefore, a timely contribution to our knowledge of this subject, and should form a firm stepping stone to further progress.

Owing to the rapid growth of alternating-current networks, there is an increasing demand for suitable a.c. motors possessing high power factor, large starting torque, and economical speed regulation. From the manufacturer's and designer's point of view these machines are most unpopular; but, from the inventor's and scholar's point of view, they are probably the most interesting of all.



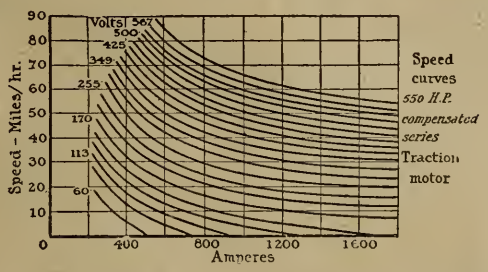


FIG. 1.—SINGLE-PHASE MOTORS WITH SERIES CHARACTERISTICS.

It is desirable to speak about these machines, because, though a good deal was published about them so long ago, it had almost been forgotten. The need for these machines is becoming urgent on account of the growing demand for a.c. motors.

Non-Commutator Types.

Non-commutator types of a.c. motors include the synchronous motor and the induction motor.

In the synchronous motor, powerful starting torque is obtained by winding the rotor as an induction motor, or, with the salient-pole construction, by arranging the damping winding so that the cross-flux at starting becomes approximately equal to the main flux. Power factor can be varied by adjustment of exciting current; d.c. supply is thus necessary, and speed control is impracticable. This type is seldom used on single-phase supply.

In the induction motor the above requirements are not feasible with single-phase induction motors, but polyphase induction motors can be made to satisfy demands. Power-factor rectification is possible by means of a phase-advancer of either the revolving or vibratory type. A commutator is essential.

A large starting torque demands high power factor during starting, but the power taken from the mains is proportional to the torque, and not to the output. Economical speed variation of a single machine entails a change in the number of poles, is achieved by regrouping the coils or phases, or by varying the phase angle (as in Creedy's method), or by cascade devices (as in Hunt's and Creedy's methods). The addition of a second, or cascade, motor introduces further possibilities.

By these means, multi-speed motors can be made to give 2, 3, 4, 5 or 6 constant speeds (shunt characteristics); but in some cases at the expense of high power factor and large starting torque. Further, gradual or continuous economical speed variation is impracticable.

Commutator Motors.

Since phenomena in the conductors are always reproduced at the commutator brushes (independent of sense or speed of rotation) it is possible to connect field and armature windings in series or parallel, although inductive effects may entail modifications with a.c. In principle, the commutator motor is well adapted for economical speed control and large starting torque. In many cases phase-advancement can also be obtained.

Considering, for simplicity, the d.c. motor, the speed is proportional to $\frac{\text{supply voltage} - \text{pressure-drop}}{\text{flux}}$, and the torque depends on the product of the armature current and flux.

Speed regulation by series resistance is uneconomical, but the speed can be controlled by varying either voltage or field.

With a single machine, voltage control is impracticable with direct current, but, with alternating current, a variable-ratio transformer or other device can be used.

With field control (the only economical method for a single d.c. motor), the torque varies inversely as the speed, assuming constant armature current; hence the output remains constant over the whole speed-range, and a variable speed d.c. motor must be

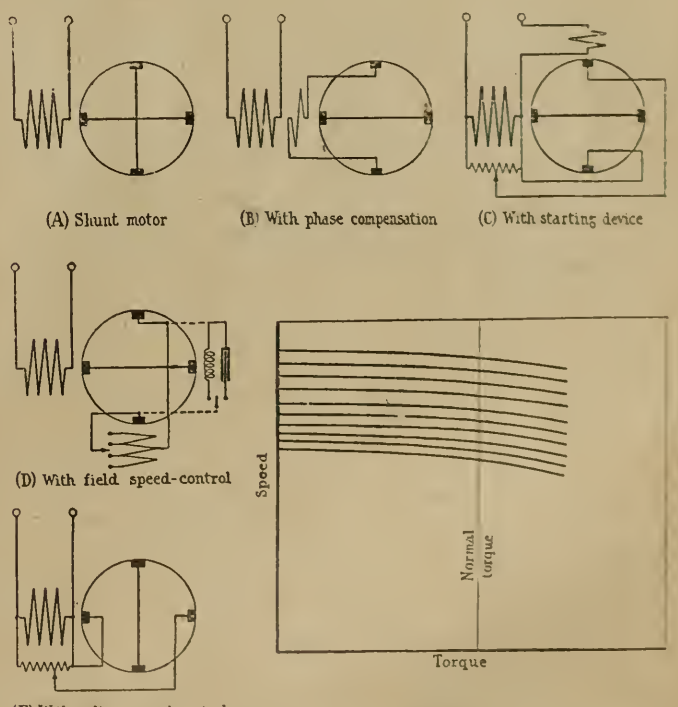

FIG. 2.—SINGLE-PHASE SHUNT MOTORS.

designed for full output at lowest speed; at all higher speeds the material cannot be efficiently utilised.

With voltage control (possible with a.c. motors), both field and armature current can be kept constant over the whole speed-range. A constant torque is maintained, and the output is proportional to the speed, enabling the material to be fully utilised over the whole

*Abstract of a lecture delivered before the Institution of Electrical Engineers.

working range and corresponding more closely to the load characteristics of usual drives.

Alternating-Current Commutator Motors.

The a.c. commutator motors in practice unite most of the drawbacks of both d.c. motors and induction motors. And short circuiting by the brushes of the transformer E.M.F. induced in the coils predominantly affects the design. Therefore the "air-gap" must be

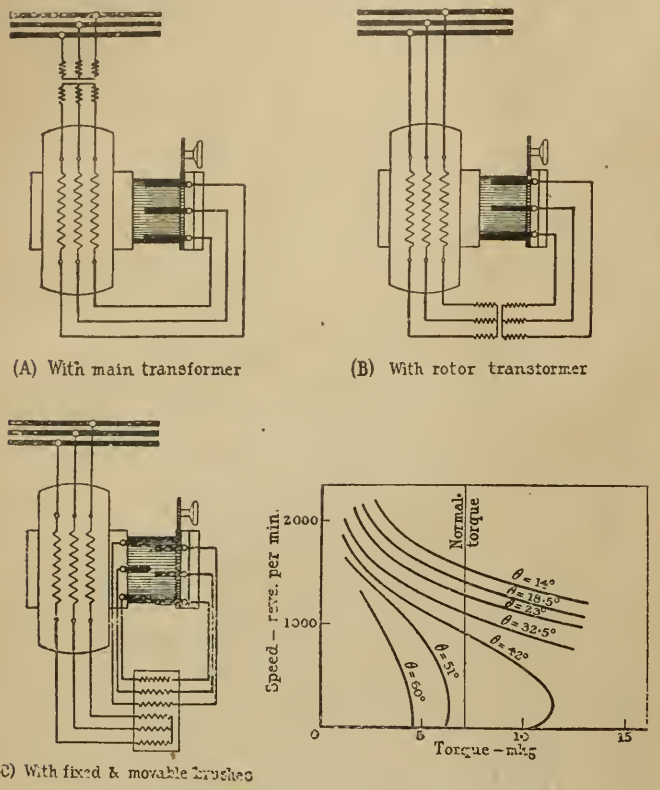

Fig. 3.—Three-Phase Series Commutator Motors.

short, the armature reaction compensated, and a low commutator voltage used—sometimes at the cost of a transformer.

Figs. 1 to 5 illustrate types of motors of practical importance. The first mention of the fact that the laminated series motor could work with a.c. current, appears to have been made by Alexander Siemens in 1884, in a discussion at a meeting of the Society of Telegraph Engineers; the polyphase commutator motor was patented by Ernest Wilson in 1888 (E. P. 18 525). About the same time Wightman in America discovered rotor excitation. In 1898, Ll. B. Atkinson showed how the single-phase commutator motor could be made to yield a shunt characteristic. The invention of the induction motor by Ferraris and by Tesla, in 1885-86, and its rapid development, indicate the inherent difficulties of a.c. commutator motors.

Single-Phase Commutator Motors.

Single-phase motors with series characteristics are illustrated in Fig. 1. The more rapid development of these types is attributable to their relative simplicity, and the incentive afforded by the prospects of railway electrification.

The compensated series motor has ousted all other types as a single-phase traction motor. For this work the transformer E.M.F. in the short-circuited coil is usually neutralized by a rotational E.M.F. induced by the flux produced by an interpole winding shunted by a resistance and excited by the main current. This gives the motor a very wide speed-range. The speed is controlled from rest by means of a variable-ratio transformer. High power factor is obtained by designing the motor with a weak field and a strong armature magneto-motive force, by working well above a synchronous speed, and by reducing inductive effects. On Continental single-phase railways, inductive effects are reduced by adopting a frequency of $16\frac{2}{3}$ periods per second. The compensating winding may be joined in series with the armature winding, or it may be short-circuited on itself. Motors for 500 h.p. are common and 3 000 h.p. has been attained. About 40 to 80 h.p. per pole is usual for large motors.

In the series-repulsion (or doubly-fed) types, power is supplied to both stator and rotor. However, this type has practically given place to the compensated series type.

In the plain repulsion motor all the power is transferred inductively to the rotor. The rotor voltage can be fixed independently so that no transformer is needed. At synchronous speed the transformer flux is correct for neutralizing the inductive effects of the exciting flux on the short-circuited coils; hence commutation conditions resemble those in a d.c. machine. At other speeds, especially at hyper-synchronous ones, the magnitude of this flux is not correct, so that all motors of the repulsion type are ill-suited for wide speed-ranges. The repulsion motor has a series characteristic because the exciting flux is produced by the main current.

Combining the two stator windings in the plain repulsion motor, the common repulsion motor with movable brushes is obtained. The brushes are in the short-circuited position when the brush axis coincides with the axis of the stator winding, in the neutral position when the brush axis is perpendicular thereto. In both positions the torque is zero. If the brushes are in the neutral position, no stator is required. The line voltage is applied to the stator winding and the motor begins to revolve in the opposite direction to that in which the brushes are moved. Thus both transformer and starter can be dispensed with.

By splitting the brushes into a fixed and a movable set, the brush shift is doubled, and finer speed regulation can be obtained. Further, no flux embraces the short-circuited coils when the brushes are in the neutral position.

Phase compensation is obtained by rotor excitation. These motors were used on the original electric rolling stock of the Brighton Railway, being practically the only type then available. The necessity of working near synchronous speed is a drawback, and the compensated series motor has replaced this motor for traction work.

Experimental Demonstration.

The characteristics of a single-phase series motor were demonstrated on an Oerlikon experimental machine which had two sets of brush gear, with which about eight series speed characteristics could be obtained for various tappings when run as a repulsion motor. The speed was varied by shifting the brushes, and the machine was reversed by putting the brushes in the other direction. By altering the connection again, the machine could be run as a shunt motor, the brushes being shifted, as in the repulsion motor, to make it start. When it reached about synchronous speed, the brushes were brought back into neutral. By applying the pressure in one direction the speed was raised above synchronism, and, by reversing it, it was brought below. The speed dropped slowly as the load was applied.

The motor would not work with a connection such as was used in a d.c. motor, because when a conductor left the top zone, as the

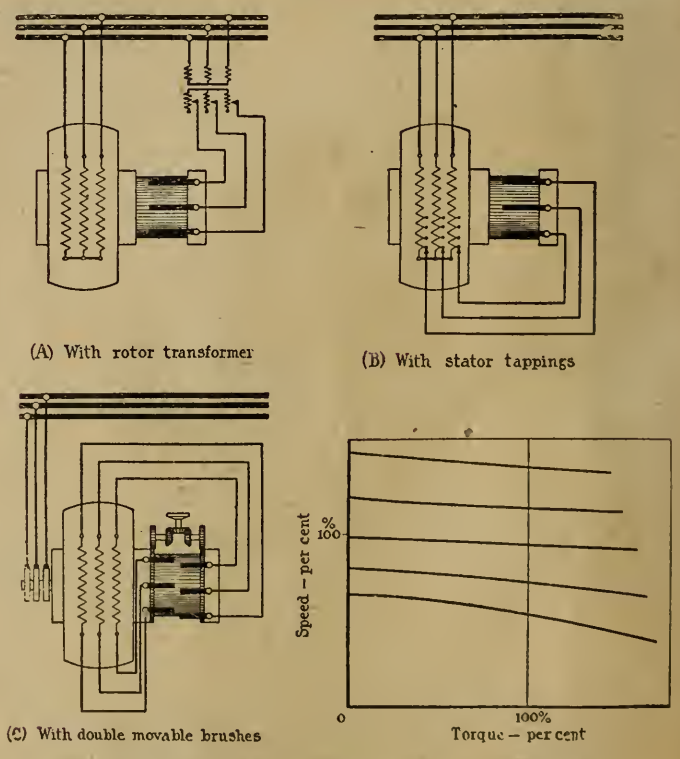

Fig. 4.—Three-Phase Shunt Commutator Motors.

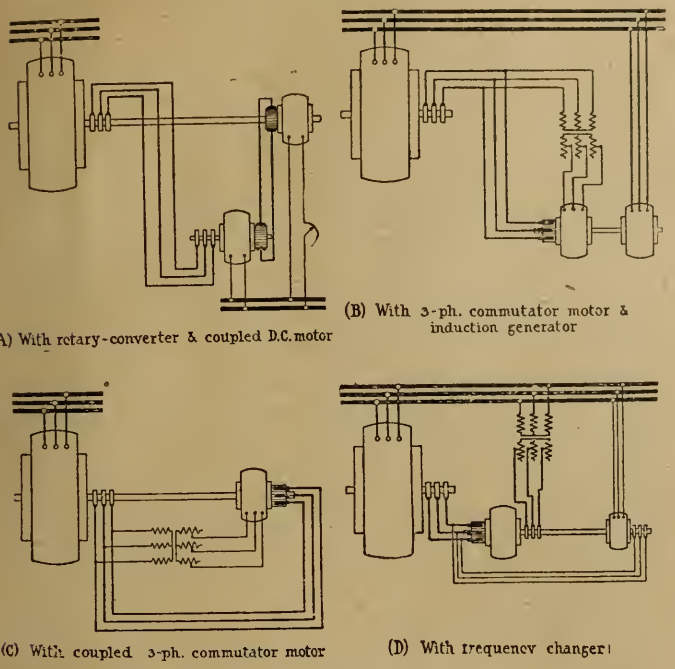
armature rotated, it entered the bottom zone, and there was always a constant number of conductors in any part of the field, so that the fixed brushes would pick up what was taking place in that zone. Consequently the flux was steady and a steady E.M.F. was picked up. If there was an alternating flux, pulsating with a frequency of 25,

there would be a frequency of 25 between the brushes. In a d.c. machine the field winding could be connected either in series or in parallel with the armature, as the commutator acted as a frequency changer and the frequency of the pressure induced in the armature conductors was therefore converted to the frequency in the field system. The reason, therefore, that this machine would not work with a simple shunt connection was that, in order to get power, there must be an E.M.F. of rotation along the axis of the power component of the current. Mr. Atkinson obtained that by putting on another pair of brushes and providing a flux which secured an E.M.F. of rotation along the axis of the excitation flux, and then the E.M.F. of rotation along the vertical axis, combined with the current, gave the torque on which the action of the motor depended.

There was no doubt these a.c. commutator motors had all the drawbacks of the d.c. motor and the induction motor, in addition



(A) With rotary-converter & coupled D.C. motor

(B) With 3-ph. commutator motor & induction generator

(C) With coupled 3-ph. commutator motor

(D) With frequency changer

FIG. 5.—VARIABLE-SPEED SETS.

to a still greater evil. It was really a successful achievement that satisfactory a.c. commutator motors had been built, and he was sorry that our own firms and designers had done practically nothing in that direction. Except for what Mr. Creedy and a few others had done, these machines had been developed in other countries, although the pioneer types were invented in this country.

As regards single-phase motors with shunt characteristics, the shunt motor needs both main and exciting brushes.

The plain shunt motor is inferior to the single-phase induction motor. It possesses no starting torque; efficiency and power factor are lower, and the motor runs merely at one speed, *i.e.* synchronism. Some methods of overcoming these drawbacks are illustrated in Fig. 2.

Phase correction is obtained by injecting a fraction of the applied pressure into the exciting circuit.

A large starting torque is obtained by letting the motor run up to speed as a repulsion motor. The machine can then run as a single-phase induction motor. It is now usual to combine devices (B) and (C) in order to obtain a constant-speed single-phase motor with high-power factor and large starting torque.

Speed regulation is obtained by varying the exciting flux. An inductance is used to raise the speed; a capacity to lower it; or an auxiliary winding can be used.

In the doubly-fed type the speed is varied by regulating the pressure applied to the brushes in the transformer axis. This motor, the series-repulsion motor and the three-phase commutator types, belong to the class in which energy is supplied to both stator and rotor, power relations being definitely associated with synchronous speed.

Three-Phase Commutator Motors.

The use of a commutator with the rotor of the three-phase induction motor raises the frequency of the slip energy to the frequency of the supply. Hence this energy can be taken from, or returned to, the supply network, according as the speed is above or below synchronism.

The speed of the three-phase series motor is controlled by shifting the brushes. The direction of rotation is independent of the sense of the rotary field. If the motor, with a fixed ratio of stator to rotor turns, is designed for a high power factor, instability occurs at low speeds (*see* Fig. 3). A transformer is usually necessary to obtain the low rotor voltage.

A main transformer, rated for full power, is usually necessary only for severe conditions.

A rotor transformer, rated for the slip power only, is often all that is needed. If this transformer becomes saturated at a certain value of the rotor voltage (*i.e.* at a certain speed), racing can be prevented.

Where stability over the whole speed-range and a high power factor are needed, the ratio of the stator to the rotor turns can be decreased, as the speed rises, by one-half of the brushes being fixed and the other half movable.

Whereas the repulsion motor is the simplest type of single-phase commutator motor, the three-phase series motor is the simplest type of three-phase commutator motor.

The three-phase series motors had, however, the peculiar characteristic that there was an instabilty at low speeds, though there was a high power factor at high speeds. A device for overcoming the instability at low speeds was to use tappings on the stator winding, which served the same function as a transformer.

With Shunt Characteristics.

The speed of the three-phase shunt motor is varied by supplying a pressure to the rotor brushes, and the brushes are rocked through 180 deg. to pass from sub-synchronous to hyper-synchronous speed. The connections are shown in Fig. 4.

A variable-ratio rotor transformer, capable of transmitting the slip power to or from the commutator brushes, fixes the speed. A special connection can be used for altering the phase of the transformer voltage in order raise the power factor.

Sometimes it is possible to obtain a desired rotor pressure by taking tappings off stator windings.

Where gradual speeed control is required, brushes can be arranged in two equal sets, both movable and connected to the separate stator phases. Power is supplied through slip-rings to the rotor, while a special regulating winding may be employed as the commutator winding. Every brush position corresponds to a definite pressure and speed.

In the types of three-phase shunt motor previously mentioned, and in the three-phase series motors, the transformer E.M.F. becomes zero at synchronism, but in this machine it remains the same at all speeds, because the frequency of the current in the rotor winding is always that of the supply. In this respect the motor resembles the single-phase series motor; but in the latter the transformer E.M.F. can be neutralized, whereas in the former it cannot be. The relative motion between the revolving field and the rotor is constant, and at synchronism the frequency of the E.M.F. induced in the stator winding is zero. By starting from the neutral position, a starter can be dispensed with. Phase compensation is obtained by shifting the two sets of brushes unequally. The direction of rotation of three-phase shunt motors is changed as in an induction motor, *i.e.*, by reversing two stator leads.

Variable-Speed Sets.

Assuming from 15 to 20 H.P. per pole as a desirable limit for the output of a three-phase commutator motor, such motors cannot well be built for outputs above 300 to 500 H.P. However, it is often only desired to use the slip power of a large induction motor having a limited speed-range. The three-phase commutator motor is well suited to fulfil these conditions. Various ways of using the slip power are shown in Fig. 5. In many cases, phase compensation in the main motor is also aimed at. When the auxiliary motor is mechanically coupled to the main motor, the drive is suitable for constant output over the whole speed-range; otherwise it is suitable for constant torque. It is desirable to arrange that synchronous speed shall be in the middle of the speed-range, so that the rating of the auxiliary machines can be correspondingly diminished.

A Merseyside Confederation.

A definite step towards a MERSEYSIDE CONFEDERATION was taken at a meeting of Liverpool City Council last week when a resolution, proposed by Sir Archibald Salvidge for the formation of a special committee to confer with Government Departments and local authorities on both sides of the Mersey with a view to securing co-operation, co-ordination and (or) federation, with greater efficiency and economy in the control of local services and the improvement of cross-river communication by means of a bridge or tunnel, was carried unanimously. In his speech Sir Archibald referred to such matters as road traffic, tramways, electricity supply, &c. He did not suggest that any of these matters ought to be controlled in all their details by one central authority, but his view was that for the purpose of ensuring efficiency and economy the policy might with advantage be guided in all these matters by a central authority in whose hands would thus fall in large measure the control of finance, and to an extent, rating, in the areas of all the communities, leaving the constituent authorities their existing operating powers.

The Institution of Electrical Engineers.

There was a fairly full attendance at the meeting of the Institution of Electrical Engineers on Thursday in last week when Dr. Stanley Parker Smith delivered a lecture on "Single and Three-Phase Alternating Current Commutator Motors with Series and Shunt Characteristics."

The Library—Hours of Opening.

The President opened the meeting by saying that it had been found that though the library was well attended on the evening of meeting nights, on other evenings those taking advantage of the facilities were very few. It had therefore been decided to keep the library open on meeting nights, but to close it on other nights of the week.

On another page of this issue we give an account of Dr. Smith's lecture, this account being based to a large extent on the printed notes circulated beforehand, though some supplementary information which the lecturer gave in the course of his extempore remarks has been included. At the conclusion of the lecture which lasted about an hour and a quarter and was accompanied by a number of practical demonstrations, the President called upon Mr. F. Creedy to open the discussion. No better choice could have been made as Mr. Creedy has probably done more than any other British electrical engineer to bring the particular type of motor with which the lecturer dealt to a practical stage.

Some Practical Aspects.

Mr. F. Creedy therefore somewhat naturally confined his remarks to practical questions. He pointed out that it was possible to overcome the difficulty of transformer voltage being induced between the commutator segments by running the machine at nearly synchronous speed. The voltage between the secondaries was then purely a reactance voltage, as in the direct current machine, while the starting torque and power factor could be favourably compared with those of other types of single phase motors. Comparing the performance of single phase and direct current motors he pointed out that in the smaller sizes, *i.e.*, about 5 h.p., the efficiency of the former was only about 5 per cent. less that that of the direct current motor, while in the large sizes up to about 35 h.p. the difference was only about 3 per cent..

As regards weight the direct current motor was heavier than the single-phase motor of 1914 design by about 10 per cent. throughout the whole range of sizes, but the weight of the modern single phase motor was only about two-thirds of that of the corresponding direct current motor. In sizes up to 25 h.p. the cost of the single-phase commutator motor was from about 4 to 10 per cent. more than that of the direct current motor and this difference increased with the size. The single-phase motor of up-to-date design was smaller than the direct current motor of the same output. In variable speed machines it was necessary to keep the commutator voltage relatively low, say less than 100 V with outputs of 100 h.p. on a 50 cycle circuit. When the machine was operated constantly at near synchronous speed, however, the commutator voltage could be at least doubled or alternatively the commutator size could be halved, an arrangement which reduced loss and so increased the efficiency.

The British Designer Vindicated.

English firms had not undertaken the manufacture of a.c. commutator motors, not because they were lazy, but because they had been busily engaged in doing something else. The cascade motor at least was entirely a British product, and in any event, as the polyphase induction motor was an ideal form of drive, it was hardly necessary for them to sacrifice all its advantages when to do so was quite unnecessary. Neither did he agree with Dr. Smith that the commutator machine was the worst of all machines from a practical point of view.

Some Practical Machines.

Concluding, Mr. Creedy showed a slide of a multi-speed induction motor which gave six variable speeds and was operated very simply by means of a drum controller. Speed changes were obtained by altering the number of poles so that with 8 poles the motor started with 1·7 times the full load current and twice the full load torque, while with four poles it started with three times the full load torque and nearly eight times the full load current. An actual motor which could run at three speeds 1 000, 1 500 and 1 750 revs. per min. was exhibited.

Conditions in 1898.

Mr. Llewelyn Atkinson said that as far as he remembered the only previous occasion on which these motors had been the subject of discussion was when Mr. Creedy, as a student of the Institution, read a paper on commutator motors which gave a great deal of information.* He himself in 1898, on the occasion to which Dr. Smith had referred, had made the mistake of reading his paper before the Institution of Civil Engineers† from whose proceedings it was only unearthed by people who were specially interested. It should be noted that in 1898 the commutator was still a great trouble to designers, even of direct current machines, with the result that everyone was looking forward to a deliverance from their afflictions by obtaining a polyphase motor which had no commutator. For this reason he had found it very difficult to get manufacturers either in this country or elsewhere to carry out the necessary experimental work. The result was that his patents had been dropped to his own great financial disadvantage and to the disgust especially of German designers.

Conditions in 1921.

Even to-day the position had not changed very much, for notwithstanding the enormous advantage of using a variable pressure on the commutator no English engineer except Sir Philip Dawson had seen the advantage of using this type of motor for long distance electrification. Nevertheless, it was his (Mr. Atkinson's) opinion that for main line electrification high pressure alternating currents would have to be used, and that the employment of a motor of the type which they had been discussing that evening was therefore ensured. The same might be said for more general work where the low power factor of the induction motor gave rise to grave difficulties at the generating station and on the network. These difficulties were overcome by the use of the commutator motor with compensated windings or by injecting a compensated E.M.F. to obtain unity power factor. If supply engineers in this country altered their tariffs so that the buyer paid not for watts but for volt-amperes it would necessarily mean a revival in the use of these compensated motors and a saving in the capital now wasted in stations and mains. He thought that Dr. Smith had perhaps inadvertently used the word "compensation" in two different senses; one of the compensations was the balancing of the flux to reduce the reactance and the other was the compensation of the phase position. For the latter the term phase compensation was best, while for the other phase neutralisation would be a convenient expression. Dr. Smith had said that he did not know what repulsion meant. In his (Mr. Atkinson's) view it did not mean anything, the only repulsive thing about these motors being their names.

Results on the Brighton Railway.

Sir Philip Dawson said that since he first undertook heavy railway electrification fifteen years ago this was the first time he had heard anything good said about the single phase system. He was also glad to see that the fiction that the single phase machine was a foreign invention had been exploded. The results of tests which had recently been undertaken on the Brighton railway showed that the system of speed control employed gave a more even rate of acceleration than direct current would permit. He agreed with Dr. Smith that the compensated motor was best adapted for general applications and pointed out that comparisons as to the relative cost of single phase and direct current traction should not be made between modern equipment and that employed on the Brighton line. For instance, with the original motors the brushes lasted from 6 000 to 7 000, and sometimes attained 11 000 miles, while with the improved type of motor this figure rose to 40 000 or 50 000 miles.

Although commutation was not altogether good with the motors used on the Brighton railway, the average mileage of a motor coach was over 50 000 miles a year, and with this mileage the life of a commutator was about ten years. In the period under review the relative cost of alternating current and direct current equipment had altered considerably and at the present time alternating current equipment was only about 15 to 20 per cent. more expensive than 750 V direct current equipment.

It had been decided to use single phase traction in Switzerland, Sweden, Norway, Germany, Austria and some parts of the United States; the question of the system to employ was now-a-days purely financial. He had signed the unanimous report of the Railways Electrification Advisory Committee because it left the door open to any railway company to apply to the Ministry of Transport for permission to use a different system than the high tension direct current systems.

"Little Billie."

Prof. Ernest Wilson gave some details of his original alternating current commutator motor which according to the President was known to the students [of King's College, as "Little Billie." This motor resembled an ordinary direct current motor in that it possessed an armature with a commutator and a stator made up of laminated stampings with four polar projections. The motor originally was constructed for two-phase working, as in those days it was difficult to get polyphase currents, but the principle was

*See The Electrician, Vol. LV., pp. 21, 46, 85.

†See The Electrician, Vol. XL., p. 714.

generally applicable to all alternating current motors. The polar projections were wound with coils, and on each was a second winding which could be used as a transformer if necessary. The brushes could be moved relatively to one another when the machine was used as a repulsion motor.

Mr. F. J. Teago gave some details of a Schräger three-phase commutator induction motor and of a Scherbius motor which he had recently had under test.

Dr. S. P. Smith in reply said that having regard to the fact that the greater part of Europe had decided to use single phase traction, and that British railways would need the same system for their long distance lines where the traffic was sparse, the Brighton railway should be required to extend their electrification to Brighton as early as possible, and the work should be done only by British firms in order that they could be in a position to compete for future tenders.

Discussion in Newcastle.

In the course of the discussion which recently took place on Dr. Smith's lecture in Newcastle, Mr. F. H. Downie said a low frequency had an advantage with commutator motors as the size of the motor increased with the frequency.

Mr. A. T. Robertson explained that one of the difficulties in connection with the manufacture of a.c. commutator motors was the prodigious number of patents which had been taken out, and the danger of infringement. This was responsible to a large extent for the disinclination of manufacturers to build these motors. The speaker asked for information as to the use of a three-phase repulsion motor, capable of phase transformation, which was described in The Electrician in 1914, but this information was not forthcoming. Referring to the direction of rotation of the motor being independent of the sense of the rotary field, Mr. Robertson asked whether all a.c. commutator motors did not actually run with the rotation in the same direction as the rotation of the field, so that the frequency of the secondary circuit should always be less than the frequency of the primary circuit.

Mr. A. B. McLean said that the application of commutator motors to rolling mill reversing equipment or to winders was hampered by fact that the size of the auxiliary machines was comparable with the size of the main motor. This made any saving in running or capital costs over the Ward Leonard equipment very doubtful.

Mr. P. F. Allan thought the author was unduly severe on d.c. railway motors. The supposed extra weight was in the best possible position, well below the centre of gravity, whilst the use of a transformer fixed some height above the bogies would transfer some of this weight to a position above the centre of gravity. Whether commutating motors would prove more advantageous than the Ward-Leonard system was doubtful, whilst the problem of reversal was an additional disadvantage of such motors.

Mr. H. B. Poynder considered that the author was hard on the tap field arrangement for traction motors, and pointed out that with traction motors on a suburban system the maximum horse power was not required at maximum speed.

Dr. S. P. Smith in reply said in the early days of design efforts were directed towards the suppression of the transformer E.M.F. and the commutation was left to look after itself; now with the use of interpoles, both the reaction pressure and the transformer E.M.F. were suppressed. The direction of rotation of the series motor was always against the rotating field. The Ward-Leonard set gave excellent control and the automatic features were good, but it was a clumsy, costly and uneconomical arrangement which it was a pity could not be dispensed with.

Annual Exhibition of the Physical Society of London and the Optical Society.

The annual exhibition of the Physical Society and Optical Society was held on Wednesday and Thursday last week at the Imperial College of Science, London, and provided a great deal of interest.

Discourses were given by Sir Frank Dyson (Astronomer Royal) on the "Employment of Coarse Wire Gratings in Astronomy," by Mr. F. H. Glew on "Radium: its Application in Peace and War," and by Mr. A. A. Campbell Swinton on the "Johnsen-Rahbek Electrostatic Telephone and its Predecessors." Our readers will have been mostly attracted by the last named, which was delivered twice. The loudness with which conversation from an ordinary transmitter and wireless signals from various stations were reproduced was surprising. Dr. F. L. Hopwood also showed some interesting optical experiments.

There was a large attendance, and the time available was by no means more than sufficient for a detailed inspection of the apparatus shown by the fifty-five firms who exhibited. In what follows we give an account of the more novel exhibits of electrical interest.

The Emergency Alarm of the Marconi Company.

Much interest has been aroused recently in the emergency alarm introduced by the Marconi Company for use on board ship. The importance of such a device is that by its use the continuous attendance of an operator is rendered unnecessary, and consequently the *personnel* can be reduced. Visitors had the advantage not merely of seeing the alarm, but of proving for themselves that it is not affected by ordinary signals.

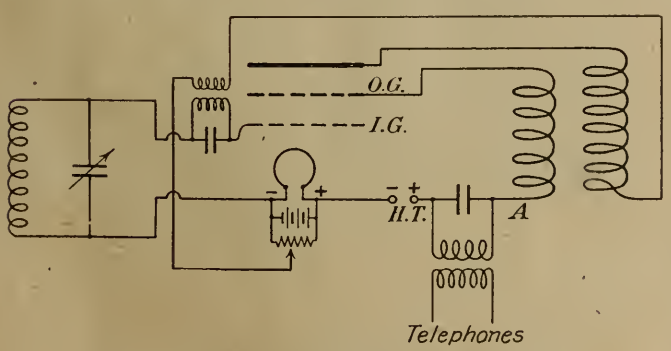


Fig. 1—Diagram of Four-Electrode Amplifier.

The device consists of a relay which serves to actuate two other relays; the action of the latter under the proper conditions causes a bell or bells to ring. In the following description, in order to avoid confusion, we shall speak of the first relay as "the relay," and shall refer to the subsidiary relays as "contact arms."

The Application of Four-Electrode Valves.

For the purpose of actuating the relay a four-electrode valve is used. Considering first the amplifier for ordinary reception, an extra terminal is fitted at a point in the H.T. circuit where the maximum change in voltage occurs. This is found to be at the point marked A in Fig. 1 (which applies to a four-electrode valve so used). The point A is connected through a condenser to the inner grid IG of a four-electrode valve actuating the relay. The arrangement of this valve is shown diagrammatically in Fig. 2. From this it will be seen that the outer grid OG is connected through a transformer T in series with a coil C to the H.T. battery. When the normal H.T. current (about half a milliampere) is flowing through this coil the tongue B of the relay is attracted into contact with the spacing stop S. When, however, a sufficiently strong signal is received the inner grid becomes sharply negative and the H.T. current is thus much reduced. The current from the plate to the filament is also reduced, and as this current is taken through the transformer T, this reduction is made to introduce a further momentary back E.M.F. in the H.T. circuit, so that there is a very marked reduction in the current through the coil C, sufficient to cause the relay tongue to fall on to the marking contact M. The making of this contact releases the negative charge on the inner grid, and consequently the current from the outer grid through the relay coil begins to grow again until the tongue of the relay leaves the marking stop. But if the signal is still going on, the inner grid then again becomes negative and the relay tongue falls back on to the marking stop as before, so that a continuous

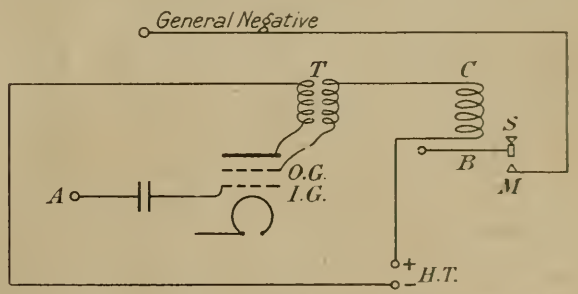

Fig. 2—Diagram of Four-Electrode Valve for Relay.

chatter results. When the signal ceases the tongue is able to rise to the spacing stop, where it will remain until another signal of sufficient strength arrives. The relay is thus self-restoring.

Some Difficulties in Responding to a Code.

There is, of course, no difficulty in merely arranging for a relay to be actuated by the variation of the current from the H.T. battery, but it is a much more serious matter to devise an arrangement which shall respond only to a prearranged code and be

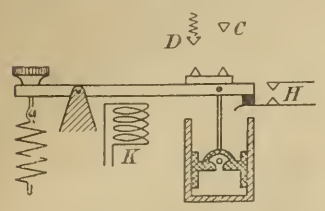

Fig. 3—Contact Arm No. 1.

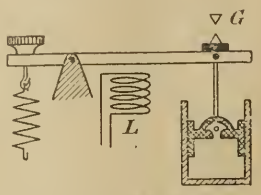

Fig. 4—Contact Arm No. 2.

insensitive to the ordinary signals. Briefly, the method adopted in the present device depends upon two selectors which pass through a cycle of operations in a certain time. Any strong signal is sufficient to start this cycle, but the cycle will only continue under a prolonged dash, and will only be completed if the dash is maintained for a definite period (within limits) followed by a space for a definite time. This cycle must be repeated three times for the bells to ring.

The arrangement will be best understood by referring to Figs. 3 to 6. The device may be said to consist essentially of three parts, namely, two contact arms with dashpots and a ratchet-operated contact, indicated in Figs. 3 to 5. There are two pawls, one for pulling the wheel round and the other for holding it against the action of a spring which would pull it back into its zero position. Fig. 6 is a simple diagram of connections, and shows the way in which these three parts are inter-connected.

Effect of a Strong Signal.

So long as the relay tongue is against the spacing stop a current flows from a local battery through the magnet coil K of contact arm No. 1 (Fig. 3), so that the normal position of this arm is down. But as soon as a strong signal causes the relay tongue to leave the

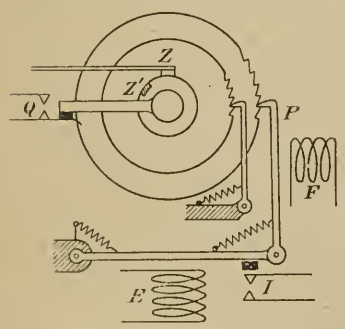

Fig. 5—Contact Disc.

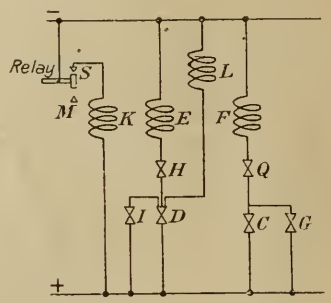

Fig. 6—Electrical Connections.

spacing stop this current is interrupted and the contact arm proceeds to rise, due to the spiral spring on the left. The movement of the arm, however, is slow, owing to the dashpot seen on the right. This consists simply of a piston sliding in a cylinder, the piston being fitted with a small ball valve, so that an upward movement is slow but a downward movement is quick, since the valve causes very little obstruction to the air when escaping. The time taken for the piston to rise the full height is five seconds.

The "Normal Emergency" Call.

The normal emergency call will consist of three dashes, each of four seconds, separated by spaces of one second, but these intervals may have rather large "tolerances."

When the first dash arrives the contact arm No. 1 begins to rise, and in doing so permits the contacts H to close. The importance of this will be seen later. A contact D is arranged at such a height as to be closed by the arm at the end of three seconds. Consequently if the dash lasts for not less than three seconds the contact D is made, and by referring to Fig. 6 it will be seen that this permits a current to flow through the coil E in Fig. 5 (H being already closed) and through L in Fig. 4. Consequently the lower limit for the dash is three seconds. If the dash lasts for a shorter time than this, the relay goes back to the spacing stop, the coil K is energised, and arm No. 1 is pulled down again before the contact D is reached. The effect of energising the coil L is to pull down arm No. 2 from the contact G (which is the normal position), and the effect of energising coil E is to pull down the pawl P, so that the wheel is brought round one step and held there, and the contact Q (which is in series with coil F) is made.

If the dash then terminates, the arm No. 1 is pulled down again by the relay, so that contacts D and finally H are broken. Consequently the coil E is de-energised, the pawl P rises to its original position ready for a further step, and the contact I is broken. It will be noticed that D and I are in parallel. Consequently coil L is still energised so long as coil E is energised, even though contact D is broken. It is only when arm No. 1 has fallen and broken contact H that coil L becomes de-energised through the action of coil E.

Thus, when arm No. 1 reaches the bottom of its stroke, arm No. 2 is liberated and begins to rise. This arm is adjusted so as to complete its stroke in 5 sec., by which time contact G is made. If this happens, the pawls are pulled out by the coil F and the wheel

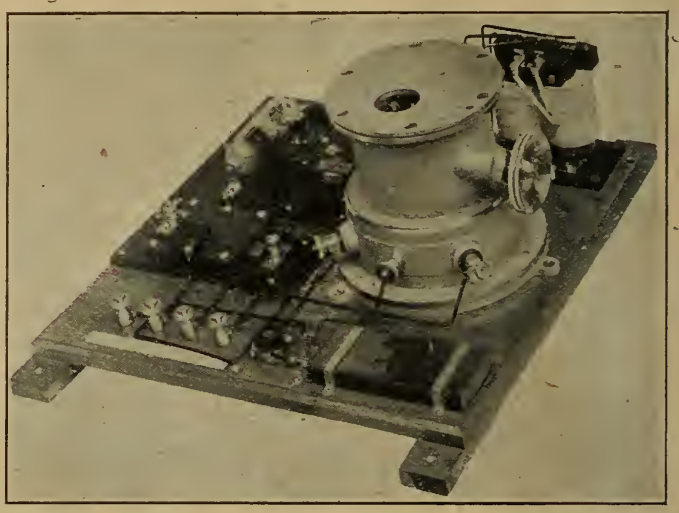

Fig 7—Relay Board of Marconi Automatic Alarm, showing Four-Electrode Valves Relay.

returns to its zero position. This would be the case if a normal dash were followed by a space of 5 sec. or more; the apparatus would be simply reset.

Time Element Devices.

Returning to arm No. 1, it will be noticed that there is a second contact C. Contact D is fixed on a spring; it is reached in 3 sec., as already stated, but does not stop the arm rising further, and so the contact C is reached in 5 sec. Contacts C and G are in parallel. Thus a dash must be between 3 sec. and 5 sec., for if it is less than 3 sec., contact D will not be reached, and if it is more than 5 sec. contact C will reset the contact wheel.

Assuming that the signal is being properly made, the first dash will be followed by a space of about 1 sec., followed in its turn by another dash of about 4 sec. As soon as the space starts (or, more correctly, as soon as arm No. 1 reaches zero position after

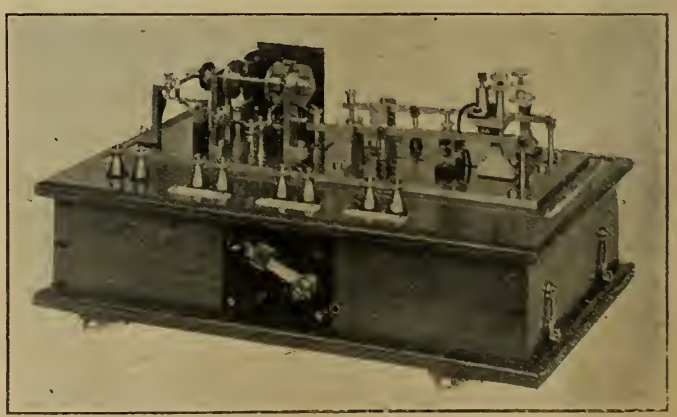

Fig. 8—Alarm Mechanism of Marconi Automatic Alarm, showing Contact Arms and Contact Disc.

a space starts), arm No. 2 begins to rise, arm No. 1 being pulled down. When the second dash starts, arm No. 1 begins to rise again, and what occurs depends on whether contact G is reached first by arm No. 2 or contact D by arm No. 1. Assuming that the signal is being properly made, the contact D will be made first, so

that arm No. 2 will be pulled down as before, and the contact wheel will be pulled round a second step. On the other hand, if the space is longer than 2 sec., arm No. 2 has a start of more than 2 sec., and since arm No. 1 requires 3 sec. to reach contact D, it follows that arm No. 2 will reach contact G first, which will result in the contact wheel being reset. It follows, therefore, that the space cannot be more than 2 sec. The shortest permissible space is about ¼ sec., due to the time which arm No. 1 takes to fall to zero position.

The third dash of the required length causes the contact wheel to take up its final position, thus making contact of Z with Z' (Fig. 5), but the bells do not ring until the relay returns to the spacing stop. When this occurs the bells continue ringing until the whole apparatus is switched off. If the final dash is too long the contact disc is released by contact C.

Effect of a Continuous Dash.

If a dash goes on continuously, arm No. 1 remains at the end of its travel, against contacts D and C, so that the contact disc returns to its starting position. If a space is too short arm No. 1 will not have time to get right down before it begins to rise again, and contact H will not be opened, so that pawl P will not be released and cannot pull the contact disc round a further step.

The ordinary Morse signals and atmospherics are not usually long enough to interfere with the working of the dashes and spaces here described. Two stations may cause arm No. 1 to rise somewhat and might possibly cause the device to operate, but this would rarely be the case. Interference from three stations is more serious, assuming always that the signals are sufficiently strong.

If the filament current fails or becomes too low the bells will also ring. Figs. 7 and 8 show the style of the apparatus.

The apparatus is now under test on one ship of each of ten commercial fleets and a set has been installed by the Post Office at the North Foreland wireless station so that regular observations may be made.

(*To be continued.*)

Amalgamation of Electricity Undertakings.

Two important resolutions were carried at the meeting last week of the Liverpool City Council. It was agreed that the electricity undertaking of Bootle Corporation (including the supply to the urban district of Litherland) be amalgamated with the Liverpool municipal electricity undertaking, and that the undertaking of the Liverpool District Lighting Company be acquired by the Corporation.

Referring to the first decision, Mr. Wilson, chairman of the Tramways and Electric Power and Lighting Committee, said that from the point of view of Liverpool, the arrangement was a most desirable one, as it would unify the system of distribution in Bootle and Liverpool, and unification would lead to a reduction in the price of electric current. It would also do away with the difficulty which had arisen in regard to the Dock Board supply. The difficulties with Bootle with regard to the maintenance of the tramway overhead equipment would also be removed. The terms arranged for the transfer of the whole Bootle undertaking to Liverpool Corporation in consideration of an annual payment of £7 500. Last year Bootle made a net profit on their undertaking of £6 342, and the Liverpool electrical engineer's estimate of the probable profit for next year was £10 000. The consumption in both Bootle and Litherland was a growing one, and it was anticipated that the output would be greatly increased. All the negotiations had been carried out in a friendly spirit, both sides having in view the desirability of securing a cheaper and more abundant supply of electricity on the Merseyside, for the benefit of the consumer and the trade of the port.

Dealing with the acquisition by the Corporation of the Liverpool District Lighting Company, Mr. Wilson said the agreement provided for an annual payment of £4 000, with the right to commute that payment, either by paying the sum of £60 000 in cash or by issuing mortgages, the interest on which would produce £3 600 per annum. The accounts of the company showed that for last year it made a profit of £6 640 on an output of 650 000 units. There seemed to be little doubt that the Corporation, with their more economical method of working, would be able considerably to improve on that result, so that the terms arranged were not likely to involve the Corporation in any loss. Objection was made by two members to the arrangement by which Liverpool was to pay Bootle £7 500 a year for ever. If Government permission is secured, the transfer will be carried through on April 1, and will come into operation on July 1.

Bootle Corporation have approved the agreement.

Electric Miners' Lamps.

In the new Safety Lamp Order of the Board of Trade particulars are given of the "Beam" Miners' electric cap and the "Adams" electric hand lamps which have been approved for general use. The "Beam" lamp is made by Wm. Paton & Co., Glasgow, and the "Adams" by Adams Bros., Longton. The "Thor" (type "M.") and the "Ceag" shaft and roadway lamps are also approved for use by officials or for special purposes.

At present there are thirty makes of approved electric lamps for general use and eighteen for use by officials or for special purposes.

Correspondence.

RECRUITING FOR TERRITORIAL ENGINEERS.

To the Editor of THE ELECTRICIAN.

Sir,—I shall be greatly obliged if you will allow me through the medium of your columns to call attention to the urgent need of this unit for recruits with electrical training. The work of "Corps Signals" is no doubt well known to most of your readers, but I may add that as now organised this unit consists of four Companies: Wireless, Construction, Cable, and Head Quarters with Artillery sections attached. It will be understood that it is difficult to organise and maintain such a unit without the close co-operation of electrical firms and employees.

I am sure I need not write at length with regard to the benefits a man and his employer both gain from his belonging to a unit such as this. To the man it means fourteen days free holiday in the summer usually by the sea with pay and an easily earned £5 bounty each year, whilst the knowledge which he acquires technically cannot come amiss in his civilian capacity. Further, Head Quarters provide a free club. Drills always take place at times fixed to suit men who earn their living. The gain to the employer is apparent after the first annual training, for the man is almost invariably a better servant as the result of his military training.

Another important point is that of economy. A Territorial unit costs a very small fraction of the cost of a corresponding Regular unit, and if the Territorial units are not recruited up to strength an increase of Regular or Militia units seems inevitable.

May I appeal to such of your readers as are themselves in a position to enlist or to give encouragement as regards leave for camp, &c., to their employees to do so, to give us the practical help of which we are in need.

Prospective recruits can enlist at our Head Quarters at Elverton Street, Westminster, any morning from 10 to 1 and any evening from 7 to 10.

I shall be very glad to furnish fuller particulars to any of your readers who may like to have them.—I am, &c.,

Westminster, January 4.

M. W. Emley,
Lieut.-Col. R.C.S. (T.),
Commanding 3rd (London) Corps Signal Coys.

THE EXPONENTIAL VALUES AND EXPANSIONS IN POWERS OF θ OF SIN θ AND COS θ.

To the Editor of THE ELECTRICIAN.

Sir,—Rigorous proofs of these important formulæ, such as are demanded by the pure mathematician, are too difficult for those engineering students whose mathematical attainments do not extend much beyond the elements of the calculus. To such—and probably they are the majority—the following method of *arriving at* these formulæ may be of service. It, therefore, seems worth publication in The Electrician.

Let $y = \cos\theta + j\sin\theta$ ..... (1)

Where j stands for $\sqrt{-1}$

Then multiplying (1) by j we get:

$$jy = j\cos\theta - \sin\theta$$

Also by differentiating (1) $\frac{dy}{d\theta} = -\sin\theta + j\cos\theta$

Therefore $\frac{dy}{d\theta} = jy$

and $y = Ae^{j\theta}$

Where A is a constant and $e^{j\theta}$ is to be taken as defined by the ordinary exponential series.

By (1) $\cos\theta + j\sin\theta = Ae^{j\theta}$

To find the constant A, put $\theta = 0$

We then get $1 = Ae^{0}$. Therefore $A = 1$

and $\cos\theta + j\sin\theta = e^{j\theta}$ ..... (2)

Writing $-\theta$ instead of θ and remembering that $\cos(-\theta) = \cos\theta$ and $\sin(-\theta) = -\sin\theta$ we get

$$\cos\theta - j\sin\theta = e^{-j\theta} \quad \ldots\ldots (3)$$

Adding and substracting (2) and (3) we get the exponential values of $\cos\theta$, and $\sin\theta$. and then writing $e^{j\theta}$ and $e^{-j\theta}$ as exponential series we get the expansions of $\cos\theta$ and $\sin\theta$. in powers of θ.—I am, &c.,

William Lucas.

London, N., Jan. 9.

THE THERMAL OHM.

To the Editor of THE ELECTRICIAN.

Sir,—May I make the following points in reply to the letter from Doctor Carl Hering, which appeared in your issue of the 6th inst.

Doctor Hering is quite right in pointing out that the employment of the thermal ohm is not new, and, as a matter of fact, quite early in my article I made the following observation:—"The following

notes lay little claim to originality. The simple principles emphasised were recognised by the earliest writers on cable heating, and several investigators have, to some extent, interpreted their results in the manner discussed."

If one were to seek the real originator of the expression one would be inclined to claim the honour—if the word "honour" can be applied to the introduction of a treatment so obvious—for Kennelly's pioneer article, which appeared in the "The Electrical World" as long ago as 1893.

After Doctor Hering's 1912 articles, and shortly before mine of last year, the Report of the British Research on Buried Cables was published. If he followed the report and subsequent discussion in detail, I am sure Doctor Hering will agree that there was still room for a wider appreciation of the advantages of the thermal resistance method.—I am, &c., P. Dunsheath.

London, Jan 7. 1822.

The Election and Trade.

By ERNEST J. P. BENN.

It used to be said that there is no politics in business, and we are still fortunately able to say that there are no party politics in business; for no political party, unless it be the Socialists, has yet succeeded in attaching itself to the business world in such a way as to make it necessary for trade associations and chambers of commerce to take a definite party line. That is a state of affairs which we hope may never come. Nevertheless, the business world is very deeply interested in the question of an election, whether it takes place within the next few weeks or in the autumn.

Industry and business are at the mercy of the politicians, irrespective of party. There is no party which does not intend to carry out its designs at the expense of the business community, and the time has arrived when business people in sheer self-defence are bound to throw off their old disinterest and take an active part in the selection of candidates and members for the forthcoming Parliament. Fortunately this is possible without infringing the rule which bars party politics from business. All the candidates who will presently submit themselves for our suffrages, with again the only exception of the Socialists, will explain to us how deeply interested they are in the question of economy. The business community, if it would only take the matter seriously, is strong enough to turn this extraordinary position to great advantage.

But although we have innumerable trade organisations there does not seem to be one amongst them which has thought it worth while to tackle this question of economy and taxation in detail. All those who have authority to speak for industry have told us that taxation must be reduced before trade can revive. Politicians take all such statements as *ex parte*, and continue to calculate how they can go on collecting taxes and relieving such distress as becomes troublesome. The direct method of the dole appeals so much more strongly to the simple political mind than the indirect method of sound economics. Business men know that the more there is collected and distributed as dole, the worse will employment become, but he does not appear so far to have thought it worth while to take the trouble to reduce this obvious truth to such a basis that the public and even the politician can be expected to understand it.

The Simple Question.

The simple question which every business man should ask himself is this. Supposing that taxation and rates were reduced by bringing down the income-tax from 6s. to 4s. 6d., reducing rates from their present height to 5s., and abandoning the excess profits duty and Corporation tax, how far should I be in a better position to offer employment to the unemployed? There is no reason why every business man should not take his rates and taxes for 1921, calculate how much he would have saved had they been at the new rate, and from the figures thus secured, arrive at an estimate as to his ability to employ. The saving in rates and taxes, however, means a great deal more than the direct employment of labour by the people who are spared part of their present burden. It at once creates further employment, and that by the most direct method. If the extra wages means extra business, that again makes further demand upon somebody.

The new rates of taxation suggested above would mean that in 1922 the business community would have at their disposal certainly not less than two hundred and fifty millions which last year was taken from them. There are something less than two million registered unemployed. It is conceivable that with two hundred and fifty millions to spare trade could absorb two million extra workers.

A Plebiscite of Industry.

I throw out the suggestion in the hope that the readers of this journal will write me on the subject. Benn Brothers, Ltd., owning nine trade papers, are in a unique position to test the feeling of the country on a question like this. We could, if it were thought desirable, conduct a sort of plebiscite of our nine industries from which statistics could be framed, which would take this question out of the realm of argument and speculation and bring it down to arithmetic. I should be glad, therefore, if the readers of the Electrician would be so good as to write to me and say whether if some simple form were devised they would be willing to go into their figures for 1921 and state their opinion as to the effect upon employment of reduced taxation in 1922.

Compensation for Deprivation of Employment

The arbitrator (Sir Wm. Mackenzie, K.C.), who recently heard evidence on the claims, made under Sec. 16 of the Electricity (Supply) Act by certain members of the staff of the Morley Electricity Department for compensation for deprivation of employment, has issued his award. The claims, which were supported by the Electrical Power Engineers' Association, were made by the chief engineer (Mr. J. E. Ellis), the chief assistant engineer (Mr. H. C. Crisp), and a charge engineer (Mr. A. Fisher). In April last Morley ceased to operate its generating station and commenced to take a bulk supply of electricity from Leeds. Messrs. Ellis and Crisp's claims were based on a loss of status, and Mr. Fisher's on loss of employment, because he was no longer in the service of the Corporation. Mr. Ellis also claimed for being deprived of the right to take pupils.

Basis of the Claims.

For Mr. Ellis it was stated that, although he had been retained by the Corporation at approximately the same salary as he would have received had the generating station continued to be in operation, he had suffered financial loss, as his status as borough electrical engineer had been considerably reduced. He also had premium pupils, who were a reliable source of income up to the period of the war, and he could justly expect to have that source of income renewed if the generating station remained in operation. Though there had been no formal agreement on this point, the privilege had been allowed by the Corporation.

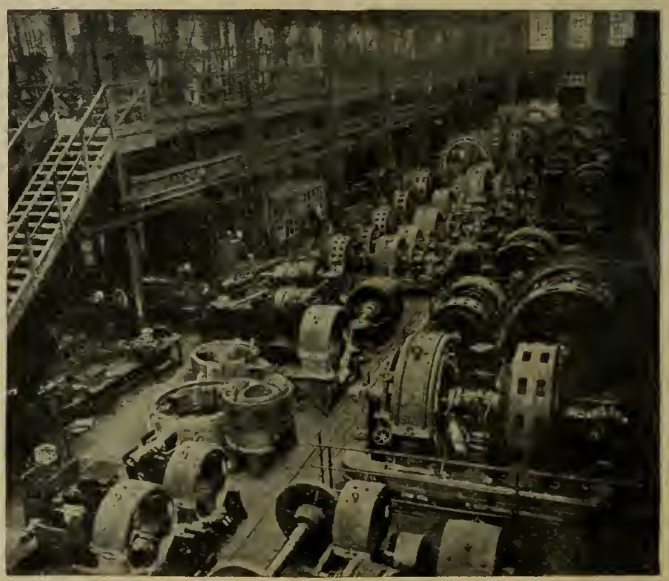
With regard to Mr. Crisp, it was said his position had been reduced to a degree similar to that of Mr. Ellis, and his duties were reduced to those of a minor character, such as wiring and meter testing, and the possibility of securing a position similar to that which he held prior to the arrangement had been materially reduced. It was also contended that both Mr. Ellis and Mr. Crisp had suffered loss inasmuch as the possibilities of advancement, either on the Morley undertaking or upon some other undertaking, had been considerably reduced, and that, therefore, both cases came within the ambit of Section 16 (3) of the Electricity (Supply) Act of 1919.

The Award.

Sir Wm. Mackenzie finds (1) that the claims of Mr. Ellis and Mr. Crisp on account of loss of status have not been made out; (2) that the permission or right to take pupils by Mr. Ellis had become a condition of service, and, therefore, as he had been placed in a worse position, he awarded him £140 compensation; that as Mr. Fisher had lost his employment he was entitled to £81. No costs were awarded.

Bruce Peebles' Heavy Test Plate.

The illustration shows part of the heavy test bed at the works of Bruce Peebles & Co., Edinburgh. At the time the photograph was taken (November 21st) some eleven Peebles-La Cour motor converters were under test, in addition to two 300 kW induction motor generators for Tasmania. The eleven motor converter sets were as follows:—



Part of the Heavy Test Bed at Bruce Peebles Works.

One 1 500 kW; three 1 000 kW; one 600 kW; five 500 kW; one 300 kW. The value of the machines was approximately £67 000.

The 1 500 kW converter mentioned above is for the Edinburgh Corporation, and the company have on hand at the present time for the Corporation, six 1 500 kW and two 500 kW motor converters, two 500 kW synchronous motor generators, and a three-machine battery booster, in addition to a large number of both vertical and horizontal auxiliary motors for the condensing and coal handling plant.

Electricity Supply.

In the early hours of Saturday there was a breakdown at the SOUTHPORT electricity works, and certain parts of the town were plunged in darkness for some time.

ARGYLL County Council have arranged to meet in Glasgow on Wednesday, Jan. 18, to consider the question of petitioning against, and, if necessary, opposing, the Grampian Electricity Supply Provisional Order.

At the adjourned monthly meeting of BELFAST City Council last week the question of the reorganisation of the electricity power-house was discussed at some length, and ultimately referred to the Council in committee.

The Borough Surveyor's Department of MANCHESTER Corporation is preparing a map 25 ft. square in connection with the inquiry to be held by the Electricity Commissioners next week into the South-East Lancashire Electricity District.

DARWEN Town Council have just entered into agreements with the Darwen Cotton Manufacturing Company, Harwood Brothers (1920) Ltd., and A. Carus & Sons, cotton manufacturers, for the supply of electricity for power purposes,

A 5 000 kW generating set, manufactured by Metropolitan-Vickers Electricity Company for STRETFORD Council's electricity station at Trafford Park, Manchester, was officially started on Monday by Coun. Sir Thomas Robinson, M.P., chairman of the Electricity Committee.

The old Davies-street generating station, and until recently a sub-station of the WESTMINSTER ELECTRIC SUPPLY CORPORATION, has been sold by private treaty for about £20 000. As soon as the machinery has been removed by the Corporation it is intended to reconstruct the building for flats.

A Provisional Order will be granted extending the borough boundary of WOLVERHAMPTON by the inclusion of several adjoining districts. The new borough will have an area of 14 000 acres, as against the present 3 000 acres. The population will be increased from 102 000 to 138 000.

At the monthly meeting of DOVER Electricity Committee last week the electrical engineer stated that the new plant would be working at the end of this month, and then there would be a saving of 50 per cent. (about 3 000 tons) on the amount of coal used per year. With the falling price of coal, the consumers are hoping shortly for a substantial reduction in charges.

There was a failure of the electricity supply on Friday afternoon at OLDHAM. Business in the centre of the town was brought to a standstill, and the newspapers were unable to publish until the evening. The "Manchester Guardian" states that a short circuit developed early in the morning at the bottom of Yorkshire-street, causing the underground electric cable to fuse. Fire broke out in the gas main conduits in consequence, and explosions occurred at several of the underground inspection chambers. Fires broke out along Union-street and Yorkshire-street, and in the afternoon further underground explosions occurred, which resulted in the cutting-off of the light and power supply in the principal thoroughfares and business houses of the town. Later in the evening most of the electricity supply had been resumed.

The question of what remuneration, if any, should be paid to Mr. C. F. McInnes, GRAVESEND Electrical Engineer, for the preparation of plans for the electricity extensions, involving £70 000-£80 000, and for the supervision of the work, was the subject of a heated discussion at the meeting of the Council last week. The Electricity Committee had recommended £200. Councillor Priestley (chairman of the committee) moved that instead of £200 Mr. McInnes should receive 1¼ per cent. on the contract. (He also read a letter from him stating that he could not undertake the extensions for £200.) This suggestion was objected to by several members of the Council, who maintained that £875, which 1¼ per cent. would amount to, was preposterous. Other members were strongly of opinion that the work came into the ordinary duties of the engineer, and if Mr. McInnes would not undertake them he must resign. Finally, it was agreed to refer the matter back to the Electricity Committee.

New Schemes and Mains Extensions.

WINCHESTER Town Council have received sanction to a loan of £1 000 for water-cooling plant in connection with the electricity undertaking.

DURHAM City Council are contemplating lighting the market place with electricity, and an estimate is to be obtained from the ELECTRICAL POWER DISTRIBUTION COMPANY.

MAIDSTONE Council have applied for loans of £3 300 for two 1 000 kVA transformers, £1 250 for mains, switchgear and transformers, and £700 for giving an increased supply to the Medway Milling Company.

It is proposed to light SPALDING by electricity. The town is to be canvassed for probable consumers, and a committee has been appointed by the Urban Council to investigate and report on the financial aspects of the proposed scheme.

TORQUAY Town Council have decided to apply for powers to enable them to carry out the terms of a draft agreement, whereby it is proposed to purchase and work the undertaking of the Urban Electricity Supply Company at Newton Abbot.

To meet increasing demands upon the supply of electricity, EASTBOURNE Corporation are spending upwards of £70 000 upon improving the plant of their undertaking. They have been asked to extend their mains to certain of the neighbouring villages.

The Town Commissioners have appointed a sub-committee to report on the question of lighting EDENDERRY by electricity. The report, it is understood, will be based on the fact that a dynamo in Alenbury's Mills will be available for the purpose at a reasonable figure.

In regard to the loan of £165 541, sanctioned by the Electricity Commissioners last July, HACKNEY Borough Council have decided to apply to the London County Council for the sum of £60 000, to be repaid with interest at the rate per annum current at the date of the advance.

HAVERFORDWEST Town Council at its last meeting discussed a scheme of lighting the town with electricity. Under the proposals the Council have the option at the expiration of twenty years of purchasing the undertaking. Negotiations in connection with the matter are still proceeding.

The Electricity Commissioners have approved the application of WORCESTER City Council for a loan for the extension of the generating station. At their meeting last week the Council approved the proposal to light the twenty-four new Corporation houses on the Bromyard-road by electricity.

With reference to the offer of the BOSTON DEEP SEA FISHING & ICE COMPANY to supply electricity to the town, the managing director of the NATIONAL ELECTRIC CONSTRUCTION COMPANY, which hold a Provisional Order, has informed the Town Council that his company intend shortly to take up the matter with a view to carrying out the obligations.

PRESTON Town Council have applied for a Special Order for sanction to supply electricity within the borough, the urban district of Fulwood, and the parishes of Broughton, Lea, Ashton, Ingol and Cottom, Woodplumpton, Barton and Penwortham, in the rural district of Preston, and to acquire and use for the purpose of a generating station land in the township of Penwortham.

The BURTON-ON-TRENT Electricity Committee recommend the Town Council to borrow £20 000 for the purpose of extending the electricity undertaking. The Corporation is to supply a large area in Derbyshire, Staffordshire, and Leicestershire under the East Midlands Electricity scheme, and the mains have already been extended for several miles outside the borough in various directions.

The village of SENNYBRIDGE (Breconshire), which is becoming known as a marketing centre and the *locale* of an excellent agricultural show, is now lighted electrically, current being supplied by a small hydro-electric station. A company was recently floated, and nearly all the business premises, as well as many private residences, are enjoying the advantages of electric lighting.

At last week's meeting of the Executive Committee of the Dublin Citizens' Association the opinion was strongly expressed that RATHMINES AND PEMBROKE should not proceed with their projected electricity scheme, involving an estimated expenditure of £50 000, in view of the probable incorporation of the two townships with the metropolis in the near future, and before the commercial possibilities of procuring electrical power from the Poulaphouca Falls of the Liffey had been thoroughly considered.

As the result of a joint meeting between the PRESTON AND BLACKBURN Electricity Committees last week, it has been decided to connect the new Blackburn station at Whitebirk with the proposed station at Preston with a duplicate main at an estimated cost of £138 000, the expenditure to be borne equally by the Blackburn and Preston authorities. Arrangements are to be made for supplying customers *en route*, and Mr. J. A. Robertson, electrical engineer of Salford, has been instructed to prepare a scheme for the supply of the district, his expenses to be shared equally between the two authorities. Blackburn and Accrington Councils are also contemplating a similar supply main, so that the whole of the district from Accrington to Preston will be linked up.

Alteration of Charges.

CANNOCK Urban Council have agreed to the recommendation of the Electricity Committee to make 8d. the maximum charge for electricity for lighting purposes.

WATFORD Town Council has decided to reduce the charge of electricity for the quarter ending March next by 10 per cent., making the increase over pre-war rates 70 per cent.

As from Jan. 1 the charges of electricity at ROTHERHAM have been reduced from 150 to 100 per cent. on pre-war rates for power and heating and from 75 to 62½ per cent. for lighting.

WOLVERHAMPTON Town Council have decided to reduce the charges of electricity to consumers by 10 per cent., meter hire by 35 per cent., and the rate per unit charged to the tramways from 2½d. to 1·16d.

BURNLEY Electricity Committee have acceded to the request of photographers that all electricity consumed in connection with the manufacure of photographs and photographic materials be charged at power rates.

The question of the possibility of reducing the price of electricity was discussed at last week's meeting of DERBY Town Council, but it

was decided that no alteration could be made, at any rate during the present financial year.

WINCHESTER Town Council has reduced, as from Oct. 1 last, the war addition to the basic price of current from 55 per cent. to 40 per cent., and application has been made for an Order fixing the maximum price of electricity at 9d. per unit.

The Ministry of Transport, in refusing to receive a deputation from WEYBRIDGE AND WALTON Councils protesting against the Ministry's decision to raise electricity from 10d. to 1s. per unit, point out that the maximum price can be revised at any time after Nov. 7, 1926!

From the 1st inst. the price for electricity for lighting at DUDLEY has been reduced from 80 per cent. to 60 per cent. over the rates specified in the agreement with the Power Company on the sale of the undertaking, on the understanding that no other price reductions are pressed for within at least the next six months.

LEEDS City Council have decided to reduce the charges for electricity for power from 80 per cent. to 50 per cent. over the 1916 charges, and for lighting from 80 per cent. to 70 per cent. above the 1916 rate. An amendment by the Labour Party that the increase in both cases should be only 50 per cent. on 1916 charges was rejected.

The WESTMINSTER ELECTRIC LIGHT CORPORATION announce that from the Christmas quarter's readings a reduction of ½d. per unit will be made on the first 1 000 units used in any one year for lighting purposes, and ½d. per unit on all units used for heating, cooking and power purposes. The reduction has been made possible by the decrease in the price of coal. From the date of the Christmas quarter's readings, therefore, the charges will be as follows:—Lighting, for the first 1 000 units 7½d. per unit, for the next 3 000 units 7d. per unit, for all units used in excess of 4 000 5½d. per unit; heating, cooking and power, if taken through a separate meter, 1½d. per unit.

ILFORD Urban Council has adopted the following decreased scale of charges for electricity:—Residential premises, 12½ per cent. per annum on rateable value, subject to an increase of 75 per cent., plus 2d. per unit, for March and December quarters, and 1½d. for June and September quarters; lighting 8d., or maximum demand system 9d. and 6d. Power, m.d. system, 6d. and 3d. per unit; first 500 units, per quarter, 5d.; next 1 000, 4½d.; next 1 000, 3¾d.; all over 2 500, 3½d.; 10 000 units and over, 3¼d. Heating, &c., March and December quarters, 3½d.; June and September quarters, 2d. For cinemas, vehicle charging, photo lamps, &c., a reduction of 12½ per cent. has been made, reducing total war increase to 112½ per cent. The minimum charge in the March and December quarters is 11s. 3d., and in June and September 7s. 6d. for each quarter.

Municipal Accounts.

The traffic returns for the READING CORPORATION TRAMWAYS show receipts from April 1 to Dec. 1 of £55 576, compared with £58 624 for the corresponding period last year.

The accounts of HACKNEY Borough Electricity Undertaking for the year ended March 31, 1921, show a net profit of £13 950. It has been decided to allocate £4 000 towards the relief of the general rates.

The accounts of HOVE ELECTRICITY UNDERTAKING for the year ended March 31 show the total income to be £39 703, as compared with £31 436 in the previous year. The total expenditure was £25 763, against £17 060, leaving a gross profit of £13 939 (£14 376). Of this sum, interest on capital absorbed £6 313, repayment of principal £4 043, taxes £618, leaving a net balance of £2,595, compared with £3 920 in 1920. Units generated numbered 1 593 428. With regard to the ALDRINGTON section, the total income was £3 385, against £2 560, and the total expenditure £2 529, leaving a gross profit of £856, against a deficit of £788 in the previous year. Of this sum, £239 went in interest, and £446 in repayment of loans, while £136 was absorbed by taxes. The net balance was £34, as compared with a deficiency of £1 223 on the whole account in the previous year. Units generated numbered 130 761.

Electricity in Birmingham.

In a review of the industrial developments for the past year, the "Birmingham Post" states that the output of electrical energy by the BIRMINGHAM Electric Supply Department was about 75 000 000 units in the year ended Sept. 30, compared with about 100 000 000 units in the preceding twelve months. New motors representing 9 282 H.P. were connected, against 10 977 H.P. During the last three months 660 new industrial and household supplies were connected, and at the turn of the year consumers representing a load of 3 500 kW were awaiting connection, and the decrease in the load due to the coal stoppage and industrial depression was rapidly being made good by new connections to the mains. The supply resources of the department are being steadily extended. Two 15 000 kW turbo-alternators are being installed at the Nechells generating station, and a similar set is on order. These additions will give a capacity of over 110 000 kW. Large additions are also being made to sub-stations plant and to the distribution system. Among industrial developments electric furnaces are making some headway in Birmingham, and electric welding is also likely to enlarge its sphere of operations. The use of electricity in connection with certain aspects of glass manufacture is also increasing.

Electric Traction.

DERBY Town Council has requested the Tramways Committee to consider the advisability of introducing penny fares.

LEEDS City Council have decided to allow twelve passengers to stand inside the trams in rush hours instead of eight.

The L.C.C. is negotiating with the London United Tramways Ltd. regarding a THROUGH TRAMWAY SERVICE FROM LONDON TO WIMBLEDON.

ST. ANNES tram receipts for November were £2 279, against £2 597 for the corresponding period of 1920. The receipts for the full period to the end of November amounted to £42 196, compared with £43 683.

The BLACKBURN Parliamentary Bill for powers to extend the tramways and run motor omnibuses, &c., has been rejected at the ratepayers' statutory meeting, and a plebiscite of the ratepayers will probably be taken.

By 1 073 votes to 72 the employees of the DUBLIN TRAMWAY COMPANY decided last week on a strike on the proposed reduction of 5s. a week and the refusal of the inspectors to remain members of the Tramway and Vehicle Workers' Union.

BURNLEY Tramways Committee have decided against the introduction of the "reversed" type of staircase in double-decked tramcars, and the Ministry of Transport has decided not to approve the construction of the "reversed" type.

The Ministry of Traction have appointed a committee to consider and report upon the CONTROL OF OMNIBUS TRAFFIC. Recently there have been demands by tramway undertakings for the regulation of the stopping places and routes of omnibuses, &c., and the whole question will be investigated by the new committee.

After passing a resolution by 34 votes to 24 at a special meeting recently in favour of SPAN WIRES IN PRINCES-STREET, Edinburgh Town Council have now decided by 37 votes to 22 against them, and the Ministry of Transport is to be approached with a view to obtaining permission for the erection of centre poles.

As foreshadowed in our issue last week, SCARBOROUGH electric trams are not to cease running. They have been purchased by a syndicate of London and Yorkshire tramway engineers. It is explained that the decision to close down was brought about by a demand upon the company for road repairs involving an outlay of between £4 000 to £5 000.

It has been agreed, by seventeen votes to fifteen, at the monthly meeting of the Town Council, to place electric runabouts on the UNDERCLIFF DRIVE between BOSCOMBE and BOURNEMOUTH Piers, but before definitely accepting an estimate as to the cost, further inquiries are to be made as to whether the proposed type of vehicles suggested will be absolutely satisfactory.

Petitions signed by some 500 night workers living in many of the south-western districts in London have been forwarded to the London County Council requesting an adjustment of NIGHT TRAMWAY SERVICES on the Brixton and Tooting routes which will more fully meet their needs. The reorganisation for which they are asking would give an independent night service from the Embankment on each route, an extension of the Brixton service to Telford-avenue and the Tooting service to Merton.

READING Tramways Committee have passed a resolution supporting the opinion expressed by the Municipal Tramways Association that the Roads Act of 1920 encourages wasteful and overlapping competition with municipal tramway and motor omnibus undertakings which will result in increased travelling charges, and is concontrary to the intention of Parliament, and that a request should be made to the Ministry of Transport that such competition should be subject to statutory regulation in the public interest.

At the annual meeting of the DOUGLAS (ISLE OF MAN) SOUTHERN ELECTRIC TRAMWAYS, LTD., it was stated that an agreement had been entered into with the Douglas Head Marine Drive Company, by which, at the end of the concession in 1926, the Drive Company would take over the tramways as a going concern, paying the agreed or arbitrated value of the mechanical and electrical plant and half the value of the permanent way. The number of service days in 1921 was 96 (1920, 130); passengers carried, 181 242 (267 671); car mileage, 25 240 (32 420); traffic receipts, £8 062 (£15 539); total receipts (less tolls), £8 062 (£11 763); expenses, £5 637 (£5 737); net profit, £2 425 (£6 025). On the ordinary shares a dividend of 5 per cent. was declared.

BIRMINGHAM Tramway Committee do not see their way clear to recommend a reduction in fares at present, but hope within a few months to be able to do so. It is estimated that during the current year, owing to the coal dispute alone, the committee's revenue was diminished by nearly £70 000. This was followed by the industrial depression. Since the beginning of July the income has decreased by upwards of £100 000, or an average of £4 600 per week, as compared with the corresponding weeks of last year, and, having regard to the considerable amount of unemployment still prevailing in the city, there does not appear to be any prospect of immediate improvement. It has also been necessary during the past year to spend large sums upon permanent way reconstruction works, chargeable to the year's trading of the department. There is now a downward tendency in wages, and to some extent in cost of material, but no appreciable benefit from these will result during the present financial year.

Personal and Appointments.

Mr. A. Simmons has been appointed manager of the Kent Coast Electrical Company, 85, High-street, Broadstairs.

Submarine Cables Trust have appointed Sir John Denison Pender, G.B.E., K.C.M.G., trustee in the place of the late Lord Balfour of Burleigh.

Mr. W. North-Lewis, J.P., has been appointed chairman of the Treforest Electrical Consumers Company, Ltd., in place of the late Mr. Hugh Bramwell.

The works staff of the British Insulated and Helsby Cable Company have presented a gold watch to Mr. George Lloyd on the occasion of his leaving the firm.

St. Annes Council have appointed Mr. Stanley Pendlebury as teacher of the electrical science class at the Technical School, in the place of Mr. J. Fairchild, resigned.

Mr. W. Rutherford, formerly managing director of Dick, Kerr & Company, and subsequently of the English Electric Company, has been elected a director of G. D. Peters & Company.

Mr. W. Prescott, of the head office staff of the Federation of British Industries, is to act as the representative of the Federation on a committee of the Institution of Electrical Engineers to consider the standardisation of electric wiring.

The regrading of some members of the technical staff of the Hackney Electricity Department has taken place. Mr. W. Barham has been placed in Grade 5 of the Schedule of the National Joint Board, and will be designated Constructional Engineer. Mr. E. Mathews is in Grade 6, and becomes Meter Superintendent. Mr. A. G. Hilling and Mr. E. Wilkinson are in Grade 6 of the Schedule, and are designated Assistant Distributing Engineer and Assistant Power Station Superintendent respectively.

Mr. N. W. Prangnell has severed his connection with C. A. Parsons & Company, at Heaton Works, and has started business on his own account as a manufacturer's area representative, with offices at 47, Pilgrim-street, Newcastle-on-Tyne. He has been appointed representative of the following firms :—Twiss Electric Transmission, Ltd., London Electric Firm, Electric Street Lighting Apparatus Company, Venner Time Switches, Ltd., Berry's Electric, Ltd., Scholey & Company, Ltd., Automatic Electric Furnaces, Ltd., Chadburns (Ship) Telegraph Company, Ltd (land interests), Ewart & Son, Ltd.

A statement has been issued by Senator Marconi, chairman of Marconi's Wireless Telegraph Company, with reference to his connection with the Banca di Sconto of Rome. He states that in consequence of his technical work requiring that he should be absent from Rome for considerable periods of the year, it was agreed that he should not be expected to take any part in the direction of the bank's affairs. He had not attended any meeting of the Board for about a year, and therefore knew nothing of what is responsible for the present situation. "The sequestration applies to the directors only until such time as each will have given evidence of his irresponsibility." Senatore Marconi is about to proceed to Italy.

On the recommendation of the Graduate Award Committee the North-East Coast Institution of Engineers and Shipbuilders have awarded a prize of £5 to Mr. Burn for his paper on "Diesel Engine Flexibility." This paper was read before the general members of the Institution at Newcastle last week, and Sir J. W. Noble, who presided, said it was the first occasion in the history of the Institution at which a paper previously read at the graduate section had been selected to be read before the general members. In view of the remarks of the Awards Committee, the paper had been submitted to the Reading Committee as being suitable for publication in the Transactions of the Institute. It was unanimously recommended that the paper be printed.

Business Items, &c.

A petition for confirming the resolution reducing the capital of P. R. Jackson & Company, Ltd. and Reduced, from £120 000 to £60 000 is directed to be heard before Mr. Justice P. O. Lawrence on Jan. 17.

Messrs. R. Wilson & G. Dickson have started business as electrical engineers at 183, High-street, Ayr. Mr. Wilson was for over twenty-six years manager of the electrical department of Reid & Company, 108, High-street, Ayr, and Mr. Dickson was the firm's leading electrician for over twenty years.

The Liverpool Electric Cable Company announce that as from Jan. 1 their London office has been removed from 219, Tottenham Court-road, London, W. 1, to 9, Playhouse-yard, Golden-lane, London, E.C. 1 (the offices of the London Electric Wire Company & Smiths, Ltd., with whom they are associated), at which address large stocks of ordinary types of rubber insulated cables and flexibles and C.T.S. cables and flexibles will be carried.

In connection with the large order entrusted to Braithwaite & Company (Engineers), Ltd., of West Bromwich and Newport, Mon., for a steel pipe 114 miles long, 6 ft. diameter, for supplying water to the city of Bombay, India, Royce Ltd., of Trafford Park, Manchester, have received an order from Messrs. Braithwaite for the full equipment of electrical overhead travelling cranes, eleven in number, for workshops which Messrs. Braithwaite are erecting to carry out the work.

T. H. Watson & Company (of Sheffield), Ltd., announce that the Ford Motor Company have placed an order for "Greaves-Etchells" electric furnaces with the Electric Furnace Construction Company (the American branch of T. H. Watson & Company, of Sheffield, Ltd). The order includes the largest electric steel-melting furnace yet designed. Its capacity will be 9 000 kVA and over 60 tons of steel, being fitted with six electrodes. Two "Greaves-Etchells" electric furnaces are already operating at the Ford works at Detroit, and, in addition to the large furnace mentioned above, two 10-ton "Greaves-Etchells" furnaces are ordered. The large furnace will be the principal melting unit of the new battery of electric furnaces for the Ford Company's River Rouge Works.

Mr. Ashley Pope asks us to state that he has commenced business on his own account at Toddington, near Dunstable. He is acting as agent for the Moorlands Engineering Company, of Leek, manufacturers of boiler-feed pumps, Brian pumps for refrigerating plants, and oil pumps, which are specially designed for dealing with fuel oils, syrups, and colloidal mixtures, and all liquids of high viscosity, also air and circulating pumps and auxiliary surface condensers, &c. He has also the agency for Crowther & Osborn for the counties of Middlesex, Essex, Hertfordshire, Bedfordshire, Buckingham, Oxfordshire, Berkshire, Surrey, Hampshire, Sussex and Kent. Crowther & Osborn are manufacturers of the well-known "Sceando" lamps, which are made in the usual standard sizes of 1 W and ½ W types. Mr. Pope is also specialising in street, workshop and shop lighting fittings.

Institution Notes.

The next salesmanship conference of the British Electrical Development Association will take place on Friday, Jan. 20, at 8 p.m., at the Chartered Institute of Patent Agents, Staple Inn-buildings, W.C. 1, when a discussion on "Salesmanship in Relation to Electric Heating and Cooking" will be opened by Mr. W. A. Gillott.

As a result of the experience obtained by keeping the library open every evening and Saturday afternoons during the last few weeks, the Council of the Institution of Electrical Engineers have decided that in future the library will be kept open until 9.30 p.m. on the nights on which are held the ordinary meetings of the Institution, the informal meetings, and meetings of the wireless and students' sections.

The annual meeting of the Iron and Steel Institute will take place on Thursday and Friday, May 4 and 5, at the house of the Institution of Civil Engineers, Great George-street, London, S.W. 1. The annual dinner will be held on the evening of Thursday, May 4, at the Connaught Rooms, Great Queen-street, London, W.C. Members are reminded that in March the Council is prepared to consider applications for grants from the Carnegie Fund in aid of research work. The latest date for receiving applications from candidates for election as members of the Institute is March 22.

The Chelmsford Engineering Society had an interesting discussion on "Gas *v.* Electricity" at their last meeting, held under the presidency of Mr. G. F. Barrett. Mr. C. Becket, of the British Commercial Gas Association, opened the discussion by enumerating the advantages which he contended gas had over electricity, dealing mainly with the comparative cost. Mr. C. S. Buyers, of Crompton & Company, spoke from the standpoints of light, heating, and power, and argued that electricity was superior to gas on each of those points. The expense of upkeep ought to be taken into account when considering the comparative costs, and he contended that electricity was cheaper than gas for many purposes. Mr. W. W. Mason, of the British Commercial Gas Association, said it was a disaster to the whole nation that the gas and electricity industries did not go hand in hand, but were at cross purposes. A discussion followed.

Many exhibits of interest to the electrical industry were shown at the exhibition at Birmingham in connection with the annual conversazione of the Council of the Midland Institute. A demonstration was given by the Electrical Engineering Department of the University of Birmingham of the application of the thermionic tube to the reproduction and amplification of transmitted speech and music. The Midland Institute Scientific Society's exhibit, which takes up nine rooms, included an automatic alarm by the Marconi Company and the Elverson oscilloscope, by means of which it is possible accurately to observe the actual behaviour of high-speed machinery. Other interesting scientific exhibits were a sound mill (by Mr. W. Bentley), a synchronised pendulum, a ripple tank, demonstrating wave motions as applied to some of the phenomena of light, the spectrum of an electric spark, dictograph telephone, spot-welding machinery, engineering and survey instruments.

Obituary.

The death is announced of Mr. F. Foord Kelcey, C.B.E., a former Professor of Mathematics at the Royal Military Academy, Woolwich.

The death is announced of Sir William Matthews, K.C.M.G., a past-president of the Institution of Civil Engineers and a well-known harbour engineer. He was created a C.M.G. in 1901 and a K.C.M.G. in 1906, and was a representative of the Institution of Civil Engineers on the main committee of the British Engineering Standards Association.

Telegraph and Telephone Notes.

Wombwell Town Council has been informed by the Postmaster-General that, unless unforeseen difficulties arise, a telephone exchange will be installed in the town without further delay.

At a conference at Sheffield, last week, between the Japanese Commercial Mission to England and prominent Sheffield business men, the latter urged the importance of the improvement of telephonic communication in Japan, and asked for reciprocity in shipping, particularly in coastal traffic.

Press telegrams at reduced rates for Austria, Lithuania, Poland, and Czecho-Slovakia are now accepted at post offices, on the usual conditions, between 9 a.m. and 12 noon, as well as between 6 p.m. and 9 a.m. Press telegrams for Esthonia and Latvia are accepted between 9 a.m. and 11 a.m., as well as between 6 p.m. and 9 a.m.

The Telegraph Money Order service with British Overseas Dominions, Dependencies, &c., will be extended on Jan. 2 to Kenya and Uganda. A special feature of the service is that the telegrams of advice may be sent at the deferred rate, which reduces the telegraph charges by one-half. The full-rate service is available for cases of special urgency.

A singular accident occurred to the 6.55 train from Worthing one morning last week. It had not proceeded far on its way to London Bridge when, according to an official statement, a telegraph wire which had broken, probably owing to the gale, caught the handle of one of the carriage doors and wrenched it off, with the result that four windows were smashed. There were no personal injuries, and the train was only delayed for seven or eight minutes.

The new London Telephone Exchange, which is to be erected in Wood-street, E.C., will, when completed, be the largest in Europe. The site has already been acquired at a cost of £50 000, but the actual date when building operations will be begun has not yet been decided. The new exchange will be known as a three-unit exchange, and will cater for 30 000 subscribers. As, however, no single exchange can consist of more than 10 000 lines, the new exchange will have three separate names, each with 10 000 lines.

Since the London Toll Exchange was opened in September last there has been a steady increase in the use of the service from 30 534 calls in September to 34 188 in December. The official records show that only 5 per cent. of the "Toll" calls made throughout the day fail to secure immediate connection, and have to be booked for completion later, and about half of the calls so booked are received during the "rush" hours of the morning, when all lines are taxed to their maximum capacity.

A new underground telephone cable has been laid between Liverpool and Manchester. It consists of 160 pairs of copper wire, each weighing 40 lb. per mile. It is 36½ miles long, and the connecting up of the comparatively short lengths in which it can be drawn into the ducts required 160 000 soldered joints, each one of which had to be electrically tested. Notwithstanding the length of the cable, its speaking efficiency, owing to the loading and balancing, is equivalent to that of a standard telephone cable nine miles in length. A cable is also to be laid between Manchester and London. Comparing the conditions which existed in 1896, when the trunk lines were taken over by the Post Office, and those existing to-day, it is stated that in 1896 there were only 23 circuits between Liverpool and Manchester. Of these 13 were constructed by the late National Telephone Company, five by the Mutual Company, and five by the Post Office, all of which were carried on pole lines, and rarely were the whole of the 23 circuits in working order on the same day. Prior to the completion of the new cable there were 173 trunk circuits between the two centres, 132 underground and 41 overhead. The new cable brings the total up to 333, of which 292 are underground and 41 overhead.

Imperial Notes.

Eastwood, Dundas, and Hornsby (N.S.W.) Councils are considering a joint electric supply scheme.

The Victorian Electricity Commission has approved a scheme for electricity supply in Benalla (Victoria).

The Board of the Karachi Electric Supply Corporation recently decided to order additional generating plant from England.

A new electric furnace with a capacity of 500 tons per month is in operation at the Vereeniging works of the Union Steel Corporation.

Mr. J. H. Butters, manager of the Tasmanian State Hydro-Electric Department, has approved the electric supply scheme drawn up by Mr. Lord for Scottsdale (Tasmania).

The Government of Jamaica propose to introduce another Bill during the 1922 session of the Legislative Council to authorise the State to use streams which run through private property for the development of hydro-electricity.

The State Hydro-Electric Department is continuing its investigations into the facilities for developing electric power locally for the towns on the North-West Coast of Tasmania, as it is believed that this will be more profitable than transmitting energy from the central plateau.

St. George (N.S.W.) County Council is borrowing £100 000 for a new electricity supply works for the towns of Rochdale, Bexley, Kogarah and Hurstville. The portion of the Illawarra railway serving these districts is being electrified, and is expected to be completed during the present year.

According to a correspondent of the "Times" Trade Supplement, all the hydro-electric power available in India is being used to the utmost by cloth mills and iron foundries. Cloth production is bound to expand very materially when the new hydro-electric works under construction are completed.

A poll of the ratepayers of Coraki (N.S.W.) has resulted in favour of establishing electricity supply in the town, and the Council has instructed T. W. Bridger & Co. to prepare plans and specifications. Negotiations for the purchase of electricity in bulk from the Moonembar Coal Company will probably be opened.

The Secretary of State for India has now approved the main principles of the recommendations of the Stores Purchase Committee, referred to in a recent issue of The Electrician, and Mr. J. S. Pitkeathly, superintendent engineer in the electrical and mechanical branch, Delhi, has been appointed chief controller of stores.

Sir John Monash (chairman of the Victorian Electricity Commission) states that coal mining at Morwell, where the Victorian Government intends to erect an electric power-house, will begin about the middle of the present year. The construction of the conduits for the cooling water from the Latrobe River has been commenced.

The Tasmanian State Hydro-Electric Department has made an offer to supply electricity to the municipalities of Kingston, Franklin, Huonville, and Port Cygnet, in the Huon district, south of Hobart. The Department offers to supply at £12 per E.H.P. per annum, but it is believed that Port Cygnet Council can do better by improving its existing plant.

A South African Press report states that the site belonging to Messrs. Steel, Murray & Company, Durban, has been purchased on behalf of the National Mutual Life Association of Australasia. The present building will be demolished and a modern building erected. United Kingdom manufacturers of materials likely to be required for the new building may deem it desirable to furnish H.M. Senior Trade Commissioner in South Africa (P.O. Box 839, Johannesburg) with copies of their catalogues and price lists.

A message from Johannesburg states that the Industrial Federation on Monday rejected the offer of the Chamber of Mines, and unanimously endorsed the resolution in favour of a strike, to start that evening. It is stated that the Federation Executive decided that for the present the essential services are to be maintained, including lighting in outside districts, hospitals, mines, &c., and the water supply. Except Johannesburg, the reef towns obtain their light and power from the Victoria Falls Company, and probably they will be affected. Victoria Falls power generation stations have only enough coal for a few days.

Cape Town Corporation have removed their restrictions on the use of electric current and power, and an immediate impetus has been given to the local market for fittings, cooking and heating apparatus. Contrary to the general impression, the bulk of the electrical plant of this type sold in South Africa is of British, and not American, manufacture, the "British and South African Export Gazette" states, and, although a certain amount of German competition is being felt, there is reason for saying that the British article is preferred, even if the price is slightly higher. Taking the Union's trade in electrical material and machinery as a whole, it is significant that, unlike many lines, purchases last year were greatly in excess of those in 1920, the business in cooking and heating apparatus alone being worth £35 692 in the first nine months of 1921, as compared with £28 195 for the same period in 1920.

Foreign Notes.

A scheme for electrifying all the railways in Norway is to be considered by a committee of the National Engineers' Association.

The November imports of German goods into this country show a drop of £18 746 under the heading of scientific instruments and domestic glassware.

The President of Brazil has issued a decree sanctioning the law which gives effect to arrangements for joining up railway and telegraph communications between Brazil, Paraguay and Bolivia.

The Esthonian Government has contracted with a German electrical works for mill equipment for the national dye industry, comprising generators, motors, &c., valued at 3 500 000 marks.

The co-efficient of increase in the French Customs Duty on dynamo brushes of artificial carbon, partly of copper, and on dynamo brushes of copper and graphite alloy, has been altered to 1·8, and that on other armatures to 5.

It has been provisionally agreed that the three former German submarine cables in the Pacific are to be allocated as follows:—To the United States the cable from Yap to Guam, to Japan the cable from Yap to Naba and the Japanese mainland, to Holland the cable from Yap to Menado.

A big trust has been formed in Berlin, under the title of the "Wirthschaftstelle für Handel und Industrie in den Osten," for the purpose of trading with Russia and developing its resources. The "Times" states that banking, commercial and industrial undertakings, as well as technical and scientific institutions and labour organisations, are all represented on the Trust, whose first business will be to increase the transport facilities of the country. Negotiations are proceeding with Messrs. J. P. Morgan & Company for the formation of a German-American fund of $250 000 000 for carrying on the business. This movement appears to be of considerable importance, and British engineers and manufacturers would do well to watch developments very closely.

The affairs of the Lisbon Tramways Company appear to be going from bad to worse. For 1919 there was a net profit of £74 505, and

for 1920 a net loss of £120 006. The results for 1921 will be even more adverse, as the company suffered from a long strike early last year, and the Portuguese exchange is operating adversely. A short time ago an agreement was made with the Government to grant an increase of wages to the employees, pending the appointment of a Commission to enquire into the financial position of the company. The report of the Commission was favourable to the company, and suggested several methods for an increase in the receipts, but no steps have been taken by the Government to adopt the suggestions of the Commission. An appeal has been made to the Portuguese Prime Minister, calling upon the Government to comply with the terms of the agreement, but up to the present no action has resulted. The company carries about 70 000 000 passengers per annum, and over £1 500 000 of British capital is at stake in the undertaking. The company has just paid the half-year's interest on its Debenture Stock.

Electrification Schemes in Japan.

Plans for the ELECTRIFICATION OF JAPANESE RAILWAYS have been drawn up by the Electrification Investigation Commission. It is proposed to electrify the following sections of line, which have an aggregate mileage of 2 000 :—

Kyoto-Kobe (47 miles), Minatomachi (*via* Kitsu-Kyoto) (51 miles), Kobe-Himeji (34 miles), Moji-Hakata (48 miles), and Osaka-Tennoji (6 miles).

The above are suburban railways, on which there is heavy railway traffic. On the under-mentioned there is a steep gradient with many tunnels, and there is abundant water power for utilisation on these routes :—

Odawara-Numazu (26 miles), Maibara-Imasho (47 miles), Hachioji-Shiojiri (116 miles), Nagova-Shinooi (151 miles), Fukushima-Yonezawa (26 miles), Yashiro-Kashima (94 miles), Kameyama-Nara (46 miles), Utsunomiya-Nikko (25 miles), Koriyama-Niigata (172 miles), Oguda-Shinjo (58 miles), Takasaki-Yokokawa (18 miles), Karuizawa-Naoetsu (92 miles).

On the Numazu-Kyoto section (244 miles) and the Omiya-Fukushima section (151 miles), shortening of the line is required, and water power can be utilised, while on the Himeji-Shimonoseki section (295 miles) the increase of transportation capacity and the shortening of the line are required. For the Imasho-Naoetsu (181 miles), Nagoya-Kameyama (38 miles), and Ohmiya Takasaki sections (46 miles) water power is available, and on Kokura-Wakamatsu (56 miles) and Muroran-Yubari sections (90 miles) increased carrying capacity is required, and coal can be obtained at low prices.

Electrification of Italian Railways.

The ELECTRIFICATION OF THE ITALIAN RAILWAYS is progressing rapidly. Work is nearing completion on the Genoa-Pisa-Spezia-Leghorn, and on the Bologna-Florence and Bologna-Faenza lines. Work on the short line from Rome to Anzio, on which the three-phase high-tension system will be used, is well advanced, as is also that on the Benevento-Foggia line, in the south of Italy, which is being electrified experimentally on the direct-current system.

The next stage in the Government programme (which provides in all for the electrification of 4 000 kms. of railroad trunk lines, comprising about 10 000 kms. of track), includes the electrification of the important Bologna-Verona-Brenner line, which will become increasingly important for the development of Italy's trade with Central Europe, the Voghera-Milan, the Voghera-Piacenza, the lines serving Trieste, Gorizia and Julian Venetia, down to Fiume, the Milan-Chiasso, the Milan-Bologna, and several other lines in Central Italy.

The power required for running these railways will be supplied mostly by the hydro-electric installations built by private corporations, supplemented by some big generating stations which the State railroads are erecting—*i.e.*, the central station at Bardonecchia, now nearing completion, two others in Central Italy which will utilise the waters of the Reno and the Limentre now being rendered available by great hydraulic works in course of execution, and a central station near Scanno, in the Abruzzi, fed by the waters of the Sagittario. Great engineering works recently visited by the Minister of Public Works and a representative committee of members of Parliament and the Press, are now being carried out in connection with this station. A barrage some 80 ft. high is being built, which will form an artificial lake with a content capacity of 3 600 000 cubic ft. The water will then run through a tunnel 6 kms. in length, passing through the mountains some 12 000 ft. below their summits, and will fall a drop of some 350 metres through three-high-pressure pipes, each 780 metres in length, setting in motion three groups of three-phase alternators, generating 45 000 H.P. of energy. It is estimated that these works will be completed in 1924.

In a report to the Senate it is stated that over 350 miles of railway line have been electrified, and 300 more miles will be converted this year, including the Rome-Tivoli and Rome-Anzio-Nettuno lines. The Ronco line is approaching completion and when this work is finished the Turin-Rome railway will be operated electrically. Orders have been let for the supply of 111 electric locomotives at a cost of 165 million lire, but the Government have authorised the Railway Administration to raise 169 million lire for the acquisition of 120 additional electric locomotives.

Trade with Canada.

Commencing with the 1st inst., all GOODS IMPORTED INTO CANADA must be marked with the country of origin, but "the name of a manufacturer or his trade mark, accompanied by the name of the country or a place in a province, state, or other division of a country where the goods have been manufactured or produced, will be accepted as sufficient indication of the country of origin."

In his report on the conditions and prospects of British trade in Canada, Capt. E. J. Edwards, H.M. Senior Trade Commissioner, states that now is the crucial time for British manufacturers to regain or obtain trade to which they have more right than a foreign country, and the Canadian Government and people have shown in a marked way their desire to encourage imports from the United Kingdom in preference to the United States. Canadian importers and merchants are anxious to trade with the United Kingdom, but they do not wish to deal with agents whose field of operations covers the United States and Canada.

During the year ending March 31, 1921, the total machinery imported into Canada (excluding agricultural) amounted in value to $44 642 000, of which no less than $40 767 000 represented importations from the United States, while the United Kingdom was responsible only for $3 546 000. Although the last-mentioned figures are more than double those of the preceding year, they are anything but satisfactory, especially as during that period United States trade increased by six and a half million dollars. Tenders for plant are usually invited in a hurry, and the question of delivery is a predominant factor. Naturally, United States engineering firms benefit by this Canadian characteristic. There is seldom sufficient time for specifications to be obtained and sent home so that United Kingdom manufacturers may tender. Consequently adequate local representation is essential, either by branch houses or by agents. The agents should be technical men, with an expert knowledge of the various types of machinery they are trying to sell and the uses to which these are put. They should be so qualified that where there is not sufficient time to mail particulars to their United Kingdom principals they are able to put the salient points succinctly in a cable. United Kingdom engineering firms are urged, when replying to a Canadian inquiry, to remember the proximity of the United States, and therefore to quote their very lowest prices and to give the most forward delivery date possible, which must be rigidly adhered to should the order eventuate.

H.M. Trade Commissioners in Canada should be kept supplied with illustrative and descriptive catalogues of all classes of machinery and engineering work. Canada's engineering and machinery requirements are considerably in excess of what might be imagined from her population. At a rough estimate, 700 000 hands are engaged in manufacture, and much of the machinery and equipment required in the work in which they are employed is not made in the Dominion, but has to be imported. In addition, her extensive water power is being steadily developed, and there is a constant demand for hydro-electric plant. Though United Kingdom manufacturers cannot be said totally to have neglected the Canadian market, in the majority of cases the efforts have been somewhat spasmodic and generally rather superficial. The machine tool trade is very important, and the leading machinery supply houses in Canada are desirous of buying from the United Kingdom. In the past it is said that British prices were much higher than those of the United States and deliveries uncertain. However, during the past few months the situation has improved; but prices are still high, especially on heavy machine tools for railroad shops, shipbuilding plants, &c.

Danish Tariff Revision.

A Bill has been introduced in the Danish Parliament providing for a revision of the DANISH CUSTOMS TARIFF. The following are amongst the proposed duties and exemptions under the revised Tariff :—

Accumulators, transformers, resistances, and other electric regulators, relays, alternators, switches, electrometers, voltmeters, galvanoscopes, telephone and telegraph apparatus (including switchboards, lamps, &c.), searchlights, electro-medical apparatus, electric ovens, bell and signalling apparatus, wireless telegraph and telephone apparatus, &c., 7½ per cent. *ad val.* Articles destined for electrical installations, consisting mainly of wood, porcelain, faience, or other earthenware, ebonite, testonite, ambroin, and the like, are dutiable as manufactures of those materials. Unmanufactured balata, guttapercha and indiarubber, and reclaimed rubber, duty free. Manufactures of ebonite, 10 per cent. *ad val.* Manufactures of guttapercha, indiarubber, not specified, 5 per cent. *ad val.* Physical and similar instruments, 7½ per cent. *ad val.* Earthenware and porcelain articles for electrical installations (other than insulators), such as safety boxes, switches, plug contact boxes, safety plugs, &c., if in combination with metal, 10 per cent. *ad val.* Dynamos, generators, motors and converters, and stators, rotors, armatures and commutators, &c., for such, 7½ per cent. *ad val.* (Machines imported in a knocked-down condition are dutiable as complete machines. If electrical machines are imported in combination with other machines, either fixed to such machines or on a common base, the whole article is dutiable as an electrical machine.) Rails and sleepers for railways and tramways, free. Wire of copper, brass, bronze and yellow metal, 5 per cent. *ad val.* Accumulator plates and electrodes of lead, soldered together, 5 per cent. *ad val.* Tramway vehicles, with or without axles and wheels, 5 per cent. *ad val.*

Tenders Invited and Accepted.

UNITED KINGDOM.

West Hartlepool. Jan. 16.—Supply of about 634 tons of steel tram rails. Particulars from the Borough Engineer.

Glasgow Corporation. Jan. 16.—Electric wiring and fitting in connection with Craigton Housing Scheme. Specifications, &c., from Mr. R. B. Mitchell, 75, Waterloo-street, Glasgow.

Newcastle-under-Lyme Corporation. Jan. 17.—Supply and laying of about 600 yards of lead-covered, steel-armoured distributing cable. Specification from the Borough Electrical Engineer.

Manchester Education Committee. Jan. 18.—Electric wiring and fitting of Embden-street, Every-street, and Bangor-street municipal schools. Specifications from the Education Offices, Deansgate, Manchester.

Edinburgh Corporation. Jan. 19.—Electric lighting installation in Public Washhouse, Causewayside, Edinburgh. Specification, &c., from the City Electrical Engineer, Dewar-place, Edinburgh.

Chorley Guardians. Jan. 21.—10 B.H.P. motor for the laundry of the Poor Law Institution, Eaves-lane, Chorley. Specification from the Clerk, Union Offices, Chorley.

Hindley Urban Council. Jan. 21.—Electric motor, centrifugal pump, pipes, &c. Particulars from the Surveyor, Council Offices, Hindley.

Worthing Corporation. Jan. 23.—One Diesel engine and c.c. dynamo; and vulcanised bitumen-sheathed paper-insulated concentric and triple concentric cable. Specifications, &c., from the Borough Electrical Engineer.

Lewisham Board of Guardians. Jan. 23.—Repairing of electrical installation at the Children's Home, Goat House Bridge, Norwood Junction. Particulars from the Clerk, Mr. W. R. Owen, 394, High-street.

Salford Guardians. Jan. 31.—Small alterations and additions to electric wiring and fittings in Pavilion B of the Infirmary at Pendleton. Particulars from the Clerk, Poor Law Offices, Eccles New-road, Salford.

Hampstead (London) Borough Council. March 15.—Supply of various stores for six or twelve months, including electrical engineers' stores and oils for the electricity station. Form of tender, &c., from the Town Clerk.

Metropolitan-Vickers Electrical Company, Cardiff.—Wiring for the electric lighting and heating of their new premises in Custom House-street.

Aylesbury Corporation.—300 kW converter, with e.h.t. and l.t. switchgear. Specifications, &c., from the Borough Electrical Engineer.

AUSTRALIA.

Victorian Railway Commissioners. Feb. 15.—*Hydraulic pig iron breaker, including tools, gears, accessories and spares, for Bendigo workshops. (Contract No. 34 191.)

Deputy Postmaster-General, Brisbane. Feb. 15.—*Telephone apparatus and parts, including bells, buzzers, chambers for transmitters, induction coils, condensers, cords. (Stores schedule No. 544.)

New South Wales Government Railways and Tramways Department (Electrical Engineer's Branch).—Feb. 22, 1922.—*Supply, delivery, erection and maintenance of one 5 000 kW 50 cycle turbo-alternator with condenser and accessories, at Zarra-street power house, Newcastle. (Contract No. 556.) Tenders, on proper forms and accompanied by a preliminary cash deposit, to the Secretary for Railways, Phillip-street, Sydney, N.S.W. Local representation is essential.

Commonwealth of Australia. March 8.—Switchboard apparatus and parts (schedule 545). Particulars from the Supply Officer, Room 101, Australia House, Strand, London, W.C. 2.

Victorian Railway Commissioners. March 8.—*Thirty-five cabin transformers for power signalling. (Contract No. 34 863.)

Deputy Postmaster-General, Brisbane. March 15.—*Protective apparatus, including arresters, carbon blocks, fibre fuses, protectors and terminals. (Stores schedule No. 546.)

Commonwealth of Australia. March 15.—Protective apparatus. Particulars from the Supply Officer, Room 101, Australia House, Strand, London, W.C. 2.

Municipal Council of Sydney (Electricity Department). April 24.—*Supply, delivery, and erection of two 2 000 kW rotary converters; one 10 000 to 12 000 kW turbo-alternator.

NEW ZEALAND.

Lyttelton, Public Works Tenders Board of New Zealand. Jan. 31.—*Two complete sets of 3 phase automatic oil circuit breakers suitable for 6 600 V, 1 200 A capacity, four sets of disconnecting switches for isolating the oil switches, and one 6 600 V air break lever operated switch for main transformer switches at Lake Coleridge power house. Tenders to the Secretary, Public Works Tenders Board, Government Buildings, Wellington.

Public Works Department, Wellington. Feb. 28.—*Supply and delivery, ex ship's slings Lyttelton, of a bank of three 11 000 V reactances, complete, for the Lake Coleridge electric power scheme.

Public Works Tenders Board, Waikato Power Scheme. March 6.—*(Section 45) two 2 500 kWa alternators, three-phase, 50 cycle, 5 000 V, at 166⅔rds rev. per min., with a power factor of ·8. Excitation at 220 V. (Section 46) two 3 100 H.P. water turbines of the double-runner Francis type to operate the generators mentioned in Section 45. (Section 47) two exciter sets, each consisting of one 200 kW d.c. generator, and one 350 H.P. asynchronous motor, together with a Tirrill regulator. The generator shall have an output of 220 V, with a full-load current of 7 000 A. The motor shall be of 350 H.P., with a power supply of 400 V, three-phase, 60 cycle. The synchronous speed of the sets shall be 750. (Section 48) four Stoney sluice gates for the pits, appertaining to the turbines mentioned in Section 46. Tenders to the Secretary, Public Works Tenders Board, Government Buildings, Wellington.

Auckland Harbour Board. April 25.—Four double-barrel electric winches for the Central Wharf, Auckland. Specifications from W. & A. McArthur, 18-19, Silk-street, Cripplegate, London, E.C. 2.

SOUTH AFRICA.

Public Works Department of the Union of South Africa. Feb. 1.—Conduit and conduit fittings. Particulars from the Electrical Engineer, Public Works Department, Pretoria.

BULGARIA.

Bulgarian Department of Posts. Feb. 14.—*Bronze in plates and bars, iron and steel plates and bars, and insulating materials.

Bulgarian Department of Posts, Telegraphs, and Telephones. February 20.—*2 000 telephone instruments for table use, with local battery and magneto. Also for spare parts for these instruments.

Bulgarian Department of Posts. Feb. 27.—*Electricians' small tools, including 900 pairs pincers, 20 brazing lamps, 100 soldering irons, 1 500 bits, 300 axes.

Bulgarian Department of Posts. March 8.—*Porcelain insulating tubes for telephones (10 000), insulating tubing (impregnated paper) for telephones (2 200 metres), ebonite caps (1 700), and insulated copper wire (1 000 metres).

The tender of R. Kendale & Sons has been accepted for wiring and fitting at the Municipal Technical College, Bath.

Aberdeen Corporation have accepted the tender of Bell & Robertson for electric equipment in workshops at the police stables.

Battersea (London) Council have accepted the tenders of Veritys, Ltd., for a 30 H.P. open-type motor, £104 5s. 9d.; and the Igranic Electric Company for a starter switch, £26 11s. 6d.

Blackpool Tramways Committee have accepted the tender of the British Insulated & Helsby Cables, Ltd., for a high-tension feeder cable, and that of the Pirelli General Cable Works for a low-tension feeder cable. The cost is to be charged against the new £30 000 cable loan.

The Victorian State Government has confirmed the acceptance by the Victorian Electricity Commissioners of the tender of John Thompson & Company (Wolverhampton) for steam-raising plant for the Morwell power house at £282 318. It is stated that of this amount £137 110 will be expended in Australia.

The New Zealand Government have accepted tenders from British firms for £100 000 worth of plant for the installation of a hydro-electric plant to supply Wellington and the surrounding district. Further tenders, Reuter states, are still under consideration. American and Swedish firms also tendered.

Manchester Corporation have accepted the tenders of the British Thomson-Houston Company for tramcar motors and controllers, the Metropolitan-Vickers Electrical Company for tramcar motors, G. Bellington for wiring and sub-service cables to houses on Newton Heath Estate. A licence has been given to the British Thomson-Houston Company to sub-let the contracts for h.t. oil switches and transformers and lighting arresters to the International General Electric Company (U.S.A.) and for trip-circuit batteries to the D. P. Battery Company in their contract for switchgear for High-street sub-station.

Edinburgh Town Council have accepted the following tenders in connection with the tramways undertaking:—Peckham Truck Engineering Company, 53 trucks, £9 010; Metropolitan Vickers Electric Company, for 106 interpole ventilated, light weight traction motors, of the box-frame type, of approximately 40 H.P., at 600 V on the one-hour rating, £18 000; British Thomson Houston Company, 106 controllers, suitable for magnetic track breaking with interpole motors, £5 814; Electro Mechanical Brake Company, 53 car sets of grid resistances (suitable for mounting on car platform), £742; N.B. Steel Foundry Company, 250 car wheel centres, £500; 250 tram tyres, £881 5s.; machining wheel centres as necessary, £231 5s. 125 axles, 4-in., £781 5s. 125 pairs wheels and axles, £2 187 10s.

Catalogues Required.

*The Director of the Public Works Department, Bagdad, Iraq, is anxious to obtain catalogues, designs, specifications, prices, &c., of machinery and equipment, including electric lighting and power plant, small electric sets with fans and accessories, farm tractors, road tractors and agricultural machinery, excavating machinery, irrigating pumps, piping and pipe fixtures, well-boring plant and casings, cement and concrete mixers, quarry plant, woodworking machinery, pumping plants, motor-cars, refrigerating apparatus.

* *Particulars from the Department of Overseas Trade.*

Miscellaneous.

NOTTINGHAM Corporation have decided to reduce by 7½ per cent. the salaries of all officials receiving less than £750 a year.

LIVERPOOL City Council have approved a recommendation to reduce the war bonuses of officials receiving over £1 000 per annum by 50 per cent. from Jan. 31.

A start has been made on the work of clearing the Wembley site of the BRITISH EMPIRE EXHIBITION OF 1923. On Tuesday H.R.H. the Duke of York cut the first sod.

A fire which broke out at CAUDON HILL granite quarry on Sunday night completely destroyed the electric power house and two-thirds of the machinery was put out of action.

The Reading Education Committee have decided to purchase a RITTER ELECTRIC MOTOR AND DENTAL APPARATUS for use in the dental clinic at a cost, including installation, of £82.

A spark from a fire in the storeroom of the METROPOLITAN-VICKERS ELECTRICAL COMPANY'S premises in Chapel-walk, Sheffield, last week ignited a roll of paper, and caused a small blaze in the storeroom, which contained electric fittings. The outbreak was soon extinguished by the Sheffield Fire Brigade.

A Canadian company, which holds the British patent rights in an ELECTRIC PLATE AND DISH WASHING MACHINE, wish to get into touch with firms in the United Kingdom open to undertake the manufacture and sale of this article. Further information may be obtained at the office of the High Commissioner for Canada, 19, Victoria-street, London, S.W. 1.

We regret that a printer's error occurred in the setting of JOHNSON & PHILLIPS' ADVERTISEMENT on page xvi. of our last issue. The words "Fig. 2" should have appeared below the bottom left-hand panel instead of "Fig. 3." "Fig. 3" should have appeared below the bottom right-hand panel instead of "Fig. 4," and "Fig. 4" above the top right-hand panel instead of "Fig 2."

Some of the members of the Coal Mining Association are, says the Central News Agency, discussing a co-operative scheme for the RECONSTRUCTION of the BRITISH COALFIELDS, with a view to bringing order out of the existing state of chaos. The scheme includes the introduction of coal-cutting machinery where it has not already been installed, the erection of pit-head baths, and greater use of electricity.

PERPETUAL MOTION has again been discovered, this time by Mr. Richard Ulram, of Jersey City. He claims to have finished a machine, which he calls "the world's greatest invention," and he has organised the Perpetual Motion, Power, Heat & Light Company, with a capital stock of 25 million dollars, to develop the invention! The machine is stated to be "a cross between an electric washer and the old stone mill. It has more parts than a watch, and more wheels than a ten-carriage railway train."

Speaking at the CONFERENCE OF THE WORKERS' INSTITUTE at Balliol College, Oxford, on Saturday, Mr. A. P. M. Fleming dealt with the subject of the use and value of records and statistics. He had seen in batches of boys admitted at the works entrance eye and ear troubles, tonsilitis, &c., which would pass undetected in the ordinary way. But under the record system the boys were sent back, and in the great majority of cases the parents had things put right by proper treatment, so that the boys, parents, employers, and, above all, the community, were saved from the lingering disadvantage which in the past—and even to a considerable degree in modern times—hampered industry.

The fourteenth annual issue of the "ELECTRICAL ENGINEERS' DIARY" has recently been issued, and contains a mass of useful information for consulting and contracting engineers, manufacturing firms, and supply houses. Nearly every branch of the industry and every practical application of electricity (including cooking and heating) is catered for. The information given seems to have undergone extensive revision. There are a number of useful technical tables and statistics, including lists of central station showrooms and electrical shop windows, the Wiring Rules of the I.E.E., the Regulations as to Electricity in Factories and in Mines, lists of streets in the London area in which mains are laid, particulars of the supply undertakings in the United Kingdom, &c. We notice that in a few cases the price of gas is wrongly given, but in the main the information is correct. The Diary is published at 10s. 6d. net by S. Davis & Company, 30-31, St. Swithin's-lane, E.C. 4.

Traveller's Wages Claim.

At the City of London Court last week Mr. R. S. Butler, commercial traveller, sued the B.T.T. Electric Lamp & Accessories Company for £3 10s., salary and expenses in lieu of notice. Plaintiff said that about Oct. 20 last he was employed by Mr. Taylor, of defendant company, as a traveller and representative at £3 per week, with 10s. for expenses, 2½ per cent. commission, and a week's notice each way. On the Friday of the first week of his employment he was told to see Mr. Ayton, the sales manager. He waited until ten minutes past seven, and then, thinking he had waited long enough, and that Mr. Ayton had gone for the day, left. On the Saturday he was told he ought to have waited. He received his week's salary, and on the Monday was told he could not start again. He claimed that he was entitled to notice.

For the defence, Mr. Ayton said the plaintiff was told by him that it was to be a week on trial, but plaintiff denied that he was engaged for a week on trial.

The Registrar gave judgment for plaintiff for £3, disallowing the claim of 10s. for expenses.

Companies' Meetings, Reports, &c.

The directors of ROYCE, LTD., have decided not to pay an interim dividend on the preference shares.

An interim dividend of 9d. per share, free of tax, on the ordinary shares is announced by HEAD, WRIGHTSON & COMPANY.

The KAMINISTIQUIA POWER COMPANY has declared its regular quarterly dividend on the common stock at the rate of 6 per cent. per annum.

The tramway and electricity receipts of the ELECTRIC SUPPLY COMPANY OF VICTORIA, LTD., for the three months ended Sept. 30 last were £34 109 and the expenses £24 930.

A meeting of the holders of MEXICO ELECTRIC TRAMWAYS 5 per cent. first charge debentures will be held on Feb. 8 for the purpose of considering resolutions sanctioning certain proposed modifications of the rights of the debenture holders.

The report of the PROVINCIAL TRAMWAYS COMPANY for the year ended Sept. 30, 1921, shows net revenue received from subsidiary companies of only £20 900, as against £40 916, while a claim by the authorities for £12 454 for E.P.D. for 1918 has resulted in a big strain on the company's resources. In the circumstances there is no dividend on the ordinary shares, as compared with 7½ per cent. for 1919-20, and no appropriation can be made this time to reserve and depreciation account, which a year ago was allocated £10 000.

The ANGLO-AMERICAN TELEGRAPH COMPANY announces the following dividends to the close of last year:—Balance of £1 10s. per cent. on the consolidated ordinary and on the preferred stocks, less tax, making £3 15s. per cent. on consolidated ordinary and £6 per cent. on the preferred; and a first and final of £1 10s. per cent. on deferred stock for 1921, less tax. It has also been decided to pay a bonus of 2s. 3d. per cent. on the undivided ordinary stock and 4s. 6d. on the deferred, free of tax, all payable on Feb. 1, to holders registered on Dec. 31.

In the course of his speech at the annual meeting of the STEAUA ROMANA (BRITISH), LTD., in London last week, Sir Charles Greenway, Bart. (the chairman), stated that the company, conjointly with the local power company, had, on a 50-50 per cent. partnership basis, started the erection of a new electric power station, to be called "Steaua Electrica," to supply its own requirements and also those of other consumers. This power station is situated at Floresti, and the company would have the first call on its output. It was hoped that it would be working before the end of this year.

New Companies.

The following list is compiled from information supplied by Messrs. Jordan & Sons, Ltd., company registration agents, 116-118, Chancery-lane, London, W.C. 2.

A. G. BURRELL & COMPANY, LTD. (178 803), 28, Change-alley, Sheffield. Registered Jan. 3. Manufacturers and dealers in systems and installations of every sort used for the purpose of synchronising or distributing time. Nominal capital, £5 000 in 1 500 6 per cent. cumulative preference shares and 3 500 ordinary shares of £1. Directors: J. W. Molden and W. E. Spearing. Private company.

CHARLES H. CHAMPION & COMPANY, LTD. (178 837). Registered Jan. 4. Producers and suppliers of electrical apparatus. Nominal capital, £10 100 in 1 000 preference shares of £10 each and 2 000 ordinary shares of 1s each. Directors to be appointed by subscribers. Qualification of directors, one share. Subscribers: H. Marcotty, 71, Castlenau-mansions, Barnes, S.W. 13; C. H. Champion; and G. H. Leslie. Private company.

HENDERSON & THORNTON, LTD. (178 865). Registered Jan. 5. Producers and suppliers of electrical apparatus. Nominal capital, £2 000 in 500 preference shares of £1 each, and 1 500 ordinary shares of £1 each. Directors: F. Higgs, Station Works, Hinton-road, Herne Hill, S.E.; B. C. Aldous; J. A. Henderson; and L. Thornton. Qualification of directors, one share. Private company.

RAPSON TYRE & JACK COMPANY, LTD. (178 851), 85, Gracechurch-street, E.C. Registered Jan. 4. Electrical and general engineers, &c. Nominal capital, £40 000 in 40 000 shares of £1 each. Directors: F. L. Rapson and G. G. Warr. Qualification of directors, £500. Remuneration of directors, £500 each. Private company.

STERLING ACCESSORIES, LTD. (178 768). Bangor House, Shoe-lane, E.C. Registered Dec. 31. Electrical, telephone and general engineers. Nominal capital, £1 000 in 1 000 ordinary shares of £1 each. Directors: C. J. Margerison and A. Handley. Qualification of directors, £200. Permanent directors, £300. Private company.

THERM SAVING APPLIANCES, LTD. (178 856). Registered Jan. 4. Iron founders, mechanical and electrical engineers. Nominal capital, £5 500 in 5 000 preferred shares of £1 each and 10 000 deferred shares of 1s. each. Directors to be appointed by subscribers. Qualification of directors, £1. Subscribers: A. E. Fournier, 18, Fleet-street, E.C., and B. L. Diddams. Private company.

Marconi's Wireless Telegraph Company announce that from the 1st inst. the charge for private RADIO TELEGRAMS FROM THEIR POLDHU STATION to ships at sea has been reduced from 2s. 6d. per word to 1s 2d. per word, plus the ship charge, which is usually 4d. per word.

Arrangements for the Week.

FRIDAY, Jan. 13th (to-day).

INSTITUTION OF ELECTRICAL ENGINEERS.

(SCOTTISH CENTRE, STUDENTS' SECTION.)

7.30 p.m. At the Royal Technical College, Glasgow. Paper on "The Protection of Alternating Current Circuits," by Mr. E. T. Pounds.

EDINBURGH ELECTRICAL SOCIETY.

8 p.m. At the Philosophical Institute, 4, Queen-street, Edinburgh. Paper on "A Chat on Storage Batteries as Applied to Electric Traction," by Mr. L. Brookman.

ELECTRO-HARMONIC SOCIETY.

8 p.m. At Cannon-street Hotel, London, E.C. Smoking concert.

SATURDAY, Jan. 14th.

BIRMINGHAM AND DISTRICT ELECTRIC CLUB.

7 p.m. At the Grand Hotel, Colmore-row, Birmingham. Presidential Address by Mr. N. Deykin.

MONDAY, Jan. 16th.

INSTITUTION OF ELECTRICAL ENGINEERS.

(WESTERN CENTRE.)

6 p.m. At the Merchant Venturers' Technical College, Bristol. Lecture "On the Work of the British Electrical Development Association and upon Advertising in Connection with Engineering and Electricity Development Generally," by Mr. J. W. Beauchamp.

INSTITUTION OF ELECTRICAL ENGINEERS.

(LIVERPOOL SUB-CENTRE OF THE NORTH-WESTERN CENTRE.)

7 p.m. At the University, Liverpool. Cinematograph films to be exhibited on "High Tension Switchgear Tests," by Mr. P. Torchio, described by Dr. C. C. Garrard; "Telephone Inventors of To-day," and "Electricity in the Home," by Mr. F. Gill, O.B.E.

TUESDAY, Jan. 17th.

INSTITUTION OF ELECTRICAL ENGINEERS.

(NORTH MIDLAND CENTRE.)

7 p.m. At the Metropole, King-street, Leeds. Paper on Single- and Three-Phase Alternating Current Commutator Motors with Series and Shunt Characteristics," by Dr. S. P. Smith.

INSTITUTION OF ELECTRICAL ENGINEERS.

(NORTH-WESTERN STUDENTS' CENTRE.)

7.30 p.m. At Houldsworth Hall, Deansgate, Manchester. Paper on "Switching Systems and Lay-Outs," by Mr. F. Gough.

ENGINEERS' CLUB, MANCHESTER.

7.15 p.m. At Albert-square, Manchester. Address on "The Relationship of Finance to the Engineering Industry," by Mr. H. G. Williams.

WEDNESDAY, Jan. 18th.

INSTITUTION OF RAILWAY SIGNAL ENGINEERS.

3 p.m. At the Institution of Electrical Engineers, Savoy-place, London, W.C. Resumed discussion on "Three-Position Signalling," by Mr. A. E. Tattersall.

INDUSTRIAL LEAGUE AND COUNCIL.

7.30 p.m. At Caxton Hall, London, S.W. Lecture on "Use and Abuse of Combines and Trusts," by Mr. R. Young, O.B.E.

THURSDAY, Jan. 19th.

INSTITUTION OF ELECTRICAL ENGINEERS.

6 p.m. At Savoy-place, London, W.C. Joint meeting with the Institution of Heating and Ventilating Engineers. Discussion on "The Utilisation of Waste Heat from Electrical Generating Stations," with Introductory Papers by Mr. C. I. Haden and Mr. F. H. Whysall.

FRIDAY, Jan. 20th.

INSTITUTION OF MECHANICAL ENGINEERS.

6 p.m. At Storey's Gate, London, S.W. Paper on "Some Observations on a Producer-Gas Power Plant," by Mr. H. S. Denny, C.B.E., and Mr. N. V. S. Knibbs, B.Sc.

INSTITUTION OF ELECTRICAL ENGINEERS.

(LONDON STUDENTS' SECTION.)

7 p.m At Savoy-place, London, W.C. Paper on "Some Applications of the Thermionic Valve to Telephony," by Mr. L. T. Hinton.

JUNIOR INSTITUTION OF ENGINEERS.

8 p.m. At Caxton Hall, London, S.W. Lecturette on "Geology in its Relation to Engineering."

ROYAL INSTITUTION.

9 p.m. At Albemarle-street, London, W. Discourse on "Soap Films and Molecular Forces," by Sir James Dewar, F.R.S.

Catalogues, Price Lists, &c.

The ENTERPRISE MANUFACTURING COMPANY have issued their January price list.

A. P. LUNDBERG & SONS have issued a leaflet dealing with their SERIES-PARALLEL SWITCHES.

Among the new catalogues just published by the OVERSEAS ENGINEERING COMPANY is List No. 195, dealing with the "Overseas-National" electric lighting outfits, and List No. 28, which deals with the "Zenith" slow-speed, four-cycle oil engines.

ELECTRICAL COMPONENTS, LTD., are determined to make a good year of 1922, and a leaflet, entitled "The Challenge of 1922," is full of vigorous determination, which is bound to meet with success. The firm have just issued an abridged price list of electrical accessories (No. 93), and the reductions shown in many instances bring prices down to pre-war levels.

Forty Years Ago.

(THE ELECTRICIAN, JANUARY 14TH, 1882.)

THE SOCIETY OF TELEGRAPH ENGINEERS AND OF ELECTRICIANS.—The next meeting of this society takes place on the 19th inst., when an inaugural address will be read by the president-elect, Lieut.-Colonel C. E. Webber, R.E.

WHY ELECTRICIANS USE GAS IN THEIR OFFICES.—The correspondent of a provincial paper says that the reason why Mr. Swan, of Newcastle, uses gas in his factory is because the electric light is "the light of the future," and that Mr. Swan evidently knows this.

RAILWAY SIGNALLING.—Mr. A. W. Tuer writes to the "Daily News" under this heading, suggesting that if "passengers were made acquainted with the state of the signals as they pursued their journey (which I think could be managed by means of an automatic electric indicator fixed in each compartment), neither driver nor guard dare for an instant neglect them."

THE FUTURE.—A glimpse into the future is afforded in an extract from a speech recently delivered at a preliminary meeting in Paris of the company which has been formed to work M. Marcel Duprez's system of transmitting power by means of electricity. M. Bontoux was the speaker. He said:—"The division of electric energy is destined to effect an entire revolution in this sphere. The day will come, and sooner than is imagined, when the artisan family will see enter their dwelling, by means of a magic wire, the force which is now so costly to them, and this will be the democratisation of force for the benefit of the working classes." What a Utopian Republic is here foreshadowed!

The "TEXTILE RECORDER YEAR BOOK FOR 1922," a copy of which we have received from the publishers, John Heywood, Ltd., will be principally of interest to electrical engineers from the short accounts of the various processes involved in textile manufacture which it contains. From these they will be able to gain some idea of the problems which have to be met in adapting the electric drive to textile requirements. A certain amount of useful information about the electric drive is given, but the editor is a little lukewarm as to its advantages. Nevertheless, it continues to develop, principally, no doubt, because it provides a convenience and flexibility which it is difficult to translate directly into figures.

Prices of Metals, Chemicals, &c.

TUESDAY, JAN. 10.

		Price.	Inc.	Dec.
Copper—				
Best selected	per ton	£68 10 0	—	5s.
Electro Wirebars ..	,,	£74 10 0	—	10s.
H.C. wire, basis	per lb.	0s. 11 3/16d.	—	1/16d.
Sheet	,,	0s. 10½d.	—	
Phosphor Bronze Wire (Telephone)—				
Phosphor-bronze wire, basis.....	,,	1s. 3 3/16d.	—	1/16d.
Brass 60/40—				
Rod, basis	,,	0s. 7½d.	—	—
Sheet, basis.....	,,	0s. 10¼d.	—	¼d.
Wire, basis	,,	0s. 10⅜d.	—	⅛d.
Pig Iron—				
Cleveland Warrants	per ton	£5 5 0	—	—
Galvanised steel wire, basis 8 SWG	,,	£22 0 0	—	—
Lead Pig—				
English	,,	£26 0 0	—	—
Foreign or Colonial ..	,,	£24 7 6	—	—
Tin—				
Ingot	,,	£167 0 0	—	£3 15 0
Wire, basis	per lb.	2s. 3½d.	—	⅜d.
Aluminium ingot		£120 0 0	—	—

Salammoniac.—Per cwt. 65s.-60s.
Sulphur (Flowers).—Ton £12 10s.
,, (Roll-Brimstone).—Per ton £12 10s.
Sulphuric Acid (Pyrites, 168°).—Per ton, £9 17s. 6d.
Copper Sulphate.—Per ton £28 10s
Boric Acid (Crystals) —Per ton £65.
Sodium Bichromate.—Per lb. 6d.
Sodium Chlorate.—Per lb. 3½d.
Rubber.—Para fine, 1s. 1½d.; plantation 1st latex. 10⅛d.

The metal prices are supplied by British Insulated & Helsby Cables, Ltd., and the rubber prices by W. T. Henley's Telegraph Works Co., Ltd.

COMMERCIAL INTELLIGENCE.

The following information is taken from printed reports, but we cannot be responsible for any errors that may occur.

London Gazette.

Bankruptcy Information.

DEPLEDGE, Robert Adrian, 53, Frodingham-road, Scunthorpe, Lincolnshire, electrical engineer. First meeting, Jan. 18, 11 a.m., Official Receiver's Office, St. Mary's Chambers, Great Grimsby. Public examination, Feb. 2, 11 a.m., Town Hall, Great Grimsby.

WILLCOX, Albert John, The Garage, Farnham Common, Bucks, electrical engineer, &c. First meeting, Jan. 16, at 11 a.m., 29, Russell-square, London, W.C. 1. Public examination, Feb. 10, 11 a.m., Town Hall, Windsor.

Companies Winding-up Voluntarily.

ELECTRICAL DEVELOPMENT & FINANCE CORPORATION, LTD. W. B. Stone, 90, Cannon-street, E.C., appointed liquidator.

FOUNTAYNE LAMP & ENGINEERING COMPANY (1910), LTD. Mr. B. R. Heaton, New-square, Lincoln's Inn, London, appointed liquidator. Meeting of creditors at liquidator's office, on Wednesday, Jan. 18, at 12 noon.

PLANET ELECTRIC COMPANY, LTD. S. H. Swallow, 67, Broad-street-avenue, London, E.C. 2, appointed liquidator.

Liquidator's Notice.

ELECTRICAL DEVELOPMENT & FINANCE CORPORATION, LTD. (in voluntary liquidation). Meeting of creditors at the offices of Cash, Stone & Co, 90, Cannon-street, London, E.C. 4, Tuesday, Jan. 17, at 2.30.

Edinburgh Gazette.

WILSON, R. Anderson, mechanical and electrical engineer, 19, Waterloo-street, Glasgow. Estates sequestrated Jan. 4. Meeting to elect the trustee and commissioners on Monday, Jan. 16, at 12 noon, Faculty Hall, St. George's-place, Glasgow. Fergusson & Ross, writers, 30, Renfield-street, Glasgow, agents.

County Court Judgments.

[NOTE.—The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debts. They may be for actions. But the Registry makes no distinction of the cases. Judgments are not returned to the Registry if satisfied in the Court books within twenty-one days.]

FULLER HEATH & CO., The Old Brewery, Earl-street, Westminster, S.W., electrical engineers. £10 8s. 1d. Aug. 25.

GAUNT, Mr. 15, Cambridge-place, Paddington, and SAYER, Mr. 117, De Beauvoir-road, Dalston, formerly trading as Gaunt and Sayer, electricians. £26 0s. 10d. Oct. 4.

HASLIN, John Joseph, 50, Nestfield-street, Darlington, electrical welder. £16 15s. 6d. Oct. 5.

HILL, Geo., 22, Chantrey-lane, Grimsby, electrician. £13 13s. 2d. Oct. 28.

LEVER, J., & SON, 1, Radipole-road, Fulham, electrical engineers. £55 9s. Oct. 18.

NEAL WOOD & CO., 5, Smallgate, Beccles, electrical engineers. £14 6s. 6d. Nov. 3.

OWEN & SON, Westcombe-hill, Blackheath, electrical engineers. £10 11s. 8d. Nov. 3.

VEVERS, Mr. J., 45, Queen-street, Maidenhead, electrical engineer. £14 12s 1d. Aug. 31.

WHITEHEAD, Henry John, 62, West-hill, Wandsworth, S.W. 13, electrical engineer. £54 16s. 10d. Oct. 21.

WYATT, Mr. A. J., 16, Hykeham-road, Bracebridge, electrical engineer. £12 1s. 10d. Nov. 7.

Bills of Sale.

[The undermentioned information is from the Official Registry. It includes Bills of Sale registered under the Act of 1882 and under the Act of 1878. Both kinds require registration every five years. Up to the date the information was obtained it was registered as given below; but payment may have been made in some of the cases, although no notice had been entered on the Register.]

BROADHURST, William Gladstone, 18, Meadow-way, Weald Village, Harrow, electrical engineer. Jan. 9. £100.

OWEN, Arthur Leo, 24, Norfolk-road, Littlehampton, electrician. Jan. 6. £40.

Mortgages and Charges on Limited Companies.

[NOTE.—The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, created by a Company after the commencement of the Act, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges which would, if created after the commencement of the Act, require registration. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced since such date.]

BRITISH THOMSON-HOUSTON COMPANY, LTD., London, E.C., manufacturers of electrical machinery. Registered Dec. 17. Trust deed dated Nov. 30, 1921, securing £3 000 000 debenture stock, to Royal Exchange Assurance Corporation, E.C.; charged on properties as set out in second schedule to trust deed (subject, as to certain premises, to trust deed dated March 10, 1902), also general charge. *£152 295. June 1, 1921.

MIDLAND COUNTIES ELECTRIC SUPPLY COMPANY, LTD. (late TRAMWAYS LIGHT & POWER COMPANY, LTD.), London, E.C. Registered Dec. 22. £400 000 debenture stock, secured by trust deed dated Dec. 14, 1921; charged on shares and debenture stock of various companies, also general charge. *£344 150 (debenture stock), £200 000 (notes). March 15, 1921.

NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY COMPANY, LTD. Registered Dec. 22. Trust deed dated Dec. 9, 1921, supplemental to and modifying provisions of trust deed registered Oct. 29, 1913, by increasing limit of debenture stock which may be issued thereunder to £2 000 000 and increasing rate of interest payable on the debenture stock thereby secured; also registered Dec. 22, acknowledgment of further indebtedness (supplemental to trust deeds registered Oct. 29, 1913, and Dec. 22, 1921), securing £750 000 second debenture stock (additional); charged on electrical lighting and power undertakings and lands and premises now comprised in trust deed, and certain shares, also general charge (except uncalled capital). *£3 014 658. April 5, 1921.

Satisfaction.

CREED & COMPANY, LTD. (late CREED, BILLE & COMPANY, LTD.), Croydon, telegraphic engineers. Satisfaction registered Dec. 29, £3 000, registered Jan. 22, 1920.

Receivership.

TREDELECT DYNAMOS, LTD. N. Bell, of 78 and 79, Wool Exchange, Coleman-street, was appointed receiver and manager by order of court, dated Dec. 21, 1921.

Bankruptcy Proceedings.

BARNETT, Bernard, electrical engineer, 104, Whitechapel-road, E. A meeting of creditors was held last week at the London Bankruptcy Court. Debtor had stated that in 1914 he took a lease of a house, shop and factory premises at 104, Whitechapel-road, where he began business. In March last he executed some work at premises belonging to M. Heller and R. Cederman, and later on these two gentlemen entered into partnership with him, the idea being to extend the business to the West End. On July 29 last his two partners served him with notice of dissolution of the partnership, and a receiver was appointed. Debtor estimated his liabilities at between £500 and £800, and valued his assets at £800. He attributed his present position to over-confidence in his manager, book-keeper and partners. There was no quorum of creditors present, and the meeting was adjourned to allow an opportunity of appointing a trustee.

PRIVATE MEETING.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

AUTOMOBILE ELECTRICAL REPAIRERS, LTD. (in voluntary liquidation), Euston-road, London, N.W. A meeting of creditors was held recently at the offices of Cole, Dickin & Hills, Kingsway, W.C. Mr. N. J. Dodd, the liquidator of the company, submitted a statement of affairs, which showed unsecured liabilities of £815. Of that amount £263 was due to the trade, £44 to the bank, and the balance represented the unsecured amount due to the debenture holders. The claim of the bank amounted to £194, but they held securities valued at £150. The assets of the company were only estimated to realise £200, from which had to be deducted £40 for preferential claims, leaving net assets of £160. The latter amount was insufficient to meet the claims of the debenture holders, which amounted to £513, and there was no balance available for the ordinary creditors. The company was incorporated in January, 1920, with a nominal capital of £1 000. The issued capital was £795. The debentures were in order, and it was pointed out that there was nothing available for the creditors. No resolution was passed, and the voluntary liquidation of the company will therefore be continued by Mr. Dodd. The following are creditors:—Brown Brothers, London, £14; Burrow & Company, Ltd., Cheltenham, £10; General Electric Company, London, £47; W. S. Jeal & Ebury Engineering Company, Ltd., London, £15; Perra Engineering Company, Blackpool, £59; C. A. Vandervell & Company, London, £15; Collins Electrical Company, London, £32.

Patent Record.

APPLICATIONS FOR PATENTS

September 14, 1921.

24 388 Dowdeswell. Commutators.
24 389 Wilson. Armature coil winder.
24 396 Lamb. Electric signs, &c
24 413 Qtenby. Combination electric lamp, horn, and switchboard.
24 441 Harrison, Pooley & Wreford. Submersible electrical apparatus.
24 442 Austin, Pooley & Wreford. Portable electric combination tools.
24 443 Haines, Pooley & Wreford. Portable electrically-driven apparatus.
24 468 de Coninck. Application of rheostatic converter system to regulation of synchronous motors.

September 15, 1921.

24 501 Corlin. Time Switch. (13/1/21, Denmark.)
24 502 Lawrance. Trollies for tramways.
24 528 Green, Willson & Jamieson. Switches.
24 529 Klug. Tide power generating systems.
24 531 Westinghouse Lamp Co. Manufacture of glass. (16/10/20, U.S.)
24 562 Akt. Ges. Brown, Boveri et Cie. Protection of polyphase circuits on earth connection. (16/9/20, Switzerland.)
24 564 Stone (J.) & Co. & Watkins. Governor for electric motor, &c., operating pump in hydraulic system.
24 579 Symonds. Electric signalling and telegraph devices, &c.

September 16, 1921.

24 593 Wilkinson. Wind-driven dynamos.
24 597 Efandem Co. & Eaton. Electric terminals.
24 598 Efandem Co. & Eaton. Electric hand lanterns.
24 607 Nicholas & Roberts. Electric lighting sets for motor vehicles, &c.
24 622 Dutt & Godfrey. Storage battery.
24 635 Zachauer (F. H.), Metallwarenfabr. & Grünthal. Electric water heaters.
24 636 Rodger. Clock-operated electric switches.
24 641 Rogge. Electric pocket lamps. (22/9/20, Germany.)
24 650 Cubitt. Switches.
24 652 Parkin. Wireless telegraph devices.
24 654 British Lighting & Ignition Co. & Tuppen. Contact breakers.

September 17, 1921.

24 681 Pinkerton. Electrical clock time switch.
24 692 Lancashire Dynamo & Motor Co. & Whitmore. Electric machines.

September 19, 1921.

24 745 Kilvert. Self-regulating magneto.
24 759 Bedson. Insulator blocks of h.t. switchgear, &c.
24 761 Horton & Preston. Electric lead terminals.
24 764 Latour. Electro-magnetic wave transmitting systems. (21/8/15, France.)
24 765 Latour. Electro-magnetic wave transmitting systems. (20/11/15, France.)
24 769 Churchill. Electric vehicles.
24 774 Farquharson. Magnetos.
24 780 Klauck. Trolley heads for tramcars.
24 808 B. T.-H. Co. (G. E. Co.). Motors.
24 782 Munro. Sockets or bases for trolly poles.
24 783 Page. Electric alarm system for detecting a damaged seat.
24 812 Allmanna Svenska Elektriska Aktiebolaget. Transformers. (2/7/21, Sweden.)
24 823 Rueff. Electric lamps
24 825 Bartholomew. Telautography.
24 847 Automatic Telephone Mfg. Co. Telephone systems. (1/10/20, U.S.)
24 848 Automatic Telephone Mfg. Co. Telephone systems. (22/9/20, U.S.)

The Editorial, Advertisement and Publishing Offices of "The Electrician" are at 8, Bouverie Street, London, E.C. 4. Telegrams: Benbroctic, Fleet, London. Telephone: City 9852 (5 lines)

The subscription to "The Electrician" is £2 12 0 per annum in the United Kingdom, and £2 14 0 per annum Abroad. Advertisement Rates can be obtained on application to the Manager. Advertisement copy and blocks should be received on the Friday preceding date of publication.

THE ELECTRICIAN

ESTABLISHED 1861.

THE OLDEST WEEKLY ILLUSTRATED JOURNAL OF

Electrical Engineering, Industry, Science and Finance.

No. 2279. [Vol. LXXXVIII. No. 3.] FRIDAY, JANUARY 20, 1922. Prepaid Subscription U.K., £1 12s. per ann.; Abroad, £1 14s. Price 1/-

CONTENTS.

The "Electrician" Index.

Copies of the Index to Vol. LXXXVII of The "Electrician," which concluded with the issue of December 30 last, are now available, free of charge. Applications should be made to the Circulation Manager, The "Electrician," 8, Bouverie Street, London, E.C.4.

Notes of the Week.

Scottish Hydro-Electrical Schemes.

Though few new electrical schemes will come up for consideration in the forthcoming session of Parliament, two interesting Provisional Orders, which are being promoted by the Hydro-Electric Development Company and the Ayr Corporation for the development of the water power of the Grampians and of Loch Doon respectively, may be noticed. The Grampian scheme is a modification of the proposals put forward last year, which were discussed at length in The Electrician of January 14, 1921. This scheme, it will be remembered, was withdrawn owing to the opposition of the riparian owners and the salmon fishery interests. The chief modifications seem to be that four sites for generating stations instead of five are specified, and that the company desires to be relieved of the usual restrictions which are imposed on power companies supplying electricity for lighting.

An All-British Project.

The scheme is interesting as being the first British hydro-electric development which will rely exclusively upon water power for the generation of electricity for bulk supply to authorised distributors and for other purposes. Though there is already evidence of opposition from the fishing and other interests, the proposals of the company, we are glad to see, are receiving a good deal of sympathy and support. We need scarcely add that we wish the promoters every success in their efforts to secure statutory authority for a project which will have a most beneficial effect on the industries and social life of the Highlands.

The Loch Doon Scheme.

The proposals of Ayr Burgh are of a much more modest character. The Provisional Order deals with electricity supply, tramways and omnibuses, and several other subjects. It is intended to acquire about eleven acres of land at Dalmellington for the erection of hydro-electric works, and power is sought to construct various specified works in order to be able to employ the water of Loch Doon for generating electrical energy and to lay mains, erect overhead lines, &c. Ten years are to be allowed for the completion of the works.

Miscellaneous Powers.

The Order also extends the area of supply to Girvan, Maybole and several neighbouring parishes, and various miscellaneous powers are sought for the better management of the Burgh supply undertaking. In the first place it is desired to increase the maximum charge to 1s. per unit, and to impose a minimum charge for any amount of energy up to 15 units at the rate of 15s. in the March and December quarters and of 10s. for 10 units in the June and September quarters. Power is also sought to revise prices and methods of charging every three years, to construct sub-stations under streets, to lay mains in private streets, to discontinue supply where electricity is used contrary to the terms of the agreement, to erect overhead poles, to supply electricity in bulk, and to equip and maintain showrooms. It will be seen that some of these powers would be conferred by the Electricity Supply (No. 2) Bill, if and when passed, and there is a precedent for practically every one of them in Acts obtained in recent years by municipal authorities.

High-Speed Wireless.

On another page of this issue we give an abstract of a Paper by Col. A. G. T. Cusins, which was recently read before the Wireless Section of the Institution of Electrical Engineers. This Paper describes the low-power high-speed wireless apparatus which has been developed for military purposes at the Army Signals Experimental Establishment.

Those who have observed the progress of "wireless" during the last twenty years will be inclined to be sceptical at the revival of a promise heard at frequent intervals since the earliest days. They will remember a little sourly how favourable previous results have been over short distances, but they will not thereby be readily led to agree with Col. Cusins that it is reasonable to suppose that much greater distances can be traversed as the power is increased. For ourselves we think that for the ranges required for military sets the apparatus described by Col. Cusins constitutes a very practical and valuable achievement, but at the same time a study of the previous history of wireless development might be undertaken with advantage by those who so frequently and so eagerly neglect the very considerable difficulties which have to be overcome in applying to high powers the methods which experience has shown to be successful at low powers. The debate on Col. Cusins' Paper carried the meeting on almost to eight o'clock—two hours' steady talking. Some speakers contributed matter of value, and it is probable that others would have given a quantitative investigation of the relative merits of the apparatus had there been time. But this was prevented by the amount of time taken up in the reading of the Paper. We have often pointed out that where members are anxious to take part in the discussion the exigencies of time make essential a considerable shortening of the period occupied in reading the Paper, and in this particular case certain parts which were read might well have been omitted.

I.E.E. Informal Meetings.

It has long been known that the ordinary meetings of the Institution of Electrical Engineers are apt to be somewhat formidable to a proportion of the members, many of whom might be prepared to speak at smaller gatherings on less highly technical, but even more debatable, subjects. The original objects of the informal meetings were, therefore, to facilitate discussion of a rather wider range of subjects than is possible at ordinary meetings, and to enable members to make contributions which would otherwise be withheld on account of modesty or unfamiliarity with the subject under discussion. As far as London is concerned these objects have been admirably achieved, while the discussion on the drives of power station auxiliaries, which inaugurated the Manchester informal meetings, indicates that these local meetings will have an equally successful future. The subject chosen, forms an illustration of a type of discussion which is less concerned with description or the elucidation of principles than with the correlation of actual experience on matters of common interest to both manufacturers and supply engineers.

A Place for Minor Papers

In the course of his evidence Mr. Wilson referred to the brought before the ordinary meetings of the Institution is limited by a number of factors, and that, however strenuous the session, a vast field of technical activity must remain unrecorded. There, therefore, is a place for what may be termed minor Papers, as distinct from the major Papers which form the bulk of the Journal. Such a minor Paper may consist of a symposium of very short contributions on a given subject, or of a round-table discussion. Contributions to the discussion on ordinary Papers are often prepared beforehand, and at the meeting the effect conveyed is naturally one of lack of co-ordination. Less formal discussions might prove to have more unity, and, with careful editing and abbreviation, should prove valuable additions to the Journal. Their introduction would have the effect of enabling more justice to be done to every branch of a complex and many-sided industry, and, in their attempts to make the Institution more useful to the general membership, their organisation is a matter to which the Council might well give their attention.

Drives for Power Station Auxiliaries.

The vital importance of reliability in the operation of power station auxiliaries appears from the discussion at the first informal meeting of the Institution of Electrical Engineers in Manchester, which we summarise elsewhere in this issue. The steam is clearly being superseded by the all-electric drive, duplicate supplies being arranged to minimise risks of a total stoppage. The enormous increase in the size of main generating units at large stations necessitates turbo-alternator sets and transformers for station service of some magnitude. It is also gratifying to find such a consensus of opinion in favour of one form of supply, alternating being preferred to direct current. Power engineers in this country rightly value continuity of supply, and may therefore safely be trusted to ensure this for their auxiliaries as well as for the outside consumer. The discussion in general, therefore, confirms the views we expressed in a recent Editorial Note.

Dumping of German Lamp Bulbs.

Important evidence was given last week by Mr. Christopher Wilson before the Committee appointed under Part II. of the Safeguarding of Industries Act. This portion of the Act deals with dumping, upon which Mr. Wilson is expert, as he has had long and extensive experience of the electric lamp trade. From Mr. Wilson's evidence, which is reported in another column, it will be seen that at present German lamp bulbs can be placed on the English market at 56s. 4d. per thousand, or considerably less than the cost of the British labour charges for the product. If the present demand for a duty of 33⅓ per cent. be conceded the price of the German bulb would still be less than 55 per cent. of the actual cost of the British article! It is interesting to learn that Germany is the only real competitor so far as bulbs are concerned, for, although Holland and Belgium also manufacture bulbs, either the output is not so good or the price is much higher.

Duty Required to Increase Employment.

Mr. Wilson stated that the fundamental cause of the present unemployment in the industry was the low price, caused by the depreciation of the mark, at which Germans can put their bulbs on the English market, and he thinks that a duty would tend to assist employment here, this benefit being increasingly felt as the foreign currencies recover. No doubt this is true, but at the present time the German mark is more likely to depreciate than to appreciate, and this depreciation may more than counterbalance the 33⅓ per cent. duty which is demanded by the manufacturer.

Cause of German Superiority.

In the course of his evidence Mr. Wilson referred to the superior equipment of the German glassworks and to the more extensive experience and higher technical skill of the German workman. These are, no doubt, very important factors in the situation, for it is common knowledge that many British glass manufacturers have been carrying on without up-to-date plant and equipment. In these days it should be obvious that no duty will save a manufacturer

unless he installs modern furnaces, and although lack of capital and heavy taxation have hitherto prevented many British firms from modernising their plant and methods, the time has come when the true facts must be faced and a real effort made to put their houses in order.

Unauthorised Connections to Mains.

A DECIDED increase in the number of unauthorised connections to the mains of supply authorities is noticeable. We have, in fact, had to chronicle several cases of the kind during the past two or three months, and we are afraid that many of those who make these irregular connections do not appreciate the result of their action. It cannot be too strongly emphasised that, apart from any question of fraud, it is illegal for a contractor or consumer to connect up premises to the supply mains without the sanction of the electricity undertaker. There are several reasons why this should be so, not the least that a main may thereby be overloaded and the other customers deprived of their supply. A case of this kind recently occurred at Chester, where an electrician employed by consumers put in larger fuses than had been allowed for, with the result that the fuse in a street box blew, and neighbouring consumers were deprived of their light for an hour or two. Though there was no fraudulent intention, we are glad to see that a fine of £5 was inflicted.

Electric Vehicles at Islington.

THE Borough of Islington will shortly have one of the largest municipal fleets of electric vehicles in the Metropolis. In March last eleven vehicles were acquired for the purpose of watering the streets and collecting refuse, and now four more 2½ ton electric dust vans have been purchased. A report states that, in the Council's experience, one motor vehicle is equal to two horse-drawn vans for dust collection, and to four horse-drawn vehicles for street watering, and therefore a large economy is effected by using electric vehicles instead of horses. We notice, however, that for the repayment of the loan of £6 100 for the dust vans only a period of five years is allowed by the London County Council. This is too short, considering that the life of the "electric" is as long as that of the petrol or steam vehicle, and the result is that the heavy interest and sinking fund charges place it at a disadvantage during this period. The Electricity Commissioners allow a minimum of seven years for the repayment of all loans for motor vehicles, whether electric, petrol, or steam, and we think that the useful life of the electric vehicle can safely be taken to be not less than this figure. Where only five years is allowed for paying back a municipal loan, it would be more economical if the money were provided out of the rates than borrowed.

Dr. Edward Hopkinson.

THE death of Dr. EDWARD HOPKINSON, which we record on another page of this issue, removes not only a pioneer but the bearer of a name which will always be honoured by those who work in electrical science and industry. JOHN HOPKINSON, it is hardly too much to say, was the father of the electrical industry as we know it to-day. BERTRAM HOPKINSON, a son who, like his father, met his death in untoward circumstances, was no less a practical scientist, whose work was of the highest importance in the development of aviation. EDWARD HOPKINSON in his turn did much to solve the early problems of electric traction, and by his knowledge and enterprise built a foundation on which others might erect a worthy superstructure. Into the wider field of politics he brought a breath of freshness and sincerity which that arid plain sadly needs. These are men who can sorely be spared.

British Tenders for Foreign Orders.

COMPLAINT is often made that British firms are unsuccessful in the competition for colonial and foreign orders, and that their tenders are frequently passed over in favour of those of German or American origin. It is therefore well to consider some of the causes of this want of success. In the first place price is not the only element considered by the customer, for prompt delivery and efficiency of product may be regarded as equally important factors. In the next place, some of the conditions of the contract in these foreign tenders are very onerous, and British firms naturally desire to obtain modifications of them. On the other hand, foreign firms, and particularly the Germans, who are just now extremely anxious to recover their foreign trade, are willing to accept exacting conditions.

Two Methods Contrasted.

A GOOD example of the methods of the two countries is to be found in the results of the tenders recently invited by the Rand Water Board for electric pumping plant. The Board's requirements were advertised in the columns of THE ELECTRICIAN. Many tenders were received, and the contract for steel pipes went to a German firm, mainly on account of the low price—£276 223 compared with £392 476, the lowest British tender. An order for electric pumping plant also went to Germany, and the Board's engineer, reporting on the tender of the successful firm, said that they had fully grasped the Board's requirements. "The electric motors were larger and heavier, the insulation of the windings was of a better quality, and the temperature rise at full load less than that put forward by a British manufacturer. Moreover, the whole of the Board's general conditions and specification, including penalties, terms of payment, etc., and the whole of the prices were firm, and not subject to any variation in exchange, freightage, etc."

Work for the B.E.A.M.A.

On the other hand it was reported that some of the British tenders were subject to exceptions and reservations, and that one firm intimated that they were not prepared to accept the following: The guarantee as to the insulation resistance, full penalties for low efficiency, testing plant at their works under load, the clause as to responsibility for mistakes, penalty for late delivery, the Board's engineer as sole arbiter, and the terms of payment. In addition they required modification of the tests applied to the plant after erection. We are not surprised, therefore, that the engineer advised the Board not to consider that particular tender. Some of the conditions are no doubt unfair and might prove burdensome to manufacturers, but to attempt to make, when tendering, such sweeping alterations in the specification was, to say the least, unwise. It would have been better to make a protest against unfair conditions before tendering, or not to submit a tender rather than to submit one with so many modifications. Such matters, too, would be better dealt with by the B.E.A.M.A. than by individual firms. It is a question they will, no doubt, take up.

Other Work of the Commissioners.

THE long delay between the provisional delimitation of an Electricity District and the holding of the enquiry,

to which attention was called recently in connection with the West of Scotland area, may perhaps be explained by the pressure of other work which is being imposed on the Commissioners. For it must not be supposed that the whole of their time and energies are devoted to surveying the existing electricity supply resources and to mapping out the United Kingdom into electricity districts. There is a constant flow of applications for Special Orders, for sanction to borrow loans, to extend generating stations and to use overhead lines. In addition, the various forms, regulations, &c., used by the Board of Trade, are undergoing revision so as to bring them into line with the altered conditions and the modern requirements of the industry. Some of these revised forms have already been issued, but we understand that the Regulations for securing the safety of the public and for ensuring a proper and sufficient supply of electrical energy are at present being overhauled, and new editions may be expected during the course of the year.

Overhead Lines.

Among the forms which have recently undergone revision is the Memorandum setting out the information to be submitted in connection with proposals for the use of overhead lines. If rural districts are to reap the advantages of a cheap supply of electricity, extensive use must be made of overhead lines. It is true the Commissioners have shown themselves friendly towards all applications for overhead wayleaves, and the revised Memorandum seems to indicate that overhead distribution is to become a regular and usual, rather than an exceptional, method of supply. Still, we think that further powers will have to be obtained in order to overcome the obstructive tactics of some landowners and local authorities. We recently noted a case in the Midlands where an impossible rent was demanded for a pole, and we also reported an instance of work on an important overhead line in North Wales being held up for months on account of the opposition of a landowner. Though Sections 21 and 22 of the Electricity (Supply) Act have greatly enlarged the powers of the Ministry of Transport, it is still possible for an obstructive property owner to hold up a useful supply scheme for a long time, and we think it is time to devise a ready means of overcoming this difficulty. We may add that those interested in the latest forms and regulations of the Commissioners will find them in the forthcoming edition of the Electrical Trades Directory and Handbook.

The I.E.E. and the Cinematograph.

An interesting departure from the daily round of Papers and discussions was made by the Institution of Electrical Engineers last week, when the theatre was turned into a cinema. Who can say after this that the Institution neglects the march of progress? Three films were shown: "Investigations and Tests on High-Tension Switchgear," by Mr. P. P. Torchio, with explanatory notes by Dr. C. C. Garrard; "Telephone Inventors of To-Day" and "The Audion," by Mr. F. Gill. For the first of these subjects the slow-running cinematograph forms an exceedingly valuable means of demonstrating phenomena about which little is known by the ordinary electrical engineer, while the other two have a human appeal, which, judging by their reception, undoubtedly made them as interesting to the electrical engineer as to the general public. Without wishing to be ungracious, we may add that it is quite time the aid of the cinematograph was enlisted to aid electrical demonstration.

Signs of the Times.

A correspondent in a Sunday newspaper complains of the failure of those residing in Kingsway, London, "to make easy the path of customers to their doors." He gives a pathetic account of his attempts to find "Imperial House," and suggests, if numbering of the premises is not possible, the setting up of at least four boards, one at each corner of each end of the street, with the names of the houses placed upon them in order, so that he who walks may read. Now, strange as it may seem, this is really an electrical question, for Kingsway is becoming a street in which electrical engineers must take a greater and greater interest. Therein are to be found at least two associations for helping electrical interests to help themselves and at least two large manufacturing firms anxious and willing to assist in this endeavour to the best of their abilities. We should hate to think that anyone entering Kingsway in an endeavour to buy either a turbo-alternator or an electric iron, or both, to say nothing of a wireless mast, should have any obstacle put in his way. Perhaps Mr. Beauchamp, who was until quite lately an inhabitant of that thoroughfare, will see to it that electric signs of appropriate brilliancy, quaintness, and appeal are erected to direct the wayfarer after things electrical. It is certainly a case where usefulness and artistry might be well combined.

1921—Some Technical Landmarks.

In the last two issues of The Electrician we have dealt with the electrical history of 1921 in its broadest aspects, and with the progress that has been made in the development of wireless communication respectively. Technically, however, progress, though perhaps less spectacular, has also been occurring in other fields. It is therefore proposed to discuss here certain advances which have taken place during the year, which consist in the definite adoption in engineering practice of ideas or discoveries which have, in their early stages, been considered as purely scientific or laboratory devices, or of new products developed as a result of research.

New Materials—Stainless Steel.

Commencing with new materials, the year saw the introduction on a large scale of stainless steel as a material for steam turbine blading. Although this material has been available for several years, it was until lately scarce and costly. It is now being made on a considerable scale, and so is likely to find wider application.

The property of rustlessness and non-staining was originally aimed at, and the earliest use was for cutlery, where its application is almost automatic. It is highly remarkable that the special properties are obtained as a result of the addition of a single ingredient, namely, some 11 to 14 per cent. of chromium. In spite of this simple addition, the actual procedure in the production of this material requires skill and care. A brief recapitulation of its properties only can be given, thus:—The maximum resistance to corrosion is obtainable in the hardened condition. Corrosion is not produced by the weaker acids, but sulphuric and hydrochloric acids attack it readily; it

is therefore not a substitute for the resistant irons "duriron" or "tantiron." The steel does not scale when heated up to 800°C. or 850°C., and the strength at 700°C. only falls to half of that at 600°C. These properties show that it is specially suitable for the valves of internal-combustion engines, for which purpose a suitable metal has long been sought.

Rustless iron has also made its appearance, and this, being free from carbon, will allow of a wider range of applications even than in the case of stainless steel.

Transformers and Rectifiers.

Apparatus for the transformation of currents is of such great use and importance for a variety of purposes that it is obvious much thought is being expended on these devices, resulting in advances of no small moment. The mercury rectifier of the laboratory, with its brittle glass or quartz bulb, has for some years been a thing of the past, and the steel vessel rectifier which has taken its place has been steadily developed on the Continent until it is now a standard article of engineering construction. Until recently, however, there were but few examples of mercury rectifiers installed in England, although the list of such equipments is growing rapidly.

The Departure of an Old Friend.

It seems hard that an old friend like the rotary converter should have to go, but the higher efficiency of the mercury rectifier is the explanation of the modern tendency either to replace the rotary, or, at any rate, to instal a mercury rectifier in place of an additional converter.

The main advantages of mercury rectifiers may be briefly summarised by saying that although they may cost somewhat more than a rotary converter or motor-generator of equal output, they have a higher efficiency, need less attention, have a longer life and require less costly lifting appliances in the station owing to their light weight. The facts that no consumption of mercury takes place and practically none of the cooling water are also of importance. As an example of the efficiency obtainable it may be stated that for a mercury rectifier of 225 kW the efficiency, inclusive of auxiliary apparatus, is 94·5 per cent. The weight of even a much larger size, namely, 700 kW, is only 1 000 kg. (2 200 lbs.).

Electric Transmission at One Million Volts.

For a number of years before the war, although the voltage at which the transmission of electrical energy was effected had been steadily rising, the value of 150 kV had not been exceeded in practice. The past year has witnessed the commencement of yet another forward and upward step. The Southern Californian Edison Co., which operates in the region where transmission voltages are highest, has now completed its Big Creek No. 8 station, which is the first of a chain of stations that are intended to operate at 220 kV pressure. The lines are at present operating at 150 kV pending the completion of the other stations, but there appears little doubt that the installation will work quite satisfactorily at the higher voltage, as it has done at the lower pressure hitherto made use of.

Having now come to within a short distance of a quarter of a million volts as transmission voltage, some new experiments which have been carried out in the course of the year by the General Electric Co., of America, with a transformer capable of giving over a million volts, are of more than passing interest, in that they portend, not an immediate extension of the high-voltage range, but an acceptance of the possibility that it may be necessary or desirable to proceed, later, to higher pressures. For this reason it is easy to comprehend that a far-seeing concern like the company mentioned is desirous of obtaining experimental proof whether the laws that have been established for voltages up to, say, 250 kV will hold at pressures which are four times as great.

Technical Details.

Reliable technical details, which were not available until after the close of the year, show that the tests were made with a 1 000 kVA transformer built specially for this high pressure and operated at 60 cycles. Inspection of the main results which have emerged from the tests reveals remarkable, yet, from the technical standpoint, satisfactory, behaviour so far as spark-over voltage, corona, and stress on insulators in cascade are concerned. These matters are fully dealt with on another page of this issue.

Spark-over Voltage.

The needle gap spark-over voltage curve shows no distortion, and is, in fact, a continuation of the straight line, as for lower voltages, in which the sparking distance increases roughly about 1 in. for each 10 kV. At 1 050 kV the sparking distance is 112 in., *i.e.*, 9 ft. 4 in., so it is obvious from this that the spacing question will be of importance. Actually, the insulators at the transformer terminals are some 15 ft. in length.

Corona.

The corona starting point, it is found, can be calculated from the known laws; the *stress on a string of, say,* 22 *suspension insultors in series*, however, would, if calculated on the low-voltage behaviour, be approximately 200 kV, and since each insulator used had at lower pressures an arc-over voltage of 75 kV, even so long a string as 22 insulators in series would be expected to aro over entirely. Contrary to expectation, it is found that, actually, it does nothing of the kind, because, owing to the corona effect, the string is automatically graded as regards stress.

Size of Conductor.

The size of conductor which should be used for such voltages is a novel problem and introduces new conceptions, since a high-voltage conductor half-an-inch in diameter is even now considered enormous. Assuming tubular conductors to be used, each would have to be 5 in. in diameter for a spacing of 20 ft. apart! The one undesirable property at 1 000 kV is that a small percentage increase in voltage means a large actual increase, and thus the losses would be enormously increased if the line voltage were to rise even a small percentage above the critical point for which the conductor was designed.

Losses in Line.

The losses observed in the experiments show, for instance, that for the three conditions as to pressure: 1 000 kV, 1 000 kV + 10 per cent., and 1 000 kV under rain (which lowers the critical voltage), the losses would be 0 325 kW, and 1 080 kW per mile, respectively, and in order to diminish this loss the diameter of the conductor would have to be increased to 6.5 in. The capacity of such a line (three-phase) with conductors of 6·5 in. and 20 ft. spacing is such that the charging current per mile of line would be 4·43 A, and the kilovolt amperes per mile 7 650. It is obvious from these figures that the introduction of much higher pressures than 250 kV will undoubtedly mean the tackling of a host of new problems; but the experiments have shown that such voltages are by no means impracticable, and so a much-debated question has received its answer.

Auxiliary Features in Automatic Telephone Systems.*

A New "All-Relay" System Particularly Applicable to Small Installations.

By W. AITKEN, M.I.E.E.

Small automatic switches are one of the most interesting and useful developments in the telephonic art. There is a great field for these both as private installations in works, warehouses and offices, and in connection with exchange service as private branch exchanges (P.B.X.), village exchanges, and the like.

This new circuit by the AUTOMATIC TELEPHONE MANUFACTURING COMPANY marks a distinct advance on present relay practice, but the author believes a mistake has been made in pursuing the ideal of an "all-relay" design. The author's model switch for small installations uses relays for the connecting means and simple stepping switches to set up the connection.

In small switches, simplicity of apparatus and circuits is essential. An all-relay system attains simplicity of apparatus at the expense of multiplication of relays and complication of circuits. It will be noted from the diagram that the preselection of an idle connection-circuit to join two lines together is most simple and efficient, but that the connection-circuits are overburdened with relays, which might be readily replaced, to a large extent, by a simple stepping device. The circuit is interesting in showing how the cycle of operations in four relays energises a relay for every impulse of a digit, so that this relay can be made the connecting relay to the called line.

The arrangement is most suitable for small exchanges having a capacity up to 28 lines, but may readily be increased. The diagram shows the circuits of a 19 line switch having three "connection-circuits" to allow of three simultaneous conversations. These can be increased as required by the traffic.

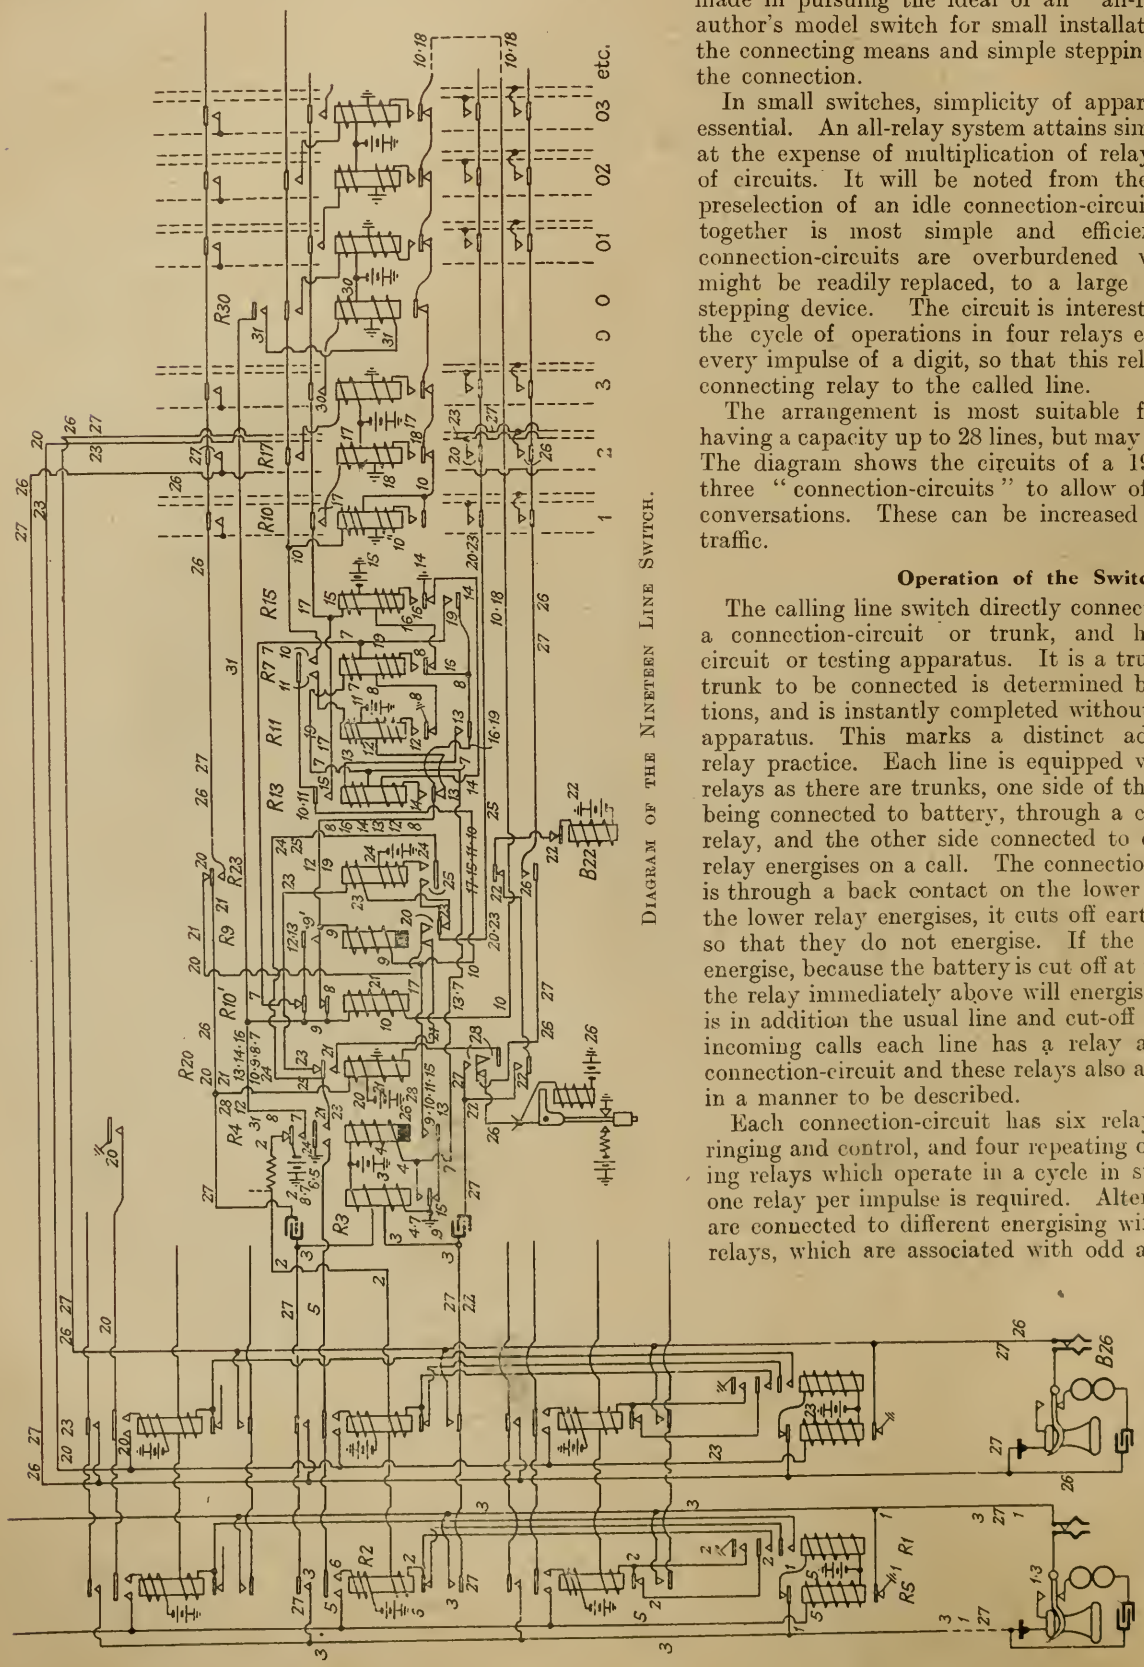

DIAGRAM OF THE NINETEEN LINE SWITCH.

Operation of the Switch.

The calling line switch directly connects a calling line with a connection-circuit or trunk, and has no intermediate circuit or testing apparatus. It is a true preselector, as the trunk to be connected is determined by the prior connections, and is instantly completed without the aid of common apparatus. This marks a distinct advance on previous relay practice. Each line is equipped with as many simple relays as there are trunks, one side of the energising winding being connected to battery, through a contact on the guard relay, and the other side connected to earth, when the line relay energises on a call. The connection to the relay above is through a back contact on the lower relay, so that when the lower relay energises, it cuts off earth from those above, so that they do not energise. If the lower relay fails to energise, because the battery is cut off at the guard relay, then the relay immediately above will energise, and so on. There is in addition the usual line and cut-off relays per line. For incoming calls each line has a relay associated with each connection-circuit and these relays also act as counting relays in a manner to be described.

Each connection-circuit has six relays for battery feed, ringing and control, and four repeating or impulsing responding relays which operate in a cycle in such a way that only one relay per impulse is required. Alternate counting relays are connected to different energising wires from the impulse relays, which are associated with odd and even numbers of impulses, and numbered 1 to 9 and 01 to 00 in a 19 line equipment, to agree with the subscribers' numbers. Relay 0 is a switching relay to bring into operation a second holding circuit.

Other features will be described in the operation of the circuits.

The circuits are numbered in the order of operation as follows:

1. When the receiver of S is lifted R′ energises. Assume No. 1 connection-circuit busy, that is, circuit 2 open. Assume No. 2 to be called.
2. Connecting relay R2 energises.
3. Impulse and feed relay R3 energises over loop.
4. Guard relay R4 energises. Circuit 2 is opened and connection-circuit 2 is made busy to other callers.
5. Cut-off relay R5 energises. R′ de-energises.
6. R2 holding circuit.
7. Repeater relay R7 energises.
8. R7 holding circuit.
9. Impulse relay R3 de-energises on first break at dial. R9 energises for the duration of the impulses.
9′. New path to battery.
10. First counting relay R10 energises; also R10′ to open circuits 7 and 8. The latter remains closed over 9′.
10″. R10 holding circuit.
11. Repeater relay R11 energises. Opens circuit 8 and R7 de-energises. Opens circuits 10 and 11.
12. R11 holding circuit.
13. R3 re-energises at the end of the first impulse and R13 energises. Circuit 12 open. R11 de-energises. Circuit 13 opened.
14. R13 holding circuit.

End of first, or odd number, impulse 1.

15. R3 de-energises on break at dial for second impulse, R15 energises.
16. R15 holding circuit.
17. Second counting relay R7 (even) energises.
18. R17 holding circuit in series with R10′. Circuit 10 open and R10 de-energises.

R3 re-energises at end of impulse.

19. R7 re-energises, partly over circuit 7, circuit 16 open and R15 de-energises.
8. R7 holding circuit. Circuits 10 and 11 are prepared for the next impulse (if any).
20. If line No. 2 is busy R20 will energise over the holding circuit.
21. R20 holding circuit.
22. Busy tone is given to caller.

If the line is idle R20 is not energised and ringing current is applied.

The number having been called R9 de-energises. R10′ remains energised. Circuit 8 is open and R7 de-energises.

23. R23 energises to complete the loop.
24. R23 holding circuit.
25. Called line made busy.
26. Ringing circuit to called line. R20 does not energise until called party answers. Ringing is by polechanger, in which the pendulum connects battery and earth alternately to line, about 20 times per second. Ringing is cut off when R20 energises.
27. Loop talking circuit, current fed through R3.
28. Battery feed for called party through R20.

The connection is broken down when the caller's receiver is replaced, when R3 and R4 de-energise.

30. When 0 is dialled (ten impulses) R30 energises, partly over circuit 17.
31. R30 holding circuit. Circuit 18 is open to de-energise all counting relays of lower value and succeeding relays are built up by impulses as before described.

A connection has thus been completed between the two telephones shown over the contacts of R2 of the calling line and R17 to the called lines. The talking circuit is divided by condensers and battery fed to the calling line over R3 and to the called line over R20. The transmission efficiency is standard.

Surface Leakage.

By G. L. ADDENBROOKE.

Some eighteen months since I bought a portable form of hair hygrometer which I thought might be applicable to certain purposes I had in view. On testing it I found that, though it deflected sufficiently, the maker's scale bore no relation to the indications of the instrument. I therefore proceeded to calibrate it myself, and finally found I had succeeded in doing so fairly, and that the scale seemed decently stable and sufficiently accurate for my purpose.

Having done this, I hung it up in a sitting-room I constantly use, and near it placed a gold leaf electroscope, an electrophorus, a small Leyden jar, and a few other appliances for electrostatic experiments. Noting the humidity of the atmosphere by the hygrometer reading, I proceeded from time to time to try a few simple experiments. At the time I first did so the hygrometer indicated 80 per cent. humidity, and the experiments were not easy. The electrophorus required a little warming before it would excite properly and would not keep charged long, and the leaves of the electroscope would not remain expanded at the same angle, but fell too quickly for good reading.

The Effect of Dry Weather.

At last came a spell of dry weather, when the humidity indicated had fallen to 60 per cent., and now things were quite different. The electrophorus once excited was found to keep its charge for hours, and the leaves of the electroscope maintained their angle for some time; other experiments also went off quite in text-book style. Similar alternative results were obtained a number of times during the past year.

Quantitative Studies.

An attempt was then made to study the results quantitatively. For this purpose a gold leaf electroscope was charged and the time it took to fall to half charge noted when the humidity was about 60 per cent., and the experiment was repeated on the next occasion when the humidity reached 80 per cent. Two different electroscopes were also used, one insulated with ebonite, another with sulphur, and the effects were similar in both cases. The leakage would be proportionate to the time of fall of the leaves and the resistance inversely to this, speaking approximately. But the fall with the drier atmosphere took something of the order of twenty times as long as when the humidity was 80 per cent., or the steady field resistance was evidently some twenty times greater at 60 per cent. humidity than at 80 per cent. The question arises, How does this come about? Assuming that there is some relation between the amount of moisture in the film causing the leakage, and the humidity of the atmosphere, it is hard to see how a reduction of this from 80 to 60 per cent., or, say, by 25 per cent., should alter the surface resistance some twenty times. Assuming that the moisture is deposited on the surfaces in an even film, it does not appear very probable that 25 per cent. decrease in humidity would evaporate everything but one-twentieth of the existing moisture, and therefore I put this explanation on one side, though for some time I could not find an alternative.

Not long since, however, I came across the account of some experiments on the moisture deposited by breathing on clear glass surfaces. It was pointed out that if this was done and the surface was examined while the moisture was evaporating, the play of colours produced and the appearances did not agree with what might be expected if the film was even gradually got thinner.

Microscopic Examination.

On examination of such a film under the microscope it was found that the film was not even, but consisted of multitudes of small, separate half-globules of dome shape, with something approaching bare glass between. It was evident that the deposition of moisture was round nuclei. Now it seems a fair assumption that such nuclei must exist abundantly on the surfaces of all insulating materials, and that, although invisible, moisture condensed on their surfaces is almost certainly in this form. Consider such a film placed in a drier atmosphere. The amount of evaporation might not make much difference in the resistance to a current passing across the globules, but evaporation from the very thin intermediate spaces might render some of these almost or quite bare. In the latter case a current would have to take a devious path and the resistance be greatly increased. This seemed a reasonable supposition for carrying a plausible explanation a little further, to which I think something more now may be added.

Other Analogies.

There has recently been published by Sir George Beilby a very interesting book, accompanied by a large number of micro-photographs, describing his work on metallic and other surfaces. In the course of such work he studied very

thin films of oil and other substances on water under the microscope, and gives several illustrations of the results.

He was able to start with relatively thick films and then gradually attenuate them. At first the films were continuous, but at a certain critical point began to reticulate; the surface tension parallel with the surface could no longer support the strain, a clear break occurred, and the material gradually broke up into more and more definite ridges and separate globules with open spaces between. It is difficult to describe the appearance; the photographs themselves should be seen to properly grasp what actually occurs. On inspecting these photographs there seems no doubt that a continuous path for a current would be formed through the inter-connection of the ridges formed, but it would be a very devious one, and if such phenomena occurred with the moisture on an insulating surface, it might well account for the great alteration in resistance found as described above.

Observations on Sir George Beilby's Lines.

Following up the suggestion contained in this work of Sir George Beilby, I have made some microscopic examination of the moisture films obtained by breathing on glass and watching the moisture evaporate.

A little difficulty was found at first in seeing the phenomena clearly, but, after some trials, it was found that the most suitable illumination was an Abbe condenser well stopped down, and using a 1 in. defective and fairly low eyepiece. The small globules of moisture then stood out well, both with daylight and artificial light. They are primarily rounded, and very interesting to watch as they gradually vanish by evaporation from the outside to the centre, but apparently evaporation for some time has the general effect of flattenng the globule without diminishing its size; it is only when it has apparently got flattened down all over to a certain thin stage that the edges begin to contract, and, when this stage is reached, the contraction is rapid in a now saturated atmosphere. It is evident that, at this point, when the traces of visible moisture are almost vanishing, and can only be seen by careful lighting, there is a very unstable state, when any slight changes in the humidity of the air make great alterations in the state of the moisture film.

At the same time this visible film is certainly thicker than the invisible film with which we usually have to deal electrically, and its behaviour can only be used as some guide towards the conditions obtaining when the film is invisible.

Characteristics of the Visible Film.

When the visible film is first observed it looks much like a simple layer of bubbles on water, in most cases the edges touch and are clearly defined. Contrary to my expectation, the bubbles do not seem to centre on any particles of dust visible, but, when very small, these latter seem to gravitate to the edges. There is no visible nucleus, but the shape and size of the globules seems to be determined by the state of the surface underneath, which looks as if it were mottled in some way as to its properties, as if, perhaps, it were made up of flattened crystals having some definite characteristic over the face exposed.

Unfortunately, having to consult an oculist some time since, he advised me not to undertake work which involved serious observation through optical instruments, and therefore I feel it would be imprudent of me to pursue this part of the subject, and one of my objects in drawing attention to these matters is that possibly what I have said may attract the attention of someone who could do so, and to whom I would be happy to give such help as I could.

Regarding the electrical characteristics of leakage with both continuous and alternating potential differences, I would refer to a Paper I read before the Physical Society in 1912. The whole subject would repay much further study.

Is Surface Leakage Inevitable ?

We are accustomed to take surface leakage as inevitable, and to accept it as a necessary nuisance, but, if the question is seriously considered, it is wonderful what a limiting factor it is becoming in a number of important and different directions, and, though looked on as of secondary importance, it seems to me that the time is coming when it is well worth studying in itself. A better and more exact knowledge of its magnitude and the conditions under which it acts would be useful, and might reveal unexpected characteristics which could be utilised for its better control.

OBITUARY.

Dr. Edward Hopkinson, M.P.

We regret to record the death of Dr. Edward Hopkinson, M.P., which took place at his home in Alderley Edge on Sunday last. Dr. Hopkinson, who was born on May 28th, 1859, was the fourth son of John Hopkinson, and brother of Dr. John Hopkinson. He was educated at Owens College, where he was Dalton Mathematical Exhibitioner. In 1877 he gained an exhibition in mathematics at Emmanuel College, Cambridge, and later a foundation scholarship. He graduated as Tenth Wrangler in the Mathematical Tripos of 1881 and became a Fellow of his college in 1883. In 1881 he took the degree of doctor of science in the University of London in the branch of electricity and magnetism, treated mathematically. In the following year he became assistant to Sir William Siemens, and continued with him till the latter's death.

Early Distinctions.

During this time he carried out experiments at Portrush on the first electric tramway in the United Kingdom, and a Paper read by him on the undertaking gained a silver medal from the Society of Arts. After Siemens' death Dr. Hopkinson designed and carried out the equipment of the Bessbrook and Newry electric tramway, which is worked by water-power. For a Paper on the construction and working of this tramway the Institution of Civil Engineers awarded him a gold medal and the Telford premium.

In the year 1884 he joined Mather & Platt, and took charge of their electrical engineering department. In 1887 he became a partner in the firm, and, when the firm was converted to a limited company in 1892, he was one of its managing directors. In 1899, when the business of Dowson, Taylor & Company was acquired, he was appointed vice-chairman, a position he held until his death He was also vice-chairman of the Chloride Electrical Storage Battery Company.

Dr. Hopkinson took out many important patents, many of them in collaboration with his distinguished brother, Dr. John Hopkinson. They were the joint inventors of the "Manchester" dynamo and motor, and of various improvements in connection with dynamos and the applications of electricity. They were also the joint authors of a Paper on Dynamo Electric Machinery, printed in the "Transactions" of the Royal Society.

Work on Electric Traction.

He was a pioneer of electric traction, and his firm undertook the first large contract for working a full-gauge railway electrically, Dr. Hopkinson being responsible for the design of the locomotives. The City and South London Railway, opened by the Prince of Wales in November, 1890, was then the largest application of electric power to locomotion. The characteristic feature was the employment of separate locomotives with the armatures of the motors built directly on the axles without the intervention of gearing. The undertaking was described in a Paper read by him before the Institution of Civil Engineers in 1893, for which he received the Telford premium and the George Stephenson medal. He also designed, and his firm undertook, the original electrical equipment of the Douglas and Laxey Electric Tramway, the Snaefell Mountain Railway, and the Blackpool and Fleetwood Tramroad. The Snaefell Railway was remarkable for having a continuous gradient of one in twelve over a four miles track, ascended at a uniform speed of nine miles an hour. It was worked by simple adhesion, every axle of the cars being driven by an electric motor. The Douglas and Snaefell lines were the first on which large fixed batteries were used.

Professional Qualifications.

Dr. Hopkinson was a past president of the Institution of Mechanical Engineers, a member of the Council of the Institution of Electrical Engineers and the first chairman of its Manchester section. He had also been president of the Manchester Association of Engineers, a vice-president of the Manchester Steam Users' Association, and chairman of the Associates of Owens College. He served on the Indian Industrial Commission which sat from 1916 to 1918, and he was a member of the Industrial Fatigue Research Board of the Department of Scientific and Industrial Research. He entered Parliament in 1918 as Unionist Member for the Clayton division of Manchester, but he took little part in party politics. He married Minnie, daughter of the late John Campbell, of Rathfern, county Antrim.

High-Speed Wireless Telegraphy.*

By Lt.-Col. A. C. T. CUSINS.

The author, who is the head of the Army Signals Experimental Establishment, describes apparatus which has been designed and experimented with between London and Cologne via Aldershot. The aim of the equipment is to provide apparatus which shall enable wireless communication to be carried on mechanically, both in transmission and in reception, at speeds up to the maximum of Wheatstone apparatus. The system is recommended for handling telegraph traffic to the Continent, for replacing sections in an important line which are liable to interruption and for Press work.

The Paper records the development of low-power apparatus which in the hands of operators of average ability enables wireless telegraphy to be carried on by mechanical operations both in transmission and in reception, either by itself or in continuation of a line system; and this at all speeds up to the maximum of Wheatstone apparatus.

For some time the Post Office have been conducting trials of the apparatus here described and traffic between London and Germany has been carried on a single wire and earth between the Central Telegraph Office, London, and Aldershot, then from Aldershot to Cologne by military wireless, and from Cologne military wireless station to the German Post Office by wire. Through transmission has also been carried on with a certain amount of steady success, using Wheatstone transmission and Creed printer reception, the working speed being up to 100 words a minute.

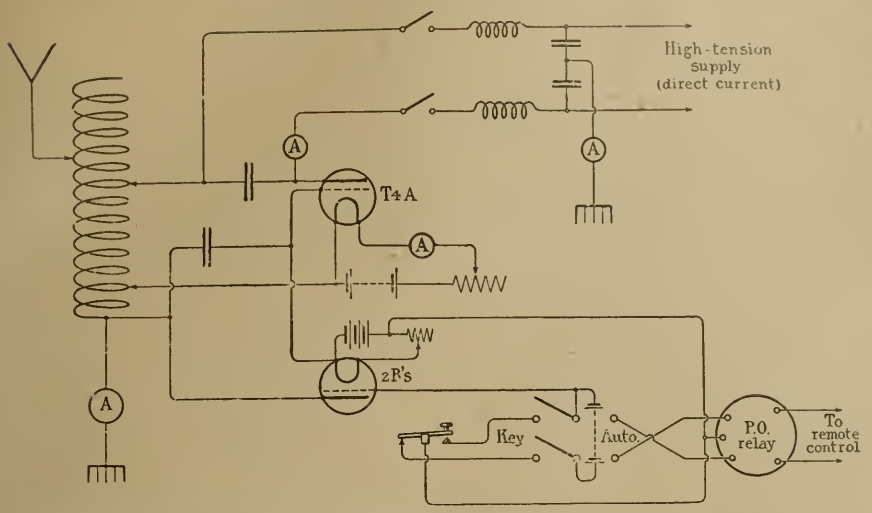

Fig. 1.—Continuous Wave Set for Field Use, with High-Speed Attachment.

The actual set at Aldershot which is now working to Cologne operates on an aerial consisting of two 300 ft. wires between 70 ft. masts. The earth resistance is 6 Ω, and the aerial current 10 to 12 A. This power is sufficient for fair conditions, but there is need for a larger factor of safety.

Circuit Arrangements.

A circuit diagram is given in Fig. 1. In this, the actual Wheatstone instrument is shown as being at a distance from the transmitter, the signals being relayed to the latter through a Post Office relay. By operating on the grid filament circuit of small "B" control valves the resistance of their anode-filament paths may be varied enormously and, if the latter be used as the grid leak of the main generating valve "T_4A," its oscillations may be controlled over the full amplitude. This action is almost instantaneous. Sets up to 6 kW can be keyed practically without sparking.

Reception.

In Fig. 2 is given a complete theoretical diagram of a receiving set which was for some time an accepted pattern. All switches, &c., are omitted for the sake of simplicity.

The oscillations were received on a tuned aerial (loop) which was loosely coupled to a tuned oscillation circuit shunted by the grid-filament path of the first valve of a 3-valve high frequency amplifier. The high frequency amplifier had an amplification factor of about 750 on three valves and was extremely stable. With a 3 per cent. variation of wave length the signal strength was reduced to 30 per cent. of the maximum.

The final anode circuit of the high frequency amplifier was coupled to the grid circuit of a Turner valve relay† which was provided with a special means of high speed quenching. In order to preserve a correct spacing of Morse signals it was necessary to quench or re-set the relay about four times per dot, and practical experience has shown that to receive 200 words per minute the quenching rate should be at least 540 per second—a rate obviously too great for the mechanical movement and highly inductive winding of the Post Office type relay which had been used for quenching the original Turner valve relay. Various methods of high speed mechanical make and break were tried, but finally additional valves were employed to give an intermittent high voltage supply to the anode of the valve relay in the manner indicated in Fig. 2.

The Singing Valve.

A valve, called the "singing valve" in Fig. 2, was caused to oscillate at a frequency between 1 000 and 3 000 periods per second, and its grid was connected through a large resistance to the grid of a second valve labelled "control valve." The filaments of these two valves are connected together with the result that the grid of the control valve is made alternately positive and negative, and, as the anode filament path of this valve is part of the anode circuit of the valve relay, the latter is quenched at the frequency to which the singing valve is adjusted.

Amplification.

The anode current of the valve relay is amplified by a single valve direct-current amplifier which in turn operates a double-current valve relay. By this means when a signal is being received a current of 40 mA passes, via the bottom valve, through one coil of the Post Office relay and 10 mA through the other. When there is no signal the conditions are reversed, and although the relay or recording instrument is not actually supplied with double current, the effect

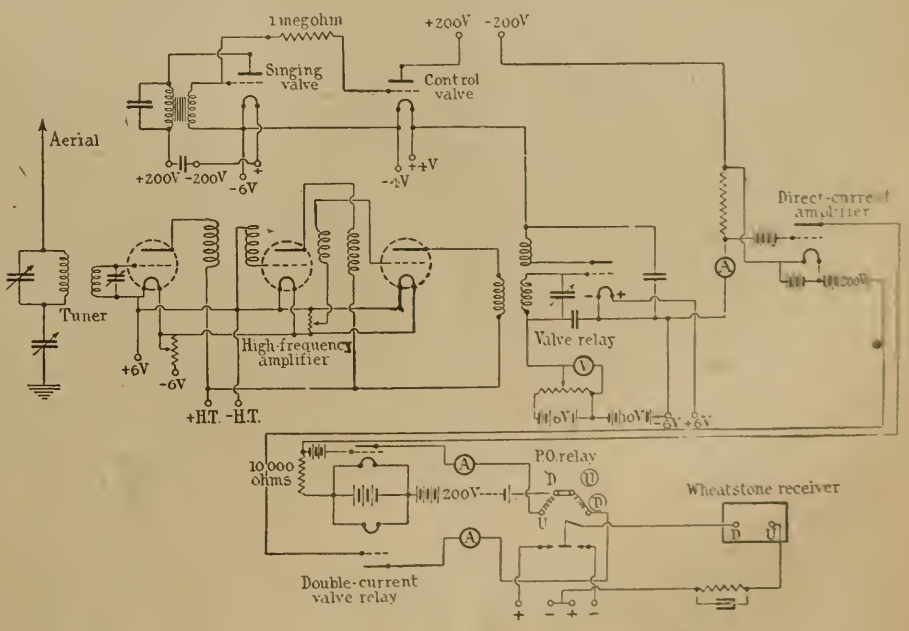

Fig. 2.—Theoretical Diagram of Receiving Set.

*Abstract of a Paper read before the Wireless Section of the Institution of Electrical Engineers.

† *See* The Electrician, Vol. LXXXIII., p. 4.

is the same as that of a true double current of half the value. With this arrangement the Post Office relay Wheatstone receiver can be made to operate at the fastest speed of the standard transmitter.

Recent Modifications.

The apparatus described has been superseded by a type employing a self-quenching relay which is set to one definite frequency, this frequency being obtained whatever the wave-length of the incoming signal by heterodyne. The need for adjustment of the whole set on change of wave-length is thus avoided. Perfect signals have been obtained at 3 000 words per minute with a chemical inker, for which standard Wheatstone slip may be prepared by passing it through a solution of potassium iodide. A complete remote control system has been devised. By this means traffic may be dealt with at some point other than the wireless station.

Conclusion.

The speed at which it is possible to work is at least as great as the speed at which the Wheatstone apparatus itself will work, and, with a specially constructed transmitter and chemical inker, speeds over 1 000 words per minute have been recorded.

The greatest range over which the system has been operated at the time of writing is 400 miles. Using 10 A (key held down) in the transmitting aerial a very fair factor of safety was obtained at the receiving station over this distance, so that it is reasonable to suppose that much greater distances can be traversed as the power is increased.

Possibly little is to be gained at present for general utility purposes in pushing up the speed to more than about 100 words per minute.

Suggested Use of the System.

Many uses for the system will occur to anyone knowing its capabilities, but a few examples may be given.

(1) For the handling of telegraphic traffic to the Continent. A system independent of submarine cables and land line maintenance would *ipso facto* be more reliable.

(2) For replacing, in an important line, any sector liable to interruption without reducing the speed of operation—since an ordinary Post Office relay serves as the transmitter key (at high speed) and the signal received also operates a similar relay.

(3) For Press work. Suppose, for example, a single transmitting station situated at some point in Great Britain. To this station would be sent by various channels the news of the day. At this station the news would be punched up and radiated at, say, 120 words per minute. At each important town in the kingdom publishing a newspaper a receiver would be installed operating a direct printing-telegraph machine. By this means, one single transmission of news would result in the news being received in plain English through the country simultaneously. The development of this scheme is left to those concerned, but the possibilities are immense.

The examples so far given are based on what has actually been achieved. If it is permissible to assume that the power handled can be increased, and consequently the range, a startling prospect is opened up.

DISCUSSION.

Sir Charles Bright opened the discussion with a reference to the "coming of age" of wireless telegraphy and the great practical advance which had taken place since the question of an Imperial Wireless Chain was first considered by the Government. The speeds of working considered practicable by Col. Cusins were higher than those for cables of normal dimensions. There was a great need for the development of wireless for the distribution of news and the fostering of trade throughout the Empire. He agreed with the Prime Minister of Australia. It mattered not what particular system be used so long as something was done, and done quickly.

Mr. R. Carpenter emphasized the particular adaptability of Creed apparatus to wireless telegraphy. The Creed high-speed system was the only one employing the Morse code, and it was in consequence much less fastidious than other systems; it corrected both bad signals shape and spacing.

Mysteries.

Mr. F. G. Creed, defined his position as that of a mechanic: one who produces machines. To him wireless and the valve were mysteries. Electricity was easy to move, and he therefore believed in the valve for high-speed work, but we must consider all our resources. He had seen high-speed working with a selenium valve in Norway in 1913. Last year Mr. Cox of the Pacific Cable Board had exhibited a selenium valve in which a magnification of 50 000 was obtained, the apparatus having a period of 1/100 sec. He could see a great shrinking in the effective size of the world, and a probability that someone would seize control.

Mr. L. B. Turner considered that anyone with the triode to his hand and his coat off could evolve the apparatus which was described. Atmospherics remained the dominant problem. At low speeds our defence was tuning and a low decrement. At high speeds this defence failed. In aural reception the operator disliked the ringing effect produced by overmuch tuning; the ear preferred a crisp signal. This disadvantage did not apply to Col. Cusins' apparatus. Had Col. Cusins made experiments at long wave lengths and noted atmospheric interference?

The Words per Minute Factor.

Mr. E. H. Shaughnessy enquired the reason for the stated extreme selectivity of the Turner relay. To his knowledge Messrs, Hinton and Gill had recorded high speed on the tape in 1918. He questioned the limit of 90 words a minute assigned by Col. Cusins to the dictaphone. In 1913 the Post Office invited tenders for apparatus to record 100 words per min., and the Marconi Company gave a very satisfactory demonstration for three days and nights at that speed over 500 miles. The results were given in the "Post Office Electrical Engineers' Journal" for July, 1914. The practical results of some recent regular Post Office working were for a certain six hour service, 40 messages per hour; for another, seven hour service, 47 messages per hour, both at high speed; a twelve hour service at hand speed of 21 messages per hour, and a ten hour duplex high-speed service 109 messages per hour. If the Turner gear was not used, what was? What was meant by change in nature of signals? Were they cooled or heated or what? Many of the general statements at the beginning and end of the Paper were doubtful. Working at 1 500 metres over 400 miles did not prove much. The distribution of news was a more complicated problem than might superficially appear.

A Remarkable Piece of Work.

Prof. G. W. Marchant challenged Mr. L. B. Turner's statement that any suitably-equipped person might have turned out the apparatus described, and he thought it represented a very creditable piece of work. He considered more traffic could be handled by wireless than by land lines.

Capt. H. Round considered the Paper described a remarkable piece of work—in fact, one solution of the old conundrum, "Given nine valves, what can be done with them?" What were the relative values of plain rectification and trigger action? Mr. Turner seemed to confuse filter and resonance circuits. The Turner relay was a single resonance device; he preferred a filter circuit, *i.e.*, several series resonance circuits in cascade. He preferred to submit his further remarks in writing.

Mr. J. Scott-Taggart enquired whether experiments had actually been carried out in bridging long distances by relays, and if so what was the effect of the outgoing signals upon those being received? What advantage had the Turner relay over amplification and rectification? A number of circuits were described, and Col. Cusins was asked to say whether they had been tried.

The hour being then 7.55, the Chairman (Prof. G. W. O. Howe) did not add to the discussion, and Col. Cusins announced that he would reply in writing to the various points which had been raised.

Coil Ignition for Motor Cars.*

This book is described as "a manual for the motor mechanic, owner-driver, and all interested in coil ignition systems." The author also says that it "may be correctly termed a course of electricity for the average chauffeur," but we cannot subscribe to that description, though we have no doubt that he makes many mental reservations in his interpretation of the phrase, "A course of electricity."

The author is convinced that coil ignition will, before long, be universally adopted in the United Kingdom, on the ground of its greater reliability, smaller first cost, and lesser running costs when compared with magneto ignition. He regards the magneto as a superfluous piece of machinery if it be conceded that the car carries a set of accumulators for car lighting. It is not our function here to agree or to disagree with this view.

There are chapters on the manufacture of an ignition coil, on the general details of the ignition system, and on coil ignition systems in use—this last filling nearly half the book and being quite up to date. Accumulators are dismissed briefly in eight pages. We wonder why.

We consider that the price of the book is much too high and quite disproportionate to that of the same publishers' "Technical Primer" series. The author naively remarks that "the price of the book will be repaid a dozen-fold through fewer repair bills," and is of the opinion that "every owner of a motor-car should obtain a copy of this work and give it to his chauffeur, who is sure to appreciate it." Criticism is disarmed.

Electrical Transmission at 1 000 000 V.

A short time ago we noted the successful conclusion of some tests which had been carried out at the Pittsfield Works of the American General Electric Company, with pressures rising up to 1 000 000 V, with a view to confirming by actual experiments the applicability of the law which had been previously established for lower voltages. Owing to the courtesy of the British Thomson-Houston Company we are able to give some further details of these tests.

Previous tests made up to 250 kV and experiments with needle and sphere gaps, as well as with line insulators at nearly double this voltage, had established spark-over curves which predicted the corona and spark-over characteristics at 1 000 000 V, but, with the present theoretical and probable future practical interest in view, it was decided to obtain actual data from experiments.

As is well known, commercial apparatus has already been built for 220 kV operation, but, for possible future developments, although no deviation from the established laws was expected, no actual data could be established without further experiments.

The results of these tests were as follow :—

(*a*) The spark-over curve between points showed no discontinuity. The spark-over at 1 000 kV was found to be about 105 in.

(*b*) The spark-over curve between 75 cm. spheres showed no great deviation from calculated values.

(*c*) Tests were made on strings of line insulators and the spark-over voltages were as expected ; for instance, a string of eighteen standard suspension insulators arced over at about 900 kV, while a string of twenty-two insulators did not arc over at more than 1 000 kV.

(*d*) Visual corona tests were made on 3½-in. diameter brass-tube lines operating single-phase. The corona starting voltage (about 900 kV) checked with the calculated value.

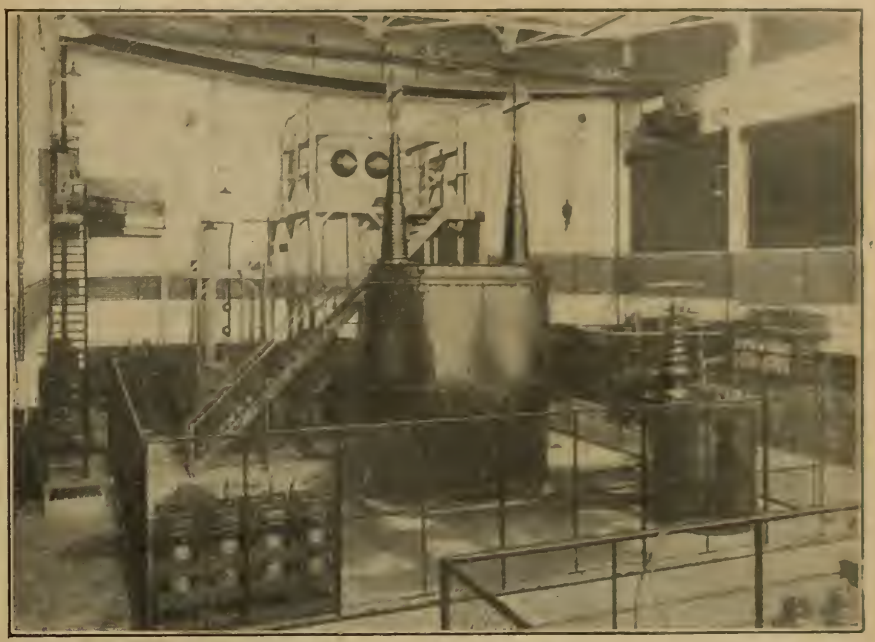

Fig. 1.—High Voltage Engineering Laboratory at the Pittsfield Works of The General Electric Company, where the transmission of electricity at 1 000 000 V was recently successfully accomplished. In the foreground is shown a transformer designed for 750 000 V.

Fig. 2.—Electric Current at 1 000 000 V arcing across a needle gap 9 ft. wide in the experimental tests.

There is one point which is particularly gratifying in connection with the production of this new limit of voltage, namely, as has been the case in previous advances, the transformer is the first part of the equipment to be produced for a given voltage. Switching devices, line transmission material protective devices, &c., have always been later developments in the art of making a complete transmission system for a given voltage.

Our illustrations show the apparatus employed for making these interesting tests, and the appearance of the arc passing across the 9 ft. spark gap.

Spark-Over Conditions.

In commenting further upon these tests in a recent issue of the "Electrical World," Mr. F. W. Peek, junior, points out that the minimum spark-over voltages for a given conductor-separation is between sharp points. Such points are likely to occur on transmission line conductors, and this minimum separation is therefore determined by the needle gap curve. This curve follows a straight line, which is subject to considerable variations with humidity and pressure, with the sparking distance between 9 kV and 10 kV per inch. The measured needle gap spark-over curve shown in Fig. 3a has no discontinuity. It is simply an extension of the approximately straight line needle-gap curve of the lower voltages and the curves with both ends isolated and one end earthed are practically coincident. A spark-over voltage curve for spheres 29·5 in. in diameter is given in Fig. 3b. No discontinuity was observed in this curve either, but accurate measurements could not be made up to 1 000 000 V when one sphere was carried because the sphere was not large enough.

Corona Tests.

Visual corona tests were made on parallel brass tubes 1 in., 1½ in., and 3½ in. in diameter at various spacings. These tests showed that the corona starting-points for very high voltages studied can be calculated from the laws established at lower voltages, and that observed and calculated values which are plotted in Fig. 3a agree very closely. The line spark-over curve shown in Fig. 3c is also continuous.

Electric Stresses.

It is interesting to observe that at low voltages the stresses on the line unit of a string of twenty-two insulators would be about 20 per cent. of the applied voltage. If this relation obtained for 1 000 000 V on a string of twenty-two units, the stress on the line

unit would be 200 kV. Since a single unit arcs over at about 75 kV the whole string would be expected to arc over as soon as the voltage became 375 kV. Such a string does not, however, arc over under 1 000 000 V, the reason being that it is automatically graded by the corona.

Some Engineering Questions.

While it is not at present important to speculate just when 1 000 000 V will be used in practice, it is important to know how to pre-determine the characteristics of high voltage lines so as to be ready when economic conditions demand these pressures. It is also pertinent to consider the characteristics of the parts of a transmission system affected by the higher voltages, and, in the article we have already mentioned, Mr. Peek deals with the transformer, transmission conductor, and the line insulator from these points of view. It is mentioned that the design of the high voltage transformer does not offer any great difficulty except at the bushing. On the other hand, the size of conductor necessary for such a line is interesting. At sea level and 20 ft. spacing on a three-phase system it is found that a conductor 5 in. in diameter is required for a critical voltage of 1 000 000 V, and while at this voltage the lines could be arranged so that the corona loss is zero if the voltage is increased 10 per cent. the loss becomes 325 kW per mile, *i.e.*, the corona loss increases very rapidly with a slight percentage increase of the voltage above the critical point. For this reason it may be desirable to operate with large margins between the critical and operating voltages with the higher voltage lines. The same applies when the critical voltage is lowered owing to rain, and to ensure only a small loss during the storm it might be necessary to increase the diameter of the tube to 6·5 in. Estimating the capacity current and the kVA per mile of a three-phase line with 6·5 in. conductors separated 20 ft. and energised at 1 000 000 V, 60-cycles, Mr. Peek points out that the current per mile of line is 4·43 A, the kVA per mile being 7 650. Line insulator design offers another difficult problem, but assuming that the insulator would be 15 to 20 ft. long, the 1 000 000 V line with 6½ in. conductors could be spaced 20 ft. apart, the minimum spacing being determined by mechanical considerations. With long lines in which one quarter, one half and full wave length of the operating frequency are approached, the line characteristics and the effect of capacity current differ greatly from the conditions on shorter lines.

Mechanical and Electrical Effects of Large Currents on High-Tension Switchgear.*

By Dr. C. C. GARRARD.

The tests described in these notes were carried out by the New York Edison Company and were recorded in a Paper † by Mr. Philip Torchio.

In a recent conversation with Mr. Torchio it was suggested that British engineers would appreciate the opportunity of seeing the films illustrating the experiments, and he has been good enough to send them for exhibition.

Oil Switch Tests.

The experiments with switches were made with currents of the order of 100 000 A, 25 cycles, but at low pressures (about 200 V). The object of the tests was not to determine the breaking capacity of the switches, but to find out in what way the apparatus withstood the very large mechanical stresses set up by these very large currents. In all the switch tests, the circuit-breakers were mechanically locked in the closed position. The arcing seen in the films is due to the opening of the main and of the arcing contacts caused by the mechanical force resulting from the high current. The justification for such a test lies in the fact that the short-circuit current in actual practice in a power station reaches its maximum value with great

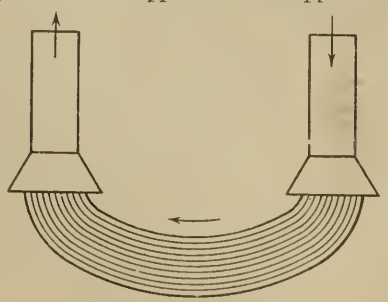

Fig. 1.—Brush which tends to out of contact under the influence of current.

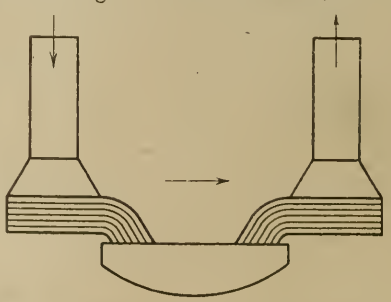

Fig. 2.—Improved inverted brushes which tend to press on tighter, due to magnetic forces set up by current

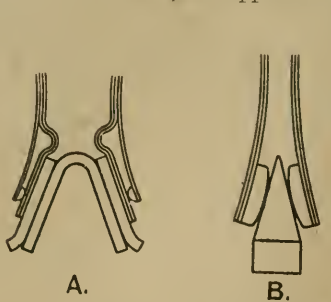

Fig. 3.—Finger contacts of oil circuit breakers arranged to attract and increase contact pressure.

* Introductory notes to a film illustrative of the mechanical and electrical effects of large currents on high-tension switchgear shown at the Institution of Electrical Engineers on Jan. 12.

† "Journal of the American Institute of Electrical Engineers," 1921, Vol. 40, p. 120.

rapidity and before the operating mechanism has had time to open. During the period before the automatic opening of an oil circuit-breaker, at which time it is, in effect, locked in the closed position, its mechanism must withstand the mechanical forces set up by the current, which may, moreover, be greater than that corresponding to its kVA breaking capacity. If, for example, the circuit-breaker be chosen under the assumption that the short-circuit current falls off to 6/10ths of its maximum value within ½ sec., the mechanical forces set up before the breaker operates will be those due to a current 66 per cent. greater than that corresponding to the kVA rating of the circuit-breaker.

It must not be assumed from the film that the switches which apparently fail were in all cases inadequate to withstand a test equal to their rating. The numerical figures of the tests must be studied in order to arrive at a conclusion in this respect, as in some cases the testing currents were increased above those corresponding to the breaking capacity rating in order to compare different types of construction.

Influence of the Shape of the Electric Circuit.

It was found that practically all the circuit-breakers tested had brush contacts arranged as in Fig. 1, so that when the current flowed the resultant mechanical force acted in a direction opposed to the brush pressure, thus tending to open the contacts and cause them to burn and weld together. This can be understood by reference to the principle that a closed electric circuit always tends to open out and enclose the maximum area.

As a result of the experiments an improved arrangement of the brushes was introduced and is illustrated in Fig. 2, from which it will be seen that the force set up by the current *increases* the brush pressure. The film clearly shows the improvement that is effected. Some of the best results, however, were obtained with finger contacts as in Fig. 3 (*a*), from which it will be seen that in such contacts the

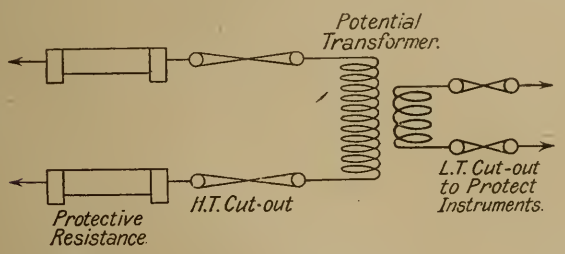

Fig. 4.—Potential Transformer with Protective Resistance. Suggested British Standard Arrangement for Heavy Systems.

current flows through each finger in the same direction. The fingers, therefore, attract each other under the influence of the current and thus the contact pressure is increased. Fig. 3 (*b*) has been introduced to illustrate a construction whereby this attracting force may be increased by bringing the fingers very near together.

Tests on Current Transformers.

The results clearly show the large forces to which current transformers are subjected on short-circuit. In one test the transformer was destroyed in ½ sec. at 92 000 A (R.M.S.).

Mr. Torchio's conclusion is that only the single-turn primary type is suitable for large systems. But it is not always possible to use this type in feeder circuits.

Tests on Potential Transformer Fuses.

Tests on potential transformer fuses were carried out at the full pressure of 6 600 and 13 000 V. The definite conclusion arrived at was that no type of potential fuse on the market can satisfactorily open the circuit without the addition of a resistance (see Fig. 4). As an example it may be mentioned that a fibre-tube fuse having a resistance of 79 Ω failed completely at 6 600 V, the current being 1 970 A (maximum). The addition of 50 Ω external resistance reduced the current to 25 A (maximum), when the fuse operated without visible disturbance in 0·02 of a cycle.

Tests on Disconnecting Switches.

The need of locking devices and the desirability of avoiding bends in the leads to the switches was demonstrated, but when these cannot be avoided the blade opening should be at right angles to the main lead.

Conclusion.

The original Paper shows the valuable information which can be obtained by collaboration between manufacturers and supply authorities. Such co-operation under the direction of the British Electrical and Allied Industries Research Association will doubtless yield similar results in this country.

Some Views on Power-Station Auxiliaries.

It is a little doubtful whether at an informal meeting greater emphasis on subject matter or on mere discussion is desirable, but there can be no doubt that, at the first informal meeting of the I.E.E. North-Western Centre, the subject-matter presented on the subject of Power-Station Auxiliaries would have done ample justice to a meeting of the more conventional type at which the heavy artillery drowns with its thunder the efforts of the smaller calibres. As a beginning the meeting was an astonishing success; later, doubtless, traces of stage management will be abandoned wholly in favour of spontaneity without the slightest risk of frost. Possibly even a little argument for its own sake will be permissible, and a speaker make an error in his arguments without feeling that he has ruined his professional reputation in the eyes of the specialist.

Methods of Driving Auxiliaries.

Mr. H. C. Lamb, in opening the discussion, was fortunate in being able to reveal some of the details of the new Barton Station at Manchester. He pointed out that increase in size of units had greatly increased the importance of auxiliary plant, which must at all costs be made safe. Failure of condenser pumps, and, with modern boilers, failure of the feed pumps soon caused difficulty. Three methods of driving auxiliaries were in common use: by steam, by electric drive from a separate and independently driven generator, and by electric drive through transformers from the high-tension system, all of which were used in Manchester. The direct steam drive was safe and simple, and independent of the other parts of the plant, but it was more costly to maintain than the electric drive and more skilled supervision was required. It was uneconomical to heat feed water with high pressure steam. The electric drive was not only more economical, but more convenient to lay out. The method of using transformers from the main bus-bars was the more efficient of the two electrical methods, but the plant had to start non-condensing unless power from outside was available. Also, if a short circuit occurred in or near the station it invariably happened that the a.c. motors would pull out and shut down, demanding attention at a time when the staff was most needed elsewhere.

The New Barton Station.*

The auxiliaries at Barton were all electrically driven, and, to ensure safety, separate and independent supplies were available both from the low tension turbo-alternators and from transformers. The main plant was divided into three sections, and for each section there was a house-service turbo-alternator generating at 420 V with the turbine exhausting into the boiler feed, and a house-service transformer giving 33 000/420 V. The alternators and transformers would not be paralleled. The works power switchboard was in three sections with duplicate bus-bars throughout, a selector switch enabling either supply to be used and the load distribution arranged to give any desired feed-water temperature. Each of the main condensing plants had duplicate sets of pumps, these being driven from the two sources of supply. The auxiliary motors were divided between the two supplies, so that failure of either source of supply would not seriously affect the main plant, and a failure of power from one source could quickly be made good from another.

Mr. Lamb showed a number of slides illustrating the auxiliary plant at Barton, and gave figures showing the relative economy of the all-transformer supply, the mixed transformer and low-tension alternator supply and the steam drive.

The Heat Balance of the Station.

Mr. J. Collinge referred to the new power station which Salford contemplated at Agecroft, and said that electrically Manchester and Salford were excellent friends. He thought the boiler feed and condensing auxiliaries needed especial care, the important features being simplicity of design and reliability of operation. They should also complete as far as possible the overall heat balance of the whole power-station. In design, amazing progress had been made in recent years. There was a tendency to organise a power station staff to specialise in the operation, maintenance and repair of the various parts of the plant. The choice of steam or electric drive should be governed by the consideration of heat balance. Theoretically, the electric drive from the main sets was most efficient. If with this was combined feed water heating by bleeding the steam from a stage at the exhaust end of the turbine, it was possible to obtain a very high efficiency in heat balance. Bleeding the turbine only slightly affected the steam consumption of the unit, but there was a gain in heat efficiency by recovering the latent heat of steam which would otherwise be largely dissipated in the circulating water.

* For some further details of the Barton Station, *see* p. 70 of this issue.

This ideal arrangement had one objection: the difficulty of starting up in the case of a complete shut-down.

Exclusive Types of Drive Undesirable.

Means should be available for pumping water into boilers in the case of a complete shut-down, to minimise the rise in pressure and to reduce the steam blown off. On the other hand, auxiliaries exclusively driven by steam would waste heat, as all the exhaust heat could not be absorbed in the boiler feed, and even if it could it would not be economical from the point of view of heat balance. There was, therefore, a mean position between the steam driven and electrically driven auxiliaries, desirable both from the point of view of heat balance and reliability. The engineer must then determine the economic heat balance of his system and arrange auxiliary plant in accordance with the particular installation.

Mr. W. Dundas said that the points to be considered in deciding the drive for auxiliary plant were economy, cost of maintenance, reliability and operation. The steam drive was undoubtedly the most reliable, but reliability was obtained at the expense of economy and cost of maintenance. With the tendency towards increased steam pressures the steam drive became more undesirable and difficult. The electrical drive interposed many links between the source of power and the point of application, each of which was a source of weakness.

A.C. Versus D.C.

Condenser auxiliaries should be in duplicate, each set capable of taking 75 per cent. load and the electrical supply taken from two independent sources, so that a.c. was preferable to d.c. The only advantage offered by the latter was speed control, and, though especially useful in stoker and fan drives, that, in view of its other disadvantages, did not justify its adoption. Electrically-driven feed-pumps were not favoured, and d.c. should be used for station lighting and for operating switchgear, where reliability of supply was of utmost importance and could be guaranteed by the use of batteries.

Mr. A. L. Lunn gave some details of the amount of power absorbed in auxiliaries at the Stuart Street Station. There were over 200 motors, varying in size from $\frac{1}{15}$th B.H.P. to 550 B.H.P. For continuity of supply the majority of power station engineers leaned towards steam auxiliaries as being the most reliable, although the only time he remembered the supply being affected by the failure of an auxiliary it happened to be a steam auxiliary that failed. Motor auxiliaries were certainly much more efficient than steam auxiliaries, and were quite reliable when proper attention was given them. A.c. was preferable to d.c. where machines had to run continuously for several weeks.

Switchgear for Auxiliaries.

Mr. W. A. Coates said that the arrangement referred to by Mr. Lunn should never be adopted except for quite small currents. The total capacity of house sets was now such that switchgear for them demanded as much consideration as power station switchgear a few years ago. The oil switches for station service transformers should be of the same breaking capacity as those for all other circuits supplied from the main bus-bars. Selective relays should be used to permit of smaller motor switches being employed. Where the auxiliary transformers were supplied from main generator leads a separate oil switch was not necessary, since biased balanced current protection could be employed so as to cause the generator oil switch to open in the event of trouble in the corresponding transformer. Two motors on the same shaft were sometimes used for the more important pumps. In this case one was commonly d.c., and since a battery was needed for switch operation this could well be employed for driving such auxiliary motors in addition.

Mr. J. S. Highfield referred particularly to feed pumps and lighting supply. Part of the latter should be on the battery. A shut down was less dangerous for circulating pumps than for feed pumps. Steam sets were most reliable, but the amount of steam to be dealt with in the all steam drive became too great. Feed pumps, however, should be steam-driven where possible. For circulating pumps the Barton method was best. He did not like stand-by plant that was not kept running.

Analysis of Conditions.

Mr. H. Midgley suggested that the problem should be set out systematically, considering types of auxiliaries and station conditions; alternative methods of supply; and the application of these methods to the particular station conditions and types of auxiliaries available. Auxiliaries were of two types—those whose momentary stoppage would cause a shut-down of the main sets, and those the shut-down of which would not cause serious inconvenience. The station conditions included starting the first set, and starting later sets; running under no load, full load and sudden peak load; and the shutting down of any section. The alternative arrangements had to be considered from point of view of capital and running costs, efficiency, staff required, simplicity, reliability and heat balance. Leakage in steam pipes necessitated more feed for make-up. In a station with electrical auxiliaries 3 per cent. was required, but 6 per cent. was necessary in a station using direct steam drive. The cumulative effect on the power supply of steam demands made by auxiliaries might be serious in an underboilered station.

Notes on the Barton Station, Manchester.

Mr. S. L. Pearce, chief engineer and manager of the Manchester Corporation Electricity Department, gave some interesting details at a recent meeting of the Junior Institution of Engineers at Manchester concerning the new power station which is being built by the Manchester Corporation at Barton. The Corporation Electricity Department now operates over an area of 48 acres and serves a population of about 900 000 people, in addition to supplying in bulk to several neighbouring authorities. The statutory powers to acquire the Barton site and build the station were acquired in 1914, but war exigencies caused all extensions to be made at the Stuart Street station, where some of the plant originally intended for Barton is installed.

The Barton site is 15 acres in extent, and is close to the Ship Canal. Coal may be brought by the Bridgewater Canal, while the West Lancashire coalfield is only four miles away. The railways in the neighbourhood of Trafford Park afford through communication to all parts of the country. The space available permits plant of 125 000 kW capacity to be put in, and at the present time operations are going forward for the installation of plant for 75 000 to 80 000 kW. The turbine room has an area of 240 ft. by 65 ft., the switch room 210 ft. by 41 ft. and the boiler house 312 ft by 85 ft.

Boiler Plant.

Boreholes showed that 1¾ million gallons of water can be obtained per day and the coal storage capacity is over six weeks' supply, 25 000 tons. The service bunkers hold 3 000 tons, sixty-two hours' supply. Ten boilers are provided for three turbine sets, each boiler having a heating surface of about three quarters of an acre. Air heaters are fitted, and two types of fuel, low grade slack and coke, could be burnt. Each unit evaporates 100 000 to 120 000 lb. per hour. The boilers are novel in design and are more efficient than ordinary types. The grate area is 512 sq. ft. The steam conditions at the boiler are 375 lb. per sq. in. pressure and 295°F. superheat. The feed temperature at the economisers is 200°F.

Turbo-Alternators.

There are three main units each of 27 500 kW maximum continuous rating, the economical load being 25 000 kW, and these units mark notable progress in steam turbine design. The vacuum allowed for is 29·1 in. The alternator and step up transformer form one unit the transformer ratio being 6 600/33 000 V, all switching being done on the h.t. side. The generator and transformer are protected as one unit by balanced current system. The condenser surface is 40 000 sq. ft., cooling water required being 2 280 000 gallons per hour. Two circulating pumps per condenser deal with 20 000 gallons per minute, the motor being 320 H.P.*

Distribution.

For each generator there are two three-phase transformers, each of 19 500 kVA capacity weighing 55·5 tons. These are on the ground floor, the next floor containing the busbars and the top floor the oil switches. Seven feeders will ultimately lead into the existing network, protected by the Merz-Beard system.

The estimated cost of the station in 1914 was £11 per kW, but the cost when installed is expected to be £29 per kW.

International Telegraphy and Commerce.

Mr. John Lee, Controller of the Central Telegraph Office, London, and formerly of Liverpool, was the guest of the Liverpool Rotary Club at luncheon at the Compton Hotel on Thursday, Jan. 12, and spoke on the subject of "International Telegraphy and Commerce." Mr. James Blackledge (president) presided. Confining himself to the portion of international telegraphic communication performed by Government enterprise, Mr. Lee mentioned that the Post Office had now direct wires from London to twenty-nine different cities on the Continent of Europe, and nearly a million messages passed from this country to the outside world each month. He referred to the line which was laid during the war from the North of Scotland to the Murman coast of Russia. Speaking of the machines employed, Mr. Lee said that Liverpool was the only provincial city which up to the present had shown sufficient direct, intimate commercial relationship with particularised Continental cities to justify a wire. Their engineers had recently been working at this problem, and they had now succeeded in "splitting" a wire with such ingenuity that they were able, by means of this one wire, to serve two cities in England (London and Liverpool) and two in France (Paris and Lyons). The machines operating this wire were worked, not by the Morse system, but by modern printing telegraph instruments.

* For details of Barton auxiliaries *see* the discussion on "Power Station Auxiliaries" on p. 69.

Annual Exhibition of the Physical Society of London and the Optical Society.

(*Continued from page* 45)

The Cambridge & Paul Instrument Company.

The CAMBRIDGE & PAUL INSTRUMENT COMPANY, as usual, provided a most interesting display of instruments. These embodied apparatus appealing both to the station engineer and the pure physicist. As an example of the former, we may mention a remote power indicator which has been patented by Mr. E. Fawsett, Chief of the Research Department of the Newcastle-on-Tyne Electric Supply Company. This gives a local indication of a.c. power at a distant station which may be several miles away.

For single-phase measurements the apparatus consists of a sensitive Cambridge unipivot indicator, a non-inductive resistance R (Fig. 9) of suitable value, two current transformers C, and two sets of thermo-junctions J fitted with separate heaters H. A potential transformer must be added in the case of high tension circuits. Connections are made so that the E.M.F.'s of the junctions are in opposition. The heaters are adjusted so that with equal currents through them equal opposing E.M.F.'s are generated by the junctions. The current transformers, which are of equal ratios and similar characteristics, are connected one to each heater. It will be noted that these transformers operate separately from each other. The heaters are joined in series and are also in series with the non-inductive resistance. This series circuit which is in shunt to the mains corresponds to the ordinary moving coil circuit of a wattmeter, the current transformer unit corresponding to the fixed coils. It will be noticed that if the load current is in phase with the pressure, the instantaneous superimposed currents in one heater are additive and in the other are in opposition, so that the former heater will be at a higher temperature than the other.

Now, if both heaters are at the same temperature, there will be no difference in E.M.F. between the thermo-couples and consequently no deflection on the indicator. If, therefore, the heaters are warmed by equal currents from the current transformers, or the same current through the non-inductive resistance, there will be no deflection in either case. If, however, the heaters are warmed by currents from the two sources simultaneously, there will (except at a power factor=0) be a difference in the temperature of the heaters. Therefore, the E.M.F. from one thermo-couple will be larger than that from the other, and a deflection will be obtained on the indicator.

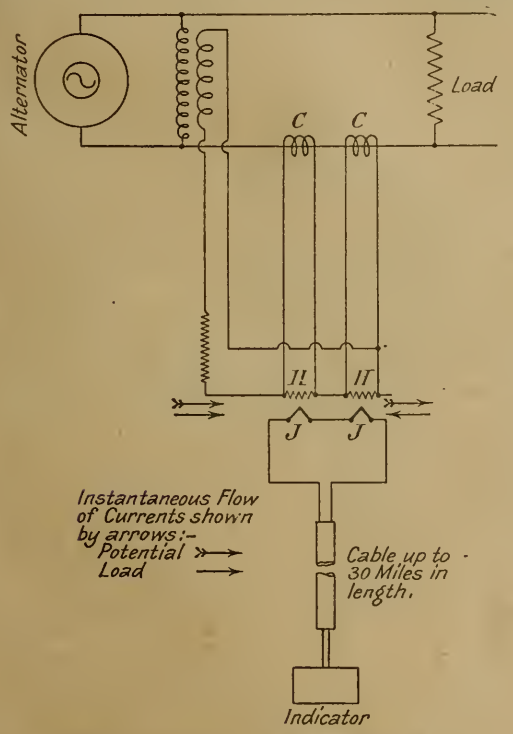

FIG. 9.—DIAGRAM OF FAWSETT'S REMOTE POWER INDICATOR.

It may be proved that the deflections of the indicator are strictly proportional to the watts in the circuit, *i.e.*, the instrument is a true wattmeter. By the provision of a condenser in the potential circuit instead of the non-inductive resistance, the apparatus is available as a wattless power indicator. The arrangements are also easily adaptable to polyphase circuits.

We understand that the apparatus has been in efficient use for some time in connection with two stations nine miles apart. It should have a wide application for the measurement of power at a distance.

Apthorpe's Temperature Regulator.

Apthorpe's temperature regulator, which was also shown, is of a novel type. It consists of a millivoltmeter calibrated in degrees. Near the end of the pointer is attached a light thermo-couple which is connected to a moving coil relay. A small platinum spiral, which is heated electrically, can be placed at any desired position on the scale in front of the galvanometer, but so that it does not interfere with the free movement of the pointer. To control the temperature of a furnace, a thermo-couple is placed in it and is connected to the millivoltmeter. The heated spiral is then set at the desired temperature. As the temperature rises the pointer deflects until it comes opposite the heated spiral. The thermo-couple on the pointer then generates current and operates the relay, which, in its turn, closes an electric circuit controlling the gas supply. The pointer is prevented from swinging past the heater by a stop. The device can be used to control temperatures from the lowest that can be measured by a resistance thermometer to the highest that would be measured by a radiation pyrometer. The instrument was shown controlling a small electrically-heated furnace at about 700°C. ± 5°C. Other uses, such as the operation of alarms, are obvious, and it appears to us that the device should find a wide application, not merely on account of its convenience but owing to its accuracy.

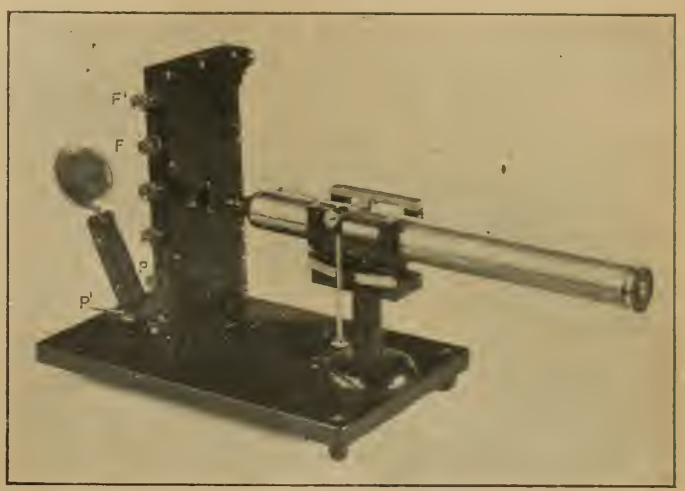

FIG. 10.—STRING ELECTROMETER.

String Electrometer.

As is well known, the string electrometer originally suggested by Prof. Einthoven is an instrument in which the moving system is a silvered quartz fibre tightly stretched between, and parallel to, two fixed metal plates. The special feature of the model shown is its compactness and the ease with which it can be assembled with any other apparatus. In particular, being flat, it may be used on a microscope stage without further fittings. The general character of the electrometer is seen in Fig. 10.

The instrument consists of a silvered quartz fibre, each end of which is carried by a flag, which is anchored to an amber block by means of a brass clip. One flag is held in a slot in each clip by a screw. This enables the interchange of fibres to be done very simply, as fibres can be supplied ready mounted on flags, and can be transferred by means of a fibre manipulator. The upper amber block is held in a fixed position, while the lower amber block is carried on a rocking arm controlled by a micrometer screw at the right side of the flat case. The ends of the fibre are mounted on an invar steel rod, so that variations of temperature have only a small effect on the tension of the quartz fibre. The position of the plates in relation to the fibre may be altered in a lateral direction to obtain electrical symmetry. Observation of the fibre is made through a microscope, with a finely adjustable forward and lateral movement.

The instrument is extremely rapid in action, the free period being small. If desired, it can be employed as an oscillograph electrometer. It is sensitive, with a very small capacity (a few

cm. only), and the sensitiveness can readily be varied. The sensitivity and period vary, of course, with the tension on the fibre and the potential difference on the plates, but it may be mentioned that in one typical instrument for standard optical work, 21 divisions for 1 V were obtained with 87 V on the plates, this corresponding to a movement of the fibre of about 0·16 mm. for 1 V. For this sensitiveness the period was about 0·1 sec. The motion for practically all workable tensions is aperiodic.

Salomonson String Galvanometer.

A simple and less costly form of Salomonson's string galvanometer with two copper fibres 12 μ in diameter, was shown. The resistance of either string is 11 O, and the magnification is about 40 at a working distance of 80 cms. A flux of 12 800 is obtained with a current of 5 A. Being a double string instrument it is capable of giving two simultaneous records on the same plate. The mechanism can be removed quite easily so as to give ready access to the fibres. It is a compact instrument, as will be seen from Fig. 11.

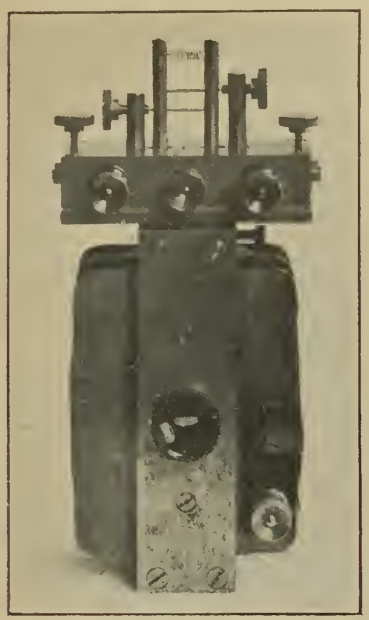

Fig. 11.—New Model of Salomonson String Galvanometer.

Disappearing Filament Pyrometer.

The disappearing filament pyrometer designed by Dr. Ezer Griffiths, of the National Physical Laboratory, is a self-contained instrument. It consists of an electric lamp which is in series with a small ammeter and a rheostat. The leads provided are connected to a 2V accumulator. The observer looks at the hot body through the eye-piece of the instrument and adjusts the current through the lamp by means of the rheostat until the tip of the filament is of the same brightness as the hot body. The temperature of the hot body is then read on the ammeter. The scale of the instrument is calibrated direct in degrees of temperature, the standard ranges being 700 to 1 400°C. for single and double scale instruments, and also 900 to 2 000°C. for double scale instruments. The eye-piece is provided with a rubber eye-guard to exclude extraneous light, and is made adjustable so that it can be focussed on to the lamp filament. The objective is also provided with an adjustment so as to bring the hot body into the correct focus. Immediately behind the eye-guard fixed to the eye-piece is a series of 3 stops, one being a plain hole which is most suitable for viewing the filament against the hot body at low temperatures. The second stop is provided with a monochromatic glass which is more useful when measuring temperatures at about 1000°C., the monochromatic glass reducing the amount of glare. The third stop is provided with an extra convex monochromatic lens suitable for still higher temperatures. The introduction of these glasses into the optical system does not affect the scale or accuracy of the instrument, but is simply a convenience when watching the colour of the two objects. The lamps in these pyrometers are never used at their maximum brilliancy under actual conditions. They are specially aged so that their brilliancy remains constant for very considerable periods. We are informed that persons without any previous experience can readily use this instrument and can obtain an accuracy within 1 per cent. without difficulty. The convenience of the instrument will be apparent from Fig. 12.

The Cambridge & Paul Company exhibited many other interesting instruments. Among these may be mentioned the beautiful apparatus evolved by Mr. T. Shimizu for showing continuously C. T. R. Wilson's experiment rendering evident the tracks of α, β and X-rays. A moving coil galvanometer was shown, designed by Dr. Moll, with an electromagnetic field—an idea which was tried years ago by Ayrton, but was then discarded. It is very quick in action and gives a deflection of 200 mm. at 1 metre for 1 microampere. It is particularly suitable for use with thermopiles. We noticed that the firm's CO_2 recorder, which has already been described in these columns, has been modified into a portable form

H. W. Sullivan.

Mr. H. W. Sullivan again exhibited an attractive collection of wireless and similar apparatus. Perhaps his hot wire microphone attracted the chief attention.

Hot Wire Resonator Microphone.

This microphone was originally designed for determining the position or origin of a sound produced by the discharge of a gun and was largely used in the war, forming the subject of a secret patent. It has since, however, been applied to a number of other purposes, particularly for the detection and measurements of sounds emanating from sources other than gun fire. The microphone consists of an electrically-heated Wollaston wire, or grid, which is mounted close to, and in front of, a small opening in a cylinder or container, the latter being closed at the other end, the volume of air in the container being variable by means of a plunger operated by a micrometer screw. The fine wire, which is supported in a suitable frame, is connected to terminals, and an electric current is passed through it for the purpose of raising its temperature above that of the surrounding air. In operation the temperature of the wire is reduced by the cooling effect of the movement of air caused by the sound to be determined or recorded, and if the ends of the wire are connected to a sensitive indicating galvanometer of the uni-pivot type, a deflection of as much as 90 deg. is easily observed. This deflection, of course, depends upon the intensity of the particular soundwave which is affecting the microphone.

The variation in the electrical resistance can be used in many ways. The greatest effect, however, is obtained by inserting the microphone in the arms of a Wheatstone bridge, which utilises to the best advantage any resistance variation in the microphone. In conjunction with an Einthoven galvanometer, or other suitable instrument, it can be used for recording the wave form of sounds of low frequency—*e.g.*, within the range of 25 to 1 000, or if connected through a transformer and used in conjunction with a valve magnifier, sounds can be rendered audible over great distances.

High Frequency Apparatus.

Among the wireless apparatus shown by Mr. Sullivan we noticed a bridge for the measurement of resistance, capacity and inductance at radio frequencies of 10 000 to 500 000 cycles per second. The buzzer hitherto used for determinations of this kind is replaced by a high frequency generator, and thus tests are carried out under actual working conditions, which is a great advantage. The higher of the two frequencies above mentioned is equivalent to a wave length of 600 metres. The operation is simple, and a calibration

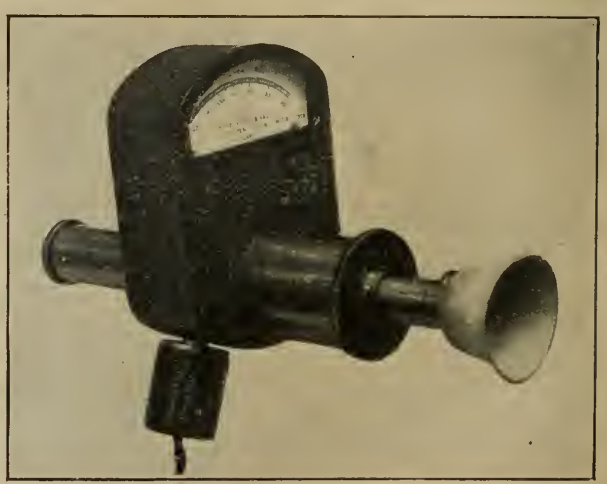

Fig. 12.—Disappearing Filament Pyrometer.

supplied with the oscillator enables inductance and capacity values to be determined by simple calculations.

A fixed air condenser of 0·001 mfd. was shown, which had been designed in conjunction with the National Physical Laboratory and made on the lines of standard condensers supplied to the Laboratory. The chief feature in the design is that quartz is used as the only insulating material, so that the condenser (which is otherwise all metal) is less liable to be affected by temperature than if materials such as ebonite are used. Quartz was selected as its dielectric losses are lower than those of any other material except amber. The latter was used in a large condenser supplied to the National Physical Laboratory, but owing to difficulty in obtaining this material it was superseded by quartz. By fitting metal caps over all the insulators, the metal cover is made to form a perfect earth, thus rendering the screening complete. We understand

that the Laboratory recently tested condensers of this kind made for a Government Department, and formed an exceptionally high opinion of their value.

The Thermionic Valve as A.C. Generator.

The convenience of the thermionic valve as a generator of alternating currents up to high frequencies is now well recognised, but apparatus for this purpose has not been readily available. Mr. Sullivan exhibited an instrument which appears to be very suitable for laboratory work. For frequencies from 3 up to 400 periods per second the instrument consists of coupled circuits with iron cores. The frequency is varied by means of a condenser, and a chart is supplied showing the capacity necessary for various frequencies. Two valves are used in parallel. The input is about

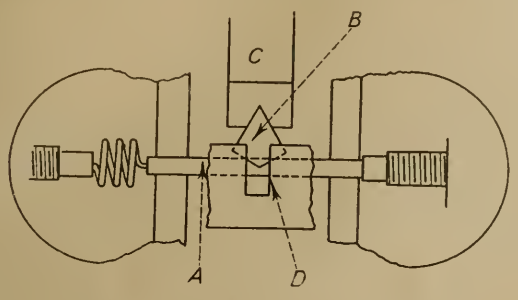

Fig. 13.—End View of Oscillograph.

12 watts and the output about 2 watts, which is quite sufficient for supplying the necessary current for general testing purposes. A further range of oscillators was shown for generating frequencies of from 400 to 10 000, and from 10 000 to 500 000.

A convenient heterodyne wave-meter was also shown, suitable for wave lengths from 150 to 20 000 metres.

The Cox-Cavendish Electrical Company, Ltd.

An interesting electrostatic oscillograph, due to Prof. Taylor Jones, was exhibited by the Cox-Cavendish Electrical Company. This oscillograph, which is very simple in construction, was used by Prof. Jones in his work on induction coils, some of which was published in our columns. Figs. 13 and 14, which are diagrammatic, show the construction that has been adopted. A strip A of phosphor bronze or steel, 1·75 cms. long, is stretched between substantial ebonite jaws, the tension being adjustable by means of a nut and sliding screw. A mirror B of elongated form is attached at one end to the centre of the strip, while the other end rests on an adjustable ebonite pillar C which forms a fulcrum so that the mirror rocks through a small angle in response to any movement of the strip. The movement is immersed in oil, the liquid serving for both insulating and damping purposes. Opposite to the centre of the strip when in position in the container is an attracting plate E embedded in an ebonite rod F which passes through the container wall, while on the side of the strip remote from this is a small plate of metal D in electrical connexion with the strip and therefore repelling it. The potential to be measured is put between E and

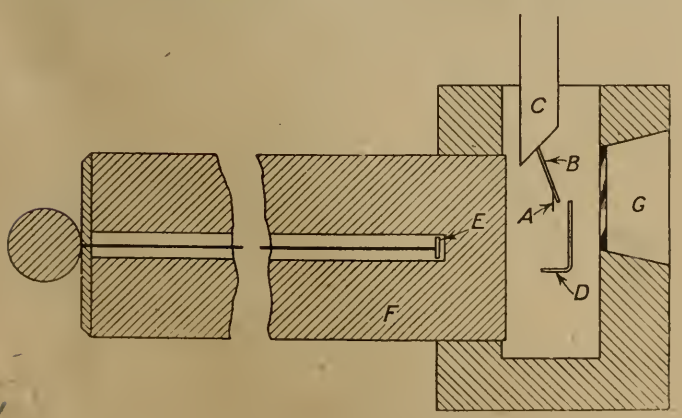

Fig. 14.—Side View of Oscillograph.

the filament. A window G in the container allows a beam of reflected light for observation or recording. For different ranges of potential, different containers fitted with attracting plates at different distances and shielded by different thicknesses of ebonite are used, the movement being the same in each case. The instrument as described can be used for frequencies up to 1 500; above this a special form, having a strip only 3 mm. long, is used. The deflections are, of course, proportional to the square of the potentials. It will be seen that this oscillograph differs from other types so far used in that the deflection does not reverse with a reversal of polarity, and consequently it cannot be used for tracing alternating potentials.

Gold Leaf Electroscope.

The design of the gold leaf electroscope shown is due to Dr. E. A. Owen, and the chief feature is the method adopted to prevent leakage. The gold leaf A (Fig. 15) is attached to a rod B screwed into an insulator D of ebonite ringed with sulphur. The charging rod F is capped with ebonite and is held up in its top position by a spiral spring. A loose flange E on its lower end, which is maintained in its position by a weak spring, makes contact when the rod is depressed with a flange C on the rod holding the gold leaf; thus the instrument cannot be injured by pressing down the charging-rod too hard. The most important point to arrange for in an electroscope is the insulation of the leaf system. Ebonite is a poor insulator as regards surface leakage and deteriorates rapidly with exposure to a damp atmosphere. The best material to employ as insulator would be sulphur or amber; the former is ruled out in this case on account of its weakness mechanically, whilst the latter is at present difficult to obtain and suffers from the same defect as sulphur, though not to the same degree, in that it is not mechanically strong. The insulating properties of ebonite can be greatly improved by the old method of letting sulphur rings into it. This method is used in the present case and is found satisfactory. The

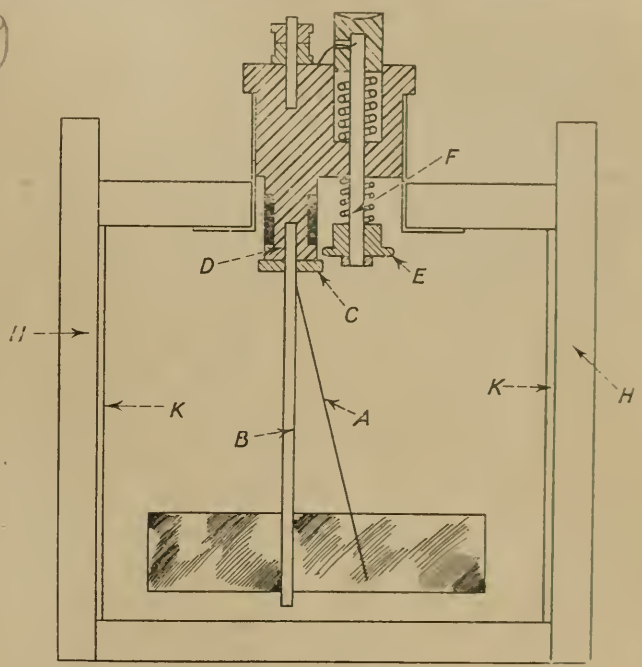

Fig. 15.—Gold Leaf Electroscope.

cylinder is immediately mounted, kept in the dark and guarded against the deposition of dust. The gold leaf is about 4·5 cms. long; the end of the leaf falls through about 0·11 mm. in one hour after the electroscope is charged at 280 V, while a change of potential of 1 V on the leaf moves it through 0·51 mm. The amount of soakage in the ebonite insulation is small, and reliable readings may be taken with the instrument in about five or ten minutes after the leaf is initially charged. The sensitivity of the instrument is constant over the whole scale of the microscope, so that readings may be taken indiscriminately over any part of the scale. For γ ray measurements the whole of the electroscope is covered with lead about 0·25 in. thick; for X-Ray measurements, the two lead-end faces H are removed and the rays pass into and out of the instrument through aluminium windows K of suitable thickness.

(To be concluded.)

German Reparations in Kind.

We are glad to see that the attack on the idea of the Germans paying for their Reparations in Electrical Machinery is not weakening. A very trenchantly-worded letter has been addressed to the Prime Minister by the British Engineers' Association on this subject, and a copy of the letter has been forwarded to the Federation of British Industries, with a protest at the failure of the Federation to take effective precautions to ensure that Press publicity should not be given to the personal views expounded by Sir Peter Rylands on a subject of grave importance to the engineering industry.

An Electrical Cinematograph Demonstration.

As already announced in THE ELECTRICIAN, the proceedings at the meeting of the INSTITUTION OF ELECTRICAL ENGINEERS on Thursday of last week were of an unusual kind. Temporarily, the lecture theatre was turned into a picture palace, and the influence of the new departure was to be seen in the display of exit notices of the type familiar in theatres over the doors and by the provision of a very inadequate emergency lighting, whose effect, if not whose function, was to make darkness visible. The hide-boundedness of bureaucracy, against which we all inveigh, could not have been better displayed than in this simple way.

As might have been expected, the fact that films were to be shown attracted a large audience, who, with rather more reason than usual, filled the back seats first, with such effect that before the President entered standing room only could be obtained in quite the best picture palace style. So much did the new atmosphere affect those present that we heard the suggestion ventured that a charge should have been made for admission and the proceeds applied towards the reduction of members' subscriptions.

A Ten-Thousand Membership.

The PRESIDENT, in opening the meeting, announced that the membership of the Institution exceeded 10 000. He also mentioned that the meeting on Feb. 2 would be followed by a dinner at the Engineers' Club, open to any members of the Institution who cared to attend. These functions, he added, were of an extremely useful kind, and he hoped that in future they would receive greater support than the one before Christmas had done.

Mr. HIGHFIELD then called upon Dr. Garrard to make some introductory remarks on the film illustrating "Investigations and Tests on High-Tension Switchgear." These introductory remarks are reproduced on another page of this issue.

When Dr. GARRARD had concluded the exhibition of the film was proceeded with and attracted a considerable amount of interest and not a little applause. Typical tests were the passing of a current of 108 000 A through a circuit-breaker rated at 1 200 A and 123 700 A through a breaker rated at 800 A. Similar tests of current transformers and fuses were also exhibited. A specially effective test was one conducted on a 4 000 A switch at a current of 102 000 A. The preliminary flares and flashes were followed by a regular Brock's benefit, and we were surprised to see anything left of the equipment when it was, as customary, exhibited after the test. As might be expected with an American film, the captions were terse and to the point, while the very wise method was adopted of showing each test twice, so that points missed during the first exhibition could be picked up during the "repeat."

Technology Popularised.

At the conclusion of this film, Mr. F. GILL was called upon to demonstrate two films entitled "The Audion" and "Telephone Inventors of To-day" respectively. Mr. Gill began by pointing out that the films, which were to be shown were not of the same high technical interest as those which Dr. Garrard had exhibited. In electrical manufacture now-a-days there were a large number of people engaged who had not much technical knowledge, but in whose interest it was necessary that a certain amount of information on the appliction of the apparatus they were turning out should be given. These films had been designed for this purpose, and we may add that that purpose was admirably fulfilled. As films they were very much better productions than that we have just described, and the one illustrating the Audion particularly showed an amount of imagination which reflects the highest credit on its authors or filmers. Even theoretical engineers are not used to seeing current flowing along a wire or electrons emitted from antennæ or passing from filament to grid. The film was received with a good deal of laughter, but at the same time its instructional properties even to a technical audience were quite evident.

Automatic Telephony Up-to-Date.

Our chief criticism of the film entitled "Telephone Inventors of To-day" is that it is most inaptly named. It deals not with personalities but with apparatus. Perhaps the most interesting feature of it was the wireless assembly of a subscriber's ordinary telephone set, in which the variety of washers, screws, and other parts employed leapt into place in a most uncanny way quite worthy of Maskelyne and Cooke. The phenomena of the receiver, which it is the lot of most of us to use every day, wiring itself, should we say electronically, must be seen to be believed.

Trade with Morocco.

Mr. C. R. B. Atkinson, H.M. Commercial Secretary for MOROCCO, is at present in London, at the Department of Overseas Trade, 35, Old Queen-street, S.W., 1, and will make appointments until Jan. 25 to interview firms who desire information regarding trade with Morocco. When writing, Reference No. 3 617 T.G. should be quoted. Mr. Atkinson will also be pleased to receive catalogues.

Correspondence.

THE EXPONENTIAL VALUES AND EXPANSIONS IN POWERS OF θ OF SIN θ AND COS θ.

To the Editor of THE ELECTRICIAN.

SIR,—With reference to Mr. Lucas's letter, giving a method of arriving at the exponential values and the expansions of sin θ and cos θ, it is perhaps worthy of note that the expansions can easily be obtained without the use of complex quantities.

It can be proved by elementary geometry that

$$\frac{d}{d\theta}(\sin\theta)=\cos\theta$$

$$\frac{d}{d\theta}(\cos\theta)=-\sin\theta$$

Assume $\sin\theta=A+B\theta+C\theta^2$ *etc.*
$\cos\theta=a+b\theta+c\theta^2$ *etc.*

Differentiating each side of each equation

$\cos\theta=B+2C\theta+3D\theta^2$ *etc.*
$\sin\theta=-b-2c\theta-3d\theta^2$ *etc.*

By equating co-efficients of similar powers of θ in corresponding expressions for sin θ and cos θ, and by putting $\theta=0$.

$A=-b=0$ and $a=B=1$
$B=-2c$ $b=2C$
$C=-3d$ *etc.* $c=3D$ *etc.*

From which are obtained by successive substitution

$$A=0,\ B=1,\ C=0,\ B=-\frac{1}{3!},\ E=0,\ \textit{etc.}$$

$$a=1,\ b=0,\ c=-\frac{1}{2!}d=0,\ e=\frac{1}{4!}$$

giving finally the usual expansions for sin θ and cos θ.

By putting $j\theta$ for θ in the expansion of sin θ, and adding the series for cos θ, the exponential value of cos $\theta+j$ sin θ is immediately obtained.—Yours, etc. G. W. STUBBINGS.

London, S.E.23. Jan. 16th.

"CHOKE CONTROL"—A QUESTION OF PRIORITY.

To the Editor of THE ELECTRICIAN.

SIR,—My attention has recently been directed to British Patent Specification No. 133 366 of June 28th, 1918, granted to the Western Electric Company, in which is described the well-known "choke control" method of modulation in radio-telephony. Various authors have wrongly attributed this system to Heising. As a proof thereof, suffice it to quote part of my French patent No. 21 855 of Nov. 30, 1916, in which this system is described in its most elaborate form and such as it was used by the British and American Signalling Corps during the war:

In certain wireless telephone diagrams the voltages obtained by the action of the voice on the microphone are amplified by means of thermionic tubes and then impressed on the high-frequency cathode tube generator which energises the antenna. These voltages may be impressed on either the grid or the plate circuit of the generator.

The object of the present invention is to realise an arrangement whereby a part or the whole of a single source of direct current may be

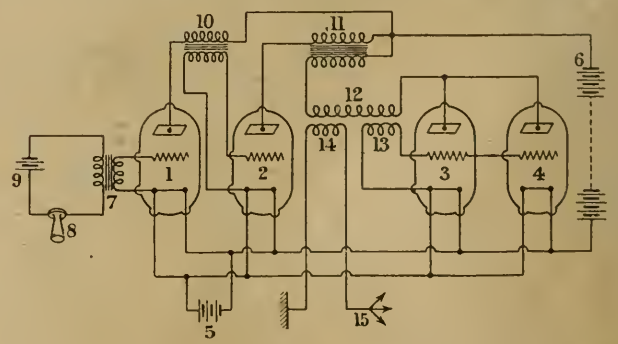

FIG. 1.

used to energise both the microphone current amplifying tubes a[illegible] generator tubes in accordance with the general idea of a common b[illegible] put forth in the main patent.

Fig. 1 shows four tubes, 1, 2, 3, 4, the filaments of which are br[illegible] to incandescence by battery 5, all the anodes being fed off a co[illegible] battery 6.

Tubes 1 and 2 are used to amplify the microphone current The microphone current originating in the circuit comprising the micro-

phone, 8, and the battery, 9, is communicated to the grid and negative pole of the filament of tube 1 through the transformer, 7. Transformer 10 permits of this current undergoing a second stage of amplification through tube 2. The resulting amplified microphone voltages are introduced in the plate circuit of the parallel-connected high-frequency generating tubes 3 and 4 through the transformer 11.

The high-frequency generator includes, in accordance with a known diagram which is only shown by way of example, a primary winding 12, and auxiliary winding 13 connected to the grids and filaments, and a secondary winding 14 which feeds the antenna 15.

Instead of the high-frequency generator output going directly to the antenna, the same may be used to energise the grid-filament circuit of a tube system working as a high-frequency amplifier the output of which is made to feed the antenna. It will be easily understood how the tubes of this high-frequency amplifier may derive their energy from the same source of current.

The secondary winding of the transformer 11 should preferably be shunted by a small capacity in order to create a by-path for the high-frequency current without appreciably impairing the low-frequency working.

If the speech-amplifying tube filaments are heated to the same degree as those of the generating tubes, the amplified microphone voltages obtained at transformer 11 may be of the order of that of the battery 6, and consequently it is easily seen that the arrangement described permits of the efficient working of the generating tubes 3 and 4, and this even with a relatively small voltage from battery 6.

Transformer 11 *may amount to an auto-transformer or a mere choke coil. In view of the fact that a relatively important steady current flows through its winding, it will be preferable to leave an air-gap in its magnetic circuit. This feature applies equally well to transformer* 7.

The elements of the battery 9 may economically be constituted by a portion of either the battery 5 or 6.

Trusting the above may serve to dissipate a prevalent error, I am, &c.,

MARIUS LATOUR.

Paris, Jan. 9.

Electricity Supply Districts.

The Electricity Commissioners (Sir John Snell, Sir Harry Haward, Mr. H. Booth and Mr. W. W. Lackie) opened their seventh public inquiry at Manchester on Tuesday. The inquiry related to the scheme submitted for the reorganisation of electricity supply in the SOUTH-EAST LANCASHIRE DISTRICT. It is proposed to set up an Advisory Board of forty-eight members, with a technical committee of engineers. The policy of the Board, which would have no borrowing powers, would apparently be little more than an extension of the principle of linking up the existing supply undertakings.

Mr. TYLDESLEY JONES, K.C., who appeared for the promoters, gave details of the scheme. He said the Yorkshire Electric Power Company, which was interested in Saddleworth and Springhead, and the Stalybridge, Hyde, Mossley and Dukinfield Joint Board opposed, but the Bredbury and Romiley Urban Council was the only authority which had passed a hostile resolution. Salford and Stretford had approved the establishment of the Advisory Board, but added some phrases pressing for the formation of a joint electricity authority, while Oldham had approved the standard resolution, adding that they thought it most unwise to embody such an authority. Counsel said there was enough opposition to the idea of a joint authority to make its introduction fatal to the success of the scheme, which would be the means of shutting down all uneconomic stations. That could, however, only be done with the goodwill and co-operation of the undertakings in the district.

Ald. W. T. DAGNALL, chairman of Manchester Electricity Committee, and Mr. S. L. PEARCE, city electrical engineer, of Manchester, gave evidence in support of the scheme, and the inquiry was adjourned.

West of Scotland District.

The map below shows the area of the West of Scotland Electricity District which was recently provisionally determined by the Electricity Commissioners.

WEST OF SCOTLAND ELECTRICITY DISTRICT.

Imported Lamp Bulbs.

Evidence concerning the manufacture of incandescent electric lamp bulbs in this country was given by Mr. C. Wilson, of the Osram Lamp Works, on the 11th inst. before the committee which has been appointed under Part II. of the SAFEGUARDING OF INDUSTRIES ACT to enquire into a complaint as to the detrimental effect upon the British industry of imported bulbs. The Committee has been asked to report as to whether, or not, a tax of 33⅓ per cent. should be imposed upon imported goods, and also to enquire whether the industry is being carried on efficiently. The complaint has been lodged by the British Flint Glass Manufacturers' Association and the British Flint Glass Makers' Society in respect of illuminating glassware as well as domestic and mounting glassware from Germany and Czecho-Slovakia.

Mr. Chas. Wilson's Evidence.

MR. WILSON said that he was a director of the General Electric Company, and managing director of the Osram-G.E.C. Lamp Works, the Lemington-on-Tyne Glass Works, and the Tyne Glass Works (Gateshead), all of which were owned by the General Electric Company. When working full time, the Company's bulb requirements amounted to approximately thirty millions per annum. Their requirements in pre-war times had been satisfied partly by the output of their own works at Lemington and partly by the purchase of foreign bulbs. Considerable quantities of bulbs were made in this country before the war, but during the war, when foreign imports were no longer possible, other English glass manufacturers took up the manufacture of bulbs, and large quantities were made, the output rising in the aggregate to about one million per week, the General Electric Company reaching over 600 000 per week. As was natural, at first the quality of the English bulbs was poor, but as the makers became more used to their new work the quality had been steadily improving, and the Lemington works now produced a bulb which compared well with any bulb in the world. The G.E.C. had invested over £300 000 in the glass business, and it had always been their policy to maintain the English industry in bulb-making in order to avoid complete dependence on foreign supplies, and in the interests of the country Mr. Wilson considered it was of vital importance that this policy should be encouraged. It had always been possible to purchase foreign bulbs more cheaply than English bulbs. Before the war the relative prices of similar bulbs were :—English bulbs, 53s. per 1 000; foreign bulbs delivered London, 44s. per 1 000, less breakage allowance and export rebate, making 36s. 6d. per 1 000. Since the war this discrepancy in price had increased. The present price of German bulb No. 0362 was :—At works, 46s. 6d., plus 9s. 10d. freight, or 56s. 4d. delivered, as against a British total cost of manufacture of approximately 135s., of which 63s. 11d. (or 48 per cent.) was represented by labour, and the balance by fuel, materials and overhead charges. Similar figures for bulb No. 564 were :—At works, 50s. 3d., plus 9s. 10d. freight, or 60s. 1d. delivered, against the British cost of approximately 140s., of which 65s. 7d. (48 per cent.) was represented by labour.

Depression in Trade Due to Imports from Germany.

MR. WILSON said the suggestion made by certain witnesses that no bulbs had been imported from Germany or Czecho-Slovakia since the war was absolutely untrue. He had been inundated with quotations of all kind, and he had himself purchased from Germany and Holland since June, 1921, upwards of two millions of bulbs. At present the electric lamp trade was undoubtedly quiet, but it was a matter of recent and temporary occurrence, and he could say without hesitation that the fundamental cause of unemployment in the bulb trade had been the very low price at which, owing to the depreciation of the mark, it had been possible for the Germans to put their bulbs on the English market. So far as bulbs were concerned, Belgium could not compete with Germany. The quotations which Mr. Wilson had obtained for Belgian bulbs showed that they were considerably more expensive. In his opinion, if relief were given under the terms of the Safeguarding of Industries Act, it would certainly tend to increase employment among English bulb blowers, and the benefit of the duty would be increasingly felt as foreign currencies recovered.

Statistics of British and Foreign Bulbs.

Replying to questions by members of the Committee, Mr. WILSON said that considerable quantities of bulbs were made in this country before the war outside his firm. His own firm made about 65 or 70 per cent. of its own requirements and imported the remainder, but at present, owing to the decreased demand, his own glass works were able to make all the bulbs which the Hammersmith lamp works required. He had no exact figures of the total production in this country. At the beginning of the war his glass works were making 250 000 bulbs per week, and in the busiest time they made 650 000 per week. The prices mentioned for the English bulbs were the usual prices here, the bulbs in his case being charged up to the lamp works at the market price.

The Chairman (SIR WM. ASHLEY) drew special attention to the statement made by witness that since the war the British price had increased 150 per cent. and the foreign bulb 50 per cent. Had witness any doubt as to affirming that?

MR. WILSON said his figures proved that. The increase was due to the greater cost of materials and labour. He held no brief for British labour as regards glassblowers. He had given orders abroad and could speak of actual prices in respect of them. He had placed an order in Germany for one million bulbs and a similar order in Holland during the last six months. One of the reasons for giving those orders was to bring home to the British workman the nature of the foreign competition we had to meet. Another reason was the coal strike, and a third was a desire to test the quality of the foreign lamps. At present his works were working alternate weeks, so that he was able to make all the lamps he required here. With regard to glassblowers' wages, the pre-war rate was 9¾d. an hour, but that was pushed up to 4s. an hour during the war. That was what was earned on piece work. Therefore, he held no brief for the workmen, but he must say that they were now in a much better frame of mind than they were a little while ago, because they saw the danger of foreign competition. He did not altogether blame the workman for the state of the industry here; the employers were also to blame.

Equipment of British and German Works.

Many of the British works were not as up-to-date as they should be, but that was due to the fact that those particular firms had not the money to instal modern plant. His own firm had been better situated in that respect than most of the others. He did not say that a 33⅓ tax would be a very great help to the trade at the moment to compete in price with the German bulbs, and it would be of no assistance to them if they did not help themselves by putting in modern furnaces and so on.

Answering SIR THOMAS ALLEN (a member of the Committee), Mr. Wilson said that before the war he had 240 employees, and now there were 517 working alternate weeks. Just after the armistice the number employed was 720. Whilst the number employed was larger than in 1914, the works could employ more workpeople than there actually were.

The Economics of Glass Works.

In reply to SIR JOHN BARRAN, witness said they had always lost money on their glass works, but as they were making for their own consumption, they were not troubled so much as they would otherwise have been. The policy had been to make this country less dependent upon foreign supplies and to increase the output. They were feeling German competition before the war, but they had enormously increased their output as between 1914 and now. That was due to an increase of plant and an increase in the number of up-to-date furnaces. A man he had sent round the country to secure orders for bulbs had come back with the report that everywhere he was met with German competition at prices which they could not touch. The reason the Germans were able to turn out bulbs cheaper than ourselves was due in a large measure to the greater technical knowledge of the German industry, and the German workpeople were also better trained. He had his manager in Germany at present studying the conditions there. The equipment of German factories was in most cases better than the average British works. Even so, if the exchange were normal he believed we could compete.

The attention of Mr. Wilson was called to the fact that in a letter from the German Embassy it was stated that the German Government had made a regulation that all quotations for goods for export were to be on the basis of the mark at 280 to the £.

MR. WILSON replied that he had a quotation received a few days ago, but there was no reference to such a regulation. It would be a step in the right direction, however, to assist the British glassmaker. The German price was 53s. 8d. per thousand and the Dutch quotation 115s. 1½d. per thousand for an inferior article. The Dutch could not compete with the Germans.

Illuminating Glassware.

Mr. F. WATKINSON, managing director of J. and W. B. Smith, Ltd., Farringdon-road, said Australia and New Zealand placed large orders for foreign glassware with English firms, and if a duty were imposed those countries would buy direct and the goods would be shipped from Antwerp or Hamburg.

Mr. D. LOEBL, chairman of Schindler & Company, said the majority of the kind of goods his firm sold were not made in England before the war, the small proportion made here being produced at exorbitant prices. There was nothing to prevent an export house here from buying mounts only in England and adding glass sent direct from the factories abroad, thus evading the duty altogether. That would increase neither the glass trade here nor employment in the glass factories, whereas shipping firms here would lose trade in consequence.

When the evidence was concluded, Sir ARTHUR COLEFAX, K.C., summed up, and said in regard to illuminating glassware, the committee must be satisfied that the prices at which these articles were being sold here to-day were the prices occasioned by the fall in the currency of the country from which the goods came. The ratio of increase over pre-war prices of imported articles was substantially higher than the ratio of increase in the case of pre-war British goods. That was not due to the question of currency. The British trade was essentially a special trade in a high class of articles, and it was not touched by the present importation.

A somewhat cryptic advertisement appears on page xxi. of this week's issue. It consists not of a hidden number, but of a number whose meaning is hidden. One of the objects of all advertisements is the stimulation of interest, and we have no doubt that our readers will be interested enough to watch these pages from week to week, notice the changes that occur therein and speculate on their probable meaning.

British Trade with India.

In the general review of the conditions and prospects of British trade in India for the two years ended March, 1921, Mr. Thos. M. Ainscough, H.M. Senior Trade Commissioner in India and Ceylon, states that the period was one of transition, and that it will be some time before a position of equilibrium will be reached. Though the year 1919-20 was one of phenomenal trade activity, there was an almost complete cessation of Indian exports in the following year, owing to the financial chaos in Central Europe and the trade depression in America, and as this drop in exports coincided with a flood of imports, a collapse of the exchange and a severe financial crisis ensued, from which the country is slowly recovering. Mr. Ainscough thinks that direct trade with responsible Indian firms is reasonably safe, particularly in cases where the home shipper has a resident representative to safeguard his interests.

British Imports and Exports.

Of the total trade of India, the share of the Empire is now 56 per cent., compared with 52 per cent. in the year before the war, while the share of the United Kingdom is 44 per cent., against 41 in 1913-14, but her share of India's imports (61 per cent.) is still 3 per cent. below the pre-war standard. The American and Japanese competitors, who gained a footing during the war, are likely to remain, and there are signs of growing German and Belgian competition.

Before the war, Great Britain supplied 89 per cent. of the total imports of machinery; in 1918-19 her share had fallen to 64 per cent., but in the past year the percentage had advanced to 78 per cent. The value of the electrical machinery imported in 1920-1921 was £2 188 587, against £1 240 680 in 1919-20; instruments and apparatus for Government purposes were valued at £602 794 (against £41 912), and telegraph materials £343 468 (£578 977). The total value of the electrical supplies imported, including wires and cables, electric fans and parts, lamps, batteries, meters, lighting accessories, &c., was £4 183 864 (against £1 549 589 in 1919-20), and Great Britain's share of this was £2 888 257 (against £800 132). The United States came second with £950 283 (£562 875), and Japan third, £126 582 (£81 253). During the war the large trade in fans was shared by the United States and Italy, but the British imports are now nearly equal to those of the United States, who also supply large quantities of electric wires and cables. Holland appears to be the chief competitor in electric lamps, and Japan sends electric cables and wires, lighting accessories, electrical porcelain, &c.

Foreign Competition.

The principal American exports during the past five years have been motor-cars (£6 486 000), iron and steel (£5 199 000), machinery (£4 026 000), hardware (£2 255 000), and instruments and apparatus (£1 335 000). It is stated that American machinery of all kinds has now gained a reputation, and is being assiduously pushed with method and enterprise. Japanese competition is mainly in textiles, matches, and hardware, and though she supplied electrical instruments, cables, &c., during the war, the shipments of these have fallen off.

The statistics for 1920-21 record the re-entry of Germany into the Indian markets with shipments of the value of £4 748 000, the principal items being dyestuffs (£1 203 000), metals (£864 000), hardware (£291 000), glass and glassware (£203 000). German exports are increasing steadily, being favoured by the depreciated mark exchange. Recently many orders for machinery for rice mills, sugar plants, &c., have gone to Germany, owing to quotations being 50 per cent. below British prices. Last year's Belgian exports were of the value of £5 326 000, or about double the pre-war shipments. Belgium is underselling British steel makers in constructional steel.

Dealing with political events, Mr. Ainscough points out that the watchwords among Indian politicians, industrialsts, and business men is protection for Indian industries, and this movement will affect British exporters more than others. During the year the general import tariff was increased from 7½ to 11 per cent. It is again urged that British houses should be represented by an active and competent organisation in the country itself, and engineers should open branches, with competent engineers and erecting staffs.

Production of Minerals.

The output of manganese ore amounted to 538 000 tons, and of this amount 370 000 tons, valued at £697 732, were exported, mainly to the United Kingdom. The quantity of mica produced was 47 783 cwts. (valued at £219 842), a decrease of about 9 000 cwts. compared with 1918-19. There were decreases in the outputs of monazite, copper, and tungsten, but there were increases in the tin and lead production. Important deposits of bauxite have been discovered near Chakar, in the province of Jammu.

Hydro-Electric Development.

A brief sketch of the progress made in the development of water power as well as the position of the hydro-electric survey is included in the Survey, but particulars of this work have already appeared in The Electrician. There are about 1·75 million e.h.p. in sight, but the actual available water power is much greater, and about half the power is produced in Bombay. Steady progress is being made with the provincial hydro-electric surveys, and it is anticipated that the initial part of the work will be completed in about three years. Abstracts of the report of the Chemical Services Committee, and of the work of the Indian Institute of Science (Bangalore), as well as accounts of the progress of various industrial companies, are also included. In 1919-20 there were 905 new companies formed, with a total capital of £275 534 700, and in the following year 965 companies, with a capital of £145 766 700.

Branch Works in India.

In regard to the factors which should influence British manufacturers in deciding whether or not to erect works in India, Mr Ainscough thinks that, in cases where the principal raw materials are available in India, and where the country affords a steady market for the finished product, the prospects for local manufacture should be promising; where there are established industries in India requiring large and constant supplies of machinery, and where there is a steady demand for standardised and simple types of heavy plant for Government, railway, or municipal requirements, local manufacture would be successful. The competition of Indian industries with British works has not yet been severely felt, but the local engineering shops are competing more and more in structural steelwork and small steam engines. The agents, representatives, and travellers of British firms engaged in the manufacture of industrial plant, machinery and stores, are recommended to establish friendly relations with the Directors of Industry in the provinces, a list of whom are set out.

Igranic Tubular Heater.

An interesting development in electrical heaters for all kinds of purposes has been made by the Igranic Electric Company. We understand this is not a variation of any existing apparatus, but is of such fundamentally different construction that it gives characteristics unlike those of any other heater. By its means, it is claimed, many requirements can be met which could not be satisfactorily met by any previous form of heater.

This heater, which is of the tubular type, consists essentially of four elements. The resistance of round wire is wound in a helix, disposed centrally along the axis of a metal tube which is completely filled with insulating material, embedding the resistance and terminals and insulating them from the tube. The resistance material is usually nickel chromium, the enclosing tube being of steel or copper, according to the use to which the heater will be put. Steel is used for general purposes and copper for water immersion heaters. The insulation employed is a specially developed highly refractory material, capable of operating at high temperatures without deterioration.

No mica is used except at the terminals to insulate them from the tube. The terminals are of brass or steel, the latter being employed for high temperatures, where brass would not be suitable, while brass is used where steel would be liable to rust; generally a copper

Immersion Water Heater.

tube heater has brass terminals and steel tube heaters steel terminals. The lead wire connecting the terminals to the resistance is of nickel chromium of much greater section than the resistance, and provides a portion of tube of inactive length, so that all the heating effect is produced within the required portion of the tube.

Application of Tubular Heaters.

There are four general types of tubular heaters

The immersion heater, which is immersed directly in the liquid to be heated. This is shaped as required, the terminals being brought out to a suitable location over the edge of the container and passed through glands in the bottom or side. The tube can be bent to conform to the shape of the vessel, and to avoid obstructions, and thus provides a maximum of adaptability in installation.

Cast-in heaters. The tubular heater is peculiarly adaptable for certain work, as it can be shaped to any desired form, and will stand the temperatures at which aluminium, copper, brass, or even iron are cast. It is strong enough to be self-supporting in the mould, so that it does not present a difficult moulding problem.

Conduction heaters are usually clamped to the part to be heated, and it is desirable to provide grooves, into which the heater will fit fairly closely, so as to secure the maximum conduction of the heat generated. This is a simpler and cheaper method of applying the tubular heater to a casting than that of casting it in, and in many cases is just as satisfactory.

Air and radiant heaters may be constructed by simply suspending the element in the air and mounting it on any suitable support. If

operated at a sufficiently high rating it will colour, and can be used as a radiant heater.

Igranic tubular heaters are standardised in four diameters :— 9/32 in., 29/64 in., 9/16 in., and 21/32 in., and made in any length up to a maximum of 60 in. The permissible watt rating is determined by the service the heater has to meet, varying from 60 W per in. of actual length of the smaller diameter when used for water immersion, down to 12 W for air heaters.

The insulation is so highly compressed by the method of manufacture that it is practically an artificial stone which fills the space between turns of the resistance helix and between the helix and the tube. The helix is kept central in the tube, and is not, we are informed, displaced by bending. The tubing, being thoroughly annealed, can be bent cold, but if required to be re-bent should be again annealed by heating to red heat and allowing to cool down again.

The advantages claimed for this heater may be summarised as follows :—Insulation unaffected by high temperature; freedom from expansion troubles; no soldered or other joints to open up; adaptability by reason of ease of bending, casting in, &c.; elimination of mica, permitting higher temperatures; small diameter permits application in restricted positions; high insulation value; great regularity in duplication owing to standardised manufacturing methods; and high thermal efficiency.

More About Electrical Showroom Service.

As already noted in The Electrician, the Metropolitan-Vickers Electrical Company have recently opened new extensive London showrooms at 232, High Holborn, W.C. 1. We are not surprised to learn that a large number of trade visitors have already availed themselves of the opportunity of inspecting these splendidly equipped premises, which are very centrally situated, being adjacent to Kingsway (Holborn end) and practically adjoining the Holborn Tube Station.

The new showrooms consist of a ground floor and basement, and cover a total floor area of about 4 000 sq. ft. The basement contains a complete display of electrical fittings, accessories, heating and cooking appliances and lamps, while a trade counter provides facilities for dealing promptly and efficiently with contractors' orders.

The accompanying photograph (Fig. 1) gives a general view of the ground floor, and indicates the care which has been taken in the grouping of the various fittings. In order to display electric fittings as far as possible in their appropriate surroundings, the showrooms have been divided up into sections, representing respectively the Adam style and the Jacobean and Georgian periods.

Another department has been decorated and furnished throughout in the William and Mary style, and has been specially designed for the effective display of the highest grade of electric fittings, designed and manufactured at the company's Birmingham works, Harcourts, Ltd.

No surprise will be felt at the announcement that the showrooms contain a kitchen. This is shown in Fig. 2. Here daily demonstrations of cooking by electricity and in the use of electric household utensils are given by an expert lady assistant. The kitchen, it is needless to add, is designed on the most hygienic and up-to-date lines, and no housewife could witness a demonstration without longing to have the control of appliances of like utility and cleanliness.

The policy of the company is to protect the interests of electrical contractors and retailers, all of whom are invited to regard the particular showroom in their vicinity as an extension of their own premises. To this end books of specially designed introduction cards are supplied free to the trade. These cards can be handed to prospective purchasers, introducing them to the nearest showroom for the purpose of witnessing a demonstration of any electric household appliance or fitting in which they may be interested, sales resulting from such introduction being credited to the retailer concerned. These showrooms were wired, furnished, and decorated by Harrods, Ltd.

A Galaxy of Electric Hot Cupboards.

The illustration shows a consignment of electric hot cupboards manufactured by the Jackson Electric Stove Company, just before despatch to a canteen in Ireland. The cupboards are 10, 12, and 13ft. long, all 2ft. 9in. high by 2ft. back to front, fitted with sliding doors on one long side. The bodies are of sheet steel double

Jackson Electric Hot Cupboards Ready for Delivery.

cased and lagged, and the tops of cast-iron ground and polished bright. The cupboard and top are each separately controlled and independently heated, each section being split into two circuits and each arranged for three-heat regulation.

The connections are of the well-known "Jackson" type, solid rod mounted on porcelain insulators. The elements are of the firm's standard fireclay pattern. No mica, asbestos, covered wires, loose leads, beaded wires or pigtails of any description are employed. The whole is built up of a solid nature and in such a manner that it is impossible for an earth or short to develop.

The 10ft. cupboards are fitted with three sliding doors and the 12ft. and 13ft. cupboards with four sliding doors.

Legal Intelligence.

Action Against Electrical Company Settled.

On Monday Mr. Justice Avory had in his list the case of the Britannia Rubber Company and Kamptulicon Company, Ltd., v. the International Electric Company, Ltd., but when the case was called on Mr. Disturnal, K.C. (for plaintiffs) asked the court to allow time for a consultation with a view to settlement. Later counsel stated that defendants (for whom Mr. Schiller, K.C. appeared) had agreed to pay £1 438 16s. 6d., with taxed costs on the claim and counter-claim.

The record was withdrawn and judgment entered accordingly.

B.T.-H. Company, Ltd. v. Corona Lamp Works, Ltd.

On the 11th inst. Sir D. Kerly, K.C., applied to Mr. Justice Astbury to postpone the hearing of this action. Counsel said he appeared for the defendants, and the plaintiffs were represented by Sir Arthur Colefax, K.C., and Mr. J. H. Grey, K.C. His position was that he had not got the brief and his clients were not able to deliver it because they had not got expert's report. He asked to be allowed to mention the case on Thursday. He said there was another case between the same parties which had just come to an end in the House of Lords.

His Lordship said counsel could mention the case again on Thursday, and observed that as it had waited six years another term would make no difference.

On the following day His Lordship fixed Feb. 6 for the hearing of the action, subject to any part-heard case.

Damages for Jacket Torn in Tramcar.

In the Glasgow Small Debt Court on the 11th inst. Sheriff Macdiarmid heard an action which raised an interesting point as to the liability of the Corporation Tramways Department for injury to a passenger's clothing. The pursuer complained that, while a passenger in an Uddingston car on July 20 last, she had had the jacket of her costume torn in consequence of a button having caught in a gap between the spars of the seating. The defence was that the seating had been examined and found in perfect order, and therefore the department repudiated liability.

The evidence was to the effect that the gap was due to the fact that the seat, which also forms the lid of a box used for storage of car requisites, had not been pushed into its place, thus leaving a space between the spars of the lid and those of the back.

The Sheriff held that it was the duty of a conductor, on taking over a car, to inspect it with a view to the safety of the passengers, and that that duty had not been fulfilled in the present case. He therefore decided in pursuer's favour, and assessed the damages at £10.

Suit by Unregistered Firm.

In the City of London Court last week Messrs. Phipps sued Mr. E. A. Galloway for £5 1s. for some electrical bowls supplied. Defendant pleaded that he placed his order with Mr. Mollett, one of the partners, with whom he had a *contra* account. He always paid Mr. Mollett and had had no transactions with plaintiffs. He declined to pay plaintiffs until he was sure of the authority to collect the account.

The Registrar pointed out that, under Sec. 8 of the Registration of Business Names Act, plaintiffs could not sue unless at the time of taking out the summons their names were properly registered as partners carrying on business under a trade name. They were not so registered, and if defendant desired he was in a position to ask that the case should be struck out. He suggested that the reasonable thing to do was for plaintiffs to allow defendant the amount of his counter-claim, and for defendant to pay the claim, less the counter-claim, plaintiffs dropping the costs of the summons. He non-suited the plaintiffs, so that they would be able to bring a fresh action if the present proceedings were not disposed of in the way suggested.

Dispute Over Electric Light Fittings.

Mr. Justice Acton gave judgment last week in the case of Halford v. McCandlish and Hasler, in which the plaintiff claimed damages against both defendants (the secretary and head porter of the United Services Club) for removing electric light fittings from 13, Stratford-place. His Lordship said that during the occupation of the premises by the club certain electric fittings and mirrors were put in. Plaintiff became owner, and part of the tenancy agreement was that the tenant's fixtures should become the landlord's property. When the club was preparing to vacate the premises, plaintiff (through his agents) was proposing to take over the fittings at a valuation. At an interview it was agreed to leave the fixtures on the premises with a view to selling them with the property. Plaintiff denied this, and alleged that defendants vacated the premises, leaving the articles on the premises, subject to the plaintiff's legal rights. The burden was on defendants to show that they had a right to take the articles away, and that his Lordship reluctantly came to the conclusion they had not done. The articles were removed, and a technical trespass was committed, and very slight damage resulted. Plaintiff was, however, technically right, but he (his Lordship) was surprised that an outrageous claim of £500 was put forward. There would be judgment for the plaintiff for £22 10s., and no costs were allowed.

Electricity Supply.

The accounts of Glasgow Electricity Department for the six months ended Nov. 30 last show a loss of £54 000.

Mr. Russell F. Ferguson, Hastings Borough Electrical Engineer, read a Paper, on Monday, before the Ratepayers' Association on "The Electricity Developments in the Town."

Stepney Borough Council have agreed to pay Babcock & Wilcox, Ltd., the sum of £4 000 in settlement of their claim of £5 400 for increases in the cost of materials and rates of wages beyond those which obtained when they tendered for the work in connection with Limehouse Generating Station.

At a meeting of Exeter Town Council last week, the Electricity Committee reported the purchase of new machinery in consequence of increased demand for electricity, and it was stated that so many lights of bigger power had been installed in business and private houses without warning that some of the sub-stations were unequal to the demand, and had been overloaded. The Committee had instructed the engineer to consider what sites were available for additional sub-stations in the centre of the city.

Dundee Electricity Department has decided to withdraw from the National Joint Industrial Council. At a meeting called to consider the question last week, the engineer explained that the Industrial Council's new scheme fixed the wages of a fitter at £3 11s. 6d., and left the pay of a labourer at £3 8s. 11d. The pay in his department was above the rates laid down in the new scheme of the N.J.I.C., and the scheme could serve no useful purpose. The conditions in Dundee also were better for the men than under the scheme, and left freedom to select and pay men according to ability.

In reference to the acquisition of the Bootle electricity undertaking by Liverpool Corporation, it is stated that the latter will pay the Bootle electrical engineer (Mr. T. D. Clothier) £8 000 compensation and the other members of the Bootle staff will be retained. The net debt on the Bootle undertaking is £160 129. Among other changes to be made in supply methods in Bootle will be the introduction of meter rents (1s. 6d. to 2s. 6d. per quarter) and a reduction of a farthing per unit for electric current for lighting. Existing agreements between the Bootle Corporation and its consumers will remain in force, and Bootle will have representation on the Liverpool Electricity Committee. It is estimated that it would cost Bootle about £120 000 to install the extra plant needed to meet the present and prospective demands for electricity in the borough.

New Schemes and Mains Extensions.

Ely City Council have decided to apply for powers to generate and supply electricity in Ely and the district.

Portsmouth Town Council has received sanction to loans of £30 000 for supply mains, £6 272 for services, and £6 000 for transformers and sub-station equipment.

Whitehaven Town Council has applied for a loan of £3 500 for the extension of electrical services at Arrowthwaite, Thwaiteville, and in connection with the Braunsty Housing Scheme.

Middlesbrough Electricity Committee is making application to the Electricity Commissioners for sanction to borrow £6 000 for the purpose of erecting a further sub-station to supply electricity to the Linthorpe district.

Westgate-on-Sea Parish Council has asked the Gas Company whether they are prepared to supply electricity to the town. If not, the Isle of Thanet Electric Tramway and Lighting Company are to be asked if they will extend their cables to Westgate.

A public meeting of the ratepayers of Neath on Tuesday unanimously approved of the Bill being promoted in Parliament by the Town Council for the extension of boundaries and additional powers in regard to the water, gas and electricity undertakings.

At a meeting of Willesborough Parish Council last week it was decided to ask the Whitstable Electric Company if they would entertain applications for lighting the parish if terms could be arranged.

The Amble Electricity Special Order, which authorises Amble Urban Council to supply electricity within the urban district, has been submitted to the Minister of Transport for confirmation. Any objections must be sent to the Ministry of Transport by Feb. 6.

Application for a Special Electricity Order for Crieff has been made to the Electricity Commissioners and an Electricity Committee of the Town Council has been elected as follows:—Provost Mungall (convener), Messrs. Lauder, Watts, and Reid, and Mrs. Wilkie Brown.

Southwick Urban Council has decided, subject to the charges for electricity not being in excess of those at Hove, to support the application of the Shoreham and District Electric Lighting and Power Company for a Special Order for the supply of electricity to the town.

The proposal to introduce electricity in the burgh of Inverurie was again discussed last week, and it was decided to ascertain what the cost of installing plant would be, and also to write to the Aberdeen Town Council to ask if they would consider the extension of their supply mains to Inverurie.

The Preston Corporation Electricity Special Order, 1921, authorising the Corporation to supply electricity in the Borough and Rural District of Preston, has been submitted to the Minister

of Transport for confirmation. Any objection must be sent to the Ministry of Transport by Jan. 28.

At a meeting held on Thursday, Jan. 12, the Glasgow Corporation Sub-Committee on the Grampian Electricity Order instructed the Town Clerk to lodge a petition against the Order, with the view of protecting the interests of the Corporation Water and Electricity Departments, both of which are affected by the provisions of the Order.

Cannock Electricity Committee have obtained sanction to a loan of £36 763 for carrying out the scheme of the authority for the supply of electricity in the district. Application is to be made to the Commissioners for authority to supply electricity to the Brereton and Cannock Chase Collieries in the area of the Lichfield Rural Council.

A Special Order made by the Electricity Commissioners for the supply of electricity by the Wareham Electric Supply Company, Ltd., within the Borough of Wareham and parts of the Wareham and Purbeck Rural District, has been submitted to the Minister of Transport for confirmation. Any objections must be sent to the Ministry of Transport by Feb. 4.

The Liverpool Electric Power and Lighting Committee has received the sanction of the Electricity Commissioners for the borrowing of the sum of £21 782 for the provision of mains, services, and sub-station building and equipment in connection with the supply of electricity to the housing scheme at the Springwood Estate, Garston, and £100 000 for the provision of mains.

Dundee Electricity Committee have appointed the chairman of the committee and the general manager to interview the Hydro-Electric Development Company with regard to the price of bulk supply to the Dundee district, and to report as to whether the Grampian Provisional Order should be opposed or not. Approval has also been given to the acceptance of contracts for £40 000 for sub-station equipment.

The Sussex Electricity Supply Company has applied to the Electricity Commissioners for powers to supply the whole of the Littlehampton urban district, including Wick, and for the installation of the necessary plant. The Urban District Council decided last week to support the company's application. The current is to be supplied by means of overhead wires, and an immediate commencement is to be made on the work.

Lewes and District Electric Supply Company, Ltd., are applying to the Electricity Commissioners for a Special Order to amend the provisions of the Lewes Corporation Electric Lighting Order, 1898, by increasing the maximum price of electricity to 1s. 2d. per unit, with a minimum charge of 11s. 8d. in respect of the July-September quarter and 17s. 6d. in respect of each of the remaining quarters.

The application by the Mersey Power Company for permission to carry overhead electric wires in the Appleton district of Widnes caused much discussion at the Widnes Council meeting last week. The application had been previously discussed in committee, and was turned down by a majority of one. Alderman Neil moved an amendment that the permission sought be granted. On the vote being taken, permission was refused by one vote.

Now that the Electricity Commissioners have given their decision in regard to the question of wayleaves over estates between the North Wales Power and Traction Company at Dolgarrog and the boundary of Colwyn Bay Urban Council, it is understood that the transmission line will be proceeded with as quickly as possible. The Colwyn Bay Council has completed their distribution station and the underground lines from the company's sub-station at Bronynant.

At a meeting of Sidmouth Urban Council last week the chairman brought up the question of the proposed electric lighting installation for the town, and reported on an interview with a representative of Gilbert Gilkes & Company, showing that the scheme for the installation would cost approximately £10 000. This was a saving of £15 000 on the scheme presented two years ago. It was decided that the Council should meet Messrs. Gilkes' engineer and consider the question with him.

The General Purposes Committee of Barrow Corporation recommend the Town Council to object to inclusion in the reorganisation scheme for the North Lancashire and South Cumberland Electricity District until some more satisfactory provision is made by the Government towards the capital cost. At the forthcoming public inquiry the Urban Councils of Millom, Bootle and Dalton will oppose the scheme, and Millom will submit counter-proposals for generating electricity from the surplus heat of the local ironworks.

The report of the London engineers on a county hydro-electric installation for Buckie was considered by the Town Council last week. The engineers divide the district as follows:—Banffshire districts of Aberchirder, Aberlour, Banff, Buckie, Craigellachie, Cullen, Dufftown, Findochty, Keith, Macduff, Portknockie, Portsoy, Whitehills, about 2 500 H.P.; Aberdeenshire districts of Huntly and Turriff, about 1 600 H.P.; Morayshire districts of Burghead, Elgin, Fochabers, Forres, Lossiemouth, Rothes, about 1 300 H.P. They are of opinion that the water-power scheme should be looked for to develop 5 000 to 10 000 H.P. They outline two possible River Spey schemes, one of which they consider too expensive. The other, by a tunnel line from Blacksboat to Carron, will develop 5 000 to 10 000 H.P. from 42 000 cubic feet water per minute, through two and a half miles tunnel. The estimated cost is £300 000. Another £100 000 for storage works would give the generating cost at the power station of 1·4d. per unit. For h.t. main from the power house at Carron to Keith, thence a ring main to Buckie along the coast to Banff, Macduff, Turriff, Huntly, and back to Keith, they estimate £160 000. The average selling price to consumers would be below 4d. per unit. The engineers recommended further investigations to reduce the Spey scheme cost, also that Aberdeenshire be asked if they would join Banffshire for a bulk supply.

Alteration of Charges.

The Urban Electric Company, Ltd., have secured an Order authorising them to charge 1s. per unit for electricity in Caterham as from Jan. 1.

The Minister of Transport has refused sanction to Lytham Council to increase the maximum price for electricity under the Lytham Electric Lighting Order, 1913.

An Order has been made on the application of the Ascot and District Gas and Electricity Company, fixing the charge for electricity at East Hampstead at a maximum of 1s. 1d. per unit Before the war the charge was 3½d.

Yarmouth Electricity Committee are to consider the question of a sliding scale of charges, to come into operation after March 31. A proposal to increase the Electrical Engineer's salary from £710 to £760 in accordance with the number of units sold has been referred to the Salaries and Wages Committee. The General Purposes Committtee recommend the Council to withdraw from the Incorporated Municipal Electrical Association, and also from the Joint Industrial Council.

Electric Traction.

Three of the newly-delivered single-decked tramcars are now running at Burnley.

By the substitution of mechanically propelled vehicles for horse traction Holborn Borough Council have saved £2 000 in a year.

Finchley Ratepayers' Defence League have approached the Metropolitan Electric Tramways Company with regard to the possibility of securing a reduction in fares.

So few people have taken advantage of the special late trains put on the tubes by the Underground Company that they have been withdrawn. Four additional six-car trains have been put into service on the Piccadilly line during the "rush" hours. These carry 2 400 passengers.

On Sunday, Jan. 22, Chelsea and Southwark Bridge will be brought into direct tram connection by a new route which will be started via Clapham, Stockwell, Brixton, and Camberwell Green. The total length is nine miles. There will be a three minutes' service during the rush hours, and a four minutes' service at other times of the day.

Taunton Town Council have instructed a committee to reopen negotiations with the Taunton Electric Traction Company for the transfer of the tramway undertaking to the Council. It was stated in discussion that during the twenty years the trams were running they were worked at a loss—except in one year, when a dividend of 1 per cent. was paid.

At a meeting of the Swansea Tramways Committee last week, the Borough Engineer asked for a definition of the Committee's future policy in regard to extending the tramways or doubling the tracks, in order that the Highways Committee could be guided in its policy of road improvements. The adoption of the trackless system was suggested, and a report is to be prepared on the subject.

Halifax Tramways Committee, on Monday, recommended the Tramways Sub-Committee to consider the advisability of purchasing another motor 'bus, with a view of starting a service for Wheatley Valley. The Committee also decided to recommend the Town Council to approve the extension of a single line from the present Skircoat Green terminus to the top of Copley Hill.

During the New Year holidays in Glasgow, nearly 33 000 passengers were carried by the all-night trams, and a revenue of nearly £500 was added to the ordinary receipts, which now total well over £40 000 each week. It was less than a year ago that the all-night service was started, for the convenience chiefly of newspaper workers. After the ordinary service is withdrawn at midnight, special cars are put on fifteen separate routes.

At Farnworth Council last week it was reported that the Farnworth and Kearsley Councils had waited on Salford Corporation regarding the linking up of the tramlines between Bolton and Manchester by providing a short length at Clifton. There was not much hope entertained of this link being supplied for the present. The Salford lease of the Swinton line would expire in four years, and the short length of tramway, costing £5 000, would then have to be handed over to the Swinton Council.

As the result of the opposition of the Commercial Motors Union and the Road Transport Association, which led to clauses in Blackburn's new Parliamentary Bill being heavily defeated at the statutory ratepayers' meeting, a special meeting of the Town Council was called on Saturday to discuss the situation. Alderman Forrest, as leader, moved that a poll of the whole town be taken, the cost of which would be between £500 and £1 000. This was seconded by Councillor Hamer. Opposition was offered on the ground of expense and because the prevailing services were ample for

the town. Eventually the resolution to have a poll was carried by thirty-one votes to three. The cost of the services proposed, with extension of tramways, will exceed £268 000. It is believed that the Bill will be opposed in London.

Considerable difficulty was experienced in working the open-air ELECTRIC RAILWAYS round London during the snowstorm which occurred on Sunday evening last. On the section of the Bakerloo between Queen's Park, Willesden Junction, Harrow, and Watford the electric service was suspended and steam trains substituted until the live rail had been cleared of snow. On the Metropolitan and District Railways snow ploughs were used to clear the live rails, while on the Central London and London and South-Western Railway late running was the rule.

In the Bill which the directors of the LONDON, BRIGHTON AND SOUTH COAST RAILWAY COMPANY are promoting power is sought to raise capital for the electrification of the line. It is estimated that the necessary works will require over £1 000 000, but this expenditure will for a considerable period be unremunerative or unproductive of an adequate return. In 1911 the company was empowered to raise £1 500 000 and to borrow by the issue of debenture stock a further £500 000. None of these powers has, however, been exercised. It is now proposed to empower the company to borrow the £500 000 authorised in 1911, and also to borrow a further £1 000 000, which "may be raised without reference to the issue of any additional capital." It is also proposed that the company may, during any period not exceeding five years, pay out of the moneys borrowed the whole or any part of the interest on any mortgages or debenture stock issued for electrifying the railway.

At the adjourned meeting of HULL CITY Council, on Monday, the Tramways Committee presented five separate schemes for improving the Hessle-road tram service to the City-square. They were, briefly (1) the widening of Midland-street at a cost of £80 000 (which was rejected by the Local Government Board some years ago); (2) taking the cars along Waterhouse-lane from the City-square to Osborne-street, at a cost of £45 000, this involving the purchase of the Punch Hotel; (3) continuing the line from Brook-street to Osborne-street, at a cost of £40 000; (4) placing the terminus at the east end of Osborne-street (with a double line), at a cost of £12 000; and (5) taking the cars from Carr-lane into Osborne-street by way of Anne-street, at a cost of £6 000. The Committee recommended the fifth scheme, for which no Provisional Order would be necessary. By laying a single track along Osborne-street, the dangerous corner of Midland-street would be relieved. After considerable discussion it was decided by 24 votes to 20 to adopt the fourth scheme, and lay a double line down Osborne-street, with a cross-over at the east end of that street.

Telegraph and Telephone Notes.

An overland telegraphic service has been established between MOMBASA (Kenya Colony) AND CAPE TOWN *via* Tanganyika Territory, Nyasaland, and Rhodesia. The rates are said to be cheaper than by the submarine cables.

Sir William Noble, Engineer-in-chief to the British Post Office, on Monday opened at the head offices of the "Liverpool Courier" and "Express" a new RELAY AUTOMATIC TELEPHONE EXCHANGE linked up with the public service, which has been laid down for the use of these journals. The Post Office, he said, was not to blame for the fact that telephony in Great Britain had not developed so rapidly as in the United States, whose mail, postal, and telegraph systems were much behind ours. When the telegraph was invented private automatic exchanges were due to private individuals, and were not controlled by the Post Office. The Post Office had installed automatic exchanges in fourteen self-contained areas, and was considering the question of automatic telephones for large multi-office areas like Liverpool and London. Sir William defended the new telephone rates, stating that otherwise part of the cost would have had to come out of taxation. Had the Government increased its charges, like everyone else, in the early stages of the war, the telephone rates would now have been on the down grade.

Wireless Notes.

At the annual meeting of the LIVERPOOL WIRELESS ASSOCIATION last week all the officers were re-elected, with the exception of Mr. J. Coulton, whose resignation was accepted with great regret. Mr. James K. Wilkie was elected to succeed Mr. Coulton as hon. secretary.

The SNOWSTORM over the week-end caused a considerable amount of damage to telephone and telegraph wires all over the country. Communication with Paris was much interrupted, Mid-Wales suffered badly, Welshpool was cut off from Shrewsbury, Oswestry and Llanfair, and only one telephone wire was left intact with Newtown. At Preston, in Lancashire, the tramway service was seriously interfered with.

The first prize in the Transatlantic amateur wireless tests has been won by the MANCHESTER WIRELESS SOCIETY. The receiving set used in the test was erected at the residence of Mr. W. R. Burne, who was responsible for the manipulation of the various instruments loaned to him by members of the Society. These instruments, together with the special panel built for the occasion by Mr. Burne himself, enabled the tests to be carried through successfully. The receiving set will be exhibited on February 25 at the Society's headquarters, the Albion Hotel, Piccadilly.

Personal and Appointments.

Prof E. W. MARCHANT has consented to act as president of the Liverpool Wireless Society.

On the 2nd inst., at St. Pancras Church, Chichester, Mr. J. S. CHILD, late joint sales manager to the Edison Swan Electric Company, was married to Miss E. L. CRUNDEN.

SIR EDWARD BUSK has formally announced his intention of retiring in May from the chairmanship of the Convocation of London University. Sir Edward is in his 78th year.

At the annual meeting of the BRITISH INDUSTRIAL "SAFETY FIRST" ASSOCIATION, Lord Leverhulme was re-elected president; Sir R. Vassar-Smith and Mr. J. H. Thomas were appointed joint hon. treasurers, and Mr. H. E. Blain was reappointed hon. secretary.

Mr. T. W. BLOXAM has resigned the position of City Electrical Engineer to Belfast Corporation Electricity Works on a retiring allowance of 23/60ths of his present salary, which, with bonus, amounts to £1 240. Mr. Bloxam was appointed assistant chief of the station in 1899, and became chief in 1907.

Service Notes.—Lieut.-Commander G. McL. Cameron, R.N. has been appointed to "Comus II." for charge of the Wireless Station at Aden. Captain C. R. H. Thorn, T.D., has relinquished his commission in the London Electrical Engineers after nearly twenty years' service. On retiring from the Southern Signal Companies Major A. Handley has been given the rank of lieut.-colonel.

Business Items, &c.

The telephone numbers of the BRITISH THOMSON-HOUSTON Company's Liverpool office (33, James-street) are Bank 4 374 and 4 375.

Mr. THOMAS TWIST, late of St. Helens Corporation Electricity Works, has started business in the town as an electrical engineer under the style of Twist & Son, at Britannia Chambers, George-street.

The business carried on hitherto by the British, Irish, and Colonial Department of the Ateliers de Construction Oerlikon has been transferred to OERLIKON, LTD., Oswaldcstre House, Norfolk-street, Strand.

The ELECTRIC LOCOMOTION & FOUNDRY COMPANY, of Glasshouse-lane, Gateshead, have obtained a contract for an electric storage-battery locomotive for the Glasgow Corporation. The order amounts to some thousands of pounds.

The offices of the BRITISH ELECTRICAL DEVELOPMENT ASSOCIATION and of Mr. J. W. Beauchamp (director and secretary) have been removed to 15, Savoy-street, Strand (Institution of Electrical Engineers' building), London, W.C. 2. Telegraphic address: "Electreda Rand, London"; Telephone number: "Regent 4570."

Vickers-Petter, Ltd., of Ipswich, have recently put a new range of SEMI-DIESSEL CRUDE OIL ENGINES on the market which are claimed to be adaptable to almost every purpose for which cheap and efficient power is required. In producing this new series the ratings and speeds have been designed with a view to meeting the demands for marine sets and for driving air compressors, pumps, and electrical equipment, both d.c. and a.c. generators.

BOVING & COMPANY inform us that they have recently been awarded a large contract by the Government of New Zealand for water turbines in connection with the Mangahao hydro-electric power scheme. The order includes five main Pelton wheels, three with a maximum output of over 8 000 B.H.P., and two of over 4 000 B.H.P.; also two smaller exciter Peltons, each 325 B.H.P.; making a total capacity of nearly 33 000 B.H.P. These water wheels will work under an average head of water of 825 ft.

LORIVAL MANUFACTURING COMPANY (1921), LTD., now established in their new works at Southall, are placing on the market a new grade of insulating material. We understand that this possesses all the properties of their ordinary material to an intensified degree, and enables the firm to quote for all classes of mouldings, large and small. The firm employ two distinct processes, producing two different classes of material. The first is a "casting" operation, particularly suitable for the manufacture of large articles; the second is the usual "pressing" process, for the manufacture of a "filled" material. It is the latter which is now being placed on the market.

Mr. Lionel Robinson, B.A., has taken into partnership Mr. W. E. WARRILOW as and from Jan. 1, and under the name of LIONEL ROBINSON & COMPANY will continue and further develop the sole agency for resistance materials and wires of Henry Wiggin & Company, Ltd., Birmingham, which Mr. Lionel Robinson has held for the past fifteen years. Mr. Lionel Robinson is the originator with Henry Wiggin & Company of their now famous "Ferry" resistance wire, so largely used in all the best makes of motor starters, controllers, regulators, rheostats, cinema projectors, and also in sliding resistances and many scientific instruments. Mr. Warrilow brings to the business fifteen years' experience of commercial work, chiefly in encouraging, through the Press, the sales of electrical and allied products of every description. Makers of electric fires and cooking apparatus will be interested to know that the company are now introducing for Henry Wiggin two grades of iron free nickel chrome alloys in wire and ribbon form, which they claim are equal to any American or other imported materials on the market. They will also develop other agencies for any class of material required by manufacturers using electrical resistance alloys. Announcements will be made regarding these from time to time. Enquiries should be addressed to the company's offices, 3, Staple-inn, London, W.C. 1.

Institution Notes.

The annual dinner of the WESTERN CENTRE OF THE INSTITUTION OF ELECTRICAL ENGINEERS will be held in Cardiff on Monday, Feb. 6.

The ANNUAL DINNER AND REUNION of the INSTITUTION OF ELECTRICAL ENGINEERS will be held at the Hotel Cecil, Strand, London, W.C., on Tuesday, Feb. 21, under the presidency of Mr. J. S. Highfield, supported by the council. It is particularly requested that early application be made for tickets, the charge for which is 13s. 6d., exclusive of wine.

Arrangements have been made for the members of the Institution to dine at the Engineers' Club, Coventry-street, W., after the ordinary meeting of the Institution, to be held on Feb. 2. The charge will be 5s. 6d. each. Members wishing to be present at the dinner are requested to send their names to the secretary in advance.

THE INSTITUTION OF CIVIL ENGINEERS have made the following awards for STUDENTS' PAPERS read in London or at local associations during the Sessions 1919-20 and 1920-21 :—The James Forrest Medal and a Miller Prize to R. D. Gauld (Manchester); the James Prescott Joule Medal and a Miller Prize to J. E. Dumbleton (Birmingham); Miller Prizes to Henry Fowler (Manchester), G. H. Humphreys (Manchester), C. M. Brain (London), J. T. Chalk (London), K. T. Spencer (London), and E. A. Phillipson (London).

A Paper on electric arc welding in steel structures, illustrated by lantern slides, was read by Major James Caldwell, of London, last week at the first meeting, held at Swansea, of the recently formed SOUTH WALES BRANCH of the INSTITUTION OF MECHANICAL ENGINEERS. The chairman of the branch is Sir John Roper Wright, vice-chairman Mr. David E. Roberts, and the joint hon. secretaries Mr. W. H. Reynolds, Cardiff, and Prof. F. Bacon, of the Swansea University College. Half the meetings are to be held at Swansea and half at Cardiff.

FINSBURY TECHNICAL COLLEGE OLD STUDENTS' ASSOCIATION have elected the following officers for the year beginning Jan. 1, 1922 :—*President:* W. G. Head. *Vice-Presidents:* Prof. G. T. Morgan, A. J. Chapman, F. H. Masters, W. J. Tennant. *Members of Council:* J. H. Coste, Harley F. Knight, W. W. Bradfield, E. W. Moss, E. S. Conradi, E. G. Walker. *Hon. Auditors:* L. M. Clark, F. R. C. Rouse, *Hon. Treasurer:* W. Bernard Thompson, "Elleray," Regent-road, Altrincham, Cheshire. *Hon. Secretary:* H. P. Guy, 74, Silver-street, Edmonton, N. 18.

At the last INFORMAL MEETING of the Institution of Electrical Engineers in London, Mr. J. W. Beauchamp opened a discussion on Co-operative Advertising. Besides outlining the activities of the British Electrical Development Association he showed and criticised a number of lantern slides of various advertisements and discussed the value of different advertising methods in the technical and lay Press. In the discussion which followed Mr. A. G. Whyte appealed for well-trained and well-paid commercial engineers in the sales departments of supply authorities. He thought that very many station engineers did not understand and even disliked publicity.

The annual dinner of the LIVERPOOL ENGINEERING SOCIETY will be held at the Exchange Station Hotel, Liverpool, at 7 p.m. for 7.30 on Thursday, Feb. 2. Tickets (exclusive of wines and cigars) will be 20s. each, and may be obtained on application to any of the following :—Mr. J. B. Wilkie, Mersey Engine Works, Sefton-street, Liverpool; Mr. J. R. Davidson, Water Engineer's Office, Dale-street, Liverpool; Prof. T. B. Abell, The University, Liverpool; Mr. R. E. Gibson, Gas Offices, Duke-street, Liverpool; Mr J. Reney Smith, H. and C. Grayson, Ltd., Royal Liver Building, Liverpool; Prof. E. W. Marchant, Electro-Technical Laboratories, The University, Liverpool; Assoc.-Prof. T. R. Wilton, 1, Crosshall-street, Liverpool.

At the last meeting of the DIESEL ENGINE USERS ASSOCIATION Mr. C. O. Milton, electrical engineer to the Borough of Maidenhead, was re-elected President for a second year, and Mr. Percy Still was re-elected hon. secretary. Messrs. H. S. Whiteley and W. E. Brandreth were elected members of the General Committee in place of the two members retiring at the end of their term of office. The members forming the Standard Committee on Insurance Against Breakdown were re-elected for a further term of office.

The hon. secretary made his annual statement, which reported a further substantial increase in the membership of the association during the year. By the courtesy of the Institution of Electrical Engineers the meetings of the association are now again being held in that building.

The BIRMINGHAM AND DISTRICT ELECTRIC CLUB held the first meeting of the new session at the Grand Hotel on Saturday, Jan. 14, when the new president, Mr. Norman Deykin, delivered his inaugural address. Dealing with the immediate prospects of the electrical industry, Mr. Deykin said that there were no prospects of a boom, but there should be a steady expansion, to assist which the primary need was reduction in price; but even this could not secure business in foreign markets against the extraordinary low prices of our Continental competitors, largely by reason of the unbalanced exchanges. In the home market it was essential there should be more effective protection for the English manufacturer, but reduction in prices and increased production were necessary steps in the direction of increased trade. It was also important for manufacturers to give greater support to their selling organisation and the needs of their customers. The cost of electrical energy was too high. It might be wise to increase the price of current for lighting purposes, making a corresponding decrease in the price for power, cheap electricity for manufacturers being vital in the struggle for trade.

Exhibition Notes.

The dates for the UTRECHT Industries Fair this year are Feb. 21 to March 3, not Feb. 27 to March 10, as previously announced.

A BUSINESS EFFICIENCY EXHIBITION organised by the Association of Office Appliance and Equipment Manufacturers and Traders will be opened by Mr. Gordon Selfridge in the Central Hall, Westminster, on Feb. 8. It will remain open for ten days, and efficiency experts will explain various ideas in the way of short cuts to accountancy, methods of keeping stock, plans of sales promotion, and how to organise efficiently an office of any description.

The OFFICE CENTRAL DE CHAUFFE RATIONNELLE, PARIS, is organising an exhibition of apparatus and material for the conservation of heat, to take place in April, in Paris. The exhibition will include every type of apparatus or material used in the conservation and recuperation of heat, and will be divided into the following sections : (1) Conservation of heat—refractory materials, insulators, instruments for testing calorific value, &c. (2) Recuperation of heat—recuperators and regenerators, economisers, air superheaters, and pre-heaters.

An INDUSTRIAL EXHIBITION which is causing much interest is now proceeding at the premises in Oxford-street of Selfridge & Co. The object of the exhibition is to bring to public notice the intricate machinery and complicated processes through which many of the things that are handled in everyday life have to pass. Among the exhibits is a new type pump made of a series of helical springs linked together to form an endless chain that will lift water to any height by regulating the speed at which it is run. The Waygood-Otis automatic lift is demonstrated; wireless concerts are given hourly; an automatic camera electrically operated takes photos and delivers the finished article in 3½ minutes; and the electric lamp is blown and very fine tungsten filaments drawn through a diamond die.

The SMALL POWER ENGINEERING AND SCIENTIFIC EXHIBITION, better known as the "Model Engineer" Exhibition, which opened on Jan. 7th at the Royal Horticultural Hall, Westminster, closed last Saturday. It was the fifth of its series since 1907, the last being held in 1913. A model tractor engine attracted much interest. It was exact in detail and measured only 1¾ in. in length. Electrically propelled locomotives and boats were also in prominence. Many interesting exhibits were to be seen at the stand of the G. E. C., Stuart Turner, and Bower Company, the Kendrick inspection lamp and Meta electric fire being demonstrated by the last-named firm. Demonstrations of wireless telephony and telegraphy were given periodically. Among the exhibitors of lathes and tools were Messrs. Drummond, H. Milnes, Buck & Ryan, Colchester Lathe Company.

On Dec. 28 the foundation stone was laid of the pavilion which is being built for the accommodation of British exhibits at the forthcoming BRAZILIAN CENTENARY EXHIBITION. Though, owing to the present state of Brazilian exchange, there is little hope of immediate business on a large scale, it is also true that the Brazilian market possesses many special attractions for British traders, and should not be ignored. Brazilian people are strongly predisposed in favour of British firms and British goods, the reputation of both standing even higher than before the war by reason of the contrast with the quality of the goods and the methods of other nations who took advantage of the war to exploit the Brazilian market. A committee, of which Mr. Lionel de Rothschild is chairman, was formed to co-operate with the Department of Overseas Trade, and has collected funds which will defray nearly half of the cost of this country's participation. Full particulars regarding rates for space, &c., can be obtained from the Department of Overseas Trade.

Obituary.

Mr. H. L. TAYLOR, of Littleborough, who died last week at the age of thirty-three years, was the managing director of E. Taylor & Company, electrical engineers, Littleborough. He had been in failing health for some months.

The death has occurred at his home at Leeds of the Hon. E. C. KITSON, third son of the late Lord Airedale, formerly Sir James Kitson, and brother of the present peer. Mr. Kitson, who was in his forty-eighth year, was chairman of Kitson & Company, mechanical engineers, of which firm his father was the founder.

The death is announced, at the age of fifty-eight, of Major-General Sir REGINALD SALMOND CURTIS, K.C.M.G., C.B., D.S.O. General Curtis saw service with the Egyptian Army in the Sudan campaign of 1891, and during the Ashanti expedition of 1895-6 acted as director of telegraphs, receiving mention in despatches and brevet majority. At the outbreak of the war in 1914 he held the post of A.A.G. at the War Office, and in 1917 was given the command of the Cromarty defences. He subsequently had charge of administration, Aldershot Command, and retired in 1920.

It is announced that the thirteenth KELVIN LECTURE will be delivered at the Institution of Electrical Engineers on May 11 by Sir Ernest Rutherford. The subject will be "Electricity and Matter."

The "CYC-ARC" PROCESS OF AUTOMATIC ELECTRIC WELDING was described and demonstrated by Mr. L. J. Steele, chief electrical engineer at Portsmouth Dockyard, its inventor, to the Birmingham Branch of the Institution of Electrical Engineers at the Birmingham University last week, Prof. Cramp presiding.

Tenders Invited and Accepted.

UNITED KINGDOM.

Worthing Corporation. Jan. 23.—One Diesel engine and c.c. dynamo; and vulcanised bitumen-sheathed paper-insulated concentric and triple concentric cable. Specifications, &c., from the Borough Electrical Engineer.

Lewisham Board of Guardians. Jan. 23.—Repairing of electrical installation at the Children's Home, Goat House Bridge, Norwood Junction. Particulars from the Clerk, Mr. W. R. Owen, 394, High-street.

Hammersmith (London) Borough Council. Jan. 25.—Supply, and drawing in existing ducts, of 11 000 V 3-phase linking-up main between Hammersmith and Fulham. Specifications, &c., from the Engineer, Electricity Works, 85, Fulham Palace-road, W. 6.

Salford Guardians. Jan. 31.—Small alterations and additions to electric wiring and fittings in Pavilion B of the Infirmary at Pendleton. Particulars from the Clerk, Poor Law Offices, Eccles New-road, Salford.

Warrington Corporation. Feb. 6.—Main e.h.t. switchboard extension. Specification, &c., from the Borough Electrical and Tramways Engineer.

Islington (London) Borough Council. Feb. 16.—One year's supply of stores, including cables, electricity meters, fuse boxes, compounds, lamps, wires, electrical sundries, transformers, carbons, arc lamp globes, insulators, &c. Specification, &c., can be obtained at the Town Hall.

Hampstead (London) Borough Council. March 15.—Supply of various stores for six or twelve months, including electrical engineers' stores and oils for the electricity station. Form of tender, &c., from the Town Clerk.

Metropolitan-Vickers Electrical Company, Cardiff.—Wiring for the electric lighting and heating of their new premises in Custom House-street.

Aylesbury Corporation.—300 kW converter, with e.h.t. and l.t. switchgear. Specifications, &c., from the Borough Electrical Engineer.

AUSTRALIA.

City Electric Light Company, Ltd., Brisbane.—Feb. 10, 1922. —*Supply and delivery of six miles of three-core 0·15 by 0·15 paper insulated cable, suitable for 5 500 V, with a non-earthed system. Tenders, accompanied by a preliminary deposit of £100, to the Engineer and Manager, Boundary-street, Brisbane.

Australian Commonwealth Government, Feb. 15 :—30 tons approximate Wheatstone tape paper white (Schedule 544). Particulars from the Supply Officer, Australia House, Strand, London, W.C. 2.

Victorian Government Railways.—Feb. 15.—*Supply and delivery of : (1) Fifty track relays, four front and two back contacts, fifty track relays, eight front and two back contacts, fifty line relays, six front and two back contacts (Contract No. 34 739); (2) 100 three-position line relays (Contract No. 34 740); (3) 100 electric signal mechanisms (Contract No. 34 738); (4) electro-mechanical interlocking apparatus (Contract No. 34 822); (5) fifty miles insulated copper wire (Contract No. 34 823). Local representation is essential.

Victorian Railway Commissioners. Feb. 15.—*Hydraulic pig iron breaker, including tools, gears, accessories and spares, for Bendigo workshops. (Contract No. 34 191.)

Deputy Postmaster-General, Brisbane. Feb. 15.—*Telephone apparatus and parts, including bells, buzzers, chambers for transmitters, induction coils, condensers, cords. (Stores schedule No. 544.)

New South Wales Government Railways and Tramways Department (Electrical Engineer's Branch).—Feb. 22, 1922.—*Supply, delivery, erection and maintenance of one 5 000 kW 50 cycle turbo-alternator with condenser and accessories, at Zarra-street power house, Newcastle. (Contract No. 556.) Tenders, on proper forms and accompanied by a preliminary cash deposit, to the Secretary for Railways, Phillip-street, Sydney, N.S.W. Local representation is essential.

Commonwealth of Australia. March 8.—Switchboard apparatus and parts (schedule 545). Particulars from the Supply Officer, Room 101, Australia House, Strand, London, W.C. 2.

Victorian Railway Commissioners. March 8.—*Thirty-five cabin transformers for power signalling. (Contract No. 34 863.)

Deputy Postmaster-General, Brisbane. March 15.—*Protective apparatus, including arresters, carbon blocks, fibre fuses, protectors and terminals. (Stores schedule No. 546.)

Commonwealth of Australia. March 15.—Protective apparatus. Particulars from the Supply Officer, Room 101, Australia House, Strand, London, W.C. 2.

Municipal Council of Sydney (Electricity Department). April 24.—*Supply, delivery, and erection of two 2 000 kW rotary converters; one 10 000 to 12 000 kW turbo-alternator.

NEW ZEALAND.

Borough Council of Palmerston North. Original closing date Sept. 24. Extended date not yet decided.—*Service meters : (*a* Single-phase, 230 V, 400 5 A, 150 10 A, 50 15 A; three-phase, balanced load, 400 V, 100 10 A, 30 25 A, 15 50 A, 10 75 A, 5 100 A. (b) 19 50 kVA single-phase transformers, with oil, complete; 1 complete winding h. and l. tension, for one leg; spare parts and accessories.

* *Particulars from the Department of Overseas Trade.*

Public Works Department, Wellington. Feb. 28.—*Supply and delivery, ex ship's slings Lyttelton, of a bank of three 11 000 V reactances, complete, for the Lake Coleridge electric power scheme.

Public Works Tenders Board, Waikato Power Scheme. March 6.—*(Section 45) two 2 500 kWa alternators, three-phase, 50 cycle, 5 000 V, at 166⅔rds rev. per min., with a power factor of ·8. Excitation at 220 V. (Section 46) two 3 100 h.p. water turbines of the double-runner Francis type to operate the generators mentioned in Section 45. (Section 47) two exciter sets, each consisting of one 200 kW d.c. generator, and one 350 h.p. asynchronous motor, together with a Tirrill regulator. The generator shall have an output of 220 V, with a full-load current of 7 000 A. The motor shall be of 350 h.p., with a power supply of 400 V, three-phase, 60 cycle. The synchronous speed of the sets shall be 750. (Section 48) four Stoney sluice gates for the pits, appertaining to the turbines mentioned in Section 46. Tenders to the Secretary, Public Works Tenders Board, Government Buildings, Wellington.

Dunedin City Council. March 31.—*Supply and delivery of one 150 h.p. three-phase induction motor and reduction gear for the Mornington Cable Service.

Auckland Harbour Board. April 25.—Four double-barrel electric winches for the Central Wharf, Auckland. Specifications from W. & A. McArthur, 18-19, Silk-street, Cripplegate, London, E.C. 2.

ITALY.

Director-General of the Italian State Railways. April 30.—Electrification of the Bologna-Venice-Monfalcone line. Particulars from the Direzione-Generale, Ferrovie dello Stato, Rome.

SOUTH AMERICA.

Chilean State Railways, Feb. 4, 1922* :—1 electric compressor; 1 air storage drum and 1 continuous current electric motor (70 h.p.); 1 300 electric filament lamps for locomotives; 38 wall telephones.

Argentine Ministry of Public Works. Feb. 21, 1922.—*Nine electric motors, 36 tip waggons, 1 centrifugal pump with electric motor. Specification expected at the Department of Overseas Trade by Dec. 28.

BULGARIA.

Bulgarian Department of Posts, Telegraphs, and Telephones. January 30.—*Supply of the following parts for telephone exchanges : 2 200 subscribers' line indicators, 600 indicators (end of conversion), 2 500 jacks, 1 500 plugs, 2 000 connecting pieces, 20 000 switchboard connecting pieces.

Bulgarian Department of Posts, Telegraphs and Telephones. Feb. 8. *Supply of the following telegraphic accessories :—Twenty terminal boxes for 40-pair cable, 1 000 combined lightning arresters and 1 A fuses, 500 combined lightning arresters in fuses (different type), 300 transformers, 700 condensers (2 micro-farad), twenty junction-boxes with protective devices for 40-pair cable.

Bulgarian Department of Posts. March 8.—*Porcelain insulating tubes for telephones (10 000), insulating tubing (impregnated paper) for telephones (2 200 metres), ebonite caps (1 700), and insulated copper wire (1 000 metres).

Bolton Corporation have accepted the tender of Hadfields, Ltd., for special tram rails, points and crossings.

Stepney Borough Council have accepted the tender of the Tipton Tub and Tube Company for two dust catchers for Limehouse generating station at £215 each.

Portsmouth Corporation have accepted the tender of J. Cochrane (Barrhead), Ltd., for additional pumps and electrical machinery for the drainage scheme at £9 182.

London County Council have accepted the tender of Steel, Peech & Tozer for tramcar trailing wheel tyres at £1 16s. each, and English Electric & Siemens Supplies, Ltd., for electric lamps.

Burton-on-Trent Corporation have accepted the tenders of G. and J. Weir for auxiliary pumps, £1 230; and the Metropolitan-Vickers Electrical Company for two 500 kW transformers, £1 603.

Peterborough.—The Board of Guardians have accepted the tender (the lowest received) of Mr. W. H. Borrows, of Werrington, for installing electric light at the Workhouse at £240. Six tenders were received, the highest being £295

Blackpool Electricity Committee have accepted, subject to the sanction of the Electricity Commissioners, the tender of Fraser & Chalmers (G.E.C.) for the supply of a new 5 000 kK turbo-alternator, and that of Hick, Hargreaves & Company for condenser and auxiliaries.

Bradford Corporation have accepted the following tenders :—T. Smith & Son (Rodley), Ltd., two 7-ton electric motor cranes, £4 194; English Electric Company, one 250 kVA transformer and two electric lifts; C. Bell, one passenger lift; and Reliance Lift and Engineering Company, one goods lift.

Glasgow Corporation have accepted the following tenders for tramway materials :—T. Bolton & Sons, trolly wire; Whipp & Bourne, switchgear; Metropolitan-Vickers Electrical Company, relays; Fleming, Birkby & Goodall, stud bolts; and Brush Electrical Engineering Company, truck frame forgings.

Hampstead Borough Council have acceptd the following tenders :—British Thomson-Houston Company, h.t. switchgears, at £1 825; Pirelli General Cable Works, laying of 2 300 yards of cable between Boundary-road and the electricity station, at £2 454 11s. 4d.; British Electric Transformer Company, distribution transformers, at £11,854 2s., less £1 694 for the transformers replaced.

Electrical Imports and Exports.

IMPORTS.—The following are official values of electrical machinery, apparatus and material imported into this country (*a*) during December, 1921, and (*b*) the aggregate figures from Jan. 1 to Dec. 31, with increase or decrease compared with corresponding periods of 1920 :—

Electrical machinery, (*a*) £49 795 (decrease £97 027), (*b*) £728 181 (decrease £603 606); telegraph and telephone cables, submarine, (*a*) nil, (*b*) nil (decrease £50); other than submarine, (*a*) £1 346 (decrease £4 973), (*b*) £76 701 (increase £49 853); telegraph and telephone apparatus, (*a*) £11 810 (decrease £40 227), (*b*) £308 723 (increase £64 415); other electrical wires and cables, rubber insulated, (*a*) £2 745 (decrease £1 392), (*b*) £43 142 (increase £10 088); with other insulations, (*a*) £1 909 (decrease £8 305), (*b*) £105 209 (decrease £128 328); carbons, (*a*) £4 519 (decrease £13 785), (*b*) £94 828 (decrease £58 578); glow lamps, (*a*) £40 966 (increase £28 730), (*b*) £280 152 (increase £204 672); arc lamps and electric searchlights, (*a*) nil (decrease £8 956), (*b*) £6 653 (increase £10 070); parts of arc lamps and searchlights (other than carbons), (*a*) £497 (increase £346), (*b*) £15 119 (increase £2 012); batteries, (*a*) £4 736 (decrease £8 426), (*b*) £119 487 (decrease £10 438); meters and measuring instruments, (*a*) £3 171 (decrease £12 297), (*b*) £135 884 (increase £37 945); switchboards, (*a*) £6 116 (decrease £2 552), (*b*) £29 344 (increase £17 924); electrical goods and apparatus unenumerated, (*a*) £46 480 (decrease £86 144), (*b*) £716 120 (decrease £174 260). Total of electrical machinery, apparatus and material (other than uninsulated wire), (*a*) £174 090 (decrease £255 008), (*b*) £2 659 543 (decrease £498 421).

EXPORTS.—The exports of electrical machinery, apparatus and material (*a*) during December, 1921, and (*b*) from Jan. 1 to Dec. 31, with increase or decrease compared with corresponding periods of 1920, were as follows :—

Electrical machinery, (*a*) £1 196 (decrease £137), (*b*) £18 267 (increase £6 367); including railway and tramway motors, (*a*) £3 (decrease £60), (*b*) £650 (increase £412); other generators and motors, (*a*) £546 (decrease £272), (*b*) £10 274 (increase £3 411); and electrical machinery unenumerated, (*a*) £647 (increase £195), (*b*) £7 343 (increase £2 544); telegraph and telephone cables, submarine, (*a*) £83 339 (decrease £242 956), (*b*) £147 250 (increase £370 310); other than submarine, (*a*) £85 128 (decrease £39 959), (*b*) £1 621 837 (increase £582 072); telegraph and telephone apparatus, (*a*) £194 330 (increase £43 485), (*b*) £2 056 532 (increase £831 675); other electrical wires and cables, rubber insulated (*a*) £61 611 (decrease £104 461), (*b*) £1 236 362 (decrease £517 087); with other insulations, (*a*) £107 067 (decrease £40 211), (*b*) £2 072 427 (increase £31 852); carbons, (*a*) £4 252 (decrease £25 036), (*b*) £70 243 (decrease £78 646); glow lamps, (*a*) £25 439 (decrease £1 022), (*b*) £443 850 (increase £123 996); arc lamps and searchlights, (*a*) £200 (decrease £3 067), (*b*) £12 941 (decrease £7 947); parts of arc lamps and searchlights (other than carbons), (*a*) £341 (decrease £1 134), (*b*) £6 265 (decrease £9 232); batteries, (*a*) £36 156 (decrease £39 776), (*b*) £675 476 (increase £47 202); meters and measuring instruments, (*a*) £35 264 (increase £5 376), (*b*) £492 002 (increase £94 822); switchboards, (*a*) £18 810 (increase £4 950), (*b*) £240 819 (increase £123 610); electrical goods and apparatus unenumerated, (*a*) £98 814 (decrease £145 729), (*b*) £1 989 411 (decrease £128 362). Total of electrical machinery, material and apparatus, other than uninsulated wire, (*a*) £1 063 154 (decrease £605 528), (*b*) £17 809 468 (increase £3 536 989).

Social Notes.

The staff engaged at the WREXHAM Electricity Works, together with members of the Town Council and a large number of consumers, were entertained to dinner last week by Alderman E. Hughes, chairman of the Electricity Committee.

The LONDON STUDENTS' SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS are arranging a theatre party for the Coliseum on Jan. 27 at 7.45 p.m. Tickets, price 3s. 6d. each, may be obtained from Mr. A. Butler, "The Cottage," Callendar's Cable and Construction Company, Belvedere.

The LONDON ELECTRICAL ENGINEERS' OLD COMRADES ASSOCIATION have arranged to hold a Bohemian concert at Bridge House Hotel, London Bridge, on Friday, Feb. 17, at 7 p.m. Admission by membership card.

The annual dinner of the London Electrical Engineers (24/26 L.A.S.S. Company), will be held at Bridge House Hotel on Thursday, Feb. 23. Tickets, 7s. each, may be obtained from Mr. E. A. Wilson, 3, Lombard-street, E.C. 3.

The annual dinner of the London Electrical Engineers (No. 4 (Newhaven) Company) will be held at Anderton's Hotel, Fleet-street, on Saturday, March 18, at 6.30 p.m. Tickets, price 6s. each, may be obtained from Mr. G. H. Cannon, 313, Fore-street, Edmonton, N. 9.

The annual New Year's Invitation Social of the ATHLETIC AND RECREATION CLUB of J. H. TUCKER & COMPANY, LTD., Birmingham, held on the 5th inst., proved a great success. The committee had arranged whist, a concert and dancing, and there were no speeches beyond the usual vote of thanks to the committee. The chair was occupied by Mr. T. R. Martin, and prizes were distributed to the winners of the whist drive.

Miscellaneous.

The contributions received and promised up to Nov. 30 in connection with the 1921 annual festival dinner of the ELECTRICAL TRADES' BENEVOLENT INSTITUTION amounted to £1 443 18s. 9d.

On a charge of embezzling £292, the money of the FIXED PRICE LIGHT COMPANY's branch at Wimbledon, W. Taylor, the firm's chief clerk, was at Wimbledon Police Court last week committed for trial to the Central Criminal Court. He denied having had the money, and refused to be dealt with summarily.

In addition to the awards in the MORLEY ARBITRATION (set out on p. 46 of our last issue), the following sums have also been awarded for loss of employment :—L. Dale, engineman, £198; E. Williams, engineman, £101; H. R. Turner, shift engineer or switchman, £66; C. Stinton, shift engineman or switchman, £66.

With certain exceptions, the salaries of MIDDLESBURGH Corporation officials receiving £500 a year and over are to be reduced by 7½ per cent., and those of officials receiving less than £500 are to be reduced by 5 per cent., the reductions to operate as from Jan. 1. The exceptions are officials who have been recently appointed, the Town Clerk, and the Director of Education.

About 2 000 UNEMPLOYED, representing various branches of the unemployed workers' movement in London, PROTESTED outside the Amalgamated Engineering Union headquarters in Peckham-road on Monday afternoon against the ballot now being taken, and the recommendation of the Executive Council that the men should accept overtime at the discretion of the employers. The interview lasted about an hour, and at the end the men were told their case would be placed before the Executive Council when it met.

An arrangement has been made between a number of the leading fuel research chemists of this country and the "Colliery Guardian" to publish a monthly record of British and foreign research regarding the PREPARATION AND USE OF FUEL, which will be available to all interested in the subject. The publication will take the form of a supplement to the "Colliery Guardian," and will appear on the fourth Friday of every month, being circulated free with that issue of the journal. The supplement will be entitled "Fuel in Science and Practice," and will be edited jointly by Dr R. V. Wheeler, Professor of Fuel Technology of Sheffield University, and Dr. J. V. Elsden, joint editor of the "Colliery Guardian."

The LONDON COUNTY COUNCIL have made new by-laws as to lamps used for marking road obstructions. (1) Where any work is being carried out, or any road material or erection (whether movable or not) is placed, in or on any part of a street or highway which makes the use of such part dangerous for traffic, that part of the street or highway shall, during the period between one hour after sunset and one hour before sunrise, be kept continuously lighted by one or more lamps showing a red light, placed in such manner and positions as to indicate sufficiently to foot passengers and drivers of vehicles the extent and position of such work, road material or erection. (2) No lamp exhibiting a light other than a red light shall be used for the purpose. For breaches of the by-laws there is a penalty not exceeding £5.

A committee of the Federation of British Industries has been investigating the REGULATIONS GOVERNING REGISTRATION OF BUSINESS NAMES, and a letter has been sent to the Controller of the Companies Department of the Board of Trade on the matter. It is pointed out that the necessity of furnishing full particulars to the Registrar at Somerset House as to all the occupations of the directors of a company is found to be extremely inconvenient and troublesome. The Federation feels that, although it might have been desirable that full information should have been disclosed during the war, the necessity for this has ceased. It urges that nothing further should now be required than that a director should supply the particulars required by the Companies Consolidation Act, 1908, giving his usual occupation. The obligation to place the names of directors on the letter paper, &c., of the company is regarded as unnecessary. As regards the Act of 1916 requiring these particulars in relation to private firms, the Federation feel this to be an advantage to the business community generally, which might well be retained, but the Companies (Particulars of Directors) Act, 1917, might be repealed.

Companies' Meetings, Reports, &c.

The EASTERN EXTENSION AUSTRALASIA & CHINA TELEGRAPH COMPANY notify that the interest on the 4 per cent. mortgage debenture stock for the half-year ending Jan. 31 will be paid by warrant on Feb. 1.

The FIFE TRAMWAY, LIGHT AND POWER COMPANY on Tuesday offered for public subscription £250 000 7 per cent. debenture stock at £93. The issue was largely over-subscribed, and the lists were closed at 11 a.m.

An extraordinary meeting of the METROPOLITAN DISTRICT RAILWAY COMPANY, last week, accepted and confirmed the revised scheme (THE ELECTRICIAN, Dec. 16, p. 770) for the common fund agreement between the above company, the London Electric Railway Company, the City and South London Railway Company, the Central London Railway Company, and the London General Omnibus Company. Similar meetings of all the companies concerned followed, and at each the same scheme was dopted.

The report of the CHATHAM AND DISTRICT LIGHT RAILWAYS COMPANY for the year ended Dec. 31, 1921, shows the revenue to be

£87 267 15s. and expenses £67 945 15s., leaving a gross profit of £19 324. From this sum had to be deducted £3 743 12s. for rent of Rochester Corporation lines, £2 470 for interest account, and £4 000 for reserve and depreciation, making a total of £10 213 14s., and leaving a net profit of £9 110 6s., which with £1 608 11s., the balance brought forward from 1920, left a balance of £10 718 17s. Of this amount £2 940 has been paid for the 5 per cent. interim dividend for the half-year ending June 30, 1921, on the preference share capital; £2 120 for the 4 per cent. interim dividend for the same period on the ordinary share capital, and the directors recommend that the balance be disposed of as follows :—£2 940 to a 5 per cent. dividend for the half-year ending Dec. 31, 1921, on the preference share capital; £2 120 to a 4 per cent. dividend for the same period on the ordinary share capital; and £598 17s to a revenue new account. There is a decrease of £3 446 in the revenue and £1 228 in the expenses as compared with the revenue and expenses for the year 1920. The decrease in net revenue is due to the coal stoppage and trade depression. During the past year an efficient service of trams on the various routes has been maintained. The generating plant has worked satisfactorily, and the whole of the company's machinery, engines, rolling stock, permanent way, cables, and other works have been maintained in good working order and repair.

New Companies.

The following list is compiled from information supplied by Messrs. Jordan & Sons, Ltd., company registration agents, 116-118, Chancery-lane, London, W.C. 2.

Brasco-Lath, Ltd. (178 940). Registered Jan. 10. Manufacturers, dealers and contractors of electric fittings and building appliances, 165, Queen Victoria-street, E.C. Nominal capital, £1 000 in 1 000 shares of £1 each. Directors : D. McPherson Armstead, J. E. Woodruff, and J. B. Wilson. Qualification of directors, one share.

British Motor Improvements, Ltd. (178 916). Registered Jan. 9. Mechanical and electrical engineers, &c. Nominal capital, £100 in 100 shares of £1 each. Qualification of directors, one share. Directors to be appointed by subscribers. Subscribers : Alice E. Egerton, 37, Essex-street W.C. solicitor's clerk; and H. G. Springall.

Culkin & Parkinson, Ltd. (178 921), 111, Woodhouse-lane, Leeds. Registered Jan. 9. Electricians, mechanical engineers, &c. Nominal capital, £2 000 in 1 000 preference shares of £1 each and 1 000 ordinary shares of £1 each. Directors : J. Culkin and J. Parkinson. Qualification of directors, £10. Remuneration of directors, £50 each.

Electrical Insulating Composition Company, Ltd. (178 923), Proval Works, Davyhulme-road, Davyhulme. Registered Jan. 9. Electrical engineers and manufacturers, and dealers in electrical insulation composition. Nominal capital, £1,500 in 1,500 shares of £1 each. Directors : A. Rigby and H. D. Shancross. Qualification of directors, £200. Remuneration of directors, £15 per annum each Managing director, £50 per annum.

Greenodd Motor and Cycle Company, Ltd. (178 902). The Garage, Greenodd, near Ulverston, Lancashire. Registered Jan. 7. General mechanical and electrical and motor engineers. Nominal capital, £1 500 in 1 500 shares of £1 each. Directors : A. E. Gazey, G. C. Farrer, and T. Tyson. Qualification of directors, £50.

Multi-Way Earthing Clip, Ltd. (179 011), 44, Weston-street, London Bridge, S.E. 1. Registered Jan. 12. To acquire the business hitherto carried on by A. E. Ryeland and C. A. Greenslade at 44, Weston-street, London Bridge, S.E. 1, for the purpose of testing and developing an invention for improvements in or relating to means for bonding metallic tubing in electrical wiring installations, and to carry on the same. Nominal capital, £5 000 in 5 000 shares of £1 each. Directors : A. E. Ryeland, C. A. Greenslade, and H. Hibbard. Qualification of directors, one share.

Shenton & Company, Ltd. (178 993), 68-69, Shoe-lane, E.C. Registered Jan. 11. Electrical, telephone, mechanical, general engineers, &c. Nominal capital, £4 000 in 1 000 preference shares, and 3 000 ordinary shares of £1 each. Directors : A. Handley and C. J. Margerison. Qualification of directors, £250. Permanent directors,, £1 000.

Timeproof Ferro-Concrete Railway Sleeper Company, Ltd. (178 965), 2, Dean's-yard, The Sanctuary, Westminster, S.W. Registered Jan. 10. To acquire from Robert Baker the benefit of an invention for improvements in railway and tramway sleepers, and turn same to account. Nominal capital, £900 in 750 ordinary shares of £1 each and 3 000 founders' shares of 1s. each. Directors : R. Baker, D. Macdonald, W. Daniel, and E. A. Kite. Qualification of directors, one share. Remuneration of directors, £50 each. Chairman, £75.

Joseph Watson & Son (Nelson), Ltd. (178 889), Walverden Foundry, Nelson, Lancashire. Electrical and mechanical engineers. Nominal capital, £15 000 in 5 000 15 per cent. cumulative preference shares and 10 000 ordinary shares of £1 each. Managing director : I. Walton. Qualification of directors, 250 shares. Remuneration of directors, £7 per week managing director and such sum to be voted by company in general meeting.

Vio-Ray Electric Company, Ltd. (178 937). Registered Jan. 9. To manufacture, purchase, sell and deal in any kind of goods, electrical or otherwise. Nominal capital, £1 000 in 1 000 shares of £1 each. Directors to be appointed by subscribers. Qualificatiton of directors, one share. Subscribers : J. H. O. Emery, 50, Brightside-road, Hither Green, S.E. 13, and A. A. Henley, Oak House, The Mount, Sydenham Hill-road, S.E., incorporated accountant.

Arrangements for the Week.

FRIDAY, Jan. 20th (to-day).

Institution of Mechanical Engineers.

6 p.m. At Storey's Gate, London, S.W. Paper on "Some Observations on a Producer-Gas Power Plant," by Mr. H. S. Denny, C.B.E., and Mr. N. V. S. Knibbs, B.Sc.

Institution of Electrical Engineers.
(London Students' Section.)

7 p.m. At Savoy-place, London, W.C. Paper on "Some Applications of the Thermionic Valve to Telephony," by Mr. L. T. Hinton.

British Electrical Development Association.

8 p.m. At the Chartered Institute of Patent Agents, Staple Inn buildings, London, W.C. Salesmanship Conference on "Salesmanship in Relation to Electric Heating and Cooking." Speaker, Mr. W. A. Gillott.

MONDAY, Jan. 23rd.

Institution of Electrical Engineers.
(Informal Meeting.)

7 p.m. At Savoy-place, London, W.C. Discussion on "Electric Vehicles, Present and Future," to be opened by Mr. R. J. Mitchell.

Institution of Electrical Engineers.
(North-Eastern Centre.)

7.15 p.m. At Armstrong College, Newcastle-on-Tyne. Paper on "The Interconnection of A.C. Power Stations," by Messrs. L. J. Romero and J. B. Palmer.

TUESDAY, Jan. 24th.

Institution of Civil Engineers.

6 p.m. At Gt. George-street, London, S.W. Papers to be further discussed, "Control of Trains, in Relation to Increased Weight and Speed Combined with Reduced Headway," by Mr. A. W. Rendell, and "Trials in Connection with the Application of the Vacuum Brake for Long Freight Trains," by Sir Henry Fowler and Mr. H. N. Gresley, C.B.E.

Institution of Electrical Engineers.
(East Midland Sub-Centre.)

6.45 p.m. At The College, Loughborough. Paper on "Loughborough Electricity Undertaking and Extensions in Hand," by Mr. R. B. Leach.

Institution of Electrical Engineers.
(North-Western Centre.)

7 p.m. At the Engineers' Club, Manchester. Paper on "Cyc-Arc Process of Automatic Electric Welding," by Messrs. L. J. Steele and H. Martin.

Junior Institution of Engineers.
(North-Eastern Section.)

7 p.m. At Armstrong College, Newcastle-on-Tyne. Paper on "Pyrometry," by Mr. R. L. Granville Johnston.

WEDNESDAY, Jan. 25th.

Institution of Civil Engineers.
(Students' Meeting.)

6 p.m. At Great George-street, London, S.W. Lecture on "The Economic Aspects of Various Methods of Power Transmission," by Mr. E. W. Monkhouse, M.A. (Lecture II.)

THURSDAY, Jan. 26th.

Institution of Electrical Engineers.
(Tees-Side Sub-Centre.)

7 p.m. At the Cleveland Technical Institute, Middlesbrough. Paper on "Methods of Conversion of A.C. to D.C. for Traction Purposes," by Mr. C. H. Davidson.

Institution of Mechanical Engineers.

7.30 p.m. At the University, Birmingham. Paper on "High Tension Spark Ignition in Internal Combustion Engines," by Mr. J. D. Morgan.

FRIDAY, Jan. 27th.

Institution of Electrical Engineers.
(Scottish Centre, Students' Section.)

7.30 p.m. At the Royal Technical College, Glasgow. Paper on "The Economical Production of Electrical Power," by Mr. R. G. Kendall.

North-East Coast Institution of Engineers and Shipbuilders.

7.30 p.m. At the Literary and Philosophical Society, Newcastle-on-Tyne. Paper on "The Use of Compressed Air in Diesel-Engined Ships," by Mr. W. Reavell.

Institution of Electrical Engineers.
(Irish Centre.)

8 p.m. At the Royal College of Science, Dublin. Lecture on "The Development of Electricity Supply in Switzerland," by Mr. E. M. Johnson.

Junior Institution of Engineers.

8 p.m. At Caxton Hall, London, S.W. Lecturette on "Fuels and the Boiler House," by Mr. L. M. Jookel.

COMMERCIAL INTELLIGENCE.

The following information is taken from printed reports, but we cannot be responsible for any errors that may occur.

London Gazette.

Partnerships Dissolved.

COLLINS, Sidney, and SLATER, William Owen, agents for electrical appliances, 17A, Sweeting-street, Liverpool, under the style of Collins & Slater, by mutual consent as from Nov. 1, 1921. Debts received and paid by S. Collins.

SUKIASSIAN, Sarkis Balthazar, and TAYLOR, James Harry, electrical accessory dealers, 29, Minshull-street, Manchester, under the style of the Princess Electrical Company, by mutual consent as from Dec. 31, 1921. Debts received and paid by S. B. Sukiassian, who will continue the business.

WINKLEY, William Leonard, and WINKLEY, Bernard Percival, electro platers and stampers, 6, Hockley-street, Brimingham, under the style of the Electro Plate & Stamping Company, by mutual consent as and from Dec. 31, 1921. Debts received and paid by B. P. Winkley, who will continue the business.

Bankruptcy Information.

FAWCETT, Ernest, 20, St. Anne-street, Liverpool, electrical and heating engineer. Receiving order, Jan. 13. Debtor's petition.

HURWORTH, Walter, 1, Back James-street, Harrogate, late 41, Town-street, Horsforth, Leeds, electrical engineer. Receiving order, Jan. 11. Creditor's petition.

LANGSFORD, Edwin Growdon, 24, Bar-street, Burnley, Lancaster, electrician. First meeting, Jan. 25, 11 a.m., Official Receiver's Offices, 13, Winckley-street, Preston. Public examination, Jan. 26, 11 a.m., County Court House, Bankhouse-street, Burnley.

ROTHWELL, Peter, trading (with Peter Ashworth Rothwell, a minor) as P. A. Rothwell & Company, at 64, Higher Bridge-street, Bolton, electrical engineer. Receiving order, Jan. 12. Debtor's petition.

Notice of Intended Dividend.

DRYSDALE, William, 24, Paxton-street, Barrow-in-Furness, Lancaster, electrician. Last day for receiving proofs, Feb. 4. Trustee, H. Mossop, 4, Ramsden-square, Barrow-in-Furness.

Company Winding-up Voluntarily.

HOOTON & ELLESMERE PORT DISTRICT ELECTRIC SUPPLY COMPANY, LTD. S. S. Dawson, 51, North John-street, Liverpool, appointed liquidator.

County Court Judgments.

[NOTE.—The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debts. They may be for actions. But the Registry makes no distinction of the cases. Judgments are not returned to the Registry if satisfied in the Court books within twenty-one days.]

BOULT, M. A., & COMPANY, 26, Slater-street, Liverpool, electrical engineers. £18 2s. 8d. Nov. 10.

Mortgages and Charges on Limited Companies.

[NOTE.—The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, created by a Company after the commencement of the Act, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges which would, if created after the commencement of the Act, require registration. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced since such date.]

EVANS (ELECTRICAL) LTD., London, E.C. Registered Jan. 3. £1 100 debentures, to A. E. Pater, 1, Arcade-house, Hendon, builder and contractor; general charge.

FELIX MACAULEY, LTD., London, E.C., turners in ebonite. Registered Dec. 30. £3 000 debentures, present issue £1 600; general charge.

Receivership.

PULLAN ENGINEERING COMPANY, LTD. T. Paton, of 3, Piccadilly, Bradford, ceased to act as receiver or manager on Jan. 9, 1922.

Bankruptcy Proceedings.

BARNETT, Bernard, electrical engineer, 104, Whitechapel-road, E. At the adjourned meeting of creditors, held on Tuesday, a draft statement of affairs was submitted, showing liabilities £800 and assets valued at £1 102, of which £781 represented the debtor's interest in his partnership business. The debtor's late partners, who were present at the meeting, claimed to be creditors, and stated that instead of there being any interest for the debtor in the business, it was insolvent at the date of the appointment of a receiver. The debtor strenuously denied this contention. After a somewhat heated discussion, the Official Receiver expressed a doubt whether any assets would accrue to the estate from the partnership. He said that he should apply for an order for the summary administration of the estate in bankruptcy. Meeting was closed, the case remaining in the hands of the Official Receiver.

PUGH, Herbert John, formerly trading as H. J. Pugh & Company, electrical engineer, 38, Broadway-parade, Crouch End, Hornsey. The first meeting of creditors was held last week at the London Bankruptcy Court. Debtor began business in May, 1914, at Hornsey Rise with very little free capital, and a few months later removed to larger premises. He was exempted from military service on medical grounds, and between 1914 and 1920 he did an increasing business, though he could not state the amount of his profits. In 1920 his business suffered from the general trade depression, and creditors began to press. In April last one of them obtained judgment, and levied execution, the effects being sold by the Sheriff to the debtor's mother, who had since continued the business under debtor's management. Debtor estimated his liabilities at £400 and disclosed no assets, the failure being attributed to trade depression and to stoppage of his business for the execution of necessary repairs to the premises. Case left in the hands of the Official Receiver for administration in bankruptcy.

Prices of Metals, Chemicals, &c.

TUESDAY, JAN. 17.

CONTENTS.

Notes of the Week.

Causes of Rail Corrugation.

The history of the investigations into corrugation of tramway rails, which has been conducted over a number of years, and has resulted in great differences of opinion on the causation, has received an addition in the Final Report of the Rail Corrugation Sub-Committee of the Municipal Tramways Association. This Committee, which was under the Chairmanship of Mr. W. W. Beaumont, was appointed some time before the war to investigate the corrugation of tramway rails, with particular reference to the vibration of the rails and of the foundations as being a probable cause. Experiments with this end in view were, therefore conducted in the London County Council's subway below Kingsway, where a length of straight, level track, protected from the weather and from the effects of other traffic, formed a suitable experimental ground. The cars running through this subway are of the single-deck type, seating thirty-six passengers and weighing 14½ tons empty. They are mounted on bogie trucks and are fitted with two 42 h.p motors. The trucks have steel tyres, the diameters of which are 31¾ in. and 21¾ in. on the driving and bogie wheels respectively, while the maximum speed attained is twenty miles per hour.

Experiments and Observations.

It was found that the corrugations were set up at intervals of about 2½ in. and of depths ranging from 0·004 and 0·008 in. As is well known, opinion on the Continent inclined to the theory that these corrugations were due to excessive rigidity in the foundations of the rails, or to inherent variations in the rail surface set up by the rolling action of the mills. Special care was therefore taken in these experiments to reduce vibration by the use of angle-irons or iron blocks bolted to each side of the rail web. The wooden sleepers on which the rails rested were replaced by short lengths of old rails laid crossways at intervals, the whole being concreted up to the level of the top working face of the track. As a result of six years' observation, the conclusion was arrived at that vibration has little or nothing to do with the appearance of corrugations. The origin is considered to be found in the action which occurs when the heavily loaded wheels roll along the surface of the rail. This action gives rise to superficial stresses in the rail material which are in excess of the elastic limit of the steel.

Joint Researches.

The total load on each wheel averages about two tons, but from experiments made by Mr. Beaumont on the area of contact between the wheel and the rail, it is concluded that this load gives rise to stress in the centre of the area of probably as much as fifty tons per sq. in. when the car is stationary, of some ninety tons when it is running at ordinary speeds on the straight, and of as much as 120 tons when it is rounding a curve at speed. We regret to notice that the Committee's report is stated to be final, as although it lays down with some definiteness the causes of rail corrugation, and thus makes a step forward in our knowledge of this important subject, it says little or nothing as to how these corrugations should be overcome. Continental investigations have rather proceeded in the other direction by starting with tracks where corrugations have been noticed and trying to find in their construction the method by which this expensive source of wear may be avoided. It would be as well if these two researches could be joined up and experiments undertaken that will lead to a removal of the damage.

Electrolytic Production of Magnesium.

Electrical engineers would do well to keep a close watch on the possibilities of magnesium as an industrial material. From the manufacturing point of view, it is already receiving a wide application in aeroplane construction, seeing that it is 40 per cent. lighter than aluminium and is no more susceptible to corrosion. Mechanically its properties are sufficiently attractive to make its use for transmission lines a possibility, as it can be easily worked and is handled

with facility. To the electricity supply engineer it makes another appeal. For the most economical means of producing it is by electrolytic methods, and considering that, like other such processes, it provides both a good load and a good load factor, the development of this process in areas where, for one reason or another, electrical furnaces have not yet been much employed, opens up possibilities of which the enterprising will not be slow to take advantage.

Details of the Process.

In the article which we publish on another page of this issue Mr. S. T. Allen gives some details of the electrolytic process employed by the Magnesium Co. in Wolverhampton for the manufacture of this metal. In this process magnesium chloride forms the starting point, as it occurs in nature as one of the constituents of the German salt deposits and forms a bye-product after the separation of the potassium chloride. This chloride is first rendered anhydrous by exposure to hot, dry air and dry hydrochloric acid gas. This results in the water being driven off and the magnesium oxide being converted into chloride; finally a salt with a content of over 99 per cent. magnesium chloride is obtained. The hydrochloric acid gas used for this purpose is produced by the electrolytic treatment of brine.

The Electrolytic Cell.

The anhydrous chloride is then mixed with either sodium or potassium chloride to reduce its melting point, and the mixture is treated in a gas-tight, cast-iron electrolytic cell fitted with carbon anodes. The cathode consists of a few inches of molten lead on which the electrolyte floats, the whole being kept in circulation. The electrical capacity of the cell is about 5 000 A at 5 V, and it is self-heating. It produces about 100 lb. of magnesium-lead alloy every twenty-four hours. In the second stage the magnesium-lead alloy forms the anode of a similar cell with steel rod cathodes. This is really a refining processs in which the molten lead is freed from its magnesium and returned to the first cell to be enriched. The second cell is worked in series with the primary and takes 5 000 A at 2 V. Thus about 100 lb. of magnesium is obtained every twenty-four hours for a consumption of 8·5 kWh per lb. In essence the process consists of the indirect separation of magnesium and oxygen, the chlorine produced being used for the production of more magnesium-chloride for the magnesite. The further development of the process will be watched with interest by both electricity supply engineers and electro-chemists.

The South-East Lancashire District.

The scheme put forward at the local inquiry last week for the reorganisation of electricity supply in the South-east Lancashire District possesses, in addition to the merit of simplicity, some special features which deserve more than passing notice. Next to the London area, this is probably the most important district in the United Kingdom, as it includes Manchester, Salford, Bolton, Oldham, Rochdale, Wigan, Stockport, Stalybridge, and other important towns and industrial centres. With the exception of those of the Lancashire Electric Power Company, all the large generating stations are owned by local authorities, who have with unpraiseworthy unanimity objected to the transfer of their undertakings to a Joint Electricity Authority. It has, therefore, become necessary to devise some substitute which would satisfy the individualistic views of Lancashire and at the same time co-ordinate the generation and supply of electricity in the area. After some delay and a good deal of discussion it was decided to form an Advisory Board of forty-eight members whose duty it will be to survey the sources of supply, to make recommendations for the closing of generating stations and the laying of transmission lines and to supervise in a general way the supply of electricity for power and lighting.

Weakness of Scheme.

Though the Advisory Board is said to be the only way of commanding the support of the whole of the twenty-eight supply authorities, it has two inherent sources of weakness. In the first place, it is too big to be an efficient instrument of administration, and we should prefer to see a Board of twenty or twenty-four members. However, as most of the real work will be performed by the technical committee of ten engineers, who will make recommendations to the Board, this objection may not be so serious as the absence of all compulsory or coercive powers. For the Board will have no authority to raise capital, its only reason for existence being to initiate or put forward plans of development that may be suggested by the engineering committee. It will thus have to rely upon its moral and persuasive powers to make the constituent authorities adopt its proposals. Already the majority of the undertakings in the district are linked up, and we are afraid that the new Board may not be able to do much more—perhaps even less—than the old linking-up committee, especially as each undertaking can appeal to the Electricity Commissioners against any of its decisions. It is therefore to be hoped that even at the last minute a way may be found to form a Joint Authority.

Technical Points in the Scheme.

From the technical point of view the scheme leaves little room for criticism, and it will at least effect real economies in generation and distribution. A capital expenditure of £13 000 000 would be necessary during the next ten years to meet the requirements of the individual undertakings, but by the suggested co-operation about £1 800 000 of this sum will be saved, and the average annual saving on coal and in capital charges is estimated at £103 423. The inquiry was one of the shortest yet held, and as it disclosed an agreeable spirit of goodwill and co-operation among the various local authorities, it may be that the proposed Advisory Board, if approved by the Commissioners, will be able to perform useful work for some years and so pave the way for the formation of a Joint Electricity Authority, when education and the experience of other such bodies will have rendered that course probable.

Telephones and Archæology.

An article by Mr. A. O. Gibbon, which appears in the current issue of the "Post Office Electrical Engineers' Journal," should be of interest both to electrical engineers and to archæologists. For, as already mentioned in connection with our description of the London Toll Exchange, the development of the telephone system in the metropolis has recently made the laying of additional cable ducts necessary. Work of this kind is always difficult in London, and, in this case, presented some more than usually stiff problems, especially between St. Paul's Cathedral and Fleet Street, where virgin soil was discovered within 10 ft. of the surface. Archæologists will note that foundations of old houses, which formerly stood on the site of the present roadway, were cut through and that some interesting Roman remains were also discovered and have been carefully preserved.

Overcoming Obstructions.

From the engineering point of view the obstructions that had to be overcome or circumvented in laying the ducts formed the most difficult problem. These included the main outfall sewer and the power supply mains of the Post Office, both of which had to be crossed at right angles. In general, such obstacles were avoided by gradually increasing the depths of the ducts until, at Ludgate Circus, a maximum depth of 19 ft. was reached. Here the Fleet River, which is now enclosed in a culvert, had to be crossed, and as the crown of the culvert is only 3 ft. below the surface of the roadway and the culvert itself is 24 ft. deep, it was decided to carry the cables at this point through steel pipes and to alter the formation of the ducts by spreading them out horizontally so as to make the most of the small vertical space available. At the point where the sewer empties into the Fleet River at Ludgate Circus, a specially-designed manhole with a strengthened roof was constructed, over which the sewer was carried. This manhole is the first to be built in London with the American method of splayed corners. The whole design and lay-out of the work and its conduct to a successful conclusion are matters upon which the Post Office Engineering Department and the contractors may be whole-heartedly congratulated, especially, as even their critics will admit, it has been undertaken to improve London's telephone service.

Selling Heating and Cooking Apparatus.

The third of the series of conferences which have been organised by the British Electrical Development Association to assist salesmen to market their wares was a little disappointing in its immediate appeal. The subject under discussion was "Salesmanship in Relation to Electric Heating and Cooking," and no subject should be of more importance to electrical engineers of all classes at the present time. For, as we have pointed out before, not only is the domestic field wide and mainly untilled, but the future of the electrical industry must depend increasingly on the success with which (to mix metaphors) this particular market is exploited. Yet the discussion tended to range not over the difficulties of salesmen and salesmanship and how these may be overcome, but over the disadvantages and shortcomings of electrical apparatus as reflected by each particular speaker's inner consciousness. This was not the opener's (Mr. W. A. Gillott) fault, for he summarised concisely and clearly the points which every salesman should keep ever in view. Especially he emphasised the need for psychology and tact of the special brands that are called into play when dealing with the non-technical and feminine public. We like particularly the idea that mistresses should be dealt with *via* the cook and masters *via* the mistress. Mr. Downe, an he would, could tell us a good deal about the success of this policy.

A Curious Lack of Enthusiasm.

One speaker, in the course of the discussion, pointed out that the real obstacle to the increased sale of domestic electrical apparatus was the lack of enthusiasm of its potentialities that persisted in electrical circles. This, in our view, exposes the sore which is infecting the whole body. The fact is that many electrical engineers have reached a stage in their domestic electrical education when discouragement has set in. Golfers know this stage well. It follows a beginning when every stroke is easy and the Amateur Championship appears within grasp. It is followed by the stage when balls vanish into hazards and broken clubs are consumed on a funeral pyre. But that stage passes too, and we hope it will soon pass with electrical engineers. Much of the old domestic apparatus was bad and many mistakes were made in its use. Apparatus is a good deal better at present, and it will be better still; and we are learning a great deal about how it should be used. Electricity supply engineers, too, must take courage and reduce their charges, as is already being done, notably by the Westminster Electricity Supply Corporation and by some of the large provincial supply authorities. Hiring schemes must be initiated and popularised. Then enthusiasm and cheapness will be most useful aids to good salesmanship.

Electrical v. Mechanical Engineers.

In our correspondence columns to-day we publish a letter to which we draw attention mainly in order that the views its writer expresses shall not obscure an important issue. A fortnight ago we said that to place the chief electrical engineer of an important railway under the chief mechanical engineer was a retrograde step. Our correspondent claims that it is equally retrograde to place the management of an electricity supply undertaking under a mechanical engineer. The two cases, however, are not on all fours. In an electricity supply undertaking the mechanical side is as important as the electrical side; indeed, in a large undertaking at the present time it may easily be more important. Again, the principal duty of the chief of a supply undertaking is to sell electricity as cheaply and efficiently as possible, and as long as he does that it does not matter whether his own bias or that of his staff is electrical or mechanical. For, unless he is a fool, he will do nothing that will check development along the most modern lines. In fact, his chief concern must be with questions of policy and management rather than with engineering details.

A Question for the Institution.

On a railway matters are far different. There are two warring factions. One led by the mechanical engineer, who hopes, though there are exceptions, that it may still by hard work and enterprise be possible to postpone the evil day when electric traction will be introduced. The other, led by the electrical engineer, who knows the advantages of electric traction and only asks to be allowed to prove them. It is obvious, it is against human nature, that the electrical engineer will not have that free hand if he is placed under the mechanical engineer. We reiterate that this is not a matter of personality, but of policy. Further, so important do we consider it in its bearings on the future of electric traction, that we feel it is a matter which the Institution of Electrical Engineers should take up without delay. They could not better signalise the grant of the Royal Charter.

Electric Lighting Developments.

It is common knowledge that during the war invention and discovery in the lighting field, as in many others, were checked or diverted into other channels. During this period, and indeed for some time after the Armistice, manufacturers were obliged to concentrate their efforts on meeting demands for standard articles. But they have now succeeded in making up arrears, and it seems likely that once again invention and discovery will come into their own. At least this should be the case if experience after the Napoleonic War is anything to go by, while the much more highly developed facilities for research at the present day suggest that, once the movement gets into its stride, progress will be rapid.

Small Discharge Lamps.

Perhaps the most striking development during 1921 was the introduction of the small "discharge" lamps, whose operation is based on the luminescence of neon gas in an ordinary lamp bulb. These lamps are capable of being inserted direct into a holder on a 200 to 240 V supply, and although their low efficiency at present prevents their having any important influence on lighting as a whole, they will doubtless be useful for such special purposes as pilot lamps, indicators, night-lights and luminous signs, while the method is probably capable of considerable development. Interesting speculations on this point are aroused by a recent Paper read in the United States by Mr. D. MacFarlane Moore, who has used the discharge through neon to start an arc between tungsten electrodes, within a sealed glass envelope, thus obtaining a relatively efficient source. Various other experiments with lamps using rare gases have been made on the Continent with more or less success, and it is possible that out of these investigations something useful may be evolved. Among other developments perhaps the most noteworthy is the increased attention paid to methods of producing "artificial daylight." The problem of imitating daylight is now much better understood, and such sources appear to have a future in connection with processes where the correct appearance of colours is vital.

Illuminated Signs.

There have also been interesting developments in connection with illuminated signs, especially those of the pictorial variety, and the range of reflectors and other appliances for the distribution of light has been considerably extended. In this connection it is probable that flood-lighting methods, i.e., the use of projectors equipped with gasfilled lamps to illuminate the surfaces of buildings and other large areas will make progress in this country as soon as the improvement in the industrial position encourages the use of spectacular lighting. The recent application of flood lighting to Selfridge's premises in London is interesting, but these methods are, of course, familiar in the United States.

The Judicious Use of Light.

The most hopeful feature in the lighting world during recent years has undoubtedly been the steady progress, aided by the propaganda of the Illuminating Engineering Society, towards more judicious methods of using light. While it is still true that many instances of glare arising from the use of unscreened gasfilled lamps in show windows exist, it is noticeable that the leading stores of London have almost invariably adopted concealed methods. In many cases their windows are now lighted in a creditable and artistic manner. London, however, is in advance of the provinces in this respect, and there is much room for further educational effort. Speaking generally, it may be said that facility in the production of light has as yet somewhat outrun knowledge as to the best way of using it, but it is encouraging to see how much better the principles of good illumination are appreciated among technical men. Various aspects of lighting have been dealt with in official reports recently, notably the second interim report of the Departmental Committee on Lighting in Factories and Workshops. It is to be hoped that the views expressed in such reports will in course of time penetrate to the lowest strata of technical knowledge.

Taxation and Trade Revival.

Opinion on the subject of taxation, in both engineering and more purely electrical circles, is hardening. We, as an industry, should soon be in a position to impose our views, through the proper channels, on those whose business it is to regulate these matters and to indicate in the most definite way the fact, learnt by hard experience, that nothing is impeding the long-looked-for trade revival more than the burden of taxation. There will be those who argue that unemployment and economy are both more important. But unemployment (and trade unions leaders and employers who meet their work people over the council table would do well to emphasise this) can only be relieved by more trade, and more trade depends, to a large extent, on the wider facilities that lower taxation would give. Economy, in the true sense, follows as a matter of course. For to spend, not recklessly but wisely, and to save, not like a miser but in order to be able to develop industry, are two ways of reviving trade which are impossible of application under present conditions.

Waste Heat Utilisation.

The policy recently adopted by the Institution of Electrical Engineers, of arranging joint meetings with other technical bodies at which "fringe" subjects are discussed, is worthy of commendation. Such meetings have already taken place with the Institution of Gas Engineers and with the Electro-Therapeutic Section of the Royal Society of Medicine and the Rontgen Society. These gatherings were most successful, and though the success that attended the joint meeting with the Institution of Heating and Ventilating Engineers last week was not quite so great, yet there is, we hope, every prospect of there being a "next time," when our congratulations on the proceedings will be whole-hearted. It is not hard to justify this optimism. For such meetings enable the views of those working in other fields to be laid before the Institution, and, similarly, enable the views of electrical engineers to be published in technical circles which are as yet unelectrified.

The Need of Universal Effort.

The subject discussed at the meeting to which we have referred was "The Utilisation of Waste Heat from Electrical Generating Stations." It was opened on behalf of the heating engineers by Mr. C. Ingham Haden, and on behalf of the electrical engineers by Mr. F. H. Whysall. Their arguments will be found summarised on another page of this issue. This matter is one on which the close union of all bodies concerned is necessary. We agree with Mr. Barker that the efforts of all sections of engineers should be directed towards improving our methods of using coal. The need for this, if not already obvious, was well brought out at the meeting last week. For some of the views expressed by the heating engineers on electrical matters were, to put it mildly, out of date. The idea, for instance, seems to be still prevalent that our generating stations are mainly concerned with a lighting load.

The Necessity for an Open Mind.

Unlike certain matters which have been raised at other joint meetings, this question of the utilisation of waste heat is one upon which electrical engineers have, and would do well to keep, an open mind. We, all of us, with Mr. Whysall, "deplore the fact that so much of the heat value of fuel is rejected to the condenser, where steam is the source of energy for the prime mover" in generating stations, and for many reasons we have recently not been inactive in a search for methods which shall allow this waste heat to be utilised in some way or other. Alternatively, efforts are being made to discover means for employing the heat content of the fuel more efficiently, so that a greater proportion may be used in the prime movers

themselves. The results of these efforts are one of the things about which Mr. Haden, for instance, does not seem to have heard. We have no reason to suppose that a great deal of good will not come from researches along both these lines, and that, in the limit, economies in the power house, with obvious added advantages in the spheres of distribution and finance, will result.

A Note of Warning.

But in this connection a note of warning must be uttered. The generation of electricity, inefficient as it is in some critics' view, might easily be made more inefficient by the adoption of methods which, though theoretically attractive, leave both the financial and heat balance-sheets little, if any, better off than they were before. Such a distinction without a difference would, we cannot help feeling, be the result of the adoption of Mr. Haden's scheme for improvement. Briefly, Mr. Haden would convert some of the existing generating stations, which would otherwise be shut down under the "super-station" scheme, into heat distribution stations, generating electricity as a bye-product and linking up such stations with the super-stations, to supply any surplus electrical load. The result would obviously be a decrease in efficiency on the generating side, but this decrease, in Mr. Haden's opinion, would be more than counterbalanced, both thermally and financially, by the advantages obtained from the distribution of heat in the form of steam to neighbouring houses, offices, flats and factories.

Which is the Bye-Product?

It will be seen that this scheme differs essentially from those that have been put forward at various times, notably by Mr. W. M. Selvey and Mr. Julius Frith, and from that which is in successful operation in Manchester and in certain cities in the United States. In Manchester electricity is the main, and heat the bye, product, and in the United States the heat stations are generally separate from those generating electricity. In Mr. Haden's scheme heat is the main, and electricity the bye, product. Mr. Haden supports his views with a wealth of ingenious argument, but, nevertheless, fails to cover up its essential fallaciousness. In a station which, as it is to be discarded, is already generating electricity uneconomically, arrangements are to be made to render the generation still more uneconomical (this must be done to supply the principal heat load), while the capital station is only to be used for supplying such electrical requirements as cannot be dealt with locally. Mr. Haden has, in fact, taken the usual argument in favour of the large station supplying a wide area—the better load and diversity factors possible, and the savings made by using large units under the best conditions—badly shaken it, and then stood it on its head. Whether it looks better after having been heated and ventilated in this way we are rather inclined to doubt. He also seems to have forgotten that, though in domestic areas heat is more in demand than power, in industrial areas the reverse is the case. In fact, we very much prefer Mr. Whysall's method of attacking the problem.

Heat as the Bye-Product.

Mr. Whysall starts from the electrical end. Given a station that under present conditions is as efficient as possible, how can that efficiency be improved? By discovering the conditions under which, without unduly decreasing the efficiency of the electrical plant (some decrease is inevitable), waste heat may be supplied to factories and other buildings within one and a half miles of the station, with mutual benefit to each. Owing to the large amount of steam provided by, say, a 750 kW set, to work on these lines requires that the plant employed shall run at 100 per cent. electrical load factor. Even under these conditions the financial results are probably no better than with energy supplied from a large central station, while the fact that the provision of a load factor of 100 per cent. on the plant supplying exhaust steam for heating purposes is effected at the expense of the load factor at the main power station must be taken into consideration when comparing results.

The Great Distribution Problem.

Economical and practical difficulties do not, however, cease with generation. There remains, especially for the heat engineer, the great problem of distribution. Mr. Haden proposes to distribute heat energy in the form of steam at the pressure of 60 lbs. per sq. in., and also in the form of hot water. It is not clear to what limiting radius from the station he thinks it would be possible to do this, and there is, indeed, a good deal of difference of opinion on this point. Mr. Selvey, in his scheme for hot-water distribution, put the maximum distance as four miles. Mr. Whysall talks about one and a half miles. In Detroit, according to Mr. Patchell, it is horizontally less than two and a half miles, though it could probably be more.

The Cost of Steam Transmission.

With steam the distance might be greater, but, in any event a suitably lagged main of a size unspecified by the author would be required, and the cost of laying this would be, according to Mr. Haden, £17 800 per mile. Both he and Mr. Whysall are a little fearful of the disturbance to the streets which would be caused by these, and Mr. Patchell's accounts of the space required for such a service in Detroit is not likely to allay their anxiety. Mr. Haden suggested that mains should be taken through the basements of the premises to be supplied, as has, in fact, been done at Manchester, where a successful scheme has been working for some time in the area adjacent to Dickenson-street station. But in any event the cost and inconvenience of the inevitable disturbance might well more than counteract the financial advantages of the steam main compared with the electric cable, even when we take into account that the energy supplied through the latter can be employed for all purposes, while the use of the steam is limited.

Too Great Ambition.

In our view, Mr. Haden's ideas on this subject are too ambitious. There are cases where the waste heat from generating stations can be, and is being, successfully utilised in the way he has described. But each such case must be judged on its merits by, as he rightly says, heating engineers and electrical engineers in combination. There can, we feel, be no general solution on the lines he suggests. Attempts to find such a solution might easily bring more disadvantages than advantages in their train, and, unless a careful balance between heat and electricity supply can always be assured, lead to a modern variant of Lamb's famous parable about burning houses and roast pigs.

If the discussion, which was unfortunately both nebulous and wandering, does nothing else, it will, we hope, indicate that present methods of generating electricity are not so economical as they might and should be, and that other people besides electrical engineers are quite aware of the fact. It follows that it is the duty of all electricity supply engineers to employ all methods which will lead to more efficient working, and especially to concentrate their efforts on the boiler-house end of the problem.

The Production of Metallic Magnesium.

The Electrolytic Process of the Magnesium Company.

By S. T. ALLEN,
(Chief Engineer and General Manager, Wolverhampton Electricity Department).

Magnesium is becoming of increasing importance as a constructional material. Its manufacture by electrolytic methods is of interest to the electricity supply engineer, as this provides a good load at a good load factor. Mr. Allen describes in detail the process devised by the Magnesium Company for the production of this metal on a commercial scale.

The importance of magnesium metal has greatly increased during the last few years, because of its present value and future possibilities in connection with the alloying of other non-ferrous metals, where extreme lightness and high strength are required, such as in the building of airships and aeroplanes, and also because of its properties as a deoxidiser of other metals.

Magnesium is 40 per cent. lighter than aluminium, and, when pure, is no more susceptible to atmospheric corrosion than is aluminium. Thus, given production as cheap as aluminium, which the Magnesium Company state is a possibility, and provided that there is a corresponding demand, the uses in the future of this beautiful metal will certainly multiply. Its production will therefore be watched with considerable interest.

A High Load Factor Supply.

The intention of this article is more especially to describe the new electrolytic process developed in Wolverhampton by the Magnesium Company, which is already creating a considerable amount of interest throughout the world. It is of special interest to the electricity supply engineer, as it is a continuous process, making for a very high load factor supply.

The only two compounds of magnesium which occur abundantly in nature are the carbonate and chloride; the choice of the raw material for the production of the metal is accordingly limited to one or other of these compounds. Magnesite, the carbonate, is found in varying states of purity in all parts of the world. There are no deposits of pure magnesite in the United Kingdom, but large quantities occur as dolomite, the double carbonate of magnesium and calcium, from which pure carbonate of magnesium can be separated by simple processes. Magnesium chloride occurs in nature as one of the constituents of the German salt deposits. The separation of potassium chloride from these deposits involves the production of huge quantities of magnesium chloride. Magnesium chloride also occurs in sea water, and is a product of its evaporation for the production of salt. Either of these two compounds can be used as raw material, the choice being influenced by the cost of freight and the means available to the manufacturer for the disposal of his by-products.

Suggested Processes.

The processes which have been proposed or used for the production of magnesium may be placed under three headings:—(1) Thermal processes; (2) substitution processes; and (3) direct electrolytic processes. In the first the oxide of magnesium is reduced by carbon at a temperature well within the range of the electric furnace. The metal is produced as vapour, which may be condensed. This process has been tried on a considerable scale, but great difficulties were encountered in attempts to produce coherent metal from the finely divided material which resulted from the condensation. In the second process magnesium has been produced experimentally by the reduction of magnesium oxide with aluminium. Unlike the well-known "Thermit" reactions, the reaction between magnesium oxide and aluminium is endothermic, and heat must be supplied. In the third process magnesium chloride is also readily reduced by metallic sodium, and at first sight this might appear to be an economic method of manufacture. To obtain satisfactory yields the magnesium chloride must be anhydrous, and as anhydrous magnesium chloride can be electrolysed for the direct production of magnesium, reduction with sodium can only be economical if the sodium electrolytic cell shows a higher efficiency than the magnesium electrolytic cell.

The Choice of Electrolyte.

The choice of the electrolyte for the production of the metal by direct electrolysis is for practical purposes limited to the chloride and the fluoride, although claims have been made for the electrolysis of magnesium oxide in a bath of fused magnesium fluoride following the lines of the ordinary aluminium process. Electrolysis of the fused sulphide has also been proposed, but it is safe to say that all the magnesium for the market is produced by electrolysis of the chloride in a state of fusion with or without the admixture of potassium and sodium chlorides.

Preparation of Anhydrous Magnesium Chloride.

The Magnesium Company are interested in two processes for the production of anhydrous magnesium chloride, in one of which the chloride is produced by the action of chlorine on magnesium oxide, and in the other water is removed from magnesium chloride crystals.

In the presence of carbon chlorine reacts with magnesium oxide, producing magnesium chloride and carbon monoxide. With pure materials the temperature at which this reaction is complete is uncommercially high. Compounds of iron act as chlorine carriers or catalysts of this reaction, and enable it to proceed to completion at a reasonable temperature. During the war large quantities of anhydrous magnesium chloride were made by this process, and subsequently reduced to the metal. The complete dehydration of magnesium chloride crystals is not a simple matter, and has been made the subject of a large number of patents.

Details of the Process.

The following is a brief description of the process employed by the Magnesium Company:—

The crystals of magnesium chloride, after passing through a hydro extractor to remove adhering water, are exposed for several hours to a current of dry air at a temperature of about 150°C. Half the combined water is thus removed with a small decomposition of the magnesium chloride, the product having the composition:—$MgCl_2$, 73·0 per cent.; MgO, 4·0 per cent.; and H_2O, 23·0 per cent.

The partially dried material is now exposed to a current of dry hydrochloric acid gas at a temperature of about 300°C. The remainder of the water is removed, the magnesium oxide is converted into magnesium chloride, and a product showing over 99 per cent. of magnesium chloride results. As the temperature of fusion is never reached during the drying process, the crystals retain their original form, and in consequence the product is very easy to handle. The hydrochloric acid gas used in the drying process is produced by direct combination of hydrogen and chlorine, resulting from the electrolysis of brine.

Electrolytic Arrangements.

As the melting point of anhydrous magnesium chloride, 750°C., is above the economical temperature for electrolysis, sodium or potassium chloride, or both, are added to the anhydrous magnesium chloride to produce the electrolyte. Molten magnesium floats on the surface of this electrolyte, and consequently a simple cell of the form used in the manufacture of aluminium cannot be employed. Such a cell would have to be fitted with permeable diaphragms in order to keep the chlorine out of contact with the magnesium. These diaphragms are a constant source of trouble

and expense, and, further, they tend to reduce the energy efficiency of the cell. This difficulty has been got over by the Magnesium Company, by conducting the electrolysis in two stages.

Stage 1.—The cell, which is of cast steel lined with fire-brick, is fitted with a gas-tight cast-iron cover which carries the graphite anodes. These have suitable openings for the discharge of the chlorine gas and the removal of the electrolyte. The cell is charged to the depth of a few inches with molten lead, which forms the cathode. On the surface of the lead cathode floats a 1 in. layer of the electrolyte, into which dip the ends of the graphite anodes. The gap between anodes and cathode surface is about $\frac{3}{4}$ in.

Circulation of Electrolyte.

Means are provided for the circulation both of the electrolyte and the liquid lead cathode. The cell has a capacity of 5 000 A, at a cathode current density of about 1 500 A per sq. foot, and a terminal voltage drop of about 5 V. Under these conditions the cell is self-heating, and produces about 100 lb. of Mg. per twenty-four hours in the form of an alloy with lead, with an ampere efficiency of approximately 85 per cent.

Stage 2.—The cell used in this stage is similar to that used in Stage 1, except that the magnesium lead alloy produced in Stage 1 forms the molten anode, while the cathode consists of a large number of small diameter steel rods immersed to a small depth in the electrolyte, which has the same composition as that used in Stage 1. Suitable means are provided for the removal of the molten magnesium as it is produced.

It will be realised that this part of the process really consists in the electrolytic refining of impure magnesium. Means are provided to circulate the magnesium lead alloy, which, as it becomes depleted of magnesium, is returned to Stage 1 to be enriched. The secondary cell, which is worked in series with the primary, operates on 5 000 A at 2 V. It will be seen that the total energy consumption for 100 lb. of magnesium per twenty-four hours amounts to 8·5 kWh per lb. of metal produced, giving an energy efficiency approaching 40 per cent. Given pure magnesium chloride, such as is produced by the processes already described, the cells operate with remarkable smoothness, and require little attention, save for the changing of the electrolyte and the removal of the metal.

Chlorine Disposal.

The disposal of the chlorine from processes of this type, especially when worked on a comparatively small scale, is always a matter of some trouble. The process adopted by the Magnesium Company overcomes this difficulty in a neat and economical manner. The chlorine is aspirated from the cells, and is brought into contact in a series of scrubbing towers with milk of magnesium, produced by suspending the ordinary calcined magnesia of commerce in water. The chlorine is absorbed by the magnesia, and a solution is produced containing magnesium chloride and magnesium chlorate in the proportion of five molecules to one.

This solution is concentrated to such a strength that, on cooling, half the contents of magnesium chloride separate as crystals. Potassium chloride is added to the mother liquors in quantity equivalent to the magnesium chlorate present. Potassium chlorate crystallises out practically quantitatively; it is washed and recrystallised, and is then ready for the market. The mother liquors from the potassium chlorate crystallisation are returned to the system, and are concentrated so as eventually to yield all their magnesium chloride as crystals. The potassium chlorate forms a valuable by-product; but, if for any reason it is undesirable to produce it, advantage may be taken of the well-known reaction whereby, when chlorine is passed into milk of magnesia in the presence of a catalyst, such, for example, as nickel oxide, magnesium chloride only is produced and oxygen liberated.

A Cyclic Operation.

It will be realised from the above description that the process forms a complete cycle, and really consists in the indirect separation of magnesium and oxygen, in that, apart from the production of the by-product, potassium chloride, the only raw material is magnesite. The chlorine is being continually separated from the magnesium in the electrolysis, and the same chlorine continually used for the production of more magnesium chloride from magnesite.

The magnesium produced is, as would be expected, of remarkable purity (over 99·5 per cent), and it is interesting in this connection to note that metal of this purity may be melted in open vessels without risk of its firing.

Properties of Magnesium.

To repeat what has been previously stated, there is no doubt that magnesium, either alone or in alloys, has big possibilities. It is 40 per cent. lighter than aluminium, and, when pure, is no more susceptible to atmospheric corrosion than is aluminium. It can be rolled and extruded. As a deoxidiser of other metals it is unrivalled, and its use in this direction is continually extending. It is a minor constituent of many valuable alloys. Alloys in which magnesium is the major constituent are already in use in cases where combined lightness and strength are desirable. Given a corresponding demand, there is nothing to prevent magnesium being put upon the market at the same price as aluminium.

The writer is indebted to the Magnesium Company for the details describing their process and the many interesting interactions connected therewith.

Armature Winding and Motor Repair.*

Of late years, there has been a tendency to reduce to order and to codify the manifold methods used in electrical repair shops—a tendency which is the logical sequence of the development and growing importance of electrical machinery. The present volume is a noteworthy attempt to provide electricians and repairers with such knowledge as will enable them to locate quickly and surely and to remedy effectively faults in motors and generators. The author is the joint editor of the "Electrical World," and, in addition to drawing on his own experience, he makes ample use of information relating to the experience of others.

At the outset, the different types of armature windings used in continuous- and alternating-current machines are described, and the importance of making parallel circuits symmetrical is emphasised. Then follows a long section on repair-shop methods for rewinding continuous-current armatures, instructions being given for the various cases that arise. The chapter on testing continuous-current armatures for faults is well written. The various kinds of insulating materials and varnishes and their uses are discussed at length, and much valuable information of a practical nature is given. Repair-shop methods for rewinding alternating-current machines, and for testing induction motors for faults, are followed by chapters on the adaptation of continuous- and alternating-current motors to changed conditions.

Criticism, but Not Disagreement.

Very important matters are also dealt with in the latter portion of the book, e.g., commutator repairs, adjusting brushes and correcting brush troubles, inspecting, costing, overhauling, diagnosis of motor and generator troubles; while numerous methods that have been devised to solve special troubles are collected. Finally, there is a chapter on the equipment needed in a repair-shop, and an appendix, containing data and reference tables. Here and there are points which might well have been criticised, but there is very little with which we should seriously disagree. The book is well written, well illustrated, and well arranged. There is ample scope for it, and it can be heartily recommended to all who have to do with the repair and upkeep of electrical machines.

THE UTILISATION OF WASTE HEAT IN GENERATING STATIONS*

We give below an account of two Papers which were read before a Joint Meeting of the Institution of Electrical Engineers and the Institution of Heating and Ventilating Engineers on Thursday, January 19th. The first, by Mr. C. Ingham Haden, suggests the combination of heat distribution in the form of steam or hot water with electrical generation so as to utilise our fuel resources to better advantage than at present. This would be effected by converting generating stations, which would otherwise be discarded, into heat stations. The second, by Mr. F. H. Whysall deals with the practical and economic difficulties of any such scheme.

The Utilisation of Exhaust Steam from Electrical Generating Stations and Coal Economy.

By C. INGHAM HADEN.

If we express the calorific value of coal as 100 per cent. the average thermal efficiency obtained from it when used for domestic purposes is 50 per cent. The number of British thermal units in coal converted into electrical energy is approximately 5 per cent., though it is hoped with the new large stations to improve this figure to 8 per cent. With the most up-to-date boiler plant it is claimed that an efficiency of 80 per cent. is obtained from the coal so that, assuming the calorific value of the coal to be 14 000 B.Th.U.,

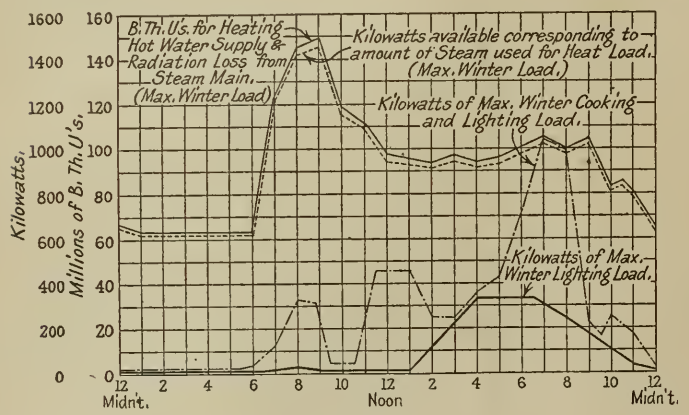

FIG. 1.

20 per cent. to be lost in the boiler, and 90 per cent. of the remainder in the generating plant, out of a total of 14 000 B.Th.U. only 1 120 B.Th.U. are converted into electrical energy.

Taking the approximate fuel consumption in generating stations in this country as 10 000 000 tons per annum, the huge total of 9 200 000 tons represents the approximate value of wasted heat. In addition, in most generating stations condensing plant is employed with cooling towers, and the circulating water is supplied by electrically driven pumps, which absorb a considerable percentage of the current generated. Large fans are also used to blow away the heat from the cooling towers, and the water lost in vapour is another expense which has to be met.

How Can Waste be Reduced?

These facts and figures being assumed correct, the question is, can nothing be done to lessen this waste? This is a difficult problem, but its complexity should not prevent an attempt being made to deal with it. The first main difficulty is to find a market for the heat, though there is the further difficulty of co-ordinating the loads, as heat for warming is only required for six or seven months in the year, and, even during this period, the load will vary tremendously. There is, however, a constant demand for hot water, but the possibility of utilising heat depends very largely upon the position of the generating station in relation to that of buildings requiring heat or hot water, and the amount of the cost of transmitting heat to any great distance.

Electricity a Wasteful Form of Heat.

In spite of the convenience, cleanliness and adaptability of electricity supply and its lower transmission losses, it has already been shown that it is a most wasteful form of heating and quite impossible if coal is to be conserved. The combination of heat distribution with the generation of electricity would give a higher heat efficiency than any other arrangement.

The positions chosen for super stations are close to some waterway, it being considered more necessary to have water for condensing purposes than to be near a coal mine. But no scheme can be considered complete which does not make some provision for the utilisation of waste heat. The scheme also involves the scrapping of many of the existing generating stations, which seems a most calamitous proposition. A possible alternative is to retain such of the existing stations as can be usefully employed as heat distribution stations—utilise them to their fullest capacity, and, if there is a greater demand for heat, then provide additional heat stations, using them also for generating current as a by-product. In this case either a part of the generating plant can be altered to exhaust at a pressure of 60 lbs. per sq. inch, or new plant could be specially designed to meet these new conditions.

Some generating stations in London and in the United Kingdom are extremely well situated for heat distribution, and if, especially in London, the difficulty of fuel delivery is given as a reason for shutting them down, it must be replied that coal has to be delivered to every house or block of buildings in the district, and that this need would be largely eliminated if the system suggested were installed.

By linking these stations up with the super stations, the balance of the electrical load would be made up by the latter. This arrangement makes it possible to provide for a varying heat load and to bring into commission a larger proportion of the plant of the super station during the summer, when the minimum heat load would occur.

The Adaptation of Existing Plant.

Assuming there is a demand for heat in the neighbourhood of an existing generating station, the question arises, can the existing plant be adapted to meet both circumstances? It is, of course, clear that the utilisation of exhaust steam considerably reduces the electrical output, and would therefore involve putting into commission additional plant, and so increasing the fuel consumption and adding to the total cost of production. Against this added cost would have to be set the income from the sale of heat and the economies obtainable by using existing stations for supplying the heat load from the present boiler plant. This would involve the discarding of the condensing plant, and the electrical output would become a by-product. The price charged for the steam supply would be calculated not only upon its actual cost at the station, but also upon the cost of its distribution to the consumers. This would vary according to the distance to which the supply was taken, and should also be subject to any rise or fall in the price of coal.

Heat Requirements.

The heat requirements of a district, of course, vary. In a residential neighbourhood the heat load would be more constant, and included therewith would be the steam for hot-water supply. The maximum demand for this would occur in the morning, with a

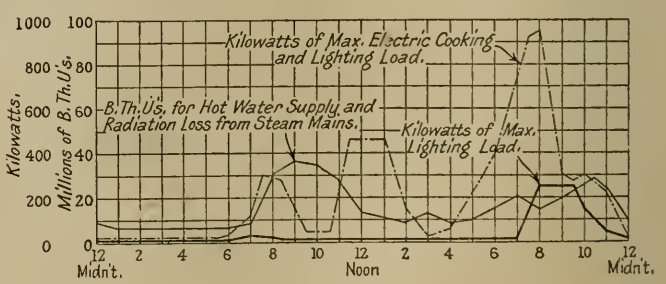

FIG. 2.

lower load in the afternoon, and an increased load again in the evening. Assuming the heat load indicated in Fig. 1 is for a complete day of twenty-four hours, the dotted line across gives the approximate rate of electrical output from generators designed to meet the working conditions, while the assumed lighting load (shown chain dotted) indicates that during certain hours of the day there is a considerable surplus of electrical energy available for other purposes. The lighting plus cooking load is also shown, and it will be noted that the possible electrical output from the heating and hot-water service loads covers the demand for lighting and cooking.

The Effect of the Heating Load.

Fig. 2 shows an assumed summer demand for hot-water supply, lighting and cooking, and it will be seen that the omission of th

* Abstract of Papers read before a Joint Meeting of the Institution of Electrical Engineers and the Institution of Heating and Ventilating Engineers.

heating load makes a great difference. Proportionately also the electrical output is much less, so that, although the lighting load is so small, when the cooking demand is added thereto the peak periods are above the line of the electrical output from the hot-water supply. In other words, if electric cooking were used to the extent shown in the curves there would be three periods per day when all the exhaust steam could not be utilised. It might be possible to provide some form of thermal storage to use the exhaust for the period if there were a large local demand for hot water.

The Utilisation of Waste Heat from Electrical Generating Stations.

By F. H. WHYSALL.

The majority of electrical engineers responsible for the operation of power stations for electricity supply deplore the fact that so much of the heat value of fuel is rejected to the condenser where steam is the source of energy for the prime mover. It has been suggested that special efforts should be made by supply authorities to surround their power stations with industries such as paper-making and sugar-refining, in order that they may sell their exhaust steam for use in industrial processes. Theoretically and thermally no fault can be found with this proposal, but it is when we come to the practical difficulties that doubts arise. In the first place, most of the undertakings with processes suitable for co-operation with this kind of power station are established in special districts. In many cases this difficulty can be overcome, on account of the ease with which electrical energy can be transmitted, and the discussion of this subject should follow the lines of putting forward commercial terms for the co-operation of steam-using industries with the supply authority so that the two may mutually benefit.

The problem is, where steam is required for heating or industrial processes within a radius of $1\frac{1}{2}$ miles of an electric power station, how can it be supplied from the power station with benefit both to the power station and to the consumer of exhaust steam? what are the conditions under which this supply should be given? and what are the commercial arrangements necessary between the parties to ensure mutual satisfaction? The commercial arrangements are the most difficult part of these proposals and, after they have been settled by agreement on some generally accepted scale of charges, we may expect a very great saving in fuel.

Steam Tariffs.

With regard to the charges to be made for exhaust steam, with coal at 10s. the proper charge would be 10d. per 1 000 lb. where the condensate is recovered by the supply authority and the distance is not more than one mile from the power station. For the supply of electrical energy as a by-product from an industrial works making a large use of steam, in order to make the arrangement a success it is necessary to allow the supply to be given when available, and this is equivalent to providing the waste-heat plant with a load factor of 100 per cent. The proper charge for a supply of this kind is 0·1d. less than the fuel cost of the supply authority for this load factor.

The chief point to bear in mind in working out the details of any such proposal is that the benefits should be equally divided between the parties under all the varying conditions likely to obtain in actual practice.

With regard to the supply of exhaust steam from a power station for heating purposes, each case must be considered on its merits. The heat available for transformation into electrical energy depends upon the temperature limits and, if the lower limit is raised to serve another purpose, the economy of generation must suffer accordingly. It is necessary to regard electrical energy as a by-product in this case and, in order to get the most economical results, the back pressure must be kept as low as possible, a maximum of 2 lb. (gauge pressure) being aimed at. This means that the exhaust-steam supply pipes and the calorifiers for the heating systems must be of such dimensions that this pressure is not exceeded. In agreements for supply, a back pressure of $\frac{1}{2}$ lb. per sq. in. at the consumer's premises should be specified. The engine unit must be of a size suited to supply the exhaust steam required for heating purposes when working under full-load conditions.

The Effect of Load Factor on Steam Supply.

The friction load of a 750 kW set is often equivalent to 5 000 lb. of steam per hour, and it is a very large building that will take more than this quantity. It is seen, therefore, that unless the 100 per cent. electrical load factor can be given to the sets used, there is very little profit on the arrangement. Where the heating load is small, an alternative is to "bleed" the turbine or to take off a supply from the receiver between the cylinders of a compound reciprocating engine, the remainder of the steam going to the condenser in each case. It is doubtful, however, in these cases if the electrical energy is generated more cheaply than it would be by a large modern electricity generating station using 11 to 12 lb. per kWh, and the fact that the provision of a load factor of 100 per cent. to the plant supplying exhaust steam for heating purposes is effected at the expense of the load factor at the main power station must be taken into consideration when comparing results.

The Finance of Distribution.

There is also the expenditure on the steam-distributing mains. It is a difficult matter to find room for steam mains which need to be of special design in order to prevent excessive radiation losses. These difficulties can, however, be overcome by an enthusiastic engineer, and wayleaves can be found most readily through the basement premises of buildings *en route*, the proprietors of these premises being induced in most cases to take a supply. The supply of exhaust steam for heating purposes is invariably most satisfactory to the consumer and the demand is generally ahead of the facilities for supply.

It is said that combined stations in America have been abandoned in many cases in favour of a separate central station for the supply of steam for heating purposes only, but this does not necessarily prove that there are not many cases where a properly organised system of collaboration between existing electric supply stations and heating consumers in congested city areas should not be profitable to both parties. It is my opinion that electricity supply authorities cannot afford to ignore the demand for exhaust steam or the possibility of obtaining cheaper supplies of surplus energy from generating stations established in works using low-pressure steam for industrial purposes, and every endeavour should be made by central station engineers to make collaboration a commercial success.

Enamelled Wire *and* Enamelled Wire.

By A SPECIALIST.

Just as there are men *and* men, so there is enamelled wire *and* enamelled wire, and one might say with equal truth in both cases the former is in the majority! Unfortunately, too, the nomenclature alone does not indicate in what class they stand. Every adult male human in the former case, and all black or brown (oxidised) covered conductor in the latter case, claim a common unclassifying appellation.

Non-British Wire for British Conditions.

As an early and persistent believer in the utility of enamelled wire, I view with real concern the flooding of our English markets from abroad with a material the major part of which, to say the best for it, is suitable for use only in cases where conditions are favourable, and reliability is not a serious factor. Unfortunately again, some of our home manufacturers are sacrificing the hitherto high quality of their product in an unwise attempt to compete with a material which will, in time, certainly be appraised at its true value. The uses of enamelled wire have, in the opinion of an eminent engineer with whom I was once discussing the question, "not been scratched," but the manufacturer must look to it that a suitable quality is maintained, otherwise he may find that enamelled wire has itself been "scratched."

The hand of the home manufacturer has perhaps been forced, and he is to blame only in so far as he is making little attempt to encourage the user to exercise some discrimination in his purchases. When one buys eggs, it is elementary economics to state one's needs—new-laid, fresh or cooking—*and to pay accordingly*; yet, incredible as it may appear, buyers of enamelled wire in nine cases out of ten ask simply for a quotation for the particular size or sizes required which, when received, is considered solely on the price. Could one but trace them, innumerable cases of ultimate trouble and expense (not to mention damaged reputations) could be found to have their root in this difference between the buyer of eggs and the buyer of enamelled wire.

The Buyer's Duty.

It must be recognised that there is good enamelled wire and there is bad. In some cases it is imperative that the very best be secured, while in other cases, such as in the production of cheap bells, indicators and like competitive lines, the quality is of less importance. It is certainly the buyer's duty to insist upon a high-grade wire whenever a high-class instrument is to be produced. If he will persist in his cheese-paring in regard to the cost, comparing his quotation from goodness knows where with the quotation from a reputable firm, then he must drive the latter from the market, or worse still, compel him to join the ranks of the purveyor of "cooking eggs."

Wire and Magneto Construction.

As a glaring instance of a penny wise and a pound foolish take as an example the construction of a magneto. As is well known, the English manufacturer was for years ostensibly striving to beat a product of his Continental and successful rival. Many, of course, claim to have succeeded, but—well, ask the motorist—he knows! To me, it is absurd to suggest that the English manufacturer cannot,

at the very least, equal the product of any rival if he only tackles the problem in a proper way. That proper way, obviously, is to take no risk, yet it is within my own personal experience that a firm manufacturing magnetos on a large scale actually dropped the use of an enamelled wire that was admittedly giving satisfaction, and purchased large quantities of imported wire, some even of unknown origin, with what results the said manufacturer alone knows. It cost less money per pound. That's all that mattered. True, this happened a year or more ago, but some of those magnetos are still giving somebody trouble. Think of it! In a magneto valued at anything up to £10, or even more, there is used approximately 4 oz. of fine gauge enamelled wire. This wire is a very vital part of the magneto, and the magneto becomes, perhaps, a very vital part of either a motor-car or a flying machine, and the satisfactory working of these expensive articles is risked for the sake of a few pence only. Enamelled fine wire has been used instead of fine enamelled wire. Do you see the difference ?

Clocks and Eggs.

It is not in magnetos alone that an infinitesimal saving on first cost is allowed to threaten a manufacturer's reputation. There are instances where a few shillings in an aggregate of several hundred pounds will exert more influence than should be permitted. This may appear an exaggerated statement, but consider the matter of a town hall or a public clock. It might be said that this is under observation every minute of the day. Should it stop, it is a subject of public discussion. The fact will, without doubt, be mentioned in the local paper. Whatever the reputation of the makers of that clock may have been, it will certainly suffer as a result. Surely every detail in the construction of such an equipment is worthy of the most careful consideration. According to his lights, the manufacturer does give that care to the minutest detail, but I claim, in the matter of enamelled wire, he still has something to learn. He has become familiar with silk and cotton-covered wires, the quality of which is apparent upon inspection ; but he must, for the sake of his reputation, be made to recognise that enamelled wire is quite a different proposition, and until he is competent to differentiate between " new laid, fresh and cooking," he should insist upon his buyer securing the highest grade material from a firm with a high-class reputation. Risk of trouble lies in any other direction.

You magneto manufacturers who have traced at least a part of your troubles to the enamelled wire : telephone engineers who have been compelled at enormous expense to replace faulty coils in a telephone exchange : cable-makers who have suffered rejections after expending time and money in completing a cable : makers of high-class instruments whose good reputation has been frayed at the edges by saving a few shillings (or pence) in an otherwise first-class instrument—should need no warning. You have had your lesson and should act accordingly. My appeal is made principally to those who have recently adopted, or are considering the adoption of enamelled wire, and to those users who are casting longing eyes on the " Factor's " price list, which is particularly alluring at this moment of money shortage.

No First-Class Wire at the Price.

A really first-class enamelled wire cannot be produced to compete with the inferior grades. The insulating compound is more costly ; extreme care and eternal vigilance is essential in its application ; while the close examination to which it is finally subjected (an operation entirely eliminated with the cheaper grades)—all spell extra costs ; yet cut one out for the sake of reducing the cost and what do we risk ? Here and there must inevitably occur brittle portions of insulation where cracks will develop when the wire is used ; understoved portions which have little or no insulating value rub off in winding and are withal vulnerable spots for attack under any adverse conditions ; rough surfaces, usually very small eruptions which flake off in winding, leaving minute bare spots, and other faults which the experienced eye and touch of the examining operator immediately detects and deletes, so that the buyer may, with confidence, use the wire received from end to end.

Some Insulation !

Many of the cheap grades of enamelled wire are covered by simple oxidising oils similar to linseed oil. The oxidation of the oil is, by boiling, carried to a maximum working limit. This, when applied to the wire and subjected to a moderate temperature, rapidly oxidises to the point of toughness, but what do we get on the finished product ? Not much more than a coat of paint ! To sum up, my advice to the user of enamelled wire is : When you are responsible for the production of high-class work, look askance at anything " cheap " or you may sooner or later add the two missing words.

A further point I should like to touch upon is the matter of impregnating coils which are wound with enamelled wire. This practice should, in certain cases, be encouraged. It is an additional precaution which wisdom dictates, particularly in cases where absolute reliability is essential. In this direction, however, trouble has sometimes been introduced instead of eliminated. Paraffin wax for this purpose must be rigidly avoided. Its deleterious effect may be plainly observed by immersing a sample of enamelled wire in very hot wax. Similar tests made in other oils, such as lubricating oils, show little or no deterioration in the covering. Every instance brought to my notice where impregnating varnish has failed in its function, has led me to the conclusion that the fault lay in the fact that the impregnating varnish and the enamel insulation had no affinity. Insulating varnishes—and enamel insulating medium comes within that category—not having a common base are certain to possess varying coefficients of expansion, and it will readily be recognised that, unless the whole mass expands and contracts in unison, separation and its evils must occur.

Hints for the Manufacturer.

To overcome this difficulty, cannot the enamelled wire manufacturer devise an impregnating varnish which he knows will have the characteristics of his stoving enamel ? This could be used in conjunction with his own product to ensure a thoroughly satisfactory result. Even where it is desired to retain the fine finish of an instrument, which a black impregnating varnish might impair, it should be quite possible to supply a clear varnish which would be equally satisfactory. In this direction, as in all others, utilise the knowledge possessed by your enamelled wire supplier. If he is at all alive he will render all the help he possibly can, and so help to popularise the product in which he is interested.

Modern Gas Works Practice.*

By H. C. WIDLAKE.

In perusing the second edition of Mr. Meade's book we are at once struck by the fact that the work possesses the much-desired, though by no means general, characteristic of being at the same time ambitious, comprehensive and thorough.

Our own interests naturally enough are largely centred in that portion dealing with the employment of electricity in gas undertakings, and we regard the section devoted to that subject as a very clear indication that old prejudices and conservatisms are being gradually swept away and are no longer permitted to interfere with the progress of a great industry.

We cannot help feeling, however, that this portion of the work is dealt with in a somewhat general manner, and takes very little account of those special conditions which have to be catered for on gas undertakings making an extensive use of electrical power. For instance, we hear from time to time of works in which practically every power-driven unit of plant is electrically driven, with perhaps the solitary exception of the coal gas exhausters. We find no mention of such extensive applications in Mr. Meade's book, and would have welcomed a section touching upon such matters as the electrical driving and governing of exhausters, the auto-control of water gas blowing fans, the driving of gas boosters (although this is perhaps a matter which falls under the heading of distribution). Another important matter which might well be included is a description of the precautions which should be observed when a single pole telpherage is introduced into a works which is already served by an ordinary double-pole system.

In most cases electrical power was first introduced into gas works in order to serve some form of electrically operated stoking machines (generally De Brouwer's in the earlier installations), but it is a far cry from those comparatively crude plants to the highly efficient and reliable lay outs which are to-day essential to a works which means to make the fullest possible use of electricity in its processes. It is in connection with such plants, capable of handling the most vital loads, that we should have welcomed further information.

In connection with the measuring of the works finished product we are surprised to find no reference to the Thomas meter, which constitutes a serious rival to the standard station meter in regard to first cost, area required for its accommodation, and its ability to provide the required information in graphic form.

In Mr. Meade's work we have a good book written by a good man, from the value of which the omissions we have noted detract but little as, in any case, the wise engineer who is considering the question of going over to electrical operation will naturally turn to a qualified consultant as a way of short circuiting the difficulties with which he finds himself beset.

The modern gas undertaking, with its many units of power-driven plant scattered over a wide area, affords an ideal field for the use of electrical power, and the acceptance of this fact by gas engineers is bound to have a most beneficial effect not only in regard to the cost of the works finished product, but in bringing about a broader view of the entire subject of power application.

In this respect Mr. Meade certainly voices the opinions of a rising and progressive generation of gas engineers.

* Modern Gas Works Practice. By Alwyne T. Meade. (London : Benn Brothers.) Pp. xi + 815. 2nd Ed. 55s.

The Institution of Electrical Engineers.

At the meeting of the INSTITUTION OF ELECTRICAL ENGINEERS on Thursday in last week, the Institution of Heating and Ventilating Engineers were entertained and two Papers on the "Utilisation of Waste Heat from Electrical Generating Stations" were read and discussed. The first of these Papers, which was from the heat engineering point of view, was read by Mr. C. Ingham Haden and the second from the electrical point of view by Mr. F. H. Whysall. Abstracts of these Papers will be found on another page of this issue.

The meeting was not very largely attended, and a majority of those present seemed to be visitors, although this is not evident in the discussion. This small attendance was a pity considering the importance of the subject.

As there was no formal business and the Papers were short the discussion was begun at a rather earlier hour than usual.

A Pioneer on the Future.

Col. R. E. CROMPTON, who seems to get younger every day, said that if the centrally situated generating stations which were now being altered into purely converting stations could be utilised for heat distribution, and the wayleave difficulty could be overcome, a useful method would appear to have been discovered of providing a new source of income for supply companies' shareholders. His opinion was that the present boilers should be utilised to supply heat as super-heated high pressure steam and so to avoid the transmission losses, which he feared would otherwise be ruinous. He did not think that heating would be carried out by any one system alone, and his view was supported by the enormous increase in the electric heating load which had taken place in the residential parts of London, even during the last twelve months. The principal cause of this increased demand was the "convenience-factor." It was true that the "efficiency-factor" of electric heating was exceedingly low; but at the point of use 90 per cent. of the energy present could be efficiently employed, and it therefore compared favourably with other methods from the consumers' pocket point of view.

Thermal Efficiency the First Objective.

Mr. F. BIGGIN, President of the Institution of Heating and Ventilating Engineers, said that many of the advantages of electric heating instanced by Colonel Crompton were equally present with heating by steam or hot water. In obtaining the highest efficiency from electric generating stations a great waste of thermal efficiency resulted and they, the heating engineers, considered it would be more practicable, wherever there was exhaust steam, to make thermal efficiency the first consideration. The world just now was calling for economy, and any method that would bring that about should be considered.

American Experiences.

Mr. W. H. PATCHELL said that the great question was, did our present methods pay? Up to the present it seemed that they had done so. Large blocks of business premises, other than factories, generally required more heat than light or power, and there obviously electricity would be a by-product. Some steam companies were running with 83 per cent. of the steam, which left the station sold and paid for. That was as much as many electricity supply undertakings could achieve. He gave an account of the development of steam supply for heating in Detroit and showed a photograph indicating the large amount of room taken up by the pipes. In that city special subways had been built to house the pipes. These were 8 ft. high and 8 ft. wide, and the top of the tunnel was from 25 to 40 ft. underground. There were two miles of these subways and they were used for steam pipes only. They contained one 12 in. high pressure pipe and one 20 in. low pressure pipe.

An Outside Supporter of Electricity.

Mr. A. H. BARKER thought that the subject under discussion should be considered entirely from the economic and hygenic angles. Experiments he had conducted in three L. C. C. cottages showed that 80 000 B.Th.U. per day supplied in the form of gas served the requirements of a house of four or five rooms in the cold weather, which, at 1s. per therm, would amount to £10 or £12 per annum. Solid fuel would cost about half this amount to give the same heat requirements, and it was extremely doubtful whether heat could be supplied from a central station through radiators, and with constant hot water, for anything like this sum, especially taking into account the need for providing against breakdowns. That meant that gas and electricity would have to be available as well as steam, and he estimated that to serve 100 000 cottages would cost £100 000, a sum which would only give a return of £6 000 a year. What the community needed was a supply of energy from which all the impurities had been filtered which could instantly be turned into light, heat and power. Electrical engineers undertook to manufacture energy of this kind, but at present in doing so they wasted about 90 per cent. of the raw material. Electrical, mechanical and gas engineers, physicists, chemists, and heating engineers, instead of fighting and sneering at one another should therefore come together and see whether they could not devise some way of manufacturing electrical energy without so high a loss. Gas people could put into their mains 80 per cent. of the energy of the coal, but even so they were obliged to make gas so expensive that the working man could hardly afford to use it. If electrical energy could get anywhere near that figure there would be no form of light, heat or power in the world which could compete with it.

The Mechanical Engineer's View.

The PRESIDENT announced that he was trying to call on heating and electrical engineers alternately, and asked Mr. Beauchamp to speak. Mr. Beauchamp, not being forthcoming, Mr. J. F. RAGGITT said that with regard to the suitability of existing power plant for supplying heat, presumably the bulk of this consisted of reciprocating engines. This was fortunate, as the steam turbine, unless specially designed, was not well adapted for exhausting against a back pressure, and, even when designed as a purely back pressure turbine, would not give such a large output as a reciprocating engine. He discussed the various types of engine in their relation to this problem and considered there was no unsurmountable difficulty in extending the scope of the operations to the heating of districts from combined heating and power stations. In any event, we could not afford to perpetuate a system which wasted 60 per cent. of the heat.

The Purest Grade of Energy.

Mr. W. M. SELVEY said that electricity was the purest and the highest grade of energy, and thought Mr. Barker was a little beside the point in talking about scrap heaps for every steam engine worked by rejecting steam at the lower limit, this being part of a definite process, not of obtaining energy, but of obtaining pure energy. It was a question whether it was more profitable to concentrate wholly on getting the largest possible amount of heat energy from raw material, or to devise processes whereby in the process of getting pure energy the remainder would be left in such a form that it could be usefully employed. After some remarks on the washing habits of the population, which it is as well were made in a cultured audience, Mr. Selvey pointed out that 10 per cent. thermal efficiency which Mr. Haden showed in his heating diagram was not the ideal they were working for. The whole point of the super station was that this figure should be increased at one bound to twenty, and they even had a station which might give twenty-five. If they could reach a figure which would more or less realise Dr. Ferranti's ideal of providing all their energy in the pure form there need be no need to worry about "scrap heaps."

Some Commercial Points.

Mr. W. W. NOBBS viewed with some alarm Mr. Whysall's suggestion of 10d. per 100 000 lb. as the proper price of steam with coal at 10s. a ton. He drew a lurid picture of the plight of many American companies who had fixed too low a rate.

Mr. J. F. DRIVER was an advocate for real central stations once more, in view of the fact that electrical engineers now threw away more than half the heat available in the coal and spent money in doing so. He thought that electrical engineers should follow the gas engineers' example and make a living out of by-products.

A New Thought on Central Stations.

Mr. W. NELSON HADEN's idea of a central generating station was one which would include generation and electricity, and the making of gas and heat, not to speak of a destructor plant. He was very eulogistic about the use of destructors, and mentioned the case of a fairly large town where the whole tramway service was run off such a plant. (Certain supply engineers could give him some other views on this subject.) One advantage of a station such as he suggested would be that the mains of the various services would radiate from one point, so justifying the expense of subways.

Mr. C. I. HADEN, in replying to the discussion, said that heating engineers wanted electrical engineers to realise that there was a demand for heat as well as for electricity, and for that reason he had suggested that retention of existing electricity stations when super stations were ready.

The PRESIDENT, in proposing a vote of thanks to the authors, said the cycle of operations in generating electricity by steam was efficient at the high pressure end and inefficient at the condensing end. Attempts must be made to alter that.

Annual Exhibition of the Physical Society of London and the Optical Society.

(*Continued from page* 73.)

Everett, Edgcumbe & Company.

A varied collection of measuring and controlling instruments was shown by EVERETT, EDGCUMBE & COMPANY. Among these, their E.H.T. voltmeter attracted attention as a new type which is likely to come into favour. It is based upon the principle first employed by Lord Kelvin, and subsequently developed by M. Abraham, the eminent French investigator, of the attraction of two oppositely electrified conductors protected by guard plates. The instrument shown had a maximum range of 40 000 V with additional ranges of 20 000 V and 10 000 V. It is illustrated in Fig. 16. Similar instruments are supplied for all pressures up to 200 000 V. The change over from one range to another is immediately effected by altering the distance between the plates. An important feature of these voltmeters is that, air being used exclusively as the dielectric, they give identical readings with direct current or alternating current of any frequency, which is not the case with electrostatic voltmeters depending upon the use of condensers; moreover, the latter instruments are liable to disturbance through variable leakage affecting the distribution of potential between the instrument and the condenser in series with it.

In the past the electrostatic principle has been considered as suitable only for comparatively large dial instruments, but Everett, Edgcumbe & Company have found it possible so far to reduce the dimensions that a 3 in. dial electrostatic voltmeter reading up to 2 500 V has now been evolved, and is very largely used for wireless installations where space and weight are often of great importance.

Special ohmmeters were exhibited by this firm for measuring the resistance, and thence the temperature, of rotors of machinery when in use, such as the running rotor of an a.c. generator. For the measurement of the temperature of the stator or other high tension windings, resistance units are embedded in the slots as near

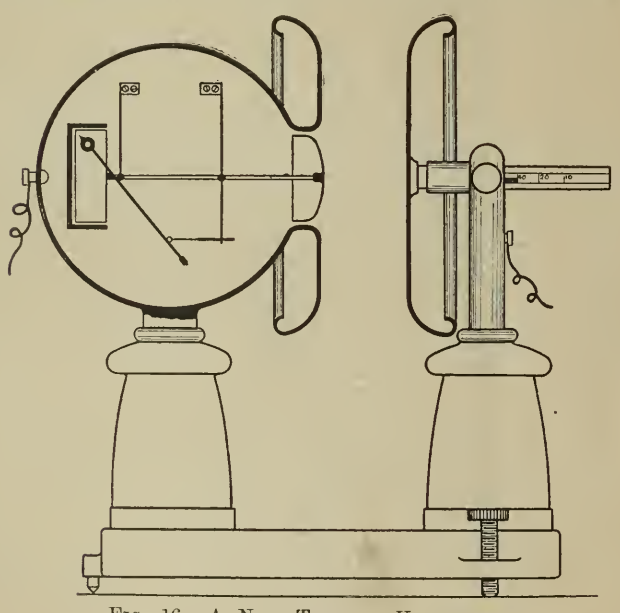

FIG. 16.—A NEW TYPE OF VOLTMETER.

to the conductors as possible, and are connected to an indicator graduated directly in degrees. We also noticed that the firm's illumination photometer had been modified by adding a second test plate. This is tinted so as to reflect only one-tenth of the incident light, thus giving a reducing effect of ten to one. By having this plate along with the usual white plate, two ranges are obtained, one up to 4 ft. candles, and the other up to 40 ft. candles.

Evershed & Vignoles.

Several instruments of interest to marine engineers were shown by EVERSHED & VIGNOLES. These included Needham's pulsator system, which we described last year, and a new form of revolution counter, also due to Mr. Needham. This apparatus is designed for the purpose of counting revolutions, or other operations, at any distance from the machinery. For revolutions up to 400 per min. it is made to count single revolutions; but, if required to count at a higher speed than this, the transmitter is suitably geared down from the revolving machinery so as to count one in every ten revolutions —a nought being added at the unit end of the counter dial. The counter, which is illustrated in Fig. 17, has the appearance of an ordinary mechanical counter; but its working parts are designed upon an entirely new principle. It is combined with a step-by-step motor driven by electric current derived from ordinary electric light mains. In order to secure that the counter shall operate with certainty, it is necessary that the motor, while sufficiently strong to rotate all the counter dials simultaneously when required, shall not move with such violence as to risk damage to the first dial when the latter only is rotated. The ordinary mechanically locked counter is therefore unsuitable, since it is liable to stick

FIG. 17.—NEEDHAM'S REVOLUTION COUNTER.

when all its dials are moved simultaneously, and therefore requires considerable power in reserve. The present counter consists of a number of dials, each arranged to be locked magnetically in any of ten positions corresponding to the digits 0 to 9, but mechanically quite independent, except during the time when a change of indication is in progress. The effect of this magnetic lock is to enable each unit to be made very free from friction; and it has the additional advantage that it helps to reduce the power necessary to change the indication of all digits simultaneously. The step-by-step motor is also novel. While providing ample power for moving the counter, its elements are light enough to work with certainty up to speeds exceeding 400 per min. The motor is of the rotary type, no reciprocating motion being employed. It operates with two wires only instead of the usual three, thus reducing the cost of installation to a minimum. It will work satisfactorily on 70 per cent. of its normal pressure, a feature which enables it to be used on ordinary electric light circuits; and its internal resistance is such that no variation of contact resistance in the transmitter will affect its proper working. The transmitter is a plain make-and-break mechanism, and is made in various forms to suit different requirements.

Recording Instruments.

The recording instruments by Evershed & Vignoles, Ltd., are on the Murday system, having rectangular co-ordinates. In the new design now shown the instrument is more compact, the clock being placed underneath the chart. A continuous roll of chart is provided, 65 ft. in length, or sufficient for one month at the rate of 1 in. per hour. The insertion and removal of the chart is very simple. A reservoir trough is provided for the ink, permitting a continuous record to be obtained on fluctuating loads for the whole period of the chart, without attention. In addition to the ordinary pattern, instruments are made in which two records can be obtained on the same chart.

Foster Instrument Company.

An interesting apparatus for the automatic control of temperature to follow a predetermined programme was exhibited by the FOSTER INSTRUMENT COMPANY. Various methods of automatic control have been proposed and used, but these have been mainly devoted to maintaining the temperature approximately at a constant figure. While this is a desirable condition for many operations, there are others in which the temperature should vary in accordance with a predetermined programme; for instance, in one important manufacturing operation, employing an electric furnace, it is desired that the temperature should rise fairly rapidly to a certain relatively low value, should be maintained at or near that value for a considerable period and should then be rapidly heated up to a higher figure, maintained there for a period and then slowly cooled. The device exhibited is designed to carry out such a programme. A thermo-couple is inserted into the electrically heated furnace, the temperature of which it is desired to control. This thermo-couple is connected to a recorder, the movements of the pen being therefore proportional to the temperature of the furnace. The record is produced by a clock mechanism in the recorder which depresses the pen alternately on to the ink drum at the side of the chart and on to

the chart itself. The pen is brought over to the ink drum by the clock mechanism and, after it has been pressed on to the ink drum and received ink, the clock mechanism leaves the pen free to take up the deflection proportional to the temperature of the furnace.

The Mechanism of Temperature Control.

A divided electrical circuit is arranged, one portion of which comprises the pen arm itself. In one arm of this circuit the contact is made between the pen arm and the circuit when the pen arm is moved over by the clock mechanism towards the ink drum. An alternative circuit is provided when the pen is depressed on to a metal plate which is fixed over the chart. This metal plate is virtually a " template " cut to the shape of the desired temperature programme. The electric circuits are shown in Fig. 18. There is provided in and connected with the recorder a divided electrical circuit coming from the main supply (for instance, a direct current lighting circuit) through the switch S, through a lamp resistance L to the pen arm P in the recorder. When this pen arm has moved over to the left, near the ink drum, it is brought into contact with the contact piece C, thereby energising the electro-magnet R, in a relay. This closes the secondary circuit on that relay, thus operating the motor M_1. The motor operates through a worm and worm wheel to increase the electrical resistance of the rheostat R, thus reducing the current through the furnace.

Alternatively, when the pen arm is free over the chart and is depressed thereon, if the temperature is below that determined by the template, the pen arm will make contact on the template itself and thus through the circuit C_2, and the relay R_2 will close the circuit of the motor M_2. This motor operates to decrease the electrical resistance of the rheostat R, thus increasing the current through the furnace. The circuit through R_2 and M_2 is only completed when the temperature is below that determined by the template. The speed of the motor M_1 is made less than that of the motor M_2 by shunting it with a lamp resistance L_1, so that as long as the temperature is below that determined by the shape of the template, there is a constant balance of tendency to decrease the electrical resistance of the rheostat R and thus to increase the current through the furnace. On the other hand, when the temperature has passed above the limits of the template (whatever that shape may be) there will be no contact made through M_2, but there will be a contact made through M_1 so that there will be a tendency then to increase the electrical resistance of the rheostat R, and thus to decrease the current through the furnace. In cutting the template it is of course necessary to allow for the time lag in the furnace.

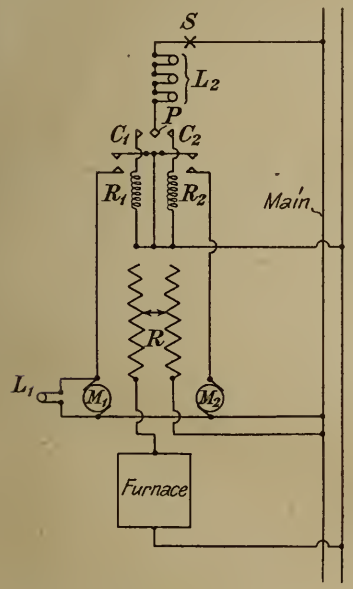

Fig. 18.—Diagram of Foster's Temperature Controller.

Nalder Bros. and Thompson.

A group of interesting and improved alternating current instruments on new principles were exhibited by Nalder Bros. & Thompson, Ltd. Some of them have already been described in our columns. Perhaps the most important of the instruments shown was the Fawssett-Parry relay. This is particularly sensitive and is intended for use in connection with the Merz-Price and similar systems of protection. In the original form of Merz-Price protection the winding of the relay is traversed by a capacity current flowing into the pilot cable and proportional (with the usual design of current transformer) to the current in the feeder to be protected. Thus the tripping current must exceed the value of this capacity current, and therefore a lower current setting, or a more sensitive relay, cannot generally be used. The Fawsett-Parry relay acts easily with one-tenth of the energy required by the ordinary relay. This is a great advantage where, say, a span of a medium pressure line drops on to dry ground, the fault current being then small.

The Fawsett-Parry Relay.

The Fawssett-Parry relay is in principle similar to a moving-iron ammeter. It is made up of rectangular stampings having a rectangular space cut away from the centre, but bridged near the centre by a fixed and a moving iron member in such a way as to leave small air gaps. These members are surrounded by three concentric coils, one of which carries the fault current and the other two the tripping current. The moving iron member is attached to a pivoted spindle carrying a switch arm, the whole being controlled by a small spiral spring. When a fault occurs the out of balance current causes the moving member to be repelled from the fixed member and to be attracted into a slightly tapering gap until the switch arm closes the tripping circuit through the outer two coils in series. This puts extra torque on the movement to make a good contact on the switch arm, and when this contact is closed the outer coil is cut out, leaving in just enough turns to keep the tripping circuit closed. By this means a maximum number of switches can be tripped simultaneously by a given battery. Once the switch

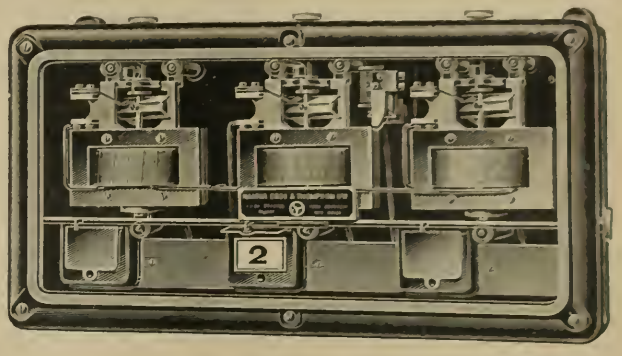

Fig. 19.—Triple Pole Relay Fitted with Inductance.

arm of the relay makes contact the process of tripping the main switch must go on until the latter is opened; this breaks the trip circuit, when the relay returns to its normal position and is thus self-setting. The relay is insensitive to vibration, and as the relay contact is held in always till the circuit is closed there is no sparking. The general appearance of a triple pole relay is seen from Fig. 19. Its field of application is in connection with the Merz-Beard and Merz-Hunter protective systems.

Siemens, Brothers & Company.

The exhibit of Siemens, Brothers & Company included several pyrometers and temperature recorders. Owing to the low E.M.F of platinum-rhodium couples, the needle of the instrument in that case is left free, and the record is made every 30 sec. by a chopper bar depressing the needle onto transparent paper, below which is a typewriter ribbon.

Several types of temperature indicator were shown, including a special locomotive pyrometer outfit, specially designed for use with the superheaters now fitted to most modern locomotives. This equipment consists of a copper constantan couple and a strongly constructed water-tight indicator. The thermo-couple consists of a copper tube, containing a stout constantan wire, wire and tube being insulated from each other by asbestos braiding and brazed together at the end which is inserted in the superheater. Since the copper sheath forms one element of the couple, the instrument responds very quickly to changes of temperature.

Muirhead & Company.

The exhibit by Muirhead & Company included an improved automatic transmitter, an artificial line box and a modified Heurtley magnifier. The original magnifier depended upon the variation in resistance due to the heating up of wires when displaced so as to be near flames. In the present model the flames are replaced by electrically heated wires. The arrangement is shown diagram-

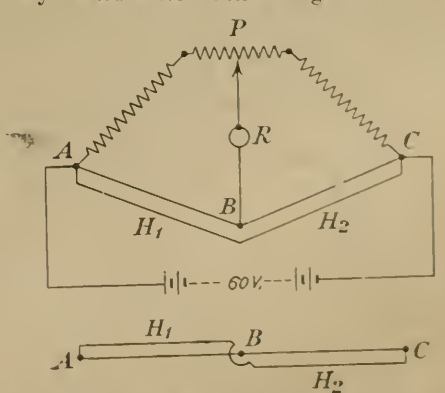

Fig. 20.—Diagram of Heurtley's Magnifier.

matically in Fig. 20. ABC is the moving wire, forming two arms of the bridge, and in proximity to the heated wires H_1 and H_2, one on either side. The bridge is balanced so that no current flows through R. A displacement of ABC towards H_1 or H_2 then upsets the balance and causes current to flow through R in one direction or the other.

(To be concluded.)

Correspondence.

SCREEN, COUNTERPOISE OR EARTH.

To the Editor of THE ELECTRICIAN.

SIR,—Capt. T. L. Eckersley's Paper on "Transmitting Aerial Resistances," as reported in your issue of December 23, 1921, has for me a very great theoretical interest, especially since I feel it is along the lines of a proper image construction of the overhead antenna that progress in greater radio efficiencies is to be made.

It would appear that the earliest disclosed departure from the original earth was that due to Fessenden (1902) in his famous "wave chute" patent. This was followed by a patent to Stone in this country. The theory of the wave chute was essentially that of a screening effect similar to that now suggested by Capt. Eckersley, with, however, this very important distinction, viz: Fessenden's wave chute was earthed at the ends, whereas the newer type of screen constructionally similar to a counterpoise is unearthed throughout.

The question is whether the counterpoise of old is exactly equal in its action to the properly adjusted type of screen suggested. Surely if the question is wholly one of earth current losses, the old counterpoise theory (screen wires insulated throughout) would indicate that a plate slightly above the ground would be better than a network of wires. Yet Lodge as well as Eckersley find that the counterpoise function pure and simple does not wholly satisfy the facts. Would it not be better to regard Eckersley's work as indicating that the earth ground should be eliminated (screened) as far as possible and that the best construction of the screen as to mesh, wire size, and extent are really dependent on the height (Lodge, Eckersley) of the aerial?

In a Paper submitted to the Institution of Electrical Engineers last summer I suggested that the prime necessity was to set up fictitious (or real) dielectric losses to an extent sufficient to produce a system of progressive waves on the antenna. The return through the screen of Eckersley, the wave chute of Fessenden, the earth of Marconi provide that resistance in series with the distributed capacitance which is equivalent to a hysteretic loading referred to in the issue of THE ELECTRICIAN for December 9, 1921. The distributed hysteretic inductance, for a given frequency, is then provided by the skin resistance of the aerial.—I am, &c.

Washington, D.C., January 5. A. PRESS.

THE EXPONENTIAL VALUES AND EXPANSIONS IN POWERS OF θ OF SIN θ AND COS θ.

To the Editor of THE ELECTRICIAN.

SIR,—Will you kindly allow me to correct a careless error in the last paragraph of my letter in last week's issue? To the exponential value of $\cos\theta + j\sin\theta$, each term of the expansion for $\sin\theta$ is multiplied by j, and the resulting series is added to that for $\cos\theta$.—I am, etc., G. W. STUBBINGS.

London, S.E.25, Jan. 21st.

RELATIVE STATUS OF ELECTRICAL AND MECHANICAL ENGINEERS.

To the Editor of THE ELECTRICIAN.

SIR,—With reference to your remarks in THE ELECTRICIAN of the 13th inst., dealing with the re-organisation of the electrical engineering staff of the L. & N. W. and L. & Y. Railways, you have drawn attention to a specific case where the electrical engineer of a large undertaking has been made subordinate to the chief mechanical engineer.

I should like, however, to point out that the majority of vacancies for chief engineers in supply undertakings are filled by mechanical engineers, and in many cases their knowledge of electrical matters is quite superficial.

An electrical engineer is just as capable of managing a supply undertaking as a mechanical engineer, probably more so, in view of the high standard of technical knowledge required when dealing with the various electrical problems which arise from time to time on the larger undertakings.

I believe that the present preference shown to mechanical engineers is due to the following:

(1) Most of the present chief engineers are mechanical men and therefore favour their own type.

(2) The majority of chief engineers were appointed in the days when a high standard of technical knowledge in electrical engineering was of secondary importance compared with a mechanical training.

In conclusion, I should like to say that the "talent" to which you refer, availeth an engineer very little as regards promotion.

Progress depends on influence, but in Government and municipal service seniority carries more weight than ability.—I am, &c.

"ELECTRON."

An appeal to members of the House of Commons has been issued by the INDUSTRIAL VEHICLE SECTION OF THE AUTOMOBILE ASSOCIATION AND MOTOR UNION on behalf of industrial vehicle owners and users with respect to the proposals of railway companies regarding road transport.

Salesmanship and Heating and Cooking.

The third of the series of lectures on "SALESMANSHIP" organised by the British Electrical Development Association was held at the rooms of the Chartered Institute of Patent Agents, London, on Friday last, when Mr. W. A. Gillott opened a discussion on "Salesmanship in Relation to Electric Heating and Cooking."

Capt. J. M. DONALDSON, who presided, in introducing Mr. Gillott referred to the intrusion into both electric heating and lighting of the fetish of the obsolete. To placate this fetish electric radiators were often fitted into fireplaces. This was a mistake, because an electric radiator was portable, and it was not always necessary to heat the whole room. With regard to cooking, an electric oven which could be mounted at a convenient height to save the necessity of stooping was required.

Different Customers, Different Methods.

Mr. W. A. GILLOTT said that salesmen would find that while fundamental principles were similar, different methods of attack must be employed when dealing with different classes of buyers, such as domestic users, hotels, restaurants and when selling appliances to the trade. In one case it would be found better to sell the idea as a means to an end, and in the other to expatiate upon quality and utility as a trade buyer should already be a convert.

Selling electric cooking and heating apparatus brought the salesman into touch with all classes of people. It was therefore necessary to know the subject thoroughly, especially in the case of domestic cooking where the housewife and cook would require advice regarding the methods which would secure the best results. Familiarity with kitchen language and tact were therefore essential qualifications, while a study of the principles of cooking and heating was necessary in order to be able to point out the advantages of using electricity as compared with other methods.

It was as well not to talk too much about price, but to keep cost in the background until the prospective buyer was interested. Quality was the thing to talk. This created a desire for possession, and it would be found that the cost was a secondary consideration. If the efforts to sell were unsuccessful, an endeavour must be made to discover the reason, and the experience used at the next attempt.

Some Important Points.

The claims of electric heating and cooking should be supported by positive facts, and in this connection the following points might be emphasised, cleanliness, the satisfactory cooking results obtained, that electric cooking meant low labour costs, especially in large kitchens, that electric cookers were convenient and safe, and that electric cooking was economical. Above all it should be the aim of salesmen to act in an advisory capacity to their clients.

When dealing with the domestic side of the business it would be found advisable to interest the housewife. This would not be difficult if it was explained how work could be reduced, how cooking could be done with very little attention, and time saved by eliminating stoking, attention to flues, manipulation of gas taps, turning of food, basting, &c. Everyone engaged in the electrical industry should run an electrical household.

Essentials for Development.

There were two essentials for domestic electric development, cheap electricity with a sympathetic supply authority and a small showroom with appliances demonstrating the capabilities of the apparatus. Co-operative effort by the heating and cooking manufacturers, the local supply authority, and the contractors, in giving a series of lectures and demonstrations in selected towns under the auspices of the British Electrical Development Association was suggested. It was regrettable, but none the less true, Mr. Gillott concluded, that electrical engineers on the whole were not salesmen, and the subject of salesmanship was not given the attention it deserved.

Colossal Savings.

Mr. A. F. BERRY, who opened the discussion, pointed to the colossal savings effected by the use of electrical apparatus. The purchase of certain types of ovens was an investment yielding something like 100 to 150 per cent. per annum. The real trouble was that electrical people did not believe that such economies could be effected, and it was a good thing for the industry that the public believed more in the advantages of electric heating and cooking than did electrical engineers.

Mr. STILL said that the heating business had been retarded by the use of heaters of small capacities for warming large rooms. Mr. ROGERS on the other hand referred to a building in the West End where heaters of too large a capacity for the wiring had been installed with bad results.

More Faith Necessary.

Mr. PRENTICE also urged that electrical people should have more faith in electrical apparatus. Salesmen should be con-

versant not only with the good points of the particular cookers they were selling, but with the methods of working them.

A Speaker, whose name we did not catch, said that salesmen should stick to selling goods, the education of the public being left in the hands of the British Electrical Development Association.

Mr. E. R. Morton asked that a hiring scheme should be evolved for electrical apparatus, while Mr. A. G. Whyte pointed out that in Glasgow there were people actually waiting for electric cookers owing to the attractive hiring charges.

Cleanliness and Hiring.

Mr. Howell pointed out that if salesmen were to talk about the cleanliness of electric cookers they should keep their own showrooms clean. More co-operation was needed between the supply authorities and the sellers of apparatus. Mr. W. E. Warrilow also supported the evolution of a hiring system, as in such a system in his opinion lay the solution of the problem.

Education of Architects.

Mr. Young insisted on the need for the education of architects in the usefulness of electricity for heating and cooking. He suggested that a special fund should be provided for E.D.A. to carry on this work.

Mr. Gillott in replying to the discussion agreed that more attention should be paid to the electric water heating apparatus, and referred to a case where money had been saved by these methods owing to it having been formerly necessary to keep the fire alight all night. Capital charges for increasing the distribution network were not so great as were sometimes supposed, as at Billingham, where about seventy houses were electrically equipped, the average maximum demand per house did not exceed 0·8 kW, with 11 kW installed in each house. The education of the public, he thought, was the business of the supply authorities because they were going to get something out of the use of the apparatus, while when a manufacturer had sold his goods he had nothing more to come.

The Protection of Alternating Current Systems.

In a Paper read before the Newcastle Students' Section of the Institution of Electrical Engineers, Mr. R. W. Biles described the characteristic features and relative advantages of the various forms of protective apparatus in general use, and said that the Merz-Price system was now in operation on a 66 000 V system.

With the use of split conductor protection, employing split switches and non-reactance current transformers, if it was desired to take off a small tapping in the middle of a line, in all probability the cost of an additional split switch would not be warranted, and he therefore suggested three arrangements for giving the required supply without the necessity of providing such a switch. These were: (1) To install two precisely similar transformers, each having a capacity equal to half the load required, with H.T. fuses between the transformers and the split conductor line, overload protection being provided on the L.T. side of the transformers; (2) to instal a single transformer with a double H.T. winding, one winding being connected to each split, with H.T. fuses, &c., as before; (3) to instal one transformer with a L.T. switch and with H.T. fuses in each tapping line. Scheme 1 was costly, scheme 3 was the most economical, but introduced certain disadvantages; whilst scheme 2 was probably the most satisfactory.

The author recommended the following as the most suitable type of protective gear to use in particular cases. For the protection of open-ended feeders—earth leakage. For the protection of closed feeders, ring mains and interconnectors—Merz-Price, split conductor, or Hunter four-core. For the protection of generators and transformers—Merz-Beard self-balance, Merz-Price circulating current, or "Between Turns."

New Electrical Society for Glasgow.

A meeting, under the auspices of the Glasgow Branch of the Electrical Contractors' Association for Scotland, was held in the Ca'Dora Restaurant, Union-street, Glasgow, on January 18, Mr. R. A. Ure, Chairman of the Glasgow Branch of the Electrical Contractors' Association, presiding. There was a large attendance representative of the Electricity Supply Authority, Manufacturers, Factors, Consulting Engineers, and Associated and Non-Associated Contractors.

The Chairman explained that the meeting had been called with the view to inaugurating an Electrical Society which would be representative of the various callings constituting the electrical industry. The feeling was expressed that the lack of cohesion of effort on the part of those engaged in the trade was retarding progress generally, and while they as engineers recognised the I.E.E. as their parent institution, some means of meeting under less formal conditions was essential. The proposal to form such a society was agreed to unanimously, and a committee was formed to frame a constitution and report at the next meeting to be held in February.

The Installation of Shaft Cables.

In a Paper read by Mr. E. E. Shatford on the "Installation of Shaft Cables" before the North of England Section of the Association of Mining Electrical Engineers, in Newcastle, it was stated that the types of cables generally used for colliery work were bitumen insulated, paper insulated lead covered, or a combination of both. A shaft cable of any type should be double wire armoured, for mechanical protection, and should have a compounded jute serving over all to protect the armouring from corrosion. The practice of splitting the load between two or more shaft cables was commended, the increase in cost being small proportionately to the advantages gained in the way of security. If the shaft cable was to be looped into one or more seams on the way to the pit bottom, it was advisable to loop in one cable only and to run a second cable direct to the pit bottom, disconnecting boxes being installed at each seam and at the pit bottom.

Installation of Shaft Cables.

The simplest method of installation was to mount the cable drum in the cage, the cable being payed out and cleated up as the cage descended. If the cage was too small to permit this to be done, the cable must be lowered end on until the whole length hung in the shaft. The safest method of lowering the cable was to lash it to a steel rope controlled by the haulage gear, and to lower both cable and rope together. When the final position was reached the cable was fixed into the top cleat and the lashing removed to a point below the second cleat, which was then fixed, and the process repeated until the cable was cleated throughout its length when the steel rope might be withdrawn. If haulage gear was not available the wire rope might be controlled by means of locomotives and spragged trucks, the cable and wire rope being laid out on rollers along the sleepers and lashed together before lowering commenced. When lowering by this method the greatest strain was put on the cable where it passed over the pulley. The cable must, therefore, be kept moving until the final position was reached, and a cleat fixed at once to release the strain. When lowering shaft cables the cable should be run over a large grooved pulley fixed over the shaft in such a position as to lead the cable as near as possible into its ultimate position. This pulley should never be less in diameter than the barrel of the drum, and particular care must be taken to avoid a twist or kink in the cable.

Cleat Design.

The cleats used for supporting cables in shafts should be made of hard wood about 2 ft. 6 in. to 3 ft. long, provided with three or four iron straps and $\frac{3}{4}$ in. bolts. They should be bored to the exact diameter of the cable, the thickness of the saw cut when cutting the cleat longitudinally would ensure a good friction grip on the cable. The distance between the cleats would depend largely upon the weight of the cable, but a good average is 20 to 25 yds. apart and no cleat should carry more than 8 cwts. All cleats should be provided with sheet iron hoods to keep off water and deflect falling stones.

The practice of suspending a shaft cable from the top only was not recommended except for very shallow shafts, on account of the stresses set up immediately below the suspender. This method had the advantage of offering no obstacle to falling material.

Surface Cables.

The soil around pit-heads was notoriously injurious to armoured cables owing to the amount of made-up ground, ashes, &c., usually present, and care must be exercised when laying out the runs. There were only two methods which merited serious consideration from a safety point of view: A culvert built between the power-house and the shaft, with brackets fixed to the side to carry the cables, the top of the culvert being covered with iron plates of stone slabs, or cables slung overhead between the power-house and headgear by suspending from a catenary wire when passing over open ground, or run along the buildings where convenient. Cables laid in the former manner were accessible and repairs or extensions can be effected conveniently. The second method permitted of the cable always being in view. The suspenders should be substantial in construction and of generous width.

Jointing.

Unless the shaft cable was to be looped into one or more seams it should, if possible, be manufactured and installed in one length. If this was impracticable, a horizontal joint should be made in an existing heading. A vertical joint in the shaft could be made, but should be avoided whenever possible, as it was difficult to make in dry shafts and practically impossible in wet shafts. Sweated joints on the conductors should be made, where possible, but if naked lights were not allowed, mechanical connectors must be used. They should give a sound mechanical grip on the strand, and good electrical contact, the resistance across the connector being at least equal to a similar length of uncut conductor. The glands of joint boxes, if the cable was bitumen sheathed, should be provided with long bearing surfaces to prevent damage at this point. The continuity of the armour wires across the joints must be provided for by means of a copper bond.

Electric Traction in Chile.

We announced a few weeks ago that the Westinghouse International Electric Company had secured an important railroad electrification contract in Chile, where the total railway mileage is 5 200, of which about 30 per cent. is privately owned, the remainder being divided into broad gauge and narrow gauge lines. The former extend south from Valparaiso by way of Santiago to Paerto Montt, with numerous branches. The conditions that arose during the war brought forcibly to the attention of the railway management the necessity for electrifying the broad gauge lines, especially the Valparaiso-Santiago line with the Los Andes branch, where traffic was rapidly approaching the track capacity. In addition fuel costs were excessive, while almost limitless water-power was going to waste.

Electric Traction Decided on.

A commission appointed in 1918 to study the problem, reported in favour of electric traction, and on account of the possible economies it was decided to electrify the broad gauge lines, beginning with the Valparaiso-Santiago and Los Andes branches, or the first zone. A loan of $10 500 000 for the purpose was heavily oversubscribed in a few hours.

The initial electrification will include 116 miles from Valparaiso to Santiago, and 28 miles from Las Vegas to Los Andes, the terminus of the Transandine Railroad, a narrow gauge line ; while the narrow gauge longitudinal railroad runs north from Calera, an important station on the line to be electrified. The maximum gradient in this zone is 2·25 per cent., approaching La Cumbre (the Summit) from the west ; there are a relatively large number of curves, the maximum being 10°. The track gauge is 5 ft. 6 in., and there are six tunnels on the main line, the longest (the San Pedro) being 1 600 ft. in length. Three of the tunnels are on the most severe gradient approaching the summit.

Electrical System.

The 3 000 V direct-current system was decided upon as best suited to the conditions. Hydro-electric power will be generated at the Maitines station of the Chilean Electric Tramway & Light Company. This station is being constructed and will utilize the waters of the Rio Colorado. The station will contain three three-phase 8 125-kVA Westinghouse generators (50 cycles), and will have an ultimate capacity of 30 000 kW. This power will be transmitted 37 miles to Santiago by twin-circuit 110 000 V transmission lines. These transmission lines will be connected at Santiago with the system fed by the Florida hydro-electric and the Mapocho steam stations, both of which were constructed some years ago by the Germans and were designed for 50 cycles three-phase power. The total capacity of the three generating systems will be, when completed, approximately 120 000 kW.

Sub-Stations.

The power supply will be distributed by five sub-stations designed to handle a train movement that is approximately 50 per cent. greater than that existing in 1917, with a further provision for tripling the 1917 traffic demands, if necessary. Each station will contain two 2 000 kW motor-generator sets, each set consisting of a 2 800 H.P. driving motor, and two 1 000 kW, 1 500 V generators connected in series. These sets will be designed to withstand a 200 per cent. overload for five minutes without injury, and as an additional safeguard the Westinghouse flash-suppressor will be included. Sub-stations Nos. 1 and 5 will receive power at 12 000 V and Nos. 2, 3 and 4, at 44 000 V. Transformers and switching equipment will be of the latest design, and the Westinghouse developed power-indicating and limiting equipment will be installed.

Electric Locomotives.

Thirty-nine electric locomotives are required for the initial electrification, including six express passenger, eleven local passenger, fifteen road freight, and seven switching locomotives. The main points of interest about these locomotives are given in the following table :—

Type Loco.	Weight.	Length.	Wheel Arrangement	No. of Motors.	Total H.P.	Max. Speed.
	Tons.	Ft. in.				M.P.H.
Express passenger	127	58 6	2-6-0 - 0-6-2	6	2 250	62½
Local passenger..	80	40 6	0-4-0 - 0-4-0	4	1 500	56
Road freight ..	113	49 10	0-6-0 - 0-6-0	6	1 680	40
Switching	65	40 —	0-4-0 - 0-4-0	4	480	34

The locomotives will be equipped with Westinghouse motors. The express-passenger and road-freight locomotives will be equipped with the Westinghouse system of regenerative breaking, with its most modern development, but the local passenger locomotives will not require or justify the regenerative braking feature.

Electrical Undertakings in India.

The Department of Overseas Trade has received the Third Supplement to the List of Electrical Undertakings in India, revised to October, 1921, which contains financial and technical details of the various licenced electrical undertakings in India. A copy of this Supplement may be seen on application to the Department (Room 84), 35, Old Queen Street, Westminster, London, S.W. 1. A further copy is available for loan to firms in the provinces (Reference E.D. 7 753.)

Future of Trolley Omnibuses.

In the course of a discussion at an Institute of Transport meeting at Warrington, last week, it was suggested that the availability of a cheap and abundant supply of electricity might result in the development of trackless trolley omnibus systems in places where it is not possible, owing to the heavy expenditure involved, to build the ordinary tramway track. The point was suggested by a lecture by Mr. E. H. Edwardes, general manager of the Lancashire United Tramways, Ltd., who, in his Paper, discussed the relative merits of the :—(1) Electric tramway, (2) trackless trolley traction, (3) motor omnibuses, (4) motor coaches. Mr. Edwardes was of opinion that all these systems had come to stay, would be further developed, and become more efficient. From estimates, after taking into account capital expenditure, the most economical form of road transport for heavy traffic, with regular services of not less than ten minutes' frequency, was the electric tramcar ; for services of ten to twenty minutes' frequency, trackless trolley traction ; and for anything less frequent, the motor omnibus. A form of traction had yet to be invented which could carry large numbers of people reliably and quickly, at as low a cost per passenger as the electric tram. The trackless trolley type of vehicle had been greatly improved recently, its seating capacity was now considerably greater than that of the motor omnibus, and operating costs were actually cheaper.

New One-Man Tramcar.

The London United Tramways are experimenting with a new one-man tramcar of their own construction. The new car is modelled on the lines of the " safety car " which is so widely used in America. It has been approved by the Ministry of Transport, and has been licensed by the Commissioner of Police. The vehicle is a single-decker, and when running the whole of it is closed in. The motorman sits in the front part of the car in a vestibule, somewhat after the manner of the modern cabriolet motor-car. He operates the car by means of a controller with his left hand, and with his right hand operates the brake, which is of a patent hydraulic type, merely by a turn of the wrist. The brake is of the slipper type, and works on the rail instead of on the wheel. It is held off by the hydraulic pressure, so that in the event of any failure it operates automatically. Further, if the driver lets go of his brake handle, through sudden illness or any other cause, the power is cut off and the brakes applied. Passengers board and alight from the car at the front end, the door and step working in unison, and being operated by the motorman by a lever in the cab. The car cannot be started until the door is shut and the step folded. The experimental car is being tried in the Kingston district, and, if it gives satsfactory results, a number of similar cars will be built by the company. With these small, handy cars it will be possible to give the public a more frequent service in suitable districts, instead of a less frequent service of larger cars.

The Tramways Question in Edinburgh.

Lecturing on the subject of city transport before the local Merchants' Association, Councillor Moncur, Convenor of the Tramways Committee of Edinburgh Tramway Council, said that the introduction of the cable system into Edinburgh was a blunder. Last year the amounts for running charges of the cable cars worked out at 3·75d. per car mile, against 0·5d. per car mile for the electric cars in Leith, and a proposal to save, say, 3d. per car mile, or a total of £75 000, was not one that could be lightly turned down. Last year the maintenance charges were 5·9d. per car mile for the cable cars, and 2·9d. for the electric cars. The electric overhead system had been shown to be the most economical, efficient, and elastic method known to engineering, and it was with the knowledge that they would be assured of that efficiency that it was decided to run no risk even in Princes-street. He could not believe that the erection of centre poles and wires in Princes-street would detract from the amenities in any way. In any case, he considered the advantage of a uniform system far outweighed any sentimental objections.

The Dean of York, whose *locus standi* in the matter is not quite clear, writes to " The Times" " protesting against the proposed action of the city authorities, which would disfigure the street and interfere disastrously with the view." " Surely," he continues, " an effective endeavour will be made to save Princes-street before it is too late by lovers of beauty throughout the kingdom, and by some who have more right to speak and more influence to exert than one who is merely an occasional visitor with a great love of Scotland and of romantic beauty." We feel sure that the financial arguments of Mr. Moncur will appeal more to the canny Scot than the æsthetic ones of the Dean.

The Municipal Electrical Old Stagers.

The question is : When is a municipal electrical engineer an old stager? The answer : When, having been in municipal service before midnight on Dec. 31, 1900, he has ever been a chief. Fifty-one of them, among whom were Messrs. S. W. Baynes, J. K. Brydges, J. E. Edgecombe, R. F. Ferguson, A. L. C. Fell, A. Gay, J. S. Highfield, F. Harman Lewis, W. W. Lackie, E. T. Ruthven-Murray, A. Page, H. Faraday Proctor, G. Scott Ram, Sir John Snell, J. E. Stewart, C. D. Taite, H. Talbot, T. P. Wilmshurst, and C. H. Wordingham, sat down to dinner at the Hotel Cecil on Friday last, with four guests, namely, Ald. W. Walker, Chairman of the N.J.I.C. Electricity Supply Industry, Mr. H. Booth, Mr. W. L. Madgen, a list of names of those who were prevented from being present, and letters from Alderman Pearson, who has been Hon. Solicitor of the I.M.E.A. for so many years, Mr. A. B. Mountain, one of the founders, Mr. A. P. Trotter, Mr. A. Bromley Holmes, and others.

After dinner a group photograph was taken, which we reproduce herewith, and brief reminiscences were given by Messrs. Baynes, Chamen, Christie, Highfield, Ruthven Murray, Faraday Proctor, C. H. Wordingham and R. Birkett. The note of cordial good fellowship and cheeriness was most marked, and all those present seemed greatly to appreciate the opportunity afforded of meeting old friends,

The "Municipal Old Stagers"—After Dinner.

first Hon. Secretary of the I.M.E.A., and Mr. S. T. Allen, President of the I.M.E.A. All these were under the chairmanship of Mr. Arthur Wright, the first President of the I.M.E.A.

The Essential Idea.

The essential idea of the gathering was the reunion, under circumstances as informal as possible, of old friends who had borne the burden and heat of the day in municipal electrical supply. There was only one toast in addition to the loyal toasts, namely, that of the Old Stagers themselves, proposed by Ald. Walker and responded to by Mr. A. Wright and Sir John Snell.

The Organising Hon. Secretary, Mr. C. H. Wordingham, read well remembered, though not seen for many years. Through the kindness of Mr. Hughman, the menu card bore an excellent reproduction of a block published by "Lightning" ("Electrical Times") in 1896 of some of the original members of the I.M.E.A., while Mr. Bentell lent a set of seventeen framed autographs of early members of the I.M.E.A., of whom eleven were present at the reunion. These were a centre of great interest and pleasure. A number of early I.M.E.A. photographs were shown by Mr. H. Faraday Proctor. Many present expressed the hope that the function might become an annual one, but opinions differed as to whether the time limit should be raised as the years went on, or whether the original limit should be maintained until only two toothless, deaf and blind old men were left to hobble in and dine on one another.

Domestic Engineering.

Before the Women's Engineering Society on Tuesday, Miss Gwynne Howell delivered a lecture on "Domestic Engineering," in which she dealt mainly with electrical labour-saving appliances. The lecturer emphasised the need for educating women to the advantages of these appliances, and so to create a demand and bring down the initial cost, which at present was quite beyond the means of the average housewife. Many of the most useful appliances, such as washing machines, were far too bulky for the ordinary house, flat, or maisonette. What was wanted were smaller, more compact machines, and, above all, utility motors which could be attached to several appliances. A further necessity was a universal voltage. In one showroom in London the appliances on one side of the room could not be worked on the same voltage as on the other side. Small labour-saving appliances, such as electric toasters, were being put on the market almost daily, and were becoming a snare to the housewife, as to possess too many of these only meant a change from one kind of work to another, on account of the additional polishing required to keep them clean. An interesting discussion followed.

The Revo Electric Iron.

The following letter, which was written to the Cable Accessories Company on Jan. 12, by Mr. H. W. Teeton, of the Foundry Works, Hanley, is, as the writer states, a good testimony to the excellence of the Revo electric iron :—"I have returned to you to-day, per post, one Revo electric iron, which I supplied to a customer on Dec. 16, 1920. The iron is a 100 V one; it has been in use since this date on a 200 V circuit, and has now burned out. The failure appears to have been in the mica insulation and not in the element itself. I have supplied my customer with a new iron, as I thought it might interest you to see this one, which is certainly a good testimonial to the capabilities of the Revo iron."

An Open Competitive Examination for 15 situations as assistant engineer in the Engineer-in-Chief's Department of the General Post Office will be held in London, Edinburgh, and Manchester, beginning on April 20. Particulars may be obtained on application to the Secretary, Civil Service Commission, Burlington-gardens, London, W. 1.

The S.-E. Lancashire Inquiry.

The inquiry into the South-east Lancashire electricity scheme was concluded on the 19th inst., three days being sufficient for the investigation. After Mr. Tyldesley Jones, K.C., had explained the general principles of the scheme, Ald. W. T. Dagnall, chairman of Manchester Electricity Committee and of the committee responsible for the scheme, gave evidence. He said he did not think that the scheme would suffer by the exclusion of Stalybridge. A smaller Board than forty-eight would be more manageable, but it was not intended the whole Board should do the work. A smaller committee would present its recommendations to the Board.

Mr. S. L. Pearce, electrical engineer of Manchester, gave details of the technical proposals. He said that the statistics compiled by the committee had been criticised, and evidence had been called to support them.

Adjustment of Areas.

At this stage the Town Clerk of Macclesfield, which is not at present included in the provisional district, asked that the town should be included. With a cheap and good supply of electricity, Macclesfield was likely to undergo considerable industrial development, and his Council had passed a resolution favouring inclusion in the scheme. Evidence to a similar effect was given by the Clerks to the Macclesfield and the Bollington Rural Councils, two neighbouring authorities. The boundary of the Macclesfield rural district was within four miles of the Stockport generating station, and Bollington Council felt it was more likely to be helped by South-east Lancashire than by the North Wales area, with which it is now grouped.

The Town Clerk of Buxton asked that his Council's area and those of the neighbouring authorities of Hayfield, Whaley Bridge and New Mills (at present in the North-east Midlands area) should be excluded altogether from any electricity district. If any district was entitled to exclusion on account of its geographical position, that district was Buxton, which was cut off from Sheffield by the Pennine Range.

Sir John Snell said the Commissioners were agreed that physical and economic difficulties were involved in associating Buxton with the Sheffield area.

The Town Clerk replied that more help might possibly be given them by South-east Lancashire than by the Sheffield area, but even from South-east Lancashire they could not expect anything during the next ten, fifteen, or possibly twenty years.

Sir John Snell reminded the witness of the possibility that the railway line between Manchester and Buxton might be electrified—a possibility which lay within the limits of practical politics. Supposing that were done, would Buxton object to receiving such an advantage, and would the association of Buxton with the South-east Lancashire area be considered a disadvantage during the years that might intervene before that electrical inter-connection could be established?

The Town Clerk said he thought not. If, by coming into the area, Buxton could in any way help towards electrifying the line from Manchester, then Buxton would be pleased to come in. But if they were to derive no benefit during the next ten or fifteen years there was the question of the contribution. It was a trifling amount, certainly—only ten guineas a year. From the residential point of view, and from the point of view of community of interest, Buxton was more nearly tied to South-east Lancashire and Manchester than to any other district.

Approval of Railway Companies.

At this point Mr. Tyldesley Jones, K.C., informed the Commissioners that the railway companies in the area, subject to one or two points on which a provisional arrangement had been made, were in agreement with the scheme.

Continuing his evidence, Mr. Pearce said that £13 000 000 represented the cost of extensions of plant which would be required in the ordinary course if the existing systems were continued in the area; it did not, however, mean that an expenditure of £13 000 000 was proposed under their scheme. Actually the scheme was an attempt to save £1 400 000 of that £13 000 000, which would otherwise be incurred. Personally, he was sanguine about the prospects of carrying out the scheme, which rested on a basis of voluntary co-operation. At present there was voluntary connection among authorities which between them accounted for 80 to 85 per cent. of the total number of units generated in the area.

The scheme had been unanimously adopted by the authorities represented at the conference, and at the same time keen hostility was shown towards the idea of setting up a joint electricity authority. As far as he could discover, no undertaking was willing to transfer its generating plant or main transmission lines to a joint authority, and such an authority, to be completely successful, must dominate the whole area—which implied a system of common ownership and common operation, with ample financial powers. As a technical scheme the present proposals were the best which the engineers could put forward.

Opposition of Stalybridge.

The attitude of the Joint Electricity and Tramways Board of Stalybridge, Hyde, Mossley and Dukinfield, which desired to be omitted from the scheme, was explained by Mr. T. Eastham, and Mr. Pearce admitted, in reply to Mr. Eastham, that the Stalybridge undertaking, owing to the non-standard frequency of the current which it supplied, would be precluded for many years from benefiting by inclusion in the scheme. The rest of the area would not be injured if Stalybridge stayed out.

Mr. Eastham objected that it would cost Stalybridge £400 or £500 a year to be included in the scheme.

Sir John Snell asked if Stalybridge would object to being included if it were not asked to contribute to the expenses of the Board.

Mr. Eastham replied that if he were informed that Stalybridge need not pay anything he would obtain fresh instructions.

Mr. Tyldesley Jones said he could not suggest that Stalybridge should pay nothing, but he would suggest that the Stalybridge contribution should be put on a nominal basis of twenty guineas.

More Boundary Adjustments.

On the 19th inst. the Clerk to the Rural Council of Chapel-en-le-Frith asked that part of his rural district should be included in the South-east Lancashire district. At present the whole of Chapel-en-le-Frith was included in the North-east Midlands (Sheffield) area. The rural district embraced seventeen parishes, and as it might be a long time before electric current could be taken across the bleak expanse dividing one part of the rural district from the other, he thought it desirable that the nine parishes to the north of the Pennines should remain in the Sheffield area and the eight parishes to the south be transferred to the South-east Lancashire area.

Mr. Tyldesley Jones, K.C., said the promoters offered no objection to the inclusion of the eight parishes in South-east Lancashire.

Mr. C. D. Taite, chief engineer and manager of the Lancashire Electric Power Company, also gave evidence in favour of the scheme. The electricity undertakings in the area included some of the most efficient in the country. In the statistics prepared for the inquiry the Lancashire Power Company's costs were the lowest, and at present the undertakings of Bolton, Bury and Stalybridge were first, fourth, and sixth respectively in the United Kingdom for the lowness of their working costs.

Agreement with Stalybridge.

After a consultation Mr. Eastham announced that the Stalybridge, Hyde, Mossley and Dukinfield authorities were prepared to come into the scheme, though they did not expect to get any material benefit for the present. They had been impressed by Mr. Pearce's views of its possibilities and were anxious not to do anything to spoil it. It had been agreed that a special clause should be added to the scheme, recognising the case of the Stalybridge joint board as a special one, allowing the Joint Board to retain its frequency of forty, and limiting its financial contribution to twenty-one guineas.

Sir John Snell expressed the Commissioners' satisfaction that agreement had been reached, and a difference of opinion having developed over the drafting of the clause, Sir John said that the Commissioners would settle the points at issue themselves.

Mr. Perkins, who appeared for the Yorkshire Electric Power Company, objected to the inclusion of Saddleworth and Springhead on the ground that it would mutilate the Yorkshire company's area.

Mr. Eastham opposed Mr. Perkins's application on behalf of the Stalybridge undertaking, which also has interests in Saddleworth and Springhead; and Sir John Snell observed that as far as he could see, the powers of the Yorkshire Electric Power Company would remain entirely unaffected by the scheme.

Position of Advisory Board.

A long discussion took place between Mr. Tyldesley Jones and the Commissioners over a clause which gave a constituent authority the right of appealing to the Commissioners against the Advisory Board's recommendations.

Sir John Snell asked if the constituent authorities would agree to be bound by the Commissioners' decision.

Mr. Tyldesley Jones said "No," and instanced the possibility of a constituent authority being compelled by such a decision to spend large sums of money against its will. At present Manchester Corporation were expending several millions in erecting a generating station, and the obligations they were undertaking to outside authorities accounted for about a million of that sum. Supposing that in the future the Advisory Board required them to spend two or three millions in extending that station to cope with the needs of outside districts, and that Manchester's refusal to do so was overruled by the Commissioners. Was it reasonable that Manchester should be bound to raise £3 000 000 on the rates in order to comply with such a decision?

Sir John Snell asked what was the good of appealing to the Commissioners if the parties declined to abide by their decision.

Sir Harry Haward, who confessed that he had a good deal of sympathy with the local authorities in their objection, suggested that the difficulty might be met by limiting appeals to the Commissioners to subjects outside finance, leaving financial points to be dealt with by the constituent authorities themselves.

Mr. Tyldesley Jones promised that his clients would consider the suggestion.

The inquiry then concluded, and Sir John Snell paid a tribute to those responsible for the preparations of the technical details.

Licences of Right have been granted to F. Butterworth for patent No. 13 146/14 for "improvements in and relating to electrical condensers"; to A. L. O. Fauchon-Villeplée, for Patent No. 128 241 (9 243/17), for "improved electric gun or apparatus for propelling projectiles"; and to E. G. Mascarenhas, for Patent No. 153 153 (24 197/19), for "improvements in electric lamps."

Legal Intelligence.

Claim for Electric Motor Repairs.

In the Shoreditch County Court, on Thursday last, the Cohalt Electrical Company sued Mr Roysenthal to recover £14 5s. for work done, including the repair of a 30 H.P 480 V motor, rewinding two field coils, re-insulating two other field coils, and repairing open circuits in armature.

Mr Wilfred E. Hackett, partner in plaintiff firm, said the orders for the work were verbal, the first being on Aug. 21 for repairs to an electric motor. It was defendant's custom to send the electric motors along for repair, and collect them on completion, but in the case of the first item on the claim, he was asked to send the motor by special van, which he did.

After hearing the evidence, Judge Cluer found for plaintiff for the full amount claimed.

Telegraph Wires Over a River.

At the Hull County Court, on Monday, the Postmaster-General sued Captain Barraclough, Barton-on-Humber, for damage caused by the breaking of fourteen telegraph wires by the mast of the defendant's vessel. It was stated that the wires were over the Aire, near Taylor's Wharf, at Leeds.

For the defence it was urged that a sharp look-out was kept over the river, but defendant could not be expected to be looking into the sky to see if it was necessary to lower the mast.

Judge Lock, in giving his decision, said masters of river craft, who were accustomed to going under wires, did not lower the masts unless a warning was given on the bank in the case of exceptionally low wires. Therefore he gave judgment for defendant.

Electric Lighting Plant Dispute.

At the Chester County Court, last week, Messrs. Cheshire Bros. sued Messrs. F. J. Jones and Sons, electrical engineers, and Messrs. Studebaker, Ltd, for the recovery of £39 3s. 6d.

For plaintiffs, it was stated that they received an inquiry for a Lalley lighting set from Monmouthshire, and Messrs. Jones were given the order. Subsequently, an advice note was received from Messrs. Studebaker from which it was known that the erection of the plant had been completed. Complaints were afterwards made of the engine stopping; Mr. Jones suggested certain tests and alterations, and he promised that he would supply a new diaphragm. After the alterations had been effected the trouble still existed, and later on Mr. Jones admitted that the plant was defective.

The manager for Messrs. Jones and Sons denied that the plant was defective when delivered, but another witness said the plant had been badly erected, and the vibration was causing trouble.

Mr. Marshall Tate, manager of the Lalley light department of Studebakers, said the machines were tested in America and in England before being sent out. He did not think there was any responsibility on the firm to put the plant right.

Judge Parsons, K.C., found for plaintiffs as against Messrs. Jones for the amount claimed, and granted an indemnity in favour of Messrs. Jones as against Messrs. Studebaker, Ltd., for the amount payable by Messrs. Jones, with costs.

Wiring Contract Disputes.

The quality of the work in connection with the "wiring" of a dwelling house was disputed at Marylebone County Court last week before Judge Scully, when Mr. Douglas H. Brayne sued Mr. W. A. Clark for £9 balance of an account for work done and materials supplied. Plaintiff wired defendant's house at Putney, the work having been finished about August or September last. He did not send in an account, but asked defendant for payment. He sent in an account later, however, after having asked defendant for payment several times. He had heard of no complaint regarding the work until defendant filed a counter-claim. The cost of the work amounted to £19. Defendant paid him £5 when he commenced the work and another £5 when it was nearing completion.

Defendant in his evidence alleged that the work was improperly done. He arranged with plaintiff to use iron pipes, but that was not done and the wires were exposed. Defendant also failed to keep an appointment when the work was being tested by the County of London Electric Supply Company, who subsequently told him that the work was disgracefully carried out.

Plaintiff said that he could not keep the first appointment, but he kept the second one. He added that in connection with the London County Council housing schemes the wiring was carried out in a fashion similar to that adopted by him, and only about 2½ per cent. of electrical contractors adopted the method suggested by defendant.

Defendant: But I asked you to do it my way, and you ought to have done it. Defendant added that plaintiff had used some of his fittings, although he contracted to use his own fittings.

In reply to the Judge, plaintiff said the fittings were a small matter and would not amount to more than one-sixth of the total.

Defendant said that no fuses were put in until they were supplied by the Supply Company.

Plaintiff: They were in when I was at the second test.

Judge Scully gave judgment for plaintiff for £7, with costs.

At Marylebone County Court, on Monday, Judge Scully heard another wiring dispute. Mr. R. H. Essex, an electrical engineer, sued Mr. F. Shirley for £11 15s. for work done. Plaintiff stated that defendant employed him to install electric light in a workshop. The contract was that plaintiff was to have £1 a day, and defendant was to supply all the materials. Plaintiff spent six and a half days on the work, and later it was agreed that he should receive £6 5s. in discharge of his account. Witness also installed electric light in defendant's flat, and was to receive £4 10s. for erecting the wires and putting a meter in the basement.

In cross-examination plaintiff said he was an electrician and motor mechanic. He was not aware that the defendant had had the work to do all over again.

A solicitor stated that owing to illness the defendant could not appear in court.

Judge Scully gave judgment for plaintiff for the amount claimed, with costs.

Working of an Electric Washing Machine

On Tuesday Mr. Justice Coleridge heard an action brought by Rear-Admiral Sueter and his wife against Harrods, Ltd., to recover damages for personal injuries, alleged to have been caused by the negligence of defendants' servants. The defence was a general denial of the allegations, and a plea that, if defendants had been guilty of negligence, the female plaintiff had herself contributed to it by attempting to put a handkerchief between the rollers of a washing machine, and holding it so negligently and unskilfully that her fingers were drawn with it between the rollers of the machine.

In opening the case, Mr. Hardy said that Admiral Sueter and his wife thought of acquiring a "Thor" electric washer, which Messrs. Harrods were offering for sale, and it was arranged that an experienced demonstrator should be sent with the machine. In August, 1920, the demonstration took place at plaintiffs' house, and during the demonstration Mrs. Sueter's fingers were drawn between the rollers, and, it was alleged, the cartilages of the joints were badly crushed and she suffered a severe shock, which made massage necessary. She received other medical treatment, and she was incapacitated for some time. It appeared that Mrs. Sueter asked if she might try the wringing out of her handkerchief in the wringing part of the machine, and the man who was giving the demonstration agreed. The man then turned the switch, and the barrel and the wringer began to revolve. Mrs. Sueter tried to feed the handkerchief into the wringer, but she could not get the wringer to bite the handkerchief. Suddenly the rollers reversed themselves. Mrs. Sueter's hand was drawn right in and crushed. Counsel said the man was so incompetent that he could do nothing to release Mrs Sueter's hand; he could not stop the machine, nor could he in any way release the rollers. Admiral Sueter's electrician kicked away the plug connecting the machine with the house wire, and the Admiral released the pressure from Mrs. Sueter's hand by unscrewing the top of the wringer.

Admiral and Mrs. Sueter gave evidence as to how the accident occurred, and Dr. Windsor described the nature of the injuries, which he admitted in cross-examination were not of a serious kind.

This closed plaintiffs' case, and after the demonstrator from Messrs. Harrods and other witnesses had given evidence for the defence, the Judge, without calling upon counsel to address him, delivered judgment in favour of Messrs. Harrods. He said that he was satisfied that the accident happened not from any circumstances over which they had control, or for which they ought to be held responsible, although he was disposed somewhat to doubt the competence of the operator. The real cause of the accident, however, had never been pleaded. There would be judgment for defendants, with costs.

Dispute about Telegraph Posts.

At Paignton County Court, on Monday, His Honour Judge Terrell, K.C., gave his decision as arbitrator on a difference which had arisen under the Telegraph Acts between Sir Robert Harvey, of Harberton, and the Postmaster-General.

In giving his decision, His Honour said that the case arose out of the intention of the Postmaster-General to extend the telegraph service from Totnes to Tuckenhay Mill. The Postmaster-General proposed to erect twenty-eight telegraph posts in the hedge alongside the road from Painsford Cross to Langridge Cross, Totnes, and to place in the field adjoining the hedge six stays. Sir Robert Harvey was willing to consent subject to a payment by the Postmaster-General of 1s. a year per post. The Postmaster-General offered to pay 6d. a year for each stay, but he claimed the right to place and maintain the poles without payment. He found that Sir Robert Harvey had given his consent upon terms, which were not prohibitive, and which were commonly agreed to between the Postmaster-General and private owners. Although the language adopted by the Telegraph Act of 1916 was very obscure, he thought he should be right in holding that the introduction of the condition to the granting of the consent was a refusal within the meaning of the Act of 1916.

His Honour said he had, however, to satisfy himself that the refusal to give consent was contrary to the public interest. The only evidence on that point was that of Mr Aldridge, the Superintendent Engineer of the S.W. District, who said the poles were required to supply a telephone service to Tuckenhay Mill. That was a purely private line, and in no sense a matter of public interest. The poles would, if required, be used for general telephone purposes. He understood that at present the poles would not be required for general telephone purposes, but, if required, they would be used hereafter. Mr. Sheldon, Engineer for the Exeter Section, told him that before that line was erected applications for a public line to Ashprington and Dittisham were made, and at the latter place they had been asked to put a telephone call office. He did not say they intended to extend a line to the villages. The Postmaster-General had not satisfied him that the refusal was contrary to the public

interests; the refusal simply affected the private interests of Tuckenhay Mill. The other question he had to determine was that of payment. Sir Robert Harvey asked for 1s. a pole, which was the almost universal payment before 1916. The Postmaster-General considered that no payment should be required in respect of the poles and wires, but he was willing to make a small nominal payment for the stays. He came to the conclusion that the application of the Postmaster-General had failed, and that the refusal of consent was not contrary to the public interests. If he was wrong as to that, then he held that the payment of 1s. per pole was a reasonable and proper condition to the giving of consent. His Honour, therefore, dismissed the application, with costs.

Hastings Tramway Arbitration Appeal.

On Monday Mr. Justice McCardie had before him a special case stated by the arbitrator in the dispute between Hastings Corporation and the Hastings Tramway Company. It related to the construction to be put upon the word "cable" in a section of the 1920 Act relating to the construction of No. 1 tramway along the sea front.

Mr. Roskill, K.C., appeared for the Tramways Company, who appealed against the arbitrator's award, and Mr. McMorran, K.C., was for the Corporation.

Mr. Roskill explained that the dispute arose out of the Hastings Tramway Act, 1920. The tramway was one mile six furlongs long, and the Act of 1903 provided that it should not be constructed on the overhead system. The Dolter surface contact system, which was adopted, proved unsatisfactory, and it was discontinued by order of the Board of Trade in 1914. Then it was worked on the petrol electric system, and that also proved unsatisfactory, and finally the company was authorised to use the overhead system. Certain words in the Act threw upon the company the obligation of connecting new lamps, which they had had placed on the tram standards, with the existing main. The Corporation contended that the company must place a new lighting cable, or an addition to the existing one. Mr. Roskill read the section of the Act, and said the arbitrator ordered them to provide a main cable for a stretch along the Front. He had found that, because the Corporation had chosen to place upon each of those standards, 40 yards apart, two 200 V gasfilled lamps, instead of one arc lamp on each standard, 80 yards apart, and because that necessitated an extra cable, therefore there was an obligation upon the company to provide that extra cable.

Mr. McMorran said it was a condition of the withdrawal by the Corporation of their objection to the overhead system that they were to get a new lighting system provided at the expense of the company. That was all the Corporation got in return for their assent to the overhead system. Once the Corporation proved a new cable was necessary, that cable must be provided by the company.

His Lordship, in giving judgment, said he thought Mr. Roskill was right. There was no statutory obligation on the company to provide a main cable, but only an inter-connecting cable. His Lordship was satisfied that from every point of view the Act supported Mr. Roskill's contention, and he allowed the appeal, with costs.

The Institute of Metals.

The annual meeting of the Institute of Metals will be held in London on March 8 and 9, when ten Papers will be presented for discussion. At the annual dinner at the Trocadero on Wednesday, March 8, lady members will be present.

The annual May lecture will be delivered on May 3 by Sir Ernest Rutherford, on "The Relation of the Elements." The autumn meeting will be held at Swansea from Sept. 20-22. From October to December (as well as during the present quarter) meetings of the various local sections—membership of which is free to members of the parent body—will be held in London, Birmingham, Sheffield, Glasgow, Newcastle-on-Tyne, and elsewhere. Last year the membership of the Institute increased from 1 298 to 1 410.

Power Supply Amenities at West Ham.

Many of the large power users in West Ham met last week at the Beta Works of Estler Brothers to receive the report of a preliminary committee appointed to investigate the condition of the supply of electricity for power in the district. The report was read by Mr. B. Estler, who referred to the frequent stoppages in supply and to the circular issued to consumers early in December last, asking them to reduce their consumption of current during the afternoons. This had occurred in spite of a promise made that after March, 1921, when it was expected that new plant would be installed, there would be an improved supply. The frequent stoppage and the curtailment asked for had been a serious matter for manufacturers and workers. The committee had made inquiries as to the price of electricity in West Ham, and found that it compared very unfavourably with other undertakings. This occurred, too, in spite of its large demand, one of the greatest in the kingdom, its good load factor, and favourable situation. Figures of the cost and price of electricity in West Ham and other undertakings about London were given in proof of this statement. After a lengthy discussion, in which several present gave details of the present heavy charges for their power, the following resolution was carried unanimously: "That this general meeting of the power consumers of West Ham, which has been called, resolves itself into a West Ham Electric Power Consumers' Association, with the object of obtaining an adequate and proper supply of power from the West Ham Corporation at a reasonable cost."

Electricity Supply.

Bedford Town Council has decided to grant an honorarium of £350 to the Borough Electrical Engineer, Mr. R. W. L. Phillips, in recognition of his services in connection with the new generating station.

Hull Electricity Committee report that the damage done to the mains and undertaking of the Electricity Department has been repaired at a cost of £2 600, the premises of 2 400 consumers having been overhauled.

Preston Electricity Committee has recommended the extension of the time limit for the purchase of the National Electric Supply Company's undertaking from the end of February, 1922 to the end of February, 1923.

At the annual meeting of the Stalham Electric Supply Association the Rev. M. C. Wallis was re-elected chairman of the committee. It was resolved that interest be paid to subscribers of over £35 at the rate of 7 per cent.

In view of the approaching completion of the super-power station at Portobello, the Edinburgh Electricity Sub-committee recommend the appointment of a sales superintendent for the Electricity Department, at a salary of £500 per annum.

It was stated at last week's meeting of Accrington Electricity Committee that no communication had yet been received from Blackburn Corporation with reference to the Commissioners' suggestion to lay an inter-communicating cable between the two towns.

The Stafford Town Council has, by sixteen votes to seven, rejected a recommendation to increase the salary of the Borough Electrical Engineer and Manager, Mr. W. H. Robins, from £550 to £650 per annum, in recognition of his services in connection with the recent extensions.

With the object of developing the domestic cooking, heating and cleaning load, Hackney Electricity Committee propose, in conjunction with the British Electrical Development Association, to hold an Electrical Exhibition at the King's Hall, Hackney Public Baths, from Monday, April 24, to Saturday, April 29 inclusive.

Hove Council have decided not to take more than 20 per cent. of the current required for their electricity supply department under the arrangement for bulk supply from Brighton. Hove will therefore continue the use of their Holland-road generating station for some time longer, though the price of fuel and wages will no doubt determine how long this arrangement will continue.

The Electricity Commissioners will hold a Local Inquiry at the Town Hall, Wolverhampton, on Tuesday, the 21st prox., and following days, with reference to the area to be included in the proposed North West Midlands Electricity District, and to consider the Scheme submitted by the Conference of Authorised Undertakers for the improvement of the organisation for the supply of electricity within the district, and for the establishment of a Joint Electricity Authority.

Glasgow Finance Committee have intimated to the Office of Works that in view of its decision, together with the Kirk Session, to install electric lighting in the Cathedral, the Corporation consider themselves free from any obligation with regard to the lighting or heating of the Cathedral. They also refuse to remove the present gas fittings, as requested, and leave the Office of Works to do as it thinks best with regard to the disposal of these fixtures.

The Hydro Electric Development Company has been notified by the Treasury Committee that no facilities under the Government's credits schemes can be granted for the Grampian Hydro-Electric project. It is stated that the Government will recognise the value of the undertaking as a means of relieving unemployment later on, for the Committee have intimated that they will reconsider their decision when the Provisional Order passes all its Parliamentary stages.

In reply to a question by Mr. Burgess at last week's meeting of Bristol Town Council, Sir John Swaish said the total number of lamps at present in the streets was as follows:—Arc and gasfilled, 712; incandescent electric, 1 588; gas, 7 890; oil, 177. The number of gas lamps still to be converted to electricity was 384. The average cost of the conversion per lamp (including reinstatement of ground) was £15. The total cost would therefore be about £5 760. In 1913-14 605 lamps were converted; in 1914-15, a further 760; in 1915-16, 1 610. War economy prevented further conversions, but last year nine lamps were converted. The balance of the cost of these conversions was only paid off last year. There was very little difference in the maintenance charges. Of course, the electric lighting was the better, and as soon as possible they hoped to be able to extend it.

New Schemes and Mains Extensions.

The Urban Council has invited the Weston-super-Mare District Electric Supply Company to submit a scheme, with charges, for lighting the town, or any part of it.

Okehampton Town Council are considering the acquisition of the electric light installation owned by Mr. G. K. Blatchford. The plant has been inspected, and Mr. Blatchford has submitted two schemes.

Although considering it inadvisable to enter formal opposition to the Grampian Electricity Order, Banff Town Council have protested against Parliamentary sanction being given to the proposed diversion of the River Spey or its tributaries. A copy of the resolu-

tion is to be sent to the Prime Minister, the Secretary for Scotland, the Lord Advocate, and the Member of Parliament for the county.

ADWICK Urban Council will support the electricity reorganisation scheme of Sheffield and Rotherham Corporations for the NORTH-EAST MIDLANDS ELECTRICITY DISTRICT, provided there is distinct representation for urban districts.

Application has been made to the Electricity Commissioners by PRESTON Corporation for sanction to a loan of £420 000 for the construction of a generating station on the south side of the Ribble, to provide for two turbo generators.

At the monthly meeting of LANARK Town Council, last week, the proposals of the Electricity Commissioners in regard to the delimitation of the West of Scotland Electricity District were referred to the Electricity Committee for consideration and report.

OXTED Parish Council has decided to support the application of the Sevenoaks and District Electricity Company to the Trades Facilities Advisory Committee for a guarantee of capital, in order that they may extend their mains to Oxted and Limpsfield.

With reference to the application for a Special Order to supply electricity to the town and district by the Hutton Electric Company, BRENTWOOD Urban Council have decided to send a deputation to the Commissioners, together with representatives of the Billericay Rural Council before deciding to support the application.

A petition, together with a private Bill, has been submitted to the JERSEY States Assembly, asking for powers to erect a power station on the island to provide electric light. It is proposed to electrify the two railways and to institute a service of electric omnibuses. The whole is to be laid down free of cost to the island.

After considerable negotiations, the Electricity Commissioners have granted power to ACCRINGTON Corporation to borrow £100 000 for additional plant at their electricity station, which is urgently required. It is understood that these powers are not contingent upon the laying of an electric cable between Blackburn and Accrington, as the Commissioners strongly recommended a short period ago.

The Minister of Transport gives notice that he proposes to confirm the SPECIAL ORDER authorising AMBLE URBAN DISTRICT COUNCIL to supply electricity. Objections may be sent to the Ministry of Transport by Feb. 15. A copy of any objection must also be sent to the Council's Solicitor, Council Offices, Amble, or their Parliamentary Agents, Messrs. Lees & Company, Palace-chambers, Bridge-street, S.W. 1.

At a meeting of Hemel Hempstead Rural District Council last week, it was stated that the Electricity Commissioners were considering the advisability of cancelling the powers of the Chesham Electric Light and Power Company to supply electricity to KING'S LANGLEY, and that the Council had decided to support an application to be made by Watford Council for powers to supply in the district, provided satisfactory terms could be arranged.

At a meeting of CARDIFF Waterworks Committee last week, a long report was submitted by Mr. Priestley on the suggestion that the water in the new pipe line might be utilised for the generation of electricity. The report stated that Manchester, Liverpool, and Birmingham were all engaged upon new pipe lines carrying far greater quantities of water than in the second pipe line for Cardiff, and that not one of those cities had found it expedient to complicate the question of water supply with that of hydro-electric power stations.

In a report to the Corporation Electrical, Lighting, and Tramways Committee on proposed plant extensions, Mr. C. G. Morley New, the City Electrical Engineer, stated that the industrial depression had kept down the maximum load and output on the feeders. The generating plant at Roath Station had not yet been usable, and for some time they had been contending against difficult and uneconomical conditions. The boiler capacity needed to be increased immediately. He recommended the extension of the boiler-house plant by three water-tube boilers. The estimated cost would be £59 300, including accessories and building work.

A scheme recently put forward by the West London Branch of the Electrical Trades Union, for wiring small property in the Borough of HAMMERSMITH, has been considered by the Electricity Committee, who recommend that a sum of £500 be allocated for the purpose, subject to the details of the scheme being approved by the committee. A loan of £30 000, further on account of the sanction issued by the Electricity Commissioners last March for extensions to the electricity undertaking, is to be taken up through a private source at 6 per cent. interest. Sanction has been received to a loan of £2 500 for the scheme to link up the Battersea, Fulham, and Hammersmith generating stations, and the Public Works Loan Commissioners have been asked to lend the money.

A proposal to pay a consulting fee to Mr. G. G. Bell, the Borough Electrical Engineer, for work in connection with the linking-up scheme, was referred back to the Electricity Committee by the Finance Committee on account of the important principle involved. The Electricity Committee, having considered the matter further, reiterated their recommendation, and explained that a similar fee was paid for laying the first main between Fulham and Hammersmith, and that the three Councils shared the expense. The work is being carried out by the engineers of the three undertakings in rotation, and it has been agreed that the present main, which is a duplicate one, should be laid under Mr. Bell's supervision. The other Councils and the Commissioners have agreed to the proposed payment. A special meeting of the Council is being held this week to consider the matter.

CONWAY Council have entered into an agreement with the North Wales Power and Traction Company, under which the company will erect overhead transmission lines for the supply of electricity to the borough. There will be one line on the Conway side of the river to a sub-station at Beechwood Court, and another on the Llandudno Junction and Deganwy side, from the transmission line which will deliver current to Llandudno. The cost will be about £10 000, including transformers and switchgear, and this sum the Council will lend to the company, who will repay it in twenty-five annual instalments with interest, the Council agreeing to take a minimum quantity of energy equal to 320 000 units per annum at 1½d. per unit. The Council have decided to proceed at once with a canvass for consumers.

Alteration of Charges.

OSWESTRY Electric Lighting and Power Company are seeking powers to raise the price of electricity from 8d. to 1s. 3d. per unit.

MUSSELBURGH AND DISTRICT ELECTRIC LIGHT AND TRACTION COMPANY has appealed to Inveresk Parish Council against a proffered 47½ per cent. abatement of their parochial assessment, and have asked for a 75 per cent. abatement. The matter has been referred to the Law Committee of the Council.

The recent agreement made by DUDLEY Electricity Committee with the Shropshire Power Company for a reduction in lighting prices, on the understanding that no further reductions were to be pressed for within the next six months, was discussed at some length at the meeting of the Council last week. It was pointed out that the restriction fell hardly upon the power users, but the Mayor (Mr. H. W. Hughes) said the alternative to accepting the bargain was to go to arbitration, which was a lengthy and costly process. He thought they would be well advised to make the best of a bad job. The price of current for lighting would be 3¾d. per unit for customers of under 700 units, plus 60 per cent., making it 6d., while for power purposes the price would remain at a penny per unit, plus 115 per cent. Eventually the matter was referred back to the committee with a view to securing the attendance of the manager of the Power Company.

Electric Traction.

Eight new tramcars have just been delivered to the RAWTENSTALL Corporation.

STOURBRIDGE Town Council have decided to oppose the Black Country Tramways and Light Railways Bill.

It is stated that the LONDON AND NORTH-WESTERN RAILWAY COMPANY contemplates electrifying the North London line from Broad-street to Poplar.

An application for twelve days' holidays in the year instead of eight as provided in the national agreement has been granted to BELFAST tramwaymen on account of the terrible conditions under which they have been working in consequence of the bombing and firing to which the cars have been subjected.

By a majority of 188, DUBLIN tramway men have agreed to accept a reduction in their wages of 2s. per week from Feb. 1, and of 2s. from March 1, after which wages are to remain stationary to September 1. This will be the first reduction in their wages since the end of the war, and will bring them practically on a level with those prevailing in England.

Owing to the fog on Sunday a COLLISION BETWEEN TWO TRAMCARS occurred near New Cross Railway Station, one car ramming the other with such force that the front part of the car was telescoped into the other. The stairs were carried away, and the controllers were forced into the inside of the car. The driver was seriously injured, and a number of passengers were cut by splinters of glass.

The residents of Upper Norwood are organising OPPOSITION TO THE L.C.C. BILL for powers to extend the tramway from the Norwood terminus through Knight's Hill, Penge, Sydenham and Catford to Lee Green, in order to link up with the lines to Eltham. The opinion of the residents is that if more travelling facilities are required omnibuses should be introduced, and not trams. Moreover, as the proposed route would pass along Westow Hill, a narrow thoroughfare, and the principal shopping centre in the neighbourhood, tramcars would, they say, be a source of danger. There can be little doubt that on the proposed route tramcars would be safer than double-deck omnibuses, and their opposition must be based upon prejudice rather than on the merits of the case.

Trade Inquiries.

A firm established at Lyons desire to obtain agencies for Lyons and south-eastern France of United Kingdom manufacturers of vulcanised fibre for insulation. Particulars from the Department of Overseas Trade. Reference No. 75.

The Canadian manufacturers of a powerful ELECTRIC WATER-HEATER desire to dispose of their manufacturing rights in the United Kingdom. Particulars may be obtained at Canadian Government Trade Commissioner's Office, Portland House, 73, Basinghall Street, London, E.C. 2.

Personal and Appointments.

Mr. W. Finlayson, senior, engineering assistant in the Melbourne (Victoria) municipal electricity department, has resigned.

Mr. H. C. Day has been appointed electrical engineer and tramways manager to Heywood Corporation, in the place of Mr. D. H. Davies, who has been appointed to a similar position at Chesterfield. There were sixty-seven applicants.

Mr. Hope, who has been on the staff of the Burton-on-Trent Corporation Electric Tramways Department since they opened in 1903, is leaving for New Zealand, and the staff have presented him with an inscribed silver wallet containing a Bank of England note.

A reward of £500 has been offered for the apprehension of the person or persons who fired on Mr. Henry Vanderbot, the traffic manager of the Cairo Electric Tramways Company, who succumbed to his wounds on Sunday. Mr. Vanderbot was shot on Jan. 3, after the dismissal of a large number of workmen.

Mr. George Russell, telegraph superintendent of the Glasgow and South Western Railway, has been appointed chairman of this year's conference of the Telegraph and Electrical Engineers of the British Railways. Mr. Russell, who has been telegraph superintendent of the Glasgow and South-Western Railway Company for twenty-four years, was chairman of the conference in 1903.

In recognition of his long service as chairman of the Tramways Committee of the Leicester City Council, Ald. S. Flint, an ex-President of the Municipal Tramways Association, has been presented with a silver rose bowl mounted on an oak pedestal, subscribed for by the members of the committee. Ald. Flint is taking over the chairmanship of the new Electricity Committee, and is succeeded by Ald. G. Banton.

A portrait of the late Sir Gilbert Claughton, Bart., formerly chairman of the London and North-Western Railway Company, who had large interests in the industrial undertakings (iron and steel, gas and electrical) in the Black Country, has been presented to the Staffordshire County Council. He was an alderman of that body, and the gift was made from the County Council Picture Fund. The painting has been hung in the Stafford County Buildings.

Business Items, &c.

The Electro-Mechanical Brake Company have now opened London offices at Donington House, Norfolk-street, Strand, W.C. 2, with Mr. W. F. Knight in charge. (Telephone No., Central 1888.)

The Wardle Engineering Company have appointed, as from Jan. 1, H. L. Nathan, Ltd., 159, Great Charles-street, Birmingham, their representatives for Warwickshire, Staffordshire, Shropshire and Worcestershire.

Mr. A. Hinderlich informs us that he has taken over the sale of the wrought copper cable sockets and the resistance nets hitherto handled by the Protector Company, Ltd., and will carry on the business at the old address, Central Hall, Southall, Middlesex (Tel. : Southall 121).

Wailes Dove Bitumastic, Ltd., at their recent annual meeting, added to the board of directors Mr. Percy Hedley, engineer, St. James's-court, London, and Mr. Thomas Macdonald, son of Mr. Charles Macdonald, who has been associated with the company for many years.

Royce Limited, electric crane makers, Trafford Park, Manchester, have received an order for a 2-motor electric telpher, with self-dumping crab of 1-ton capacity, from the Worcester Corporation in connection with a scheme for an extension of the plant at their electricity station.

New electrical works have been opened in Linacre-road, Litherland, near Liverpool, by the Delta Electrical and General Engineering Company. The firm is specialising in lighting installations, motor repairs, armature winding, and is also undertaking toolmaking and millwright's work.

The productions of C. A. Vandervell & Company will be exhibited on Stand No 69, at the Scottish Motor Show, which opens in Glasgow to-morrow (Saturday). The exhibit embraces all the latest electrical productions of the firm, including the C. A. V. Willard starting and lighting battery. A full range of commercial, motor-car and motor cycle productions is also on view, comprising dynamos, starters, batteries, lamps, and electrical components of all descriptions

In connection with the visit of the Japanese Commercial Mission to Edinburgh on Saturday, Jan. 14, the Edinburgh Chamber of Commerce made arrangements for a visit to the electrical engineering works of Bruce Peebles & Company. On arrival at the works the party divided up into three sections, each section starting from a different point, to avoid confusion in the works. Considerable interest was shown in the work on hand for Japan, which includes Peebles-la Cour motor converters and induction motors for the Imperial Japanese Navy and the Kure Naval Arsenal. At the conclusion of the visit the party were addressed by Sir John Cowan (chairman of the company).

The Yorkshire Electric Power Company is seeking Parliamentary power to divide the whole of its issued and unissued £10 ordinary and £5 cumulative preference into £1 shares. The authorised capital is £2 000 000, and the issued capital now consists of 83 000 £10 ordinary and 54 328 £5 cumulative preference shares. The company has also raised £360 000 by debenture stock.

Institution Notes.

The next Salesmanship Conference will be held at the rooms of the Chartered Institute of Patent Agents on Feb. 17, at 7.30 p.m., when Mr. Haydn Harrison will open a discussion on "Salesmanship in Relation to Electric Lighting." Mr. S. T. Allen (President of the I.M.E.A.) will preside.

The Fuel Research Board have made arrangements for the recognition of the Lancashire and Cheshire Coal Research Association as the local committee working under the Board for the purpose of dealing with the physical and chemical survey of the coal seams in the area. The chairman of the committee is Mr. Robert Burrows, and the director of research Mr. F. S. Sinnatt.

The Association des Ingénieurs Electriciens Sortis de l'Institut Electrotechnique Montefiore announce that the international competition for the triennial Montefiore prize (interest on 150 000frs. 3 per cent. Belgian Funds) will take place in 1923. The prize is awarded for the best original work on the scientific progress or the technical applications of electricity in any of its branches. The works may be in French or English, printed or typed. Of the jury of ten electrical engineers, five are Belgian and five foreigners. Twelve copies of each work must be sent on or before April 30, 1923, to M. le Secretaire-Archiviste de la Fondation George Montefiore, 31, rue St. Gilles, Liège.

A students' meeting of the Chelmsford Engineering Society was held on Thursday, Jan. 19, in the Agricultural Institute, under the chairmanship of Mr. G. F. Barrett, when two junior members read Papers. Mr. J. A. Sayer dealt with "Search-Light Projection," and explained fully the electric arc and the methods of projecting a powerful light beam. Reference was made to an experiment carried out during the war, in which the light was reflected from a screen of liquid containing a solution of metallic salts sprayed into the air under pressure. By this means the beam of light could be reflected in any direction, while the search-light was safely concealed under the ground. Mr. E. Tomalin read a Paper on "The Production of Profile Gauges by Grinding," in which he described the usual workshop practice and methods of forming profiles of various shapes to a high degree of accuracy. It was claimed that profiles on gauges 1-16 in. thick could be ground to an accuracy of one ten thousandth part of an inch. Both lectures were followed by interesting discussions.

At a meeting of the Belfast Association of Engineers last week a paper was read by Mr. J. M'C. Girvan on "Electricity Supply; the Factors Determining the Cost to Consumer." Mr. Girvan stated that the first essential for low cost of production was that the demand should be of long duration, for the standing charges, which were determined solely by the magnitude of the demand, were thus spread over a large number of units. The second factor was the diversity of the demands. If the demands were simultaneous the standing charges per kW were a maximum; if they did not occur simultaneously the standing charges were proportionately less. The greater the area to be supplied, the more likely the load factor and the diversity factor would be improved. In conclusion, Mr. Girvan dealt generally with the situation in the Belfast electricity undertaking, and pointed out that they had to pay out of revenue for the upkeep of three stations, the existing East Bridge-street station, the temporary power station, and the non-productive new power station in the course of construction.

Telegraph and Telephone Notes.

The new underground telephone cable between Leeds and York has just been brought into use.

The Ascot Telephone Exchange, in Upper Village-road, Sunninghill, has been completed, and is now in operation.

A Rio de Janeiro telegram states the steamer "Cormorant," owned by the Western Telegraph Company, has been lost off the coast of Brazil. The "Deseado" saved the crew.

The Great Northern Telegraph Company has re-opened its office in Petrograd for the transmission of telegrams between Russia and other countries, excepting Finland.

A sufficient number of subscribers having been obtained in Caithness to warrant the installation of a telephone exchange, the P. O. Telephone Department have intimated that the work of erection will be begun at once. The service will be the first step towards linking up the north with the trunk line to the south.

The Japanese have now renounced their rights to the former German submarine telegraph cables in the Kiaochau (China) leasehold. The cables affected are the Chefoo-Tsingtao and the Tsingtao-Shanghai lines, which were laid by the Germans. The Tsingtao-Sasebo cable, which the Japanese laid down, will be operated by a joint Chino-Japanese commission, subject to the terms of existing contracts to which China is a party. The Japanese have agreed to hand over to Chinese control, subject to fair compensation, the two wireless stations in the leasehold, one at Tsinan-fu and the other at Tsingtao, immediately the Japanese troops are withdrawn from these points.

Arrangements have been made for putting Germany into direct submarine cable communication with the United States. It is announced that the Commercial Cable Company has agreed to lay

a new cable from New York to the Azores, a distance of 2 302 miles. At the Azores connection will be made with a new cable from Emden, which the Deutsch Atlantische Telegraphen Gesellschaft have contracted to lay. The cost of the manufacture of the cable and of the laying is estimated at £2 500 000, and the contract is to be carried out in eighteen months. The new cable will establish a direct service between the two countries. Since the Armistice cable messages to and from Germany have passed through either England or France, an arrangement to which American business interests object. Mr. Clarence Mackay, president of the Commercial Cable system, in making the announcement concerning the new cable, stated that his company ceded none of its rights or claims against the Allied Powers in connection with the former German cables, which they have diverted to their own uses. Naturally, the new cable will be of the latest design.

ABERDEEN Chamber of Commerce, last week, decided to make another effort to secure an extension of UNDERGROUND CABLES from Edinburgh to Aberdeen, to obviate such a situation as was brought about by the recent snowstorm through the destruction of overhead wires. Mr. Robert Milne, ex-president, in making a motion to approach Aberdeen Town Council with a view to getting Dundee Town Council and Chamber of Commerce to join Aberdeen in a representation to the Postmaster-General, said that the previous day the Aberdeen fish markets had upwards of £20 000 worth of fish on their hands, and they could not place a single quotation by telegram into the hands of a customer, or get a reply back. The messages were five, six, and seven hours delayed in dispatch, and the industry was paralysed. He had been on two delegations to the Postmaster-General. In 1911 they were met with platitudes; in 1913 they had a stiff reception, and were told it would be very expensive—£30 000 to Dundee, and another £30 000 to Aberdeen. On the last occasion they met the Postmaster-General he said that, in place of extending the underground cables, he was going to erect powerful wireless installations with phantom circuits. Those circuits had been "phantom" ever since.

Wireless Notes.

A wireless station with a radius of 300 miles has been opened at Grand Bassam, IVORY COAST, French West Africa.

A temporary wireless service is being established between STORNOWAY and the mainland until the cable communication, which broke down during the recent snowstorms, has been restored.

Farmers in FRANCE are to be advised by wireless of the Paris Observatory's weather forecast at the time it is made instead of waiting for the morning newspapers. Instructions on the erection of a wireless receiver are to be sent to all interested, and they will not be subject to any State tax for enjoying this privilege.

The RUNDEMANDEN RADIO-TELEGRAPH STATION, which is close to Bergen, and was equipped on the Telefunken system in 1912, is to be modernised by the Norwegian Radio Company, of Christiania. The new station will have a radius of 3 000 kilometres for telegraph, and 600 kilometres for telephone, by day, and a proportionately greater radius by night.

In urging the need for an improved and cheaper news service between England and India, the "Times of India" states that this can only be accomplished by COMPLETING THE IMPERIAL WIRELESS CHAIN, the future of which is prejudiced by the attitude of the British Post Office in "adhering to experimental and second-rate methods" while India is in direct communication with the Marconi station of Carnarvon. Recently, for a month at least, the London correspondent of the "Pioneer," of Allahabad, has been sending his news to India through the Carnarvon station, and it has been received in India intact. In December the Marconi Company offered to erect within twelve months a wireless station in India at its own cost. The station would be for commercial service with Great Britain, and elsewhere if required, and the expenditure would be not less than £400 000. As an alternative the company would erect the station and conduct the service on a joint account with the Government of India, on a basis similar to that approved recently by the Australian Parliament.

Mr. E. T. Fisk, managing director of Amalgamated Wireless (Australasia), Ltd., is reported by the "Industrial Australian" to have said the company are now fully prepared for establishing a modern WIRELESS SERVICE BETWEEN AUSTRALIA AND ENGLAND, and that, in order to provide for the growing traffic between Australia and North America, he has also made arrangements for a station to be established in Western Canada capable of communicating with Australia. Arrangement have also been made for sending and receiving commercial, social and Press messages between Australia and the United Kingdom at one-third of the existing cable rates. He has also an undertaking that if the Marconi Company erects and operates stations in India and South Africa capable of communicating with Australia, they will make similar traffic arrangements in regard to such communication. The Australian and the English high-power stations will be equipped with apparatus for duplex automatic reception and transmission. The main Australian station will be in the vicinity of Sydney or Melbourne, and the stations in other parts of the Commonwealth, besides acting as feeders for the trunk station, will afford facilities for communication to and from ships at sea.

Imperial Notes.

CONDOBOLIN (N.S.W.) Council have borrowed £7 000 for electricity supply purposes.

BALLIVA (N.S.W.) Council are negotiating for a supply of electricity from a local butter factory.

The N.S.W. Railway Commissioners have agreed to supply electricity in bulk to BANKSTOWN (N.S.W.) Council.

A petition has been presented to CORAKI (QUEENSLAND) for a poll on the question of borrowing money for establishing electricity works.

It is announced that the CANADIAN PACIFIC RAILWAY is likely to acquire the tramway service operated in Kingston and district by the West India Electric Company, another Canadian concern, with headquarters at Montreal.

As the outcome of his recent visit to CEYLON, Lord Northcliffe has expressed the opinion that, in regard to the proposed development of hydro-electric power, Ceylon has the same opportunities as Tasmania, especially in view of the high price of coal.

The "Daily News" states that a COMPANY has been FLOATED, with a capital of five lakhs, for the supply of electricity in the municipality of NAVASARI, INDIA (B.B. and C.I. Railway) and the adjoining area. Engines, generators, switchgears, &c., will be required.

CASINO (QUEENSLAND) Council have passed a resolution in favour of the adoption of an electric supply scheme, in conjunction with a project for pumping the town water electrically. The expenditure is estimated at £16 000. The proposal will require confirmation by the ratepayers.

The Victorian Railway Commissioners have arranged for the construction of h.t. feeder lines for the shires of LILYDALE, FRANKSTON, MORNINGTON and DANDENONG, and for the supply of electricity to these districts from metropolitan undertakings pending the carrying out of the Morwell scheme.

The High Commissioner for CANADA has received a cablegram from the Department of Customs, Ottawa, announcing that the enforcement of the provisions of the Marking of Imported Goods Act has been postponed by Order in Council until the close of the next session of Parliament.

The Minister for Works has reported to the Tasmanian Parliament that the transmission line from the Great Lake to Launceston, in connection with the TASMANIAN GOVERNMENT HYDRO-ELECTRIC UNDERTAKING, will be completed by Aug. 1 next. The steel required for the towers has now been obtained, chiefly from England.

BOMBAY Corporation is considering a scheme for the construction of a tube railway at an approximate cost of 2½ crores of rupees (about £1 600 000). It is suggested that the work should be undertaken by one of the two railway companies serving Bombay or by the tramways company, and, failing either of these, by the Corporation with Government assistance.

The TASMANIAN Minister of Works recently presented to the House of Assembly a statement on the progress of the STATE HYDRO-ELECTRIC DEPARTMENT. £932 507 was expended on the undertaking during the year ended June 30 last, bringing the total expenditure to £1 996 860, and £930 250 is to be spent during the current year. The Waddamana development of the Great Lake power scheme is rapidly approaching completion, and the whole plant should be in operation in less than a year

The Parliamentary Public Works Committee of the TASMANIAN HOUSE OF ASSEMBLY have reported in favour of building an ELECTRICALLY DRIVEN VESSEL to supersede the "Kangaroo," which has made the trip between Hobart and Bellerive several times daily since 1855. The estimated cost of the proposed new vessel is £30 000, including £15 000 for machinery, £16 000 for hull, and £2 000 for upper structure. The dimensions are to be:—Length, 140 ft.; beam, 35 ft.; depth, 8½ ft.; and the speed, 5 knots.

Though great efforts have been made to establish the IRON AND STEEL INDUSTRY IN AUSTRALIA on a satisfactory basis, it is reported that, owing to the severe competition of overseas manufacturers, the enterprise will have to be restricted to the production of rails and structural sections. Consequently the Commonwealth Government have been asked to impose a duty of 50 per cent., as anti-dumping legislation is not considered sufficient protection. The trouble is attributed mainly to the high rates of wages allowed by the Australian arbitration courts.

In connection with the proposal of the GOVERNMENT OF INDIA to establish a central organisation to buy all stores, whether imported or not, it is reported that the railway companies may also come into the scheme, and the local governments, the native States, and municipalities can come into it too, if they wish. The Bengal Chamber of Commerce, although to some extent an interested party, supports a proposal by the Calcutta Import Trade Association that the stores organisation should make it a rule to invite public tenders for all purchases above a limit of, say, Rs. 5 000

The "Times" Melbourne correspondent states that the Commonwealth Government has REFUSED ADMISSION INTO AUSTRALIA OF SIX GERMAN ENGINEERING EXPERTS engaged by the Victorian Government to supervise the erection of briquette machinery for the Morwell electricity scheme. Permission had been granted to import the briquetting apparatus, at a cost of £100 000, from Germany, on the plea that it was not obtainable elsewhere. The action of the Federal Government is taken under the amended Immigration Act of 1920, which

classes persons of German parentage and nationality as prohibited immigrants for a period of five years. The Act gives the Federal Government the power to grant exemption, but the Government refuses to exercise it, saying that the Victorian Government could have obtained experts from North America.

The directors of the HONGKONG TRAMWAY COMPANY have decided to assign the whole of the tramway undertaking to a new company, to be incorporated under the Hongkong Companies' Ordinance in exchange for shares of that company. The capital of the new company will be 325,000 shares of the nominal value of $5.00 each, treated as fully paid up, which will all be issued to the existing company. This arrangement is being carried out in order to avoid the incidence of English taxation, and particulary the corporation profits tax. It will also diminish differences in exchange.

The SYDNEY correspondent of the "Telegraph" states that Mr. McGregor, the British Trade Commissioner, in his report on Australian trade conditions, lays stress on the importance of Australian trade with British manufacturers in view of a probable considerable increase in the population in the future. Australia buys 60 per cent. of her overseas requirements from the United Kingdom, which proportion should increase to 75. The principal weakness is in machinery, engineering material, and metal manufacture, of which the United Kingdom percentage is 57 out of total imports of £39 000 000. There is, he states, abundant evidence that many firms are doing business in Australia without studying local conditions, or formulating a sales policy.

The KINGSTON (JAMAICA) correspondent of the "Times Trade Supplement" states that the Governor of British Guiana, at the opening of the annual session of the Combined Court, intimated that the Government intended to ask for a vote to carry out a contour survey of the colony above the Great Falls on the Demerara River in order to decide whether or not a reservoir lake can be established to enable a good permanent head to be maintained for hydro-electric works. The Governor stated that it was not likely that the colony would undertake the construction of hydro-electric works out of its own funds, but capitalists in Great Britain would be disposed to do so once they were satisfied that they would find a market for hydro-electric power if it were provided.

It is stated that very little interest is being shown in Canadian Government circles regarding the report of the Joint International Commission on the DEEPENING OF THE ST. LAWRENCE waterway for the purposes of navigation and water power. The report declares the project feasible and recommends a division of the cost of construction between Canada and the United States on the basis of benefits received through navigation; but the general opinion seems to be that, while the construction of the waterway will prove beneficial to the Dominion, owing to the financial position of the country, the scheme could not be undertaken for some years. The estimated cost of making a 30ft. channel on the St. Lawrence River from Lake Ontario to Montreal would be $269,000,000 (£54,000,000 at par), and on the Welland Canal to $60,000,000 (£12,000,000).

A notification issued by the INDIAN GOVERNMENT on Dec. 17 last gives the following amongst other new valuations for IMPORT DUTIES upon articles imported into India :—Telegraph instruments and apparatus imported by a railway company (formerly duty free), 2½ per cent., *ad. val.;* implements, instruments, apparatus, and appliances not otherwise specified, 11 per cent., *ad val.* This heading does not include the following articles, on which the duty is 2½ per cent., *ad val.* :—High-pressure switchboards, oil switches, and oil circuit breakers, motor starters and controllers, with accessories and resistances (for use with machinery and not with vehicles or lifts), regulators and rheostats (except regulators for fans other than induced or forced draught fans), and resistances intended for purposes other than the control of machinery, transformers, static converters and static condensers of 3kVA capacity or over.

Obituary.

The death is announced of Sir WILLIAM CHRISTIE, the Astronomer Royal from 1881 to 1910.

While attending to a switchboard at the Phœnix Dynamo Works, Bradford, recently, Mr. LAWRENCE WATERHOUSE, engineer, of Horsforth, near Leeds, fell against a live wire and was instantly killed.

The death is announced of Prof. J. H. COTTERILL, M.A., F.R.S., who was for many years Professor of Applied Mathematics at the Royal Naval College, Greenwich. He was born in 1836, and was the youngest son of the Rev. J. Cotterill, of Blakeney, Norfolk. He was educated at Brighton College, and after serving an apprenticeship in the engineering works of Messrs. Fairbairn at Manchester went to St. John's College, Cambridge. In 1866 he became Lecturer and in 1870 Vice-Principal of the Royal School of Naval Architecture at South Kensington. The school was removed to Greenwich in 1873, and became part of the Royal Naval College, in which Cotterill was Professor of Applied Mathematics till his retirement in 1897. Prof. Cotterill was a clear and original teacher, and he was the author of several well-known works, including "The Steam Engine, considered as a Thermodynamic Machine," and a treatise on "Applied Mechanics." These text-books passed through several editions, and had much influence on the teaching of these subjects in engineering schools. He was elected a Fellow of the Royal Society in 1878.

Foreign Notes.

A Presidential decree approves the installation of a factory for making electric light bulbs in HAVANA.

The Rhenish Westphalian Electricity Company, in agreement with the A.E.G., have decided to increase the capacity of the GOLDENBERG POWER STATION to 3 000 000 kW, and so make it the largest in Germany. The present output is 200 000 kW.

A hydro-electric plant for lighting and power has recently been installed at Tensa, COLOMBIA; a new telephone system at Cartagena; and a new electric lighting plant at the pier of Buenaventure, in order to provide the town with energy for power and lighting.

Owing to British competition, a "Times" correspondent states that United States trade with VIGO, SPAIN, shows a considerable decrease, especially in boiler tubes, chains, steel and iron cables, hardware, sheet metals, including tinplate, and electrical supplies.

A new and powerful LIGHTHOUSE for NIGHT-FLYING AEROPLANES will be erected on Mont Afrique (1 835 ft.), near Dijon. It is claimed that the light on Mont Afrique will be the strongest in the world, and will be 1 000 000 000 c.p., with a range of 100 miles, or, in very clear weather, 180 miles.

Owing to having ex-enemy members, the UNION INTERNATIONALE DE TRAMWAYS ET DE CHEMINS DE FER D'INTÉRÊT LOCAL, of Brussels, was sequestered in 1919, and was legally dissolved in November last. It has, however, been decided to reform the association this year, but ex-enemy representatives will be excluded.

A fire which broke out recently in the Vitkovice Iron Works in MORAVIA caused serious damage. The shunting plant was entirely destroyed, with all plant and material, and owing to the damage caused to the electrical equipment work in the engine shops has had to be suspended, throwing 2 000 men out of work.

A Reuter's message from Washington states that the Republican members of the Finance Committee of the Senate have come to a tentative agreement that the basis for assessing import duties under the NEW PERMANENT TARIFF LAW should be the American wholesale price at the time the article was shipped to America.

In the course of a speech delivered at the recent opening of the Antananarivo-Ambatolampy section of the Southern Railway in MADAGASCAR, the Director of Public Works mentioned that the electrification of two sections of the Tamatave-Antananarivo line was under consideration, and sketched out a comprehensive plan of railway development for future years.

According to a message from MOSCOW, a Government decree has been published directing an immediate start on the electrification of industries, railways, wharves, &c. Numerous new powerful electrical stations are to be erected, and old ones are to be extended. The decree, which carries out the instructions of the recent Congress of Soviets, places electrification on a footing of equal national importance with coal mining, metallurgy, and other leading industries.

The Commercial Secretary to H.M. Legation at Christiania reports that the AKER (NORWAY) Municipal Council have agreed to guarantee that sufficient capital to complete the two electric railways, for which concessions have been granted to the A/S Akersbanerne, shall be at the disposal of the company. The Council have also undertaken to guarantee a loan of two million kroner, to be taken up by Akersbanerne for commencing the building of both railways, conditionally upon both being constructed simultaneously and the work being initiated during the present winter.

Electricity development on a large scale is reported from FUKIEN (CHINA). The following are recent promoters of electric light companies: Wu Shih-hwang (Tungan), Chen Chen-sin (Kienyung), Lin Kien-tsing (Yungtai). There are also stated to be numerous other activities on a smaller scale. Merchants at Sinshihchen, Kashing, Chekiang, have established an electric plant under the name of "Chen Sin Electric Light Company," with a capital of $25 000. Machinery has already arrived, and subscribers total over 400.

A Bulletin issued by the Chinese Government Bureau of Economic Information states that the Chung Hsin Telephone Company of Kiahsin, Chekiang, has been registered by the Ministry of Agriculture and Commerce; a telegraph office has been opened at Sintsichen, Chihli; the Tsilu Electric Company, organised by Ma Wei-chia, has been granted registration by the Ministry of Communications; and the Ever Bright Electric Company has been organised in Chang Hsin, Chekiang. Mr. Wang Yu-puh, formerly manager of the Wuhsin Electric Company in Wuchow, is manager. Buildings are now under construction, and will be completed about April, 1922.

Recent Wills.

MR. SEPTIMUS YOUNG, late of Head, Wrightson and Co., has left estate valued at £10 329.

Mr. F. G. HART, of Easthope, Epping, M.I.E.E., for many years associated with Messrs. Peto & Radford, has left estate valued at £19.168.

Mr. HERMANN SLOOG, M.I.E.E., M.S.E., M.Soc.C.E. (France), secretary of the Groupe inter-Universitaire Franco-Britanique, the Société des Ingenieurs Civile de France, and the Office National des Universités et Ecoles Française, and agent in Great Britain for Danto, Rogo et Cie., Lyons, manufacturers of enamelled iron apparatus, has left estate valued at £1 726.

Miscellaneous.

The TOLGARRICK RADIUM MINE, near Truro, is to be reopened.

LONDON COUNTY COUNCIL have decided, subject to the consent of the Ministry of Health, to PROSECUTE ISLINGTON Borough Council for allowing the issue of black smoke from the shafts of their electricity works.

The British Electrical and Allied Manufacturers' Association announce that the BEAMA TECHNICAL CABLE CODE, by John F. Shipley, M.I.E.E., will be ready on Feb. 6. The published price will be 5 gs. net, plus postage.

Lord Weir of Eastwood will preside at A COSTING CONFERENCE to be held on Feb. 3, at 2.30 p.m., under the auspices of the Institute of Costs and Works Accountants. Tickets may be obtained from the Secretary, 38, Grosvenor-gardens, S.W.1.

Dr. W. F. Dearden (Medical Officer to the Port Sanitary Authority), lecturing at the Y.M.C.A., Manchester, on Tuesday on the HEALTH PROBLEMS OF MODERN INDUSTRY, said that it did not appear to be sufficiently understood that good lighting was absolutely essential as a working requirement in the factory and elsewhere.

The Metropolitan Railway Bill, and the North Metropolitan Electric Power Supply Bill are among the PRIVATE BILLS passed by the examiners last week for the first reading in the House of Commons. In the first METROPOLITAN RAILWAY BILL the company is seeking power to guarantee or subscribe an amount not exceeding £50 000 to the association organising the British Empire Exhibition, 1923.

The council of the UNIVERSITY OF BIRMINGHAM, in a report to the Court of Governors, make acknowledgement of the following gifts: The Watford Electric & Manufacturing Company, per Hunter, Ogle & Company, an automatic Watford motor starter; Donovan & Company, an up-to-date distribution board; Mr. George Ellison, a circuit relay and a complete motor starter and circuit breaker; and Dr. Ratcliffe, wireless apparatus.

The following have been appointed a special committee of the Royal Dublin Society to deal with the WATER-POWER RESOURCES OF IRELAND:—Sir John Griffith, Lord Powerscourt (chairman of the Committee of Agriculture), Mr. George Fletcher (chairman of the Science Committee), Mr. John Good (chairman of the General Purposes Committee), Prof Hackett, the Right Hon. Frederick Wrench, Mr. Edgar Anderson, and Prof. P. F. Purcell.

H. K. LEWIS & COMPANY have just issued a new list of "College Textbooks and Works of Reference in Science and Technology." The titles are arranged alphabetically under authors' names, and are classified under eighteen subjects, some of which, such as chemistry, engineering (civil, electrical, mechanical,) &c., are again divided. The subjects are arranged alphabetically, and a contents list is also included. The list will be sent post free to any address on application.

Dr. Walter W. Seton, organising secretary of the RAMSAY MEMORIAL FUND, states that a commemorative medal of the late Prof. Sir William Ramsay has been executed by the French sculptor, M. Louis Bottée, and will be struck shortly, when it is known how many medals will be required. The price of the bronze medal, including postage, will be 5s. to subscribers to the Ramsay Fund and 7s. 6d. to all other persons. Those desiring a medal should forward a remittance to Dr. Walter W. Seton, Ramsay Memorial Fund, University College, London.

With the object of interesting business men in this country in the forthcoming INTERNATIONAL INDUSTRIES FAIR OF SPAIN, which is to be held at Barcelona from March 15 to 25, a meeting was held in London at the Spanish Club last week, over which the Spanish Ambassador presided, and was supported by Sir Maurice de Bunsen (late British Ambassador at Madrid). The forthcoming fair will be the third to be held in Barcelona, and the exhibits are to be assembled in groups, not according to countries, but according to the various industries represented, and the classification will include the following sections: Metallurgy and hardware; mechanical and electricity; photography and cinematography; water power and hygienic applications; glassware; heating, lighting; transports and conveyances; and books.

From a statement of RATES LEVIED IN VARIOUS TOWNS, issued by Mr. W. A. Davis, borough engineer of Preston, it appears that of county boroughs, Stoke-on-Trent, paying £2 14s. 2d. for rates per head of population, is the cheapest, and Bradford, which pays £6 17s. 7d. per head, the dearest, with Manchester and Bootle in close attendance. Of the boroughs, Ilkeston, £2 12s. 7d., is the cheapest, and Chatham, £6 18s. 6d., the dearest; of the urban districts, Heston and Isleworth, £2 4s. 9d., is the cheapest, and Ebbw Vale, £2 8s. 11d., the dearest. Attention is called to the fact that high rateable value often goes with low rates, while the contrary is equally true. We note with interest that of eighty-two county boroughs no fewer than seventeen contribute nothing for the relief of the rates from any of their trading undertakings, such as markets, electricity, tramways, gas, water, motor omnibuses, and estates. On the other hand, most of the county boroughs had to help at least one of their undertakings from the rates, so the happy position of just being on the right side has not yet been widely attained.

Companies' Meetings, Reports, &c.

The directors of the EDISON SWAN ELECTRIC COMPANY have decided not to pay a dividend on the preference shares for the half-year to the 31st inst.

MONTREAL LIGHT, HEAT AND POWER CONSOLIDATED have declared a dividend of 1½ per cent., and the MONTREAL LIGHT, HEAT AND POWER COMPANY a dividend of 2 per cent. to shareholders of record at Jan. 31.

The directors of the LANARKSHIRE TRAMWAYS COMPANY recommend a dividend of 6½ per cent. for the past half-year, making, with the interim dividend of 5 per cent. paid to June last, a dividend of 5¾ per cent. for the year 1921.

The accounts of the BRITISH URALITE COMPANY show total debit balance of £14,383. The bankers have applied to the court for the appointment of a receiver, and the directors see no alternative but to place the company into voluntary liquidation.

The results of the working for the year 1921 of the ANGLO-ARGENTINE TRAMWAYS COMPANY, as cabled from Buenos Aires, will permit of the payment of a half-year's dividend on the 5½ per cent. cumulative second preference shares. This payment, amounting to 2s. 9d. per share, less income-tax at 6s. in the £, will satisfy the arrears to June 30, 1917, and will be made to shareholders on the books of the company at Feb. 7, 1922.

The report of the EAST LONDON RAILWAY COMPANY for 1921 states that the Joint Committee's traffic receipts for the past year cannot be furnished, as accounts between the companies in respect of receipts and working expenses have not been rendered during the period of Government control. The gross receipts are estimated at £87 189, which would give the company £48 826, instead of a minimum rental of £30 000 per annum. The arrears of interest to Dec. 31, 1921, in connection with the electrification of the line will be reduced by an amount (when agreed) representing the balance of revenue for the year due to the East London Railway in excess of the minimum rent of £30 000.

For the two years ending March 31, 1920, the balance at the credit of the profit and loss account of CHADBURN'S (SHIP) TELEGRAPH COMPANY, after paying directors' fees, depreciation, &c., amounted to £14 421, to which was added £6 052 brought in from March 31, 1918, making a total of £20 473. From this amount £7 200 has been deducted, representing four half-yearly dividends which have been paid at the rate of £6 per cent. per annum on the preference shares, leaving £13 273. Of this sum a dividend has already been paid on the ordinary shares at the rate of £6 per cent. per annum, less income tax, for the two years ending March 31, 1920, and the balance of £6 073 has been carried forward. The directors again have to record that, owing to the exceptional circumstances recently prevailing, it is impossible to submit at the present time a balance-sheet and profit and loss account for the year ending March 31, 1921. They, however, confirm the payment of a dividend of 6 per cent. on the ordinary shares, and the usual dividends on the preference shares, for the year in question.

The Chairman of the GREAT INDIAN PENINSULA RAILWAY COMPANY (Sir Charles H. Armstrong), who presided over the annual meeting on Friday, referred to the proposed electrification of the Bombay suburban lines, and said that all preliminary work had been completed. They were quite ready to go ahead when the necessary funds could be found. If, as was likely, the Government of India were unable to help them, it would not be difficult to arrange a satisfactory financial transaction in this country by which payments would be spread over a period of several years, but an arrangement of that nature would need the sanction of the Secretary of State. The importance of the work was very urgent, as it would not only reduce the cost of working, but would be of material assistance to Bombay in the years to come in helping to move expeditiously its rapidly increasing population. The cost at present prices was by no means excessive—very moderate, in fact—and the return on capital would be immediate and satisfactory. Offers of the character referred to had been made already, and they had also had similar offers in connection with the supply of rolling stock, of which they were badly in need.

New Companies.

The following list is compiled from information supplied by Messrs. Jordan & Sons, Ltd., company registration agents, 116-118, Chancery-lane, London, W.C. 2.

Berry, Wiggin & Company, Ltd., 3, Short-road, Stratford Market, E. 15. (178 880). Registered Jan. 6. Capital, £1 500 in £1 shares. Manufacturing chemists, manufacturers, exporters and importers of and dealers in bitumen, asphaltums, waxes, resins, pitches, and tars, chemical compounds, &c. Permanent directors : C. R. Berry and A. E. Wiggins. Private company.

A.H. Development Syndicate, Ltd. (179 052), 16-18, St. Bride Street, E.C. Registered Jan. 16. Engineers, manufacturers of all kinds of apparatus. Nominal capital, £100 in 100 shares of £1 each. Directors : E. S. Hunter and E. K. Hunter. Remuneration of directors, £100 each. Qualification of directors, one share. Private company.

S. Gurney & Company, Ltd. (179 073). Registered Jan. 16. To acquire and carry on the business of silk lamp, electric, and candle shade manufacturers and importers, now carried on at 29, Kirby Street, Hatton Garden, E.C., and elsewhere. Nominal capital, £2 000 in 2 000 shares of £1 each. Directors : A. K. Bulley, and Lelia A. Cooke (Miss). Private company.

Johnson & Slater, Ltd. (179 066), 119/121, The Albany, Oldhall Street, Liverpool. Registered Jan. 16. Manufacturers and dealers in electrical goods and accessories of all kinds. Nominal capital, £1 000 in 1 000 shares of £1 each. Directors : E. J. Johnson (chairman), and W. O. Slater. Qualification of directors, one share. Private company.

John R. Kinsey & Company. Ltd. (179 092), 350, Lower Addiscombe Road, Croydon, Surrey. Registered Jan. 17. Electrical engineers and motor repairers. Nominal capital, £5 000 in 5 000 shares of £1 each. Directors : J. R. Kinsey, A. W. Wood, L. E. Napper, and H. W. Leyland. Qualification of directors, £100. Private company.

Kirby Johnson & Company, Ltd. (12 017). Registered in Edinburgh, Jan. 17. Capital £3 000, in £1 shares. To acquire and develop the business of H. L. Kirby Johnson & Co., 62, Gordon-street, Glasgow, and to carry on the business of electrical engineers, engineering contractors, &c. First directors : H. L. Kirby, T. Young, and F. Greenwood. Qualification, 100 shares.

Shropshire Electrical & General Engineering Company, Ltd. (179 180), Corve Bridge Works, Ludlow, Shropshire. Registered Jan. 17. Electrical, consulting, and general engineers. Nominal capital, £500 in 500 shares of £1 each. Directors : E. Townson, A. Taverner. Qualification of directors, £200. Private company.

Teignmouth Electric Lighting Company, Ltd. (179 116), 2 and 3, Orchard Gardens, Teignmouth, Devon. Registered Jan. 18. Electrical engineers, electricians, engineers and contractors, and suppliers of electricity. Nominal capital, £10 000 in 10 000 shares of £1 each. Minimum subscription £4 000. Directors : W. M. Bird, A. P. Dell, F. C. M. Giles, E. W. Parsons, J. A. Purves, and G. Rossiter. Qualification of directors, £100. Remuneration of directors, first year of the company £175; second year not less than £150; third year not less than £120. Public company.

J. R. West, Ltd. (179 094). Registered Jan. 17. Electrical and mechanical engineers. Nominal capital, £300 in 6 000 shares of 1s each. Directors : J. R. West, and H. Causton. Qualification of directors, 100 shares. Remuneration of directors, £100 each. Private company.

Forty Years Ago.

(The Electrician, Jan. 28, 1882.)

A Concession.—The Postmaster-General has, in deference to a request from the Wolverhampton Chamber of Commerce, allowed the word "Wolverhampton" to be paid for as one word on all foreign telegrams.

The Government and the Telephone Companies.—A rumour was, according to the "Standard," current on Wednesday last to the effect that the Government contemplated purchasing the telephone undertakings of this country. We have reason to believe that there is no foundation whatever for this rumour.

Electrical Patents, 1881.—From a perusal of the records of the Patent Office, it may be roughly estimated that the following patents were taken out in 1881 :—Electric lighting and appliances therefor, 162, telegraphs and telephones, 111; secondard batteries, 28; other batteries, 22; electric clocks, 7; compasses, 6.

A New Electric Light Company.—The prospectus of the Hammond Electric Light & Power Supply Company has been issued. The company has a capital of £250 000, of which it is proposed at present to issue one-half. The company is formed to purchase from Messrs. Hammond & Company their existing electric light business, including their "Brush" concessions and "Lane Fox" license.

A Government Cable Depot.—We recently stated that tenders had been invited by the Government for the erection of a cable depot at Woolwich. This depot is now in course of erection, and will include cable tanks, offices, &c. The total cost is estimated at £10 000, and a staff of telegraph engineers will be attached to the works, which will chiefly be devoted to the Post Office cables round the coast, and connected with the various islands in the British seas. Operations hitherto performed for the Government by private firms at a cost of some thousands of pounds per annum will now be carried out by the Post Office.

Social Notes.

Mr. J. C. Cubitt has been presented with a case of cutlery by members of Crompton and Company's Cricket Club, Chelmsford, on the occasion of his forthcoming marriage.

The Dundee Sub-Centre of the Institution of Electrical Engineers will hold a smoking concert on Monday, January 30, at 7.30 p.m., at the Royal British Hotel, Dundee.

The Greater London Division of the Electricity Supply Commercial Association are holding their second Bohemian concert at Anderton's Hotel, Fleet-street, on Wednesday evening, March 1, under the chairmanship of Mr. D. C. Clark. Tickets may be obtained at 2s. 4d. each from members of the E.S.C.A., or from Mr. G. S. Watts, 121, Little Ealing-lane, Ealing, W. 5. Ladies are especially invited.

Calendars, Diaries, &c.

An artistic wall calendar for 1922 has been issued by the D.P. Battery Company, consisting of twelve small monthly sheets below a water-colour of Peveril Castle.

In addition to a handsome desk blotter, the Hart Accumulator Company have sent us a useful desk calendar, consisting of twelve monthly cards in a frame mounted on a stout yellow card, the upper half of which is black, and cut to the shape of a storage battery.

The Liverpool Electric Cable Company have sent us their calendar for 1922. This measures 10in. by 12in., and consists of twelve good-sized monthly slips below a coloured illustration entitled "The 'Mauretania' in the Mersey." The whole is mounted on a stout brown card.

The "Mechanical World" Year Book, 1922, which is published by Emmott & Company, at 2s. 6d. net, now reaches its thirty-fifth year of publication. The present edition has been enlarged by the addition of about twenty pages, largely accounted for by the section on boiler construction, which has been rewritten, and a considerable amount of new matter added. We also note some useful details regarding pipes and tubes, while the tables on the thermal properties of solids, liquids, and gases have been restored. A useful feature is a classified buyers' directory in several languages.

The "Practical Electrician's" Pocket Book and Diary, 1922, is published by S. Rentall & Company, at 3s. net. The usual care is noticeable in the production of this little book, and in this edition several chapters have been rewritten and new chapters added, with the result that the pages have been increased in number by about forty, though by the employment of thin paper the publication has not increased in bulk; a point worthy of notice in a pocket book. New chapters contain information on motor converters, current limiters, railway signalling apparatus, and the care of ignition, lighting, and self-starting sets for motor vehicles. Some up-to-date details on mercury vapour rectifiers, and on the tungar rectifier for garage charging, are also given. Tables of electricity supply undertakings, revised up to a few weeks ago, are also included.

Prices of Metals, Chemicals, &c.

Sodium Chlorate.—Per lb. 3½d.
Rubber.—Para fine, 1s. 0¾d.; plantation 1st latex, 9⅛d.

The metal prices are supplied by British Insulated & Helsby Cables, Ltd., and the rubber prices by W. T. Henley's Telegraph Works Company.

Tenders Invited and Accepted.

UNITED KINGDOM.

Salford Guardians. Jan. 31.—Small alterations and additions to electric wiring and fittings in Pavilion B of the Infirmary at Pendleton. Particulars from the Clerk, Poor Law Offices, Eccles New-road, Salford.

Northfleet. Jan. 31.—Installation of the electric light at the Council's Offices. Particulars from the Surveyor, Mr. J. A. Mitchell.

Warrington Corporation. Feb. 6.—Main e.h.t. switchboard extension. Specification, &c., from the Borough Electrical and Tramways Engineer.

Dublin Electricity Supply Committee. Feb 7.—One or two years' supply of extra high-pressure and low-pressure cables, cable laying, and supply of troughing, section pillars and joint boxes. Specification, &c., from the City Electrical Engineer, Fleet-street, Dublin.

Islington (London) Borough Council. Feb. 16.—One year's supply of stores, including cables, electricity meters, fuse boxes, compounds, lamps, wires, electrical sundries, transformers, carbons, arc lamp globes, insulators, &c. Specification, &c., can be obtained at the Town Hall.

Hampstead (London) Borough Council. March 15.—Supply of various stores for six or twelve months, including electrical engineers' stores and oils for the electricity station. Form of tender, &c., from the Town Clerk.

Aylesbury Corporation.—300 kW converter, with e.h.t. and l.t. switchgear. Specifications, &c., from the Borough Electrical Engineer.

AUSTRALIA.

Australian Commonwealth Government, Feb. 15 :—30 tons approximate Wheatstone tape paper white (Schedule 544). Particulars from the Supply Officer, Australia House, Strand, London, W.C. 2.

Victorian Government Railways.—Feb. 15.—*Supply and delivery of : (1) Fifty track relays, four front and two back contacts, fifty track relays, eight front and two back contacts, fifty line relays, six front and two back contacts (Contract No. 34 739) ; (2) 100 three-position line relays (Contract No. 34 740) ; (3) 100 electric signal mechanisms (Contract No. 34 738) ; (4) electro-mechanical interlocking apparatus (Contract No. 34 822) ; (5) fifty miles insulated copper wire (Contract No. 34 823). Local representation is essential.

Victorian Railway Commissioners. Feb. 15.—*Hydraulic pig iron breaker, including tools, gears, accessories and spares, for Bendigo workshops. (Contract No. 34 191.)

Deputy Postmaster-General, Brisbane. Feb. 15.—*Telephone apparatus and parts, including bells, buzzers, chambers for transmitters, induction coils, condensers, cords. (Stores schedule No. 544.)

New South Wales Government Railways and Tramways Department (Electrical Engineer's Branch).—Feb. 22, 1922.—*Supply, delivery, erection and maintenance of one 5 000 kW 50 cycle turbo-alternator with condenser and accessories, at Zarra-street power house, Newcastle. (Contract No. 556.) Tenders, on proper forms and accompanied by a preliminary cash deposit, to the Secretary for Railways, Phillip-street, Sydney, N.S.W. Local representation is essential.

Commonwealth of Australia. March 8.—Switchboard apparatus and parts (schedule 545). Particulars from the Supply Officer, Room 101, Australia House, Strand, London, W.C. 2.

Victorian Railway Commissioners. March 8.—*Thirty-five cabin transformers for power signalling. (Contract No. 34 863.)

Postmaster-General's Department, Brisbane. March 8.—*Telephone switchboard apparatus and parts, including calculagraphs, caps, plane convex lens, retardation coils, cords, generators, indicators, jacks, keys, lamps, pegs, plugs, meters, relays, telephone sets &c. (Stores schedule No. 545.)

Deputy Postmaster-General, Brisbane. March 15.—*Protective apparatus, including arresters, carbon blocks, fibre fuses, protectors and terminals. (Stores schedule No. 546.)

Commonwealth of Australia. March 15.—Protective apparatus. Particulars from the Supply Officer, Room 101, Australia House, Strand, London, W.C. 2.

Municipal Council of Sydney (Electricity Department). April 24.—*Supply, delivery, and erection of two 2 000 kW rotary converters ; one 10 000 to 12 000 kW turbo-alternator.

NEW ZEALAND.

Public Works Department, Wellington. Feb. 28.—*Supply and delivery, ex ship's slings Lyttelton, of a bank of three 11 000 V reactances, complete, for the Lake Coleridge electric power scheme.

Public Works Tenders Board, Waikato Power Scheme. March 6.—*(Section 45) two 2 500 kWa alternators, three-phase, 50 cycle, 5 000 V, at 166⅔rds rev. per min., with a power factor of ·8. Excitation at 220 V. (Section 46) two 3 100 h.p. water turbines of the double-runner Francis type to operate the generators mentioned in Section 45. (Section 47) two exciter sets, each consisting of one 200 kW d.c. generator, and one 350 h.p. asynchronous motor, together with a Tirrill regulator. The generator shall have an output of 220 V, with a full-load current of 7 000 A. The motor shall be of 350 h.p., with a power supply of 400 V, three-phase, 60 cycle. The synchronous speed of the sets shall be 750. (Section 48) four Stoney sluice gates for the pits, appertaining to the turbines mentioned in Section 46. Tenders to the Secretary, Public Works Tenders Board, Government Buildings, Wellington.

Dunedin City Council. March 31.—*Supply and delivery of one 150 h.p. three-phase induction motor and reduction gear for the Mornington Cable Service.

Auckland Harbour Board. April 25.—Four double-barrel electric winches for the Central Wharf, Auckland. Specifications from W. & A. McArthur, 18-19, Silk-street, Cripplegate, London, E.C. 2.

SOUTH AMERICA.

Argentine Ministry of Public Works. Feb. 21, 1922.—*Nine electric motors, 36 tip waggons, 1 centrifugal pump with electric motor. Specification expected at the Department of Overseas Trade by Dec. 28.

BULGARIA.

Bulgarian Department of Posts, Telegraphs and Telephones. Feb. 8. *Supply of the following telegraphic accessories :—Twenty terminal boxes for 40-pair cable, 1 000 combined lightning arresters and 1 A fuses, 500 combined lightning arresters in fuses (different type), 300 transformers, 700 condensers (2 micro-farad), twenty junction-boxes with protective devices for 40-pair cable.

Bulgarian Department of Posts. Feb. 14.—*Bronze in plates and bars, iron and steel plates and bars, and insulating materials.

Bulgarian Department of Posts, Telegraphs, and Telephones. February 20.—*2 000 telephone instruments for table use, with local battery and magneto. Also for spare parts.

Bulgarian Department of Posts. Feb. 27.—*Electricians' small tools, including 900 pairs pincers, 20 brazing lamps, 100 soldering irons, 1 500 bits, 300 axes.

Bulgarian Department of Posts. March 8.—*Porcelain insulating tubes for telephones (10 000), insulating tubing (impregnated paper) for telephones (2 200 metres), ebonite caps (1 700), and insulated copper wire (1 000 metres).

Bulgarian Post and Telegraph Authorities, March 15.—*The supply of 1 A fuses, cartridge fuses for protection from lightning, 3 A fuses, line annunciators, carbon lightning arresters.

Bulgarian Postal Authorities, March 21.—*Telephone, pole-line hardware (4-pin carriers for insulators, bolts, etc.).

Bulgarian Postal Authorities, March 27.—*3 000 junction pieces for batteries. Delivery required within four months.

** Particulars from the Department of Overseas Trade.*

London County Council Education Committee have accepted the tenders of H. J. Cash & Company, for electric lighting work at Sherrington-road, Greenwich, schools, £506 ; and Webb-street, Bermondsey, schools, £519.

Hackney Borough Council have accepted the tender of the Stanton Ironworks Company, at £909 13s. 9d., for condensing-water circulating pipes in connection with the extension of the electricity power-house at Millfields-road.

Hammersmith Borough Council have accepted the tender (the lowest received) of the Enfield Ediswan Cable Works, Ltd., for 2 500 yds. of 0·1 sq. in. 3 core l.t. cable at £947. Five tenders were received, the highest being £1 007 10s.

It is reported in Sheffield that Metropolitan-Vickers, Ltd., have secured, in the face of keen competition, an electrical contract in South Africa of the value of £1 000 000. German firms are said to have made a vigorous effort to secure the business.

The General Electric Company inform us that the alternator of the turbo-alternator set for the Eastbourne Corporation, the contract for which was recently awarded to W. H. Allen, Son & Company (Electrician, Jan. 6, p. 24), will be a G.E.C. machine, manufactured by the firm at their Witton Works, Birmingham.

Sydney (N.S.W.) City Council have decided to place an order with the Electricity Meter Manufacturing Company for 1 000 5 A 240 V s.p. meters at £3 each, on condition that when the company develops a satisfactory meter which is cheaper to manufacture, a reasonable preference will be given to the Council in the matter of price, in return for their efforts to foster local manufacure.

London County Council have accepted the following tenders : Dorman & Smith (lowest tender), for two main power distribution boards and power sub-distribution boards in connection with the electrical installation at the new County Hall, £1 014 7s. 11d. (five tenders were received, highest £1 696) ; W. J Furse & Company (lowest tender), for the supply and installation of lightning conductors at the new County Hall, £1 411 1s. 8d. (four tenders received ; highest £1 765 3s. 4d.). The Council have also authorised the ordering of additional mains and circuit cables up to the value of £3 000 under the existing sub-contract with the Pirelli General Cable Works, Ltd.

Swansea Borough Council have reversed the decision of the Electricity Committee to place a contract with a British firm, although a French firm's quotation was lower. The committee recommended the acceptance of the tender of Ferranti, Ltd., for a transformer at the sum of £1 408 7s. This was the lowest British tender : but the French firm, Le Transformateur, tendered at £900. Col. Sinclair, chairman of the Electricity Committee, said that but for the difference in the rate of exchange the French price would be double. He showed that no less than £870 of the sum quoted by the British firm would be expended in wages, and emphasised that the acceptance of the French tender meant throwing British workmen out of employment for weeks. On a division, however, the contract was awarded to the French firm by a large majority.

COMMERCIAL INTELLIGENCE.

The following information is taken from printed reports, but we cannot be responsible for any errors that may occur.

London Gazette.

Partnerships Dissolved.

GOODENDAY John, and FRENK, Albert Simon, electrical contractors, 101, Dale-street, and 62, Smithdown-road, Liverpool, co. Lancaster, under the style of Goodenday & Frenk, by mutual consent as from Dec. 1, 1921. Debts received and paid by A. S. Frenk.

HORSFALL, Robinson, and HARRISON, Richard, electricians and armature winders, Waltham-street, off Doncaster-road, Barnsley, under the style of Harrison and Horsfall, by mutual consent as from Jan. 18, 1922. Debts received and paid by R. Horsfall, who will continue the business.

JAMES, Arthur Leonard, and WHITE, Albert, electrical engineers, &c., 56, Wiverton-road, Sherwood-rise, and 52a, North-gate, Old Basford, Nottingham, under the style of A. L. James, by mutual consent as from Dec. 31, 1921. Debts received and paid by A. White, who will continue the business.

Bankruptcy Information.

FAWCETT, Ernest, 20, St. Anne-street, Liverpool, electrical and heating engineer. First meeting, Feb. 1, 11.30 a.m., Offices of the Official Receiver, 11, Dale-street, Liverpool. Public examination, Feb. 13, at 10.30 a.m., Court House, Government Buildings, Victoria-street, Liverpool.

TRUELOVE, Harold (trading as H. Truelove & Company), 19, Shepley-street, Stalybridge, Co. Chester, electrical engineer. Receiving order, Jan. 18. Creditor's petition.

Notice of Intended Dividend.

BAKER, Reginald Percival, and STUBBS, Frederick Clarence, trading together in co-partnership as the Sheffield Electric Construction Company, 124, Pond-street, Sheffield, electrical engineers. Last day for receiving proofs, Feb. 8. Trustee, L. J. Clegg, Official Receiver's Offices, 14, Figtree-lane, Sheffield.

Company Winding-up.

CEDES ELECTRIC TRACTION, LTD. Last day for receiving proofs, Feb. 9. Liquidator, H. E. Burgess, 33, Carey-street, Lincoln's Inn, London, W.C. 2.

Company Winding-up Voluntarily.

PEARLITE ELECTRIC WELDING COMPANY, LTD. J. C. Burleigh, Bond Court House, Walbrook, E.C. 4, appointed liquidator.

Liquidator's Notice.

PEARLITE ELECTRIC WELDING COMPANY, LTD. (in voluntary liquidation). Meeting of creditors at Bond Court House, Walbrook, London, E.C. 4, Jan. 31, 11 a.m. N.B.—The above is a formal notice to comply with Section 188 of the Companies (Consolidation) Act, 1908. All creditors have been, or will be, paid in full.

County Court Judgments.

[NOTE.—The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debts. They may be for actions. But the Registry makes no distinction of the cases. Judgments are not returned to the Registry if satisfied in the Court books within twenty-one days.]

CHARNOCK, Mr. M. J., 339, Icknield Port-road, Birmingham, electrical engineer. £21 4s. 3d. Nov. 11.

CROXON, Ralph Wilfred, 38a, Brixton-road, S.W., electrician. £13 6s. Nov. 15.

JACOBS, ARTHUR (trading as Arthur Jay), 20, St. Thomas-square, Hackney, electrical engineer. £10 19s. 7d. Nov. 10.

WASSELL, Mr. G. W., 4 Tividale-road, Tipton, electrical engineer. £10 14s. 6d. Nov. 15.

WOODS, Mr. A., 8, Ladbroke-grove, Holland Park, electrician. £16 3s. 8d. Nov. 15.

Bills of Sale.

[The undermentioned information is from the Official Registry. It includes Bills of Sale registered under the Act of 1822 and under the Act of 1878. Both kinds require registration every five years. Up to the date the information was obtained it was registered as given below; but payment may have been made in some of the cases, although no notice had been entered on the Register.]

BENNETT, Albert Richard, 119, Blackfriars-road, Southwark, electrical apparatus maker. Jan. 20. £30.

JACKS, Filmer, 57, Peacock-street, Gravesend, electrician, &c. Jan. 18. £30.

OSBORNE, Oliver James, 16, London-road, Maidstone, electrician. Jan. 18, £50.

SEAGE, Albert, 114, Airdale-avenue, Chiswick, electrical engineer. Jan. 23. £60.

Mortgages and Charges on Limited Companies.

[NOTE.—The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, created by a Company after the commencement of the Act, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges which would, if created after the commencement of the Act, require registration. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced since such date.]

"ALFO" ELECTRICAL ENGINEERING COMPANY, LTD., Liverpool. Registered Jan. 12, £250 debentures, to G N. Kenney, Glenolden, Birkenhead-road, Moreton, electrical engineer; general charge.

BOURNE END AND DISTRICT ELECTRICITY CORPORATION, LTD. Registered Jan. 11, £850 debentures, part of £20 000; charged on land at Bourne End; also general charge.

Satisfactions.

BIRMINGHAM DISTRICT POWER & TRACTION COMPANY, LTD. (late BIRMINGHAM & MIDLAND TRAMWAYS, LTD.). Satisfaction registered Jan. 12, £40 000; and further advances, &c., registered Jan. 24, 1918.

NAIROBI ELECTRIC POWER & LIGHTING COMPANY, LTD., London, E.C. Satisfaction registered Jan. 17, £1 000, part of amounts registered Sept. 29, 1913, and July 30, 1915.

Receivership.

WATSON, FOGGO & COMPANY, LTD. G. H. Highcock, of The Retreat, Victoria-road, West Kirby, ceased to act as receiver or manager on Dec. 15, 1921.

Bankruptcy Proceedings.

BLOWER, Arthur Ernest, lately trading as Blower & Cooper, electrical engineers' merchant, 1-3, Paul's Bakehouse Court, E.C. This debtor attended at the London Bankruptcy Court last week for public examination on a statement of affairs showing gross liabilities £762, and an estimated deficiency of £484. He began business in partnership in Sept., 1917, when he and his partner bought for £750—payable as to £100 down and the balance on or before Aug., 1924—the stock, fixtures, and book debts of a business carried on at the above address. He introduced no capital, but had a trade connection, and was to receive 60 per cent. of the profits, while his partner, who brought in £100, was to have 40 per cent. They were fairly successful until Dec., 1920, when the partnership was dissolved. Under the deed of dissolution he took over his partner's interest in the business and goodwill, but the proceeds from the stock and book debts were to be paid into a joint banking account and applied in payment of the partnership debts and in reduction of the amount due to the vendor of the business. He continued alone until August last, when, owing to trade depression, he closed down. Since Dec., 1920, the business had resulted in a net loss of £284. The debtor added that £275 of his debts represented the unpaid balance of the purchase price of the business. The examination was concluded. The following are creditors: Vulcan Electrical & Mechanical Company, £15; Wandsworth Electric Mfg. Company, London, £32; Trevelyan & Company, Birmingham, £19; Boyton, C. & Sons, Ltd., Wealdstone, £20.

Private Meeting.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

PLANET ELECTRIC COMPANY, LTD. (in voluntary liquidation), St. George's Road, London, S.E. The creditors of the above were called together recently, at the offices of Dollman & Pritchard, 52, Tavistock Square, London, W.C., when it was stated that the shareholders had passed the usual resolutions for voluntary liquidation, and had appointed Mr. S. H. Swallow as liquidator. An approximate statement of affairs presented, disclosed liabilities of £1 177, of which £877 was due to the trade. The assets were estimated to realise £918, or a deficiency of £259. The assets consisted of: stock estimated to realise £350; good book-debts, £350; furniture, fittings, and lighting installation, £160; plant, £55; and cash in hand, £3 3s. 8d. The company was registered some three years ago with a nominal capital of £2 000. The issued capital was £1 908, of which £1 246 was subscribed for in cash. The last balance sheet was prepared as at June, 1921, and disclosed a loss of some £600. A resolution was passed confirming the voluntary liquidation with Mr. Swallow as liquidator, while a committee was appointed consisting of the representatives of Rose Bros., Ltd., Lion Engine Company, Ltd., Telga Company, and Fuller United Electric Company, Ltd.

Arrangements for the Week.

FRIDAY, Jan. 27th (to-day).

PHYSICAL SOCIETY.

5 p.m. At the Imperial College of Science, London, S.W. Papers to be read "On the Diffusion of Solutions," by Mr. T. H. Littlewood, M.A.; "A Special Apparatus for the Measurement at Various Temperatures of the Thomson Effect in Wires," by Mr. H. R. Nettleton, M.Sc., and "A Defect in the Sprengel Pump—Its Causes and a Remedy," by Mr. J. J. Manley, M.A.

ELECTRICAL POWER ENGINEERS' ASSOCIATION. (SOUTHERN DIVISION.)

7 p.m. At Central Hall, Westminster, London, S.W. Lecture on "The Metering of Steam by Means of Orifices," by Mr. J. L. Hodgson, B.Sc.

INSTITUTION OF ELECTRICAL ENGINEERS. (STUDENTS' SECTION OF SCOTTISH CENTRE.)

7.30 p.m. At the Royal Technical College, Glasgow. Paper on "The Economical Production of Electrical Power," by Mr. R. G. Kendall.

NORTH-EAST COAST INSTITUTION OF ENGINEERS AND SHIPBUILDERS.

7.30 p.m. At the Literary and Philosophical Society, Newcastle-on-Tyne. Paper on "The Use of Compressed Air in Diesel-Engined Ships," by Mr. W. Reavell.

INSTITUTION OF ELECTRICAL ENGINEERS. (IRISH CENTRE.)

8 p.m. At the Royal College of Science, Dublin. Lecture on "The Development of Electricity Supply in Switzerland," by Mr. E. M. Johnson.

JUNIOR INSTITUTION OF ENGINEERS.

8 p.m. At Caxton Hall, London, S.W. Lecturette on "Fuels and the Boiler House," by Mr. L. M. Jockel.

TUESDAY, Jan. 31st.

ENGINEERS' CLUB, MANCHESTER.

7.15 p.m. At Albert Square, Manchester. Address on "A Business Trip to Canada and the U.S.A.," by Mr. J. P. Bedson.

INSTITUTION OF ELECTRICAL ENGINEERS. (STUDENTS' SECTION OF N.-WESTERN CENTRE.)

7.30 p.m. At Houldsworth Hall, Deansgate, Manchester. Paper on "Some Electric Lift Control Systems," by Mr. W. O. Brakenridge.

ILLUMINATING ENGINEERING SOCIETY

8 p.m. At the Royal Society of Arts, John-street, London, W.C. Discussion on "The Use of Light as an Aid to Aerial Navigation," opened by Lt.-Col. L. F. Blandy, D.S.O.

WEDNESDAY, Feb. 1st.

INSTITUTION OF ELECTRICAL ENGINEERS. (WIRELESS SECTION.)

6 p.m. At Savoy Place, London, W.C. Papers on "The Determination of the Decrement of a Distant Sending Station," by Major J. Erskine-Murray, and "Some New Methods of Radio-Navigation," by Major J. Erskine-Murray and Capt. J. Robinson, Ph.D.

INSTITUTION OF ELECTRICAL ENGINEERS. (SOUTH MIDLAND CENTRE.)

7 p.m. At the University, Birmingham. Lecture on "Single and Three-Phase Alternating Current Commutator Motors with Series and Shunt Characteristics," by Dr. S. P. Smith.

INDUSTRIAL LEAGUE AND COUNCIL.

7.30 p.m. At Caxton Hall, London, S.W. Lecture on "The Curse of Work," by Mr. H. T. Smith.

THURSDAY, Feb. 2nd.

INSTITUTION OF ELECTRICAL ENGINEERS.

6 p.m. At Savoy Place, London, W.C. Paper on "The Interconnection of A.C. Power Stations," by Messrs. L. J. Romero and J. B. Palmer.

LIVERPOOL ENGINEERING SOCIETY. (STUDENTS' SECTION.)

7.30 p.m. At the Royal Institution, Colquitt-street, Liverpool. Paper on "Sound Ranging," by Mr. E. G. Stepheus.

FRIDAY, Feb. 3rd.

INSTITUTE OF COST AND WORKS ACCOUNTANTS.

2.30 p.m. At the Holborn Restaurant, London, W.C. Costing Conference on "The Necessity for Scientific Costing."

JUNIOR INSTITUTION OF ENGINEERS

8 p.m. At Caxton Hall, London, S.W. Lecturette on "Utilisation of Waste Heat from Internal Combustion Engines," by Major W. Gregson.

Patent Record.

SPECIFICATIONS PUBLISHED.

The following abstract from some of the specifications recently published have been specially compiled by MESSRS. MEWBURN, ELLIS & CO., *Chartered Patent Agents, 70 and 72, Chancery-lane, London, W.C.*

COMPLETE SPECIFICATIONS.

140 789 SCOVILL MANUFACTURING CO. Automatic control mechanism for electric furnaces. (28/6/18.)
145 675 SIEMENS & HALSKE AKT.-GES. High-tension electric transformers. (30/6/19.)
146 873 RENAULT, L. Electric starting and lighting systems for automobiles. (2/12/13.)
146 914 SIEMENS-SCHUCKERTWERKE. Portable electric welding apparatus. (3/5/19.)
146 990 WESTERN ELECTRIC CO., LTD. Telegraphic ciphering and deciphering mechanisms. (4/12/18.)
147 664 KOHLER CO. Electric generating systems. (2/3/16.)
147 850 GES. FÜR DRAHTLÖSE TELEGRAPHIE. Wireless telegraph transmitters. (22/12/17.)
147 890 FERY, C. Primary batteries. (1/12/14.)
149 349 METROPOLITAN VICKERS ELECTRICAL CO., LTD. Electric wireless receiving apparatus. (5/8/19.)
168 350 FELLOWS, A. W., & GARDNER, W. A. Electric distributing device for the ignition systems of internal combustion engines. (5/6/20.)
168 360 AJAX, LTD., COOPER, C. A., & SELL, D. F. Containers for electric batteries and other electrical apparatus. (29/4/20.)
168 363 TUCKER, J. B., & TUCKER & CO., LTD., J. H. Electric contacts. (20/5/20.)
168 394 TAGGART, J., SCOTT, & RADIO COMMUNICATION CO., LTD. Vacuum-tube relay devices and the like especially for use in wireless signalling systems. (29/5/20.)
168 407 MACRORIE, A. K., AIREY, H. MORRIS, & SHEARING, G. Supports for filaments for thermionic valves. (31/5/20.)
168 409 MARR, G. Construction of combined electric switch and plug coupling. (1/6/20.)
168 432 KIRKHAM, J. Auxiliary device for use with sparking-plugs. (6/3/20.)
168 443 BRITISH THOMSON-HOUSTON CO., LTD., & JEWITT, D. E. Systems of electric ship propulsion. (12/6/20.)
168 474 RELAY AUTOMATIC TELEPHONE CO., LTD. (BETULANDER, G. A., & PALMGREN, N. G.). Arrangement for testing lines or line groups, particularly in automatic and semi-automatic telephone plants. (2/7/20.)
168 479 BROWN, G. R. Process and apparatus for electrostatic separation of finely divided discrete material. (7/7/20.)
168 499 WALKER, H. E. Junction boxes and the like for electricity distributing systems. (24/7/20.)
168 508 MULL, R. S. S. Process for utilising mica for electrical purposes. (4/8/20.)
168 514 HOWARTH, O. Apparatus for measuring the maximum demand demanded from an electricity supply. (13/8/20.)
168 537 JOHNSON & PHILLIPS, LTD., & HOCKLY, A. Means for holding in close contact a movable truck and stationary cubicle of an electric switchboard or other relatively movable members. (7/10/20.)

APPLICATIONS FOR PATENTS

October 3, 1921.

26 056 DAVIS. Recording telephone calls.
26 060 SUTHERLAND, COOKE, COPELAND & ROGERS Device for recording telephone calls.
26 078 CLAREMONT & SCHOLES. Electric junction boxes.
26 089 RYAN. Relays for reception of signals, &c.
26 098 HEESCH. Automatic electricity meter. (27/8/21, Denmark.)
26 102 BENNETT. Switches.
26 125 DENNY. Switches.
26 127 HUTH & OPPENHEIMER. Transmission of signals by electric oscillations. (2/10/20, Germany.)
26 141 GOLDSMID-STERN-SALOMONS (Fayol). Incandescent lamps.
26 147 LINDNER. Electric pocket lamps.

October 4, 1921.

26 135 GENILLER. Incandescent lamps for advertising, &c.
26 162 SMITH & ANSELL. Indirect lighting fitting.
26 212 RICKETS. Electric appliances for seam or line welding.
26 214 LEVIN. Electrolytic cells for generating oxygen and hydrogen.
26 220 WALKER. Radio-telephone transmitter.
26 227 JOFEH. Telephone mouthpieces
26 229 SOC. ANON LE FER. Production of electrolytic iron. (19/10/20, France.)
26 231 METROPOLITAN-VICKERS ELECTRICAL CO. Steam turbines.
26 238 FROST. Electrically heated vulcanising apparatus.

October 5, 1921.

26 258 TAYLOR. Overhead electric transmission.
26 291 BROOK. Electric lamps.
26 302 ELECTRIC CONTROL, LTD., & ELLEFSEN. Electric control for lifts, haulage gear, &c.
26 307 PHI-KAPPA SYND. & KLUIJTMANS. Combined switches and fuses.
26 308 PHI-KAPPA SYND. & WATSON. Electric heating apparatus.
26 314 CASH. Releasing arms of starting gates by electric power. (11/10/20, S. Africa.)
26 332 B. T.-H. CO. (G. E. Co.) Wireless signalling systems.
26 330 ANDERSON & ELLISON. Magnetic blow-out devices for electric circuit controlling apparatus
26 336 ZWEIGBEROK. Brakes for railway and tramway vehicles.
26 345 WATANABE. Steel for making magnets.
26 354 SULLIVAN. Submarine telegraph cables.
26 355 TELEPHONE MFG. CO. (1920) & SMITH. Automatic exchange telephone apparatus.

October 6, 1921.

26 366 WALTERS. Horizontal electrically-driven pumps.
26 383 BARNETT. Automatic electric switch.
26 388 WALL. Direct current dynamo.
26 417 HATCHER. Commutators.
26 425 AUTOMATIC TELEPHONE MFG. CO. Telephone systems. (15/10/20, U.S.)
26 427 ROMBACH. Electric lamps.
26 431 B. T.-H. CO. (G. E. Co.). Wireless signalling systems.
26 436 WATTS, WILLIAMS & CO. & MIDDLETON. Dynamo and accumulator sets.
26 449 SMITH. Inductances, inductance coils, &c.
26 466 BRYAN & TATHAM. Switch.
26 475 ABRAHAM. Wireless telegraphy. (6/10/20, France.)

October 7, 1921.

26 501 Fildes. Storage of fuse wire.
26 511 Hougardy. Switches.
26 541 Judge. Commutator rotating disc and terminal for ignition discs.
26 549 & 26 550 Igranic Electric Co. (Cutler-Hammer Mfg. Co.). Electro-magnetic brakes.
26 553 Phi-Kappa Synd. & Kluijtmans. Electric heating and cooking apparatus.
26 561 Berry. Electric lamps and fans.
26 567 Chamberlain & Hookham & James. Circuit interrupting devices.
26 568 Valentine. Commutators for electric ignition systems.
26 580 B. T.-H. Co. (G. E. Co.). Electric signalling devices.
26 585 Hermet & Izoard. Electric lamps.
26 589 Amphlett & Lewis. Electric ignition apparatus.

October 8, 1921.

26 612 Bosch (R.) Akt. Ges. High-tension ignition systems. (23/10/20, Germany.)
26 613 Jones. Electric contacts or connections.
26 662 Johnson. Automatic control of electric lamps for motor vehicles, &c.
26 670 Spencer & Co. & Sharp. Magnetic separators.
26 673 B. T.-H. Co. Electron-discharge devices. (28/10/20, U.S.)

October 10, 1921.

26 729 Phi-Kappa Synd. & Watson. Electric irons.
26 732 Telephone Mfg. Co. (1920). Warning signals for platelayers, &c.
26 744 Hyman & Saxby. Telephone apparatus.
26 746 Cardwell. Electric ignition apparatus.
26 768 Oldham. Electric connections
26 780 Dinnibier. Electrical entertainment devices. (9/10/20, U.S.)
26 793 Bardt. Manutacture of electrodes.
26 801 Bardt. Storage batteries.
26 802 Huth & Kühn. Apparatus for influencing electric waves produced by cathode tubes for telephony. (2/12/19, Germany.)
26 807 American Radio & Research Corporation. Rectification of alternating currents. (8/10/20, U.S.)
26 820 Gurney. Reflecting devices for electric lamps, &c.

October 11, 1921.

26 821 Mechanical Supplies, Ltd. & Baynes. Relays for amplification of sound, &c.
26 836 Automatic Telephones Mfg. Co., Electrical Improvements, Ltd. & Beard. Indication position of apparatus or condition of circuits at a distance.
26 841 Moore. Electric contact makers.
26 852 Midland Electric Mfg. Co. & Barber. Ironclad switches.
26 853 Midland Electric Mfg. Co. & Barber. Adpustable time-lags for circuit breakers.
26 887 Ball Bearing Works, J. Schmid-Roost. Current transmission devices for ball bearings in electrically driven rail vehicles. (6/11/20, Switzerland.)
26 892 Western Electric Co. Electric signalling systems. (11/10/20, U.S.)
26 899 Cambridge & Paul Instrument Co. Adjustable sensitive relays.
26 900 Turner & Lucas. Terminals for electric circuits.
26 901 Danks, Lucas & Miller. Electricity measuring instruments.
26 903 Andersen. Transmission of pictures by telegraph and telephone.
26 905 Siemens - Schuckertwerke. Electric precipitating plants. (28/10/20, Germany.)
26 927 Lodge Fume Co. (Metallbank u. Metallurgische Ges.). Circuit breaker.
26 931 B. T.-H. Co. (G. E. Co.). Thermostatic elements.
26 932 B. T.-H. Co. & FitzGerald. Relays, &c.
26 945 Pasteur. Automatic circuit breakers. (12/10/20, France.)

October 12, 1921.

26 963 Taylor. Electric transmission of power with underground cables.
26 976 Taylor. Eliminating currents in lead sheating of cables.
26 981 Taylor. Improving current-carrying capacity of existing three-phase cable systems.
27 023 Austin & Macfarlane. Electric driving of machines on c.c. series system.
27 034 Rooke & Hatcher. Electric machines.
27 045 Coales, Darby, Garrard & Railing. Combined expansion joint and clamping support for electrical box bars.
27 049 Haefely et Cie. Insulators. (6/11/20, Switzerland.)
27 052 Hoar. Canopies for electric light fixtures, &c. (22/10/20, U.S.)
27 057 B. T.-H. Co. (G. E. Co.). Electrical apparatus.
27 089 Siemens-Schuckertwerke. Purifying gas by electricity. (22/10/20, Germany.)
27 102 Wolf & Zeketmaier. Electric heating and cooking appliances. (27/10/20, Germany.)
27 107 Rosenbaum, Huth & Loewe. Telegraphy or telephony. (15/9/15, Germany.)
27 108 Huth. Generating and strengthening oscillations for wireless telegraphy, &c. (17/5/19, Germany.)
27 110 British Lighting & Ignition Co. & Turner. Switches.

October 13, 1921.

27 119 Tracy. Electrical connection.
27 131 Kratt & McClelland. Electric motors for gramophones.
27 139 West Lancashire Electrical Co. & Speed. Portable electric water heaters.
27 140 West Lancashire Electrical Co. & Speed. Method of controlling water heaters.
27 145 Roberts. Device for varying illuminating power of electric lamps.
27 148 Rice & Weir. Controller for electrical advertising signs, &c.
27 159 Russell. Electric irons.
27 160 Lancashire Dynamo, &c., Co. & McLeod. Apparatus for changing velocity ratio and relative direction of rotation of two rotatable parts.
27 164 Eastern Telegraph Co. Apparatus for maintaining equality of speed in two or more motors, &c.
27 189 Kawakami. Accumulators.
27 197 Kemp. Electric condensers.
27 208 Graham. Mouthpieces, &c., for telephone transmitters and receivers.

October 14, 1921.

27 222 Robinson. Electric diaphragm warning horn.
27 230 Angold, Railing, & Orsettich. Brush-holders for electric machines.
27 231 Aitken. Automatic, &c., telephone exchange systems.
27 246 Parsons. Switches.
27 283 Finizio. Electric irons.
27 293 Loke. Electric furnaces, &c.
27 295 Payne. Wireless apparatus for producing continuous oscillations.
27 308 Hunt. Holders for incandescent lamps.
27 309 B. T.-H. Co. (G. E. Co.). Means for producing oscillations.
27 310 B. T.-H. Co. (G. E. Co.). Radio receiving systems.
27 324 Dubois & Reynold. Electric cut-out apparatus. (14/10/20, Switzerland.)
27 335 Motorenfabrik Oberursel A. G. Arrangement of magneto in cycle auxiliary engines. (12/2/21, Germany.)
27 337 Compton & Musgrave. Key contacts for electrically-operated organs, &c.
27 344 Ever-Ready Co. (Great Britain) & Mummery. Invert electric batteries.
27 346 Zehnder. Electro-magnetic chucks. (16/10/20, Switzerland.)
27 356 Combination Metallic Packing Co. (1921) & Harrison. Field magnets of magneto-electric generators, &c.
27 357 Combination Metallic Packing Co. (1921) & Harrison. Dynamo-electric machines.
27 358 Combination Metallic Packing Co. (1921) & Harrison. Armatures of magneto-electric generators.
27 359 Combination Metallic Packing Co. (1921) & Harrison. Magnetos, &c.

October 15, 1921.

27 360 Brown. Apparatus for making communication secret in wireless telegrapny and telephony.
27 365 Horton. Contrivance for generating electrical energy.
27 367 Harris & Wiseman. Supports for electric conductors.
27 407 Habann. Production of high-frequency oscillations for transmitting messages, &c
27 433 Sprosen & Wiseman. Electric lamps for vehicles.
27 435 Automatic Telephone Mfg. Co. Relay circuit arrangements for telephone, &c., systems (17/11/20, U.S.).
27 437 Koeh & Schwarz. Three-phase induction motors.

October 17, 1921.

27 464 Parsons. Adjustable electrical contacts.
27 484 Woodmancz. Electric switchgear for automobiles
27 497 Emtage. Electric indicators.
27 504 Vries de Waal. Electricity as mechanical advertising apparatus.
27 512 Naamlooze Venootschap Metaaldraadlampenfabr., Holland. Incandescent lamps, &c. (29/7/21, Holland.)
27 519 Rickets. Electric welding devices of resistance type.
27 522 Monger & Ruler-West. Electric model and toy apparatus, &c.
27 527 Todman, Ryall & Co. Cooling electrical machines.
27 528 Todman, Ryall & Co. Electric machinery.
27 529 Todman, Ryall & Co. Brush-gear for electrical machines.
27 533 Bergmann Elektricitäts Werke A. G. Starter for 3-phase short-circuited motors. (25/10/20, Germany.)
27 538 New Switchgear Construction Co. & Hall. Protected switches.
27 546 Woods. Electric motors.
27 549 Siebe, Gorman & Co. & Jenner. Battery plates.
27 550 Muller. Electric alarms. (4/7/21, Germany.)
27 581 Siemens & Halske A. G. Telephone systems. (16/10/20, Germany.
27 636 Everett. Alternating current protective devices

October 18, 1921.

27 575 Crankshaw & Markland. Automatic electro-magnetic lock for carriage doors, &c.
27 599 Mullard Radio Valve Co. Suspension of filaments in vacuum tubes, &c.
27 620 Oppenheimer. Electric lamps, &c
27 622 Estler Bros. Trolly collectors for tramcars or motor vehicles.
27 636 Edgcumbe. Alternating current protective devices.
27 639 English Electric Co. Brakes of tramcars, &c.
27 651 Speedy & Eynon. Switches, &c.
27 665 White (Magnetic Power Typewriter Co.). Electrical actuating means for type-bars of typewriters, &c.
27 668 B. T.-H. Co. (G. E. Co.). Systems of illumination.
27 674 Hodgson. Stand for electric irons. (29/10/20, New Zealand.)
27 677 & 27 678 Ellison. Switches, &c.
27 683 Illingworth. Electrodes.
27 689 Pollak (Siemens & Halske A. G.). Telephone systems.
27 690 Park & Rose. Device for rendering inoperative simultaneously prime movers and brakes of mechanical and electric vehicles, &c.
27 692 Aregall. Interrupter rheostats.

October 19, 1921.

27 763 B. T.-H. Co. (G. E. Co.). Electric machines.
27 787 Ges. für Drahtlose Telegraphie. Means for operating electrical signals, &c. (22/10/20, Germany.)
27 788 Pollak (Siemens & Halske A. G.). Telephone systems.

October 20, 1921.

27 808 Crust. Switch plugs.
27 822 Rogers. Electric horns.
27 835 Bridges. Steam-electric plant.
27 843 Murdoch. Electric machines.
27 846 Licht Akt. Ges. Manufacture of wires from metal having high melting point. (22/10/20, Switzerland.)
27 849 Young. Electrical transmitter microphones.
27 868 Western Electric Co. Carrier telegraph circuits.
27 874 British Generator Co. & Constable. Electric heating of water, &c.
27 883 B. T.-H. Co. (G. E. Co.). Radio signalling systems.
27 885 Ben-Ayad. Automatic electric ship's lead.
27 889 Bullimore. Containers for secondary batteries.
27 893 Godsell. Telephone systems, &c.
27 896 Loth. Looating losses in electric cables or lines.
27 901 Durtnall. Systems of operation for electric locomotives, trams, &c.
27 902 Etchells. Switches for train lighting systems.

October 21, 1921.

27 934 Electric Construction Co. & Close. Overload trip retarding device for circuit breakers, &c.
27 937 Field. Electrical instruments.
27 977 Knight. Incandescent lamps.
28 016 Metropolitan-Vickers Electrical Co. Electric railway motor control systems. (5/11/20, U.S.)
28 017 B. T.-H. Co. (G. E. Co.). Electrical discharge apparatus.
28 047 Schattner. Circuit making and breaking device.

October 22, 1921.

28 063 Thomas. Electric fly and insect killer.

CONTENTS.

Notes of the Week.

Autocracy at Wimbledon.

Recent occurrences at Wimbledon are enough to make the least communistically minded see red. For the Borough Council, becoming dissatisfied with their chief electrical engineer's work after twenty-one years' service, on Tuesday night held a special meeting, at which it was proposed that Mr. Tomlinson Lee's engagement should be terminated as from May 31 next, but that he should virtually be dismissed at a few hours' notice. This proposal was agreed to by sixteen votes to six, without any statement as to why or wherefore. It is only right to add that requests as to why this course was adopted were made by a stalwart minority, but nothing was disclosed, for the quaint reason that publicity would be against Mr. Lee's interests. For his part, we understand that Mr. Lee courts a full inquiry. This he certainly should have.

Immediate Action Required.

It is obvious, whatever the cause of the Council's action, that this sort of thing cannot be allowed to pass without both protest and action. It is likely to cause both. For the Electrical Power Engineers' Association (of which Mr. Lee is a member), the Chief Technical Assistants' Association, and the Associated Municipal Electrical Engineers all made representations to the Council before the meeting, asking for an inquiry, and pointing out that, however justified the dismissal might be on facts, to effect it so summarily means virtual ruin for the man concerned. The Ministry of Labour have also been approached, as they were when a similar case occurred with subordinate employees of the undertaking a short time ago—for this is not the first time that Wimbledon has offended—to force the Council to come into the open. Much might be written about the ethics of the whole matter, but it is not worth while. It is sufficient to say that if the conduct of municipal affairs is allowed to fall into the hands of those whose actions are mainly directed by swollen views of their own importance, such regrettable incidents will follow. The ratepayers of Wimbledon have the remedy in their own hands, and the E.P.E.A. might give them a chance of using it by running a candidate at the next election. In any event, the matter should not be allowed to drop.

Overhead or Contact Rail.

The discussion on "The Electrification of English Main Line Railways," which took place at a joint meeting of the Institutions of Electrical, Civil and Mechanical Engineers in Birmingham was not confined to the arid field where talk on systems alone flowers, but ventured into the more fruitful pastures where questions of greater engineering interest flourish. This is as it should be. For even when the great problem of the system is settled, if ever it is settled, there still remains the question, far greater in practical importance, of how best to apply the system, and especially whether it is better to use the overhead line or the contact rail. As might be expected, each solution has its supporters. Mr. Willox, fortified by his experience on the Metropolitan Railway, told the meeting that the contact rail was cheap to maintain and that even during such operations as the Baker Street widening was no source of danger to platelayers and others working on the line. On the other hand, Mr. C. F. Bengough, after a very just summing up of the advantages and disadvantages of each system, gave his vote in favour of the overhead line on account, principally, of its low maintenance costs.

The Overhead System Leading.

This question of choice of system is one which cannot, we feel, be given a general solution at the present time. Indeed, we doubt whether a general solution can ever be given. For on long stretches of underground lines, where the clearances are small and ingress by unauthorised persons is impossible, both economically and from the engineering point of view it may be found better to continue to use the contact rail. On the other hand, in shunting yards and in the open country, where the line can be used as a convenient path for adventurous humans

and cattle, the overhead equipment may give commercial advantages which will outweigh any engineering shortcomings. It is true that these engineering shortcomings have not been small or easy to avoid, but the Paper read by Sir Philip Dawson before the Institution of Electrical Engineers eighteen months ago, and the results of the experiments on the Lancaster-Morecambe-Heysham branch of the Midland Railway, which we publish to-day, show that they are being eliminated. Again, the higher the working pressure is raised, the greater the advantages of the overhead system, and as our standard is becoming rapidly de-standardised, this may very likely be a deciding factor. That, however, is for the future. At present it is interesting to note that Sir Vincent Raven has announced that the overhead system is to be used in the York-Newcastle electrification on the North Eastern Railway.

The "Geddes Axe" and the Electricity Commission.

The "Geddes Axe" will find no dead wood to lop in the Electricity Commission, which is conducted with a small staff and very economically. Moreover, although a Government department, it is not on all fours with most others of that kidney, owing to the important fact that the cost is defrayed by the industry, and not from public funds. For the first two years the excess of expenditure over the revenue of the Commissioners is advanced by the Treasury, but this loan must be refunded within the next three years. But even if this did not put it outside the Geddes purview, there would be little to economise. In fact, the Commission is so miserly that the industry, which pays, feels that an increase in the staff employed at Gwydyr House would be beneficial. The vast and increasing mass of work now pouring on to the Commission's desks could then be more quickly dealt with and a glow of satisfaction would result in the invisible queue outside Gwydyr House. The Commissioners have full authority to employ an adequate staff. They should do so for the good of the industry. This being so we hope that the report that the Geddes Committee is recommending the root-and-branch abolition of the Electricity Commission is without foundation. Such a recommendation could only have been made under a misconception.

Conspiracy and Protection of Property Act.

We have often wondered why electricity-supply authorities have been so slow in invoking the aid of Sec. 31 of the Electricity (Supply) Act of 1919 when their employees go on strike without notice or before effective steps can be taken to provide a staff for the maintenance of supply. Perhaps it is because their own consciences are not always clear. Fortunately for the industry, such strikes are very rare, but nevertheless the continuity of electricity supply is such an important matter, from the points of view of both commercial and public safety, that no avoidable cause of interruption should be countenanced. We are glad, therefore, to see that the Lancashire Electric Power Company have taught four of their engine-room attendants a much-needed lesson, and we hope it will not be lost upon the employees of other supply undertakings.

A Trumpery Quarrel and its Consequences.

The employees concerned were summoned under Sec. 31 of the 1919 Act, which extends Sec. 4 of the Conspiracy and Property Act of 1875 to electricity supply stations, and were fined £5 each and ordered to pay the costs of the prosecution. The trouble arose out of a trumpery dispute between the employees themselves, no industrial principle being involved. The four defendants left the station at 1.20 a.m., after only an hour's notice. Fortunately, two charge engineers were on the premises and, as a result of urgent messages, the men on the morning shift came on duty early. The defendants admitted their conduct was illegal and contrary to the rules of their union, and pleaded that they should not be sent to prison. Fortunately for them, the Bench took a lenient view of the case.

Tramway Charges Legislation.

Owners of tramway undertakings will be glad to learn that there is a good prospect of fresh legislation this year on the question of tramway fares. Tramways have had a bad time of late. Increases in maintenance charges and the competition of the motor omnibus have badly affected their financial position, and any sign of relief will be doubly welcome, though it is doubtful if continued high fares will provide an adequate remedy. It is, however, announced that the Ministry of Transport contemplate the introduction of a Bill to continue the increase of charges authorised by the Tramways (Temporary Increase of Charges) Act of 1920, and the Association of Municipal Corporations is urging the Minister to take the opportunity of including clauses relating to trolley vehicles fares in the Bill.

Careless Legislation.

As our readers are aware, the Temporary Increase of Charges Act will expire on February 15, 1923, and as it is desired to provide for this contingency as well as to remodel the constitution of the Advisory Committee set up by the 1920 Act, a fresh Bill becomes necessary. Before making an Order to authorise increased fares on an undertaking, the Minister must refer the application to an Advisory Committee, of which the Light Railways Commissioners formed a part. Now, by the Railways Act of last year, the powers of the Commissioners were transferred to the Minister of Transport and the Commissioners themselves were abolished! This is a good specimen of modern "rush" legislation. One grievance is remedied and two more created owing to the habit of dealing with some only of the interlinked subjects on which it is desired to legislate.

The Institution and Hydro-Electrics.

The development of what may be called hydro-electric technology has reached a critical stage in this country. The examination of the water-power resources of this country by a Board of Trade Committee and their various reports have shown that there is power of this kind worth developing in these islands, and the Committee themselves have suggested the lines along which this development should take place. As we noted last week, a start has already been made with two fairly important schemes in Scotland. But technically it may be wondered whether our engineers are quite ready to begin. There are some, it is true, who have had experience with similar schemes in other countries, but, generally speaking, the information is limited both in amount and disposition. For this reason, if for no other, the subject is one which requires early treatment in electrical circles, and we should like to see a meeting of the Institution arranged at which the Committee's reports could be discussed and the technical position made clear. This development is a British problem and it should be a British duty to solve it.

Hydro-Electric Developments—Some Drawbacks.

The year 1921 was remarkable, among other things, for a failure of what might almost be termed one of the laws of Nature, *i.e.*, the approximate constancy of the rainfall in a given watershed. Owing to the comparative scarcity of hydro-electric stations in this country little attention has been directed to the extraordinary predicament in which the drought of the past year placed certain countries, notably Italy and Switzerland, whose reliance upon the natural water-powers has in many cases hitherto been absolute. Even in France, where the reliance is not so great, it is common knowledge that in the Department of Isère there was only sufficient water available for a supply of energy to be given on three days out of each week.

Some Revision of Ideas Necessary.

This is a type of difficulty which is far greater in the case of the purely hydro-electric station than in stations using steam or gas engines, for in these last two cases, should one source of supply fail, another can be resorted to, or the plant be converted so as to use the fuel in a different form, *i.e.*, as pulverised coal or fuel oil in place of gas. With a water-power plant, on the other hand, no substitution is possible. Although such an occurrence may not be repeated for a number of years, and although, probably, in the case of hydro-electric stations that may be erected in Great Britain arrangements will be made for an auxiliary stand-by plant, not dependent upon water power, the fact that such a drought is possible shows that, for the sake of continuity of supply, our general ideas as to watercourses being a perpetual source of power must undergo some revision, and such a contingency must in future in every case be guarded against.

Bankers and Taxation.

Were it not that both our politicians and our bureaucrats despise and fear the expert, they might gather some useful hints as to future conduct from the speeches made by the chairmen of the various banks, whose annual general meetings have recently taken place. One and all they condemned the Government's financial policy, and one and all they indicated the ruin that will overtake the trade and industry of the country unless some reduction is made in the present scale of taxation. The critic of any Government action is always suspected (often wrongly) of being not entirely disinterested in his strictures. But no such indictment can be made on this occasion. Bankers, though all business men, are not all of the same political tint, and their unanimity, therefore, has something more behind it than merely a desire to harass well-meaning ministers and overworked officials. Those same ministers and officials would, therefore, do well to hear and obey, for as Mr. Reginald McKenna, chairman of the London Joint City and Midland Bank and one-time Chancellor of the Exchequer, pointed out, "The present taxation has probably exceeded the maximum which can be imposed without greatly impairing the national spirit of enterprise. . . . The remedy is to reduce the national expenditure."

The Labour-Saving House.

The competition organised by the "Daily Mail" to secure the best design of labour-saving house suitable for professional-class families has had some interesting results. The principal is that, though the approximate total cost was laid down as £2 500, none of the designs submitted could be carried out for less than £3 000. This seems to have been mainly due to conservatism. For though the chief object of the competition was to secure the extended use of labour-saving devices, and especially of a kitchen which, while being small and well arranged, should contain everything for, and no more than, was required for cooking, all the architects clung to the idea that the kitchen must also be the servant's sitting-room, and so made the house larger than had been originally intended. Incidentally, it may be remarked that such a kitchen is most easily obtained by the use of electric cooking apparatus, which can be, at the same time, accessible and out of the way. We are glad to see that the part electricity can play in domestic labour-saving is fully recognised by the competitors. The dining- and drawing-room fireplaces, in most of the designs, are fitted with plugs, while in the hall and on the landing are similar outlets for supplying the vacuum cleaner, and in the bedrooms, too, plugs have not been forgotten. We hope that it will soon be found possible to erect houses according to these designs, so that some very interesting ideas may be turned into practice.

Imperial Wireless.

Politically speaking, the report of the Wireless Telegraph Commission, which we publish to-day, takes us back to 1912, when a contract for the erection of eighteen stations, which were to form an Imperial Wireless Chain, was let to the Marconi Company. But nothing is to be gained by traversing those muddy lanes of past history. Anyone who wishes to do so will find the facts set out in the files of The Electrician. It will be sufficient to say that little was done with what would now be called a grandiose scheme, and to-day the only tangible results of many manœuvrings, if we except the present report, are the stations at Leafield and Cairo.

Past History.

It is true the war intervened to prevent further attempts being made to establish a system of Imperial wireless communication until, in November, 1919, a Committee was appointed under the chairmanship of Sir Henry Norman to consider the question afresh. The Marconi Company refused to give evidence before this Committee, and put forward in March, 1920, a scheme of their own, in which they proposed to establish, at their own expense, a "network of wireless communications to serve the ends of the whole British Empire," paying to the Government, in addition, 25 per cent. of the profits. In June, 1920, the Committee recommended the establishment of an Imperial wireless system, using the thermionic valve, except at Leafield and Cairo, where arcs were to be employed. They also recommended the appointment of a Commission to design the stations, and that the stations should be erected by the Post Office engineering department and the corresponding Dominion and Indian authorities. It is this Commission, which met under the chairmanship of Lord Milner, and consisted of Dr. W. H. Eccles, Mr. L. B. Turner, Mr. E. H. Shaughnessy, with Lt-Col. C. C. Crawley as secretary, whose report we deal with to-day.

"Severely Technical."

The report, as Dr. Eccles remarks in an explanatory foreword, is of a "severely technical nature." It makes twenty-eight pages of medium octavo, the first six of which are taken up with preliminaries and the last sixteen with detailed recommendations on the plant that is to be installed. In between the introduction and the conclusion

are sandwiched six pages of matter on the development of high-power thermionic stations, the choice of wave length, transmitting antennæ, masts and towers, earth screens, and the methods of reception and the design of receiving stations. This information, in vulgar parlance, in spite of its "severely technical nature," is worth the money.

The Valve Advantages and Disadvantages.

Among these technical points, it is interesting to find the statement that this country remains the home of the valve and that, with the exception of a little work in the United States, practically nothing has been done elsewhere with this means of high-power transmission. This is, therefore, an excellent reason for using the valve, even if the Commission had not been limited by the report of Sir Henry Norman's Committee to its employment. The chief difficulty about its application is, of course, that it has not, so far, been used for such high powers as are specified for a Chain station, though experiments at Carnarvon have been conducted at powers very nearly as high as the 120 kW laid down. There should, therefore, be no insuperable difficulties to the erection of these high-power sets, for the main disadvanage about this form of transmission is the large consumption of the valves themselves. This point is well made in the Committee's report. As, however, valves with replaceable filaments are now on the market, both in silica and glass containers, the cost of renewals should continue to fall, while the time may soon arrive when filament renewals will be an operation that can easily be accomplished by the station engineer.

From this point of view, the work that has recently been carried out, notably by the Mullard Valve Co., with silica valves, is of the highest importance. For it is by the use of either silica or metal containers, rather than in the employment of glass, that ultimate success is likely to be obtained. As regards the supply of valves, there need be no anxiety, as the number that can be turned out is already greatly in excess of that laid down by the Committee as being necessary for use in the Chain stations.

Station Design.

In the general design of the stations, the Commission have wisely permitted themselves considerable latitude, so that the power employed may, in future, be doubled if necessary, and so that the aerial current may be adjusted to suit special conditions. This, of course, is all the more easy, for the cost of the generating plant is small compared with that required for the accessory power plant, buildings, sites, aerials, towers, earths, and other apparatus which are common to all systems. Extensions and developments will also be facilitated by the standardisation of the different parts which the Committee recommend.

Aerials, Earths, Screens, and Masts.

It is to be noted that the aerials are to be supported on steel towers and will not be directional. Counterpoise earths or earth screens are to be used, and the main building is to be below the aerial. There is no indication that the screens will cover the building and so reduce the losses, but the lead-in will go from the buildings straight up to the aerial system, thereby minimising the losses in the steel masts and avoiding harmonics. This is satisfactory. For, as is well known, great trouble has, in the past, been caused by the generation of heavy currents in steel masts, a trouble which the Commission evidently intend shall now be circumvented. As regards mast design, the Commission are not erring on the side of caution. The masts themselves are to be 250 metres high, and will be designed to take a horizontal pull of 10 tons, with a factor of safety of 3. Taking into consideration the wind load on the down lead and the span of 1 300 ft., this horizontal pull should be considerably increased. On receiving apparatus and its problems the Commission are silent. They apparently regard the problem of atmospheric elimination as unsolved, but they make no recommendations, which is rather disappointing.

The Development of the Arc System.

Referring once again to the question of systems, though, as has been pointed out, the Commission were practically limited to a consideration of the application of the valve, they have nevertheless extended the use of the arc to the stations in East Africa and at Singapore and Hong Kong, where combined arc-valve transmission is to be employed. This is very wise, not the least for the reason that, if experience proves that a mistake has been made in recommending so wide an application of the thermionic valve, retreat will be possible. In any event, by giving scope for further development, competing ideas in technical progress will not be unduly stunted.

It is for this reason a pity that the high-frequency alternator is not to be tried, though that, of course, is not the fault of the Commission. At any rate, the two systems, which are to be erected in parallel, will allow the present rather vague costs for valve provision and renewals given in the report to be checked, and as the arc is comparatively cheap and its performance known, it can be relied upon to deal with the traffic as a second string, whose performance is not far short of the first choice.

A Welcome Olive Branch.

A small, but pleasing, feature of the report is the suggestion that the Marconi Company should be asked to tender for a part of the apparatus, on the ground that the tests at Carnarvon show them to be capable of building a thermionic valve station of the size required. It is to be hoped that this olive branch will be accepted, and that, for the sake of technical progress, a not very edifying chapter in wireless history will be closed. This is the more necessary as the enterprise, invention and hard work of the Company in the design and manufacture of large valve sets has put them far ahead of the Signal School, whose report of 1919-20 disclosed an optimism which results have not justified.

Is a Wireless Chain Advisable?

Leaving technical matters, as the Committtee do on this particular question, it may be asked whether, in these economical days, it is wise or even necessary to build such stations at a cost to the Imperial Government of some £853,000. The existing telegraph cables, it may be argued, are sufficient to deal with the international traffic for many years to come, and it would therefore be better, for both financial and technical reasons, not to go on with this scheme for the present. We do not agree. These stations are long overdue. They have an immense strategic importance, as the war amply showed. In case of hostilities they can be more easily protected and can work with greater flexibility than a cable. In time of peace they form a useful addition to the facilities which the cables provide, and, in addition, as Dr. Eccles has pointed out, they will greatly aid both Press work and propaganda in a way which is not only of the highest importance to political development and industrial progress, but will tend to assist, by bringing nations into closer contact, towards the stabilisation of a world peace.

Electric Traction Experiences

On another page of this issue we publish an article of, what we may be forgiven for terming, the highest interest. In 1908 the Midland Railway Company equipped the short length of railway between Lancaster, Morecambe and Heysham on the high tension overhead single-phase system of electric traction, principally with a view to obtaining data regarding operation and equipment which could be applied with confidence on a large scale. Mr. J. Sayers and Mr. J. Dalziel, the two engineers most intimately concerned with the construction and performance of this line, have now taken the wise, and, in some ways, the heroic, course of permitting us to place on record the experiences they have gained during the past fourteen years. We hasten to add that the record, though inevitably one of failure, is certainly something a great deal more—a record of education

Improvements in Overhead Design.

When the line was equipped, the best designs and material available at the time were used. But in the case of the overhead equipment, fourteen years' working has shown that the design could be improved by, for instance, abandoning the original arrangements for tightening the trolley wire by weights, by reducing the horizontal stagger over the centre of the running rails, and by substituting for a straight line lay out of the trolley wire in the vertical plane a wave form which has overcome all the troubles due to pull-off insulators and has given a greater flexibility and absence of hard spots, points which are most desirable in any overhead system which is to be employed for high-speed traffic. In fact, it may be said that by these means the great crop of troubles due to pull-off insulators, of which we ourselves witnessed an example, has been entirely eliminated. In appearance the new suspension is preferable and it follows the curvature of the line better.

Insulator Difficulties.

The experiences with the insulators originally employed were not very happy. This is not, perhaps, unnatural. The line is exposed to all varieties of gales and to a great deal of weather, mostly bad. It is not surprising, therefore, that weak points soon began to be discovered, especially in the litharge and other cements used for fixing the insulators. These weaknesses arose in spite of the careful tests that had been applied before erection. This particular difficulty was overcome on the catenary insulators by the use of insulating links in addition to the other insulators or by the use of the Diabolo type of insulator, both of which adaptations have proved quite satisfactory. It is interesting to note that Mr. Sayers' view is that a small quantity of really sound porcelain, combined with a robust construction of the supports and fastenings, provides the best type of insulator for this purpose. There is much virtue in these adjectives.

The greatest failures from the insulation point of view were, however, at the pull offs, and in spite of various attempts to improve these supports, it was at last decided to abandon their use altogether. This was made possible by the employment of the modified system of overhead equipment which we have noted above.

Motor Equipment.

As regards the motor equipment, experience has been more gratifying. It must be obvious that this equipment is old, and Sir Philip Dawson's recent remarks on improvements in single-phase motor design show how much that connotes. Nevertheless, the equipment has been generally satisfactory, and this particularly applies to that part of it which was obtained from America. In the German equipment it was found, on the other hand, that the lubricating system was too elaborate, and broke down under the stress and strain of normal working; that the design employed caused excessive bearing wear, leading to core looseness and consequent connection breakage which gave a good deal of trouble. A series of electrical troubles, consisting of short circuits between the commutator segments, also occurred. These were finally traced to the bad mechanical design of the commutator quill, which was made in two halves, and so permitted the access of dirt to the commutator. Dirt also caused insulation failures on both rotor and stator windings, and this particular defect was overcome by cementing the windings up solid.

The Role of Dirt in Electrical Operation.

This whole chapter of accidents is an interesting commentary on the part dirt plays in electrical progress, and of the great importance of eliminating it by every possible means. Again, resistance and connection troubles were prevalent, passing from point to point in a most puzzling fashion. Finally, all these difficulties were overcome by increasing the area of contact between the commutator connection lugs and the resistance strips by the use of tubular connectors with large contact areas. The expansion of the resistance strips owing to heat, and their subsequent breakage, has also caused trouble. As might be expected, vibration was another source of worry, while the brush holder design employed has been a cause of anxiety.

Most Useful Experience.

In fairness to all parties we must add that, with the few exceptions noted, the Midland Railway engineers have retained the original equipment, instead of scrapping it, and have directed their efforts to the more useful work of discovering improvements rather than of providing replacements. In the meantime design and manufacture have moved and, especially in the case of the motors, the equipment available to-day is very different from the equipment of 1908.

Main Line Conditions.

Nevertheless the experience that has been gained is of the very greatest use, and forms a good basis for future advances. This, we feel, applies particularly to the radical changes made by Mr. Sayers in the overhead equipment. It is not generally realised that the use of electric traction on main lines will impose different and very much more arduous conditions than those present on sections where purely suburban traffic is dealt with. This is of the greatest importance. For it may be predicted with a fair degree of certainty that main line electrification means the employment of the overhead system, and for this system to be used at high speeds an equipment possessing the highest degree of flexibility, both of bow and contact wire, is essential. Though it may be argued that maximum flexibility has not been obtained with Mr. Sayers' new system, at least it will be admitted that a great step has been made in that direction. Our illustrations are sufficient guarantees of that.

Finally, though perhaps not altogether germane to the matter in hand, a word may be said about the generating plant. The problem that has been overcome was not easy. To use gas engines for such a load was, perhaps, in slang terms, asking for trouble, but the results are at least interesting, even if they are not likely to lead to such wide imitation as in the case of other experiments with which we have dealt.

Notes on Theory of Grassot Fluxmeter.

By R. B. BURROWES.

The author, in dealing with the Theory of the Grassot fluxmeter, considers such questions as the back movement of the coil to the zero position, the non-synchronous movement of the coil with the flux changes, the time constant of the throw and its independence of reactance and resistance, and proves that the energy is proportional to the square of the throw.

The Grassot fluxmeter is a moving coil, permanent magnet instrument, with suspension control eliminated as far as possible by suspending the coil with unspun silk. The damping should be only electro-magnetic, other damping being negligible. If these conditions are fulfilled the following theory holds :

Let ϕ = Flux linkage in part of circuit under test.
„ ϕ_m = Permanent magnet flux linkage.
„ R = Total resistance in coil circuit.
„ I = Moment of inertia of moving coil system.
„ θ = Angular displacement of coil from zero position.

On changing ϕ, there is an E.M.F. in circuit $\frac{d\phi}{dt}$, and when the coil begins to move an E.M.F. in opposite direction $=-\frac{d\phi_m}{dt}$.

Therefore the current round coil circuit, neglecting reactance E.M.F.

$$=\frac{1}{R}\left(\frac{d\phi}{dt}-\frac{d\phi_m}{dt}\right)$$

So that, assuming flux to be uniformly distributed round annular air gap, we have :

$$\text{Deflecting torque}=\frac{k}{R}\left(\frac{d\phi}{dt}-\frac{d\phi_m}{dt}\right) \text{ where } k=\text{a constant.}$$

Hence we have :

$$\frac{k}{R}\left(\frac{d\phi}{dt}-\frac{d\phi_m}{dt}\right)=I\frac{d^2\theta}{dt^2}$$

Integrating over the period t_1 when coil begins to move till when it stops, we have :

$$\frac{k}{R}(\phi-\phi_m)=\int_o^{t_1} I\frac{d^2\theta}{dt^2}dt=O \quad \ldots\ldots\ldots\ldots\ldots\ldots(1)$$

Hence $$\phi=\phi_m.$$

That is change of linkage ϕ is equal to the change of permanent magnet flux linkage in coil ϕ_m. With uniform flux distribution in air gap, in which coil moves ϕ_m is proportional to angular deflection θ, so that change of linkage ϕ is proportional to deflection and a uniform scale is obtained.

It will be noted that accelerating torque becomes a retarding torque when $\frac{d\phi}{dt}-\frac{d\phi_m}{dt}$ changes sign, $\frac{d^2\theta}{dt^2}$ also changing sign.

The throw θ is independent of rate of change of flux, being proportional to absolute change ϕ only, also proportional to quantity of electricity which has passed round circuit.

The energy used up due to resistance is, however, proportional to E.M.F. e or rate of change of flux. For example, if this were doubled, flux change remaining the same, e is doubled and, therefore, energy dissipated.

$\int 2eidt$ also doubled, where $i=\frac{e}{R}=\frac{1}{R}\frac{d\phi}{dt}$.

Back Movement of Coil to Zero Position.

The above explains why the coil will always return to its zero position in time, however small the restoring couple due to torsion of suspension ; for it has only to move back slowly enough to reduce the E.M.F. to any degree of smallness and consequently the energy also. When the coil returns to zero position exactly the same quantity of electricity passes round circuit as during its deflection, but it does so against an extremely small E.M.F. The energy given to the circuit as heat in this way is that due to the torsion of the suspension when in deflected position.

Movement of Coil Non-Synchronous with Flux Change.

If the coil could be imagined massless, so that $I=O$, then $\frac{d\phi}{dt}-\frac{d\phi_m}{dt}=O$ at all instants, that is, the movement of the coil would exactly synchronise with change of flux linkage, there being no resistance loss. Taking the other extreme case in which the whole of the flux change takes place before coil begins to move—that is, when acting as a ballistic galvanometer—it is of some interest to compare its action with that of an ordinary moving coil ballistic galvanometer, whose movement is controlled by the torsion of the suspension.

Taking the latter case first, the equation of motion is given by

$$I\frac{d^2\theta}{dt^2}+k\frac{d\theta}{dt}+T\theta=O$$

Where I = moment of inertia of moving system, $k\frac{d\theta}{dt}$ = damping couple, and $T\theta$ is the torsion couple of the suspension. This motion may or may not be oscillatory, according as $\frac{T}{I}-\frac{k^2}{4I^2}$ is positive or negative. If oscillatory, the solution is :

$$\theta=\theta_o e^{-\frac{k}{2I}t}\cos\left(\sqrt{\frac{T}{I}-\frac{k^2}{4I^2}}t+\epsilon\right)$$

Neglecting the damping couple $k\frac{d\theta}{dt}$, the equation reduces to :

$$I\frac{d^2\theta}{dt^2}=-T\theta$$

whence $$I\left(\frac{d\theta}{dt}\right)^2=-T\theta^2+c$$

where $c=I\omega_o^2$, ω_o = initial angular velocity of coil. At instant when $\theta=\theta_m$ or amplitude of throw, $\frac{d\theta}{dt}=O$, so that, substituting these values, we have :

$$O=-T\theta_m^2+I\omega_o^2 \text{ or } \theta_m=\sqrt{\frac{I}{T}}\,\omega_o \quad \ldots\ldots\ldots\ldots(2)$$

that is, the "throw" is directly proportional to initial angular velocity ω_o.

Now, taking the case of the Grassot instrument, in which the torsion couple $T\theta$ is negligible and the whole of the control due to the damping couple $k\frac{d\theta}{dt}$, the equation of motion reduces to :

$$I\frac{d^2\theta}{dt^2}+k\frac{d\theta}{dt}=O$$

whence $$k\theta=-I\frac{d\theta}{dt}+c$$

when $$t=O,\ \theta=O,\ \frac{d\theta}{dt}=\omega_o,\ \therefore c=I\omega_o$$

At the instant of maximum value of θ that is, when amplitude θ_m is attained, $\frac{d\theta}{dt}=O$ and $\theta_m=\frac{I}{k}\omega_o$ $\quad\ldots\ldots\ldots\ldots(3)$

So that in this case also the throw is directly proportional to initial angular velocity ω_o.

Time Constant of Throw.

With resistance R in circuit unchanged and instrument used in ballistic way, *i.e.*, with no movement till all flux

change has taken place, the time taken by the throw or swing is independent of amplitude. For equating rate at which kinetic energy is reduced to rate at which energy is used up in the circuit, we have :

$$\frac{d}{dt}\left\{\tfrac{1}{2}I\left(\frac{d\theta}{dt}\right)^2\right\}=ei$$

where $e=k\frac{d\theta}{dt}$, k=permanent magnet linkage with θ equal to unity.

$$i=\frac{k}{R}\frac{d\theta}{dt}, \text{ so that } ei=\frac{k^2}{R}\left(\frac{d\theta}{dt}\right)^2$$

and

$$\frac{d}{dt}\left\{\tfrac{1}{2}I\left(\frac{d\theta}{dt}\right)^2\right\}=\frac{k^2}{R}\left(\frac{d\theta}{dt}\right)^2$$

Integrating we have

$$e^{\frac{k^2}{RI}t}\frac{d\theta}{dt}=\omega_o, \text{ where } \omega_o=\text{initial angular velocity.}$$

$$d\theta=e^{-\frac{k^2}{RI}}\omega_o dt$$

Integrating again

$$\theta=\frac{RI}{k^2}\omega_o\left(1-e^{-\frac{k^2}{RI}t}\right) \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots(4)$$

$\frac{RI}{k^2}$ may be called the time constant of the throw, the amplitude of which is given by : $\theta_m=\frac{RI}{k^2}\omega_o$

This result has already been arrived at in (3) above, in which the k corresponds to $\frac{k^2}{R}$ in this.

Throw Independent of Reactance.

Used in the ballistic way, the equation of E.M.F.'s in circuit is :

$$\frac{d\phi}{dt}+L\frac{di}{dt}+Ri=O$$

where L = inductance. Integrating over period of flux change ϕ before motion begins we have :

$$\phi+Li+R\int idt=c=O.$$

Also $Li=O$. Therefore $\int idt=\frac{\phi}{R}$=quantity.

It will be noted that the energy due to electric momentum given to the circuit while current rises is given back again when current decreases, otherwise reactance E.M.F. $L\frac{di}{dt}$ first acts against current and then with it, having only the effect of delaying discharge through coil. This could be similarly proved with instrument used in non-ballistic way.

Throw Independent of Resistance.

This is shown by equation (1), ϕ being equal to ϕ_m independently of R. It is also shown by results (3) and (4). This latter is not quite so apparent at first till it is noted that initial angular velocity ω_o is inversely proportional to R, so that the R's cancel out.

Energy Proportional to Square of Throw.

This is evident at once from the relation $\theta_m=\frac{RI}{k^2}\omega_o$; for as kinetic energy is proportional to ω_o^2, electrical energy absorbed is proportional to θ_m^2. Otherwise, as both quantity and E.M.F. are proportional to throw θ_m, the time of throw being constant, see result (4), electrical energy absorbed is proportional to θ_m^2.

Wireless Design and Practice.*

By JOHN SCOTT-TAGGART.

The first chapter of this volume deals with oscillations, wave-lengths, frequency, inductance and capacity, mutual inductance, co-efficient of coupling. Tables are given showing the frequency which corresponds to different wave-lengths between 100 and 40 000 metres. This sort of thing is spoon-feeding in its worst form, and will deter the experimenter from making his own calculations. Methods of working out the ranges obtained with a variometer and the meaning of mutual inductance are explained. Co-efficients of coupling, capacities in series and parallel are next considered, and a table is given showing the different values of capacity produced by connecting condensers in series.

The second chapter deals with aerials. No methods are given of calculating aerial capacities, but a practical method is given and the formulæ for finding the inductance of coil antennæ are supplied.

Chapter III. is an important one, as it discusses the design of inductances. Various useful tables are given, including one showing the turns per inch of different gauges of wire with different coverings. As the wires are given in the B. and S. gauge as used in America (whence this book hails), this table is of no great use to British readers. Special coils are also described, and methods of calculating their inductance are given. Chapter IV. deals with condensers of both the variable and fixed types.

We now come to valve detector circuits and more descriptive matter. In the preliminary remarks we find the statement that it is advisable to connect a grid cell in the grid circuit of a valve fitted with a leaky grid condenser, "so that incoming positive charges will not be great enough to make the grid positive." To prevent the establishment of grid currents is to stop the cumulative rectification effect entirely, and to use a grid cell so as to make the grid negative is to do the worst thing possible. With reference to the grid condenser, the author states that "it is usually said that the grid condenser keeps the negative charge off the grid." A saying of this kind should be hushed up.

Oscillating valve circuits are dealt with in Chapter VI. Figs. 19 and 20 show no telephones. Figs. 21 and 22 show no grid leak (an omission which occurs in all subsequent valve circuits). Fig. 20 is quite impossible as it stands. The grid potential would be about + 30 volts, and the circuit would not oscillate. The second half of the book deals with transmitters for spark and C.W. signalling. In the chapter on valve telephone sets several circuits are given, but there is no attempt at proper explanation, or even at explaining practical details. A disappointing chapter!

Things brighten up when we come to Part II.—a description of some eighty circuits for wireless work. But all the valve receivers are bare of grid leaks. The choke-coil amplifier of circuit 52 is not a very practical arrangement for amateurs. Small variable resistances are inserted in the filament circuit "to give a slight negative voltage to the grid." The first one makes the first grid positive instead of negative, while the other two make no difference at all to the grid potentials of the second and third valves. The last few circuits deal with transmitters. The spark circuits are without blemish, but the valve transmitter circuits will puzzle the beginner. Circuit 67, for example, should have a choke coil across one of the condensers. Circuit 69 would be improved by various practical expedients, unnecessary batteries being eliminated. Circuit 71 will not work, as no choke is shown in the d.c. anode circuit.

The book as a whole is good as far as the elementary calculations are concerned, bad as far as practical instruction in circuit arrangement is concerned, and deplorable as far as care in drawing the circuits is concerned.

THE LANCASTER-MORECAMBE-HEYSHAM ELECTRIC RAILWAY.

Some Experiences of Fourteen Years' Working with the Single-Phase Overhead System.

The Lancaster-Morecambe-Heysham branch of the Midland Railway was equipped with single-phase electric traction in 1908 to obtain experience which would be valuable in dealing with the wider problem of main line electrification. This article gives an account of the failures and modifications which have been shown to be necessary in various parts of the apparatus during fourteen years' working. The overhead work, insulators, bonding, generating plant and rolling stock are dealt with.

It was recently remarked in an engineering journal that one of the handicaps of electric traction was that to be tried at all it must be tried on a large scale, and that if it were possible to convert a system gradually from steam to electric traction we might see greater endeavours made to adopt this form of haulage. In this respect, the article continued, the electrical operation of our main line railways was especially handicapped, for to form a fair guide every experiment had to be undertaken on a scale which involved heavy capital expenditure.

This of course is true enough, but at the same time it must not be forgotten that the results and experience which have been obtained on the various railways now operated electrically are not without their uses in considering the wider problem of main line electrification. If this be not admitted we may add that there is at least one section of railway in this country which was definitely converted to electric traction as an experiment, that is with a view to obtaining not immediately improved results but data regarding operation and equipment which could be applied with confidence on a large scale. As we shall show in this article some interesting results of the highest value have been obtained.

Details of the Line.

The line to which we refer is on the Midland Railway and comprises the Lancaster-Morecambe-Heysham branch, that is the double roads between Heysham and Morecambe, and Morecambe and Lancaster, Green Ayre, certain interconnecting junctions, and the single line from Lancaster, Green Ayre Station to Lancaster, Castle, Station on the London and North-Western Railway. The total length of single road is about 21 miles. The general lay-out of this section with information regarding the curves and gradients is given in Fig. 1. Its electrification was decided upon in 1907, with the avowed intention of obtaining experience with electrical operation when applied to comparatively light traffic.

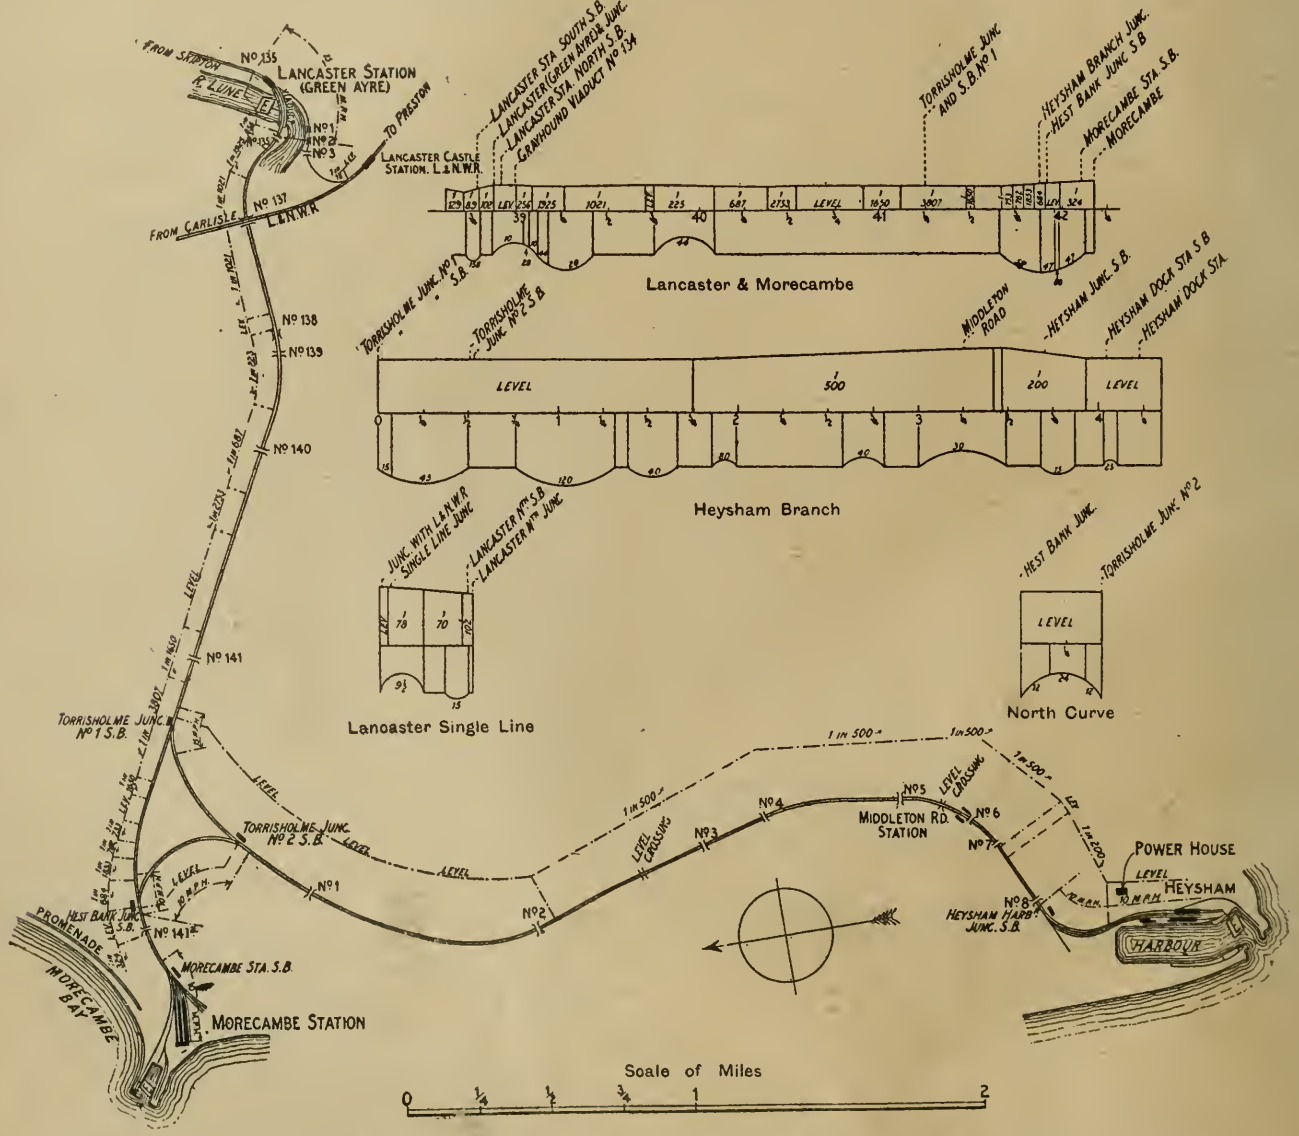

FIG. 1.—PLAN AND DIAGRAM OF GRADIENTS OF THE ELECTRIFIED PORTION OF THE MIDLAND RAILWAY SYSTEM.

An Interesting Prophecy

From the beginning there was no lack of optimism as to the result. And in this both the directorate and the officials of the Midland Railway were before their time. For in a Paper read before the Institution of Civil Engineers* a short time after the line was opened

* *See* THE ELECTRICIAN, Vol. LXIV., p. 222.

by Mr. J. Dalziel and Mr. J. Sayers, who were to a large extent responsible for the work of conversion, it was remarked that there was no reason why electric traction should not be equally successful for main line passenger and goods traffic as it had at that date been shown to be for suburban traffic. It was further argued that for heavy traffic working over long distances electrification even in 1908 offered a better solution of a problem than the only other alternative of extensive widening and regrading. These arguments are applicable *a fortiori* in 1922 and to that extent the Midland Railway built better than they knew.

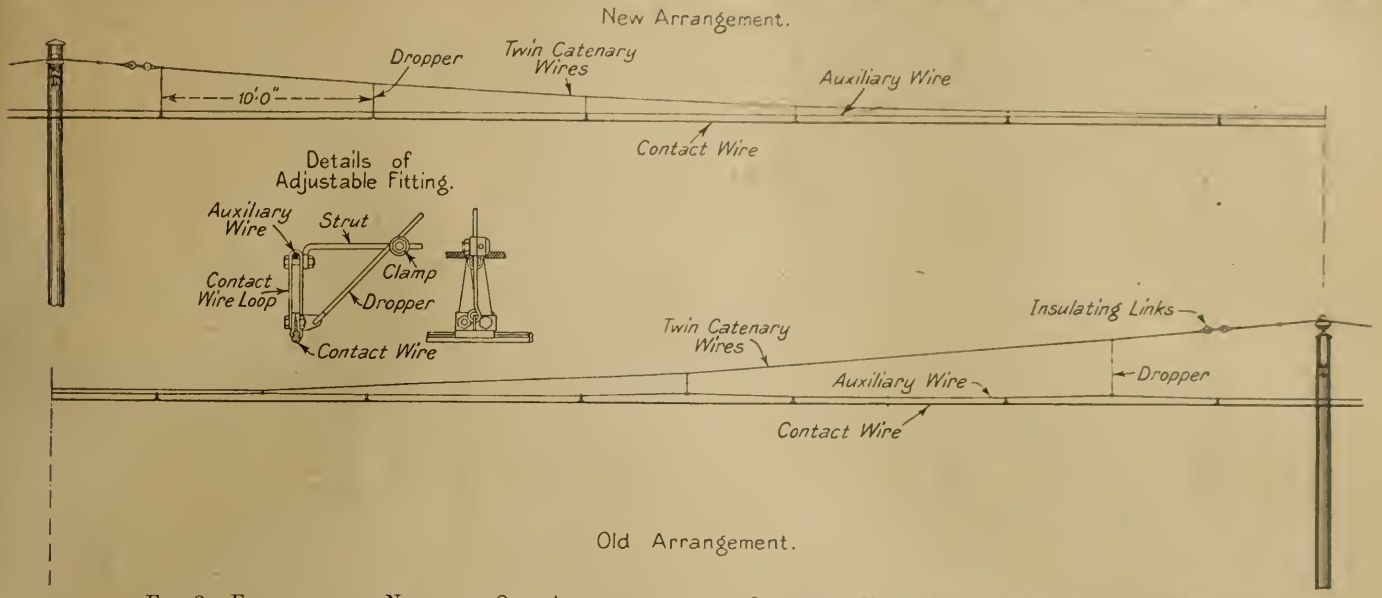

FIG. 2.—ELEVATION OF NEW AND OLD ARRANGEMENTS OF OVERHEAD EQUIPMENT ON A STRAIGHT STRETCH.

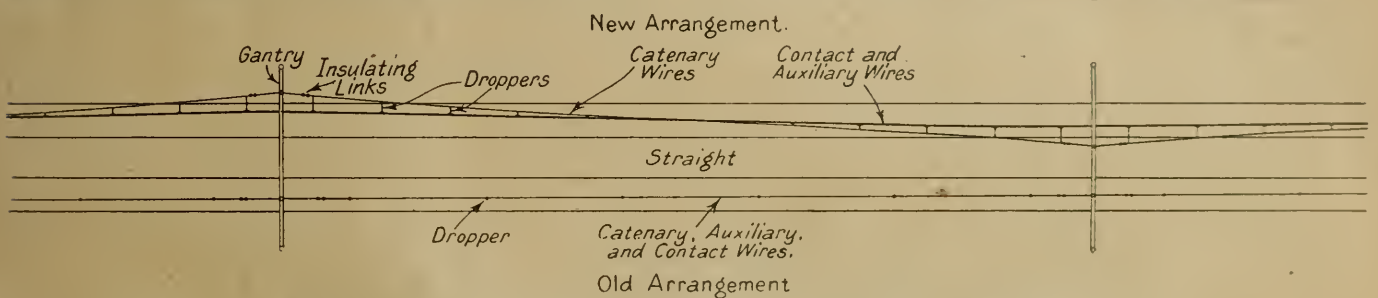

FIG. 3.—PLAN OF OLD AND NEW ARRANGEMENTS ON A STRAIGHT STRETCH.

Reasons for Adopting the Single-Phase System.

To carry out the electrification some form of overhead system was considered essential and as at that time the single-phase system was the only one available it was perforce adopted. This is one of the things that have changed, for not only have Messrs. Dalziel and Sayers a more open mind on this question but the experience they have obtained with the overhead equipment is equally applicable to the standard 1 500 V direct-current system, where overhead work is employed.

Traffic Conditions.

Before detailing the changes that have been found necessary in the equipment of the line something may be said about the nature of the traffic, as this is not without influence on the results obtained. The electric trains on this section provide a shuttle service between Morecambe and Heysham, and a similar shuttle service between Morecambe and Lancaster Green Ayre, with occasional trains between Lancaster Green Ayre and Lancaster Castle Station. The lines over which the electric trains run are also traversed by numerous steam goods trains and by a certain number of steam through passenger trains. Though the traffic is light in the winter it is spread over about seventeen hours out of the twenty-four and electric traction has therefore not only allowed of the release of a number of steam locomotives, but has prevented the waste due to the lengthy standing time inevitable under the old conditions. In the summer, on the other hand, the traffic is comparatively heavy and rather peaky owing to large numbers of passengers travelling at one time in connection with the steamers at Heysham. To deal with this traffic the electric trains have been found a great advantage, for the local passengers between Heysham and Morecambe can thereby be quickly carried off while the main line steam trains are being loaded up. There is also a considerable peak traffic on Saturday nights and at other special times between Lancaster and Morecambe, so that apart from other considerations the adoption of electric traction on this section has meant the elimination of a great deal of running round and shunting at these two stations.

Some Disadvantages.

From the traffic point of view it will be gathered that the service is not an easy one on which to obtain good results. The engineering difficulties in the way of conversion and maintenance are equally

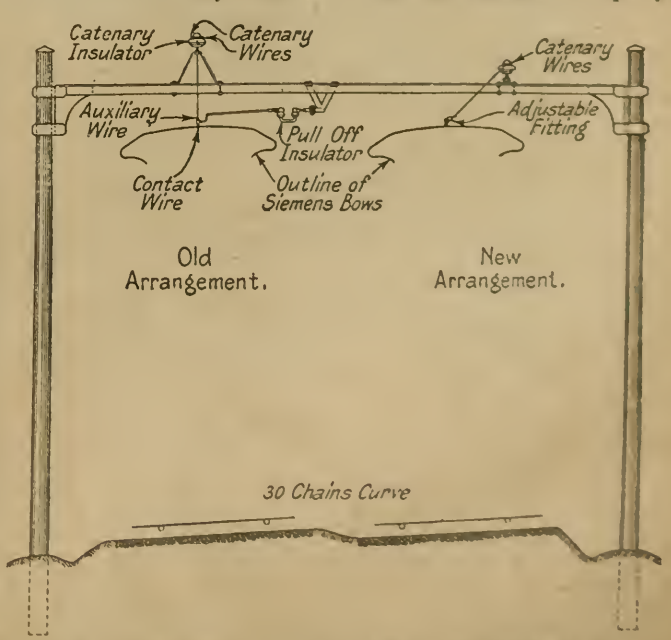

FIG. 4.—ELEVATION OF OLD AND NEW ARRANGEMENTS ON A 30 CHAIN CURVE.

great. Indeed, it may be said that there was every possible difficulty in the way of the erection of the overhead line, including severe gradients, sharp curves and low bridges. The line is situated in a country swept by violent gales and experiencing the worst of weathers, so that the equipment has been thoroughly tried out in every respect with the sole exception that it has not been possible to discover the effect on the overhead equipment of combined steam and electric traction through tunnels.

The Paper by Messrs. Dalziel and Sayers to which we have referred and the articles which we published in The Electrician of June 12, 19, and 26, 1908, give a detailed account of the original equipment of the line. It is the purpose of this article to indicate the changes which have since been found necessary in accordance with the experience of intervening years.

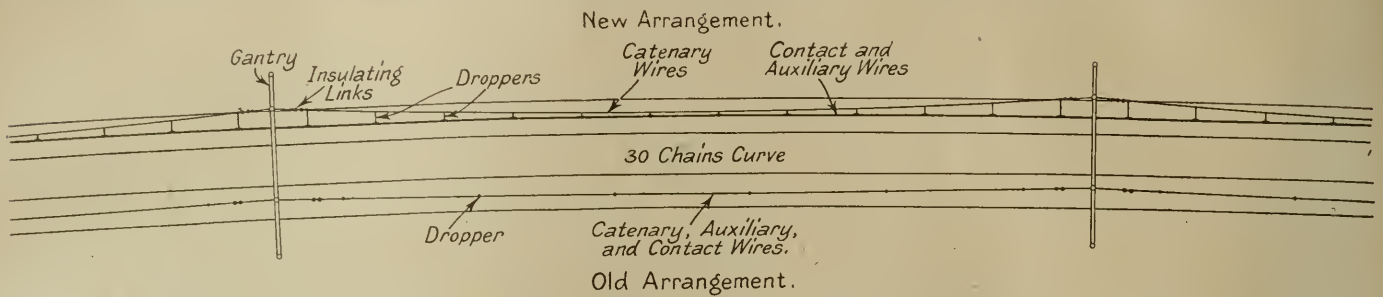

Fig. 5.—Plan of Old and New Arrangements of Overhead Equipment on a 30 Chain Curve.

Overhead Equipment.

The overhead construction originally used is shown in detail in the accompanying drawings and photographs (Figs. 2 to 7).

As regards collection, the employment of a single collecting bow for travelling in both directions necessitated the bow being symmetrical about the centre line of the coach and consequently only a very small clearance between the bow and the structure of the bridge was permissible. In fact, to obtain sufficient clearance it was necessary to take the contact wire well out towards the centre of the bridge arches, so that it came down quite low, though clear of the loading gauge, in order that the other side of the bow might clear the structure properly. It is interesting to note that the clearances actually used are less than those recommended by the Advisory Committee on Electric Traction on Railways, and no trouble has been experienced. Such practice is not of course recommended as one to be followed, but where there are numerous low bridges it is inevitable (see Fig. 6).

Contact Wire.

Turning to the overhead equipment, the contact wire originally used was of figure 8 section and was run in lengths of from 800 to 1 000 yds. It consisted of the equivalent of a 000 SWG copper conductor and was of 70 sq. mm. sectional area. One end of each length of the contact wire was fixed through insulators to a terminal gantry, the other being attached through pulleys and other gear to a weight equal to about 1 200 lb. The fixed end of this arrangement was always that at which the train entered the section and the weighted end that at which the train left, the idea being that the tendency of the bow would be to straighten the contact wire. The original weight used was equal to about 800 lb. with a horizontal stagger of 4 ft., *i.e.*, 2 ft. from the centre line of the coach, but in the experimental trials which were made for a period of some months before the line was opened it was found necessary to increase the tension to that mentioned above for lengths of trolley wire up to 1 000 yds. in length and to reduce the stagger to 2 ft. The latter reduction was principally necessary owing to the exposure of the line to the worst of weathers, and even with the reduced stagger there have been occasions when the line has been blown out and kept some distance from its position of repose by the violence of the gale. Another reason for increasing the tension was to remove the numerous small kinks which occurred in the trolley wire, especially on the more exposed sections between Heysham and Morecambe.

Fig. 6.—The Old (Left) and New (Right) Construction compared at an Overbridge Crossing.

Tightening Arrangements Abandoned.

Generally speaking, however, the tightening arrangements were found to be unsatisfactory. For weighting the contact wire in the way described gives a pull all in one direction, tending both to tighten and elongate it. The friction over the pulleys and at the auxiliary loops and pull-off fittings also overcame any tendency of the weights to rise with a decrease in temperature,

while as the contact wire wore the tension of course increased instead of decreasing, as would have been more desirable.

To overcome these difficulties, in April, 1910 an improved pulley arrangement was fixed at the weighted end of one section, and all the auxiliary loops and pull off fittings in that section were lubricated with vaseline. With this arrangement the weights did actually rise and fall with temperature variations, but it soon became evident that to maintain the movement satisfactorily all points where friction occurred would have to be lubricated periodically. For labour and other reasons this was considered impracticable, and it was therefore decided to abolish the weighting apparatus and to anchor the contact wire at both ends, an operation which was successfully carried out between June and October, 1913.

It may be mentioned that only a very small wear of the contact wire has been observed, and though it has been in use over fourteen years it has apparently still several years of life. The only trouble, a minor one, that has been experienced with this part of the installation is an accumulation of rust at the contact wire clips, though this has not accumulated in sufficient quantity to prevent smooth running.

Pull-Off Difficulties.

As mentioned above, it was soon found that the 4 ft. stagger of the contact wire over the track was too great, for even during the experimental runs several cases occurred of the bow running off the wire owing to the oscillation of the cars and the wind pressure. It was also found that the arrangement of the pull-offs on alternate gantries did not counteract these factors sufficiently to allow the wiring to be adequately held. The stagger was therefore reduced, as mentioned above, and as an additional precaution the pull-off insulators were fixed at every gantry in the manner shown in Fig. 7. Since this modified arrangement has been in use there has only been one instance of the bow running off the wire, and this was due to the combined effect of a gale and a loose joint. Experience, in fact, shows that with a stagger not exceeding 2 ft. and the upward tension of the bow limited, the line is held by the pull-offs sufficiently satisfactorily to eliminate such occurrences entirely. The height of the contact wire from rail level varies from 18 ft. 3 in. in the open to 13 ft. 3 in. under the bridges. It is suspended by short loops about 4 in. long from a steel cable, known as the auxiliary wire. These loops are rigidly fixed to the contact wire, but are movable along the auxiliary wire.

Catenary Details.

The auxiliary wire, which consists of a 7/13 steel flexible cable, is hung from two main catenary cables, of which there are two, at five points in each span, as can be seen from the illustrations reproduced herewith. These catenary cables, which each consist of 7/13 steel wires, are clipped together throughout their whole length except for about 3 ft. on either side of the insulator, where they divide to pass through the grooves of a ring on opposite sides of the insulators. The catenary is, therefore, free to move for this distance, so equalising the stresses in the spans due to unequal loading. At the same time everything is secure should a wire break. All these wires were treated with hot red paint before erection and no trouble has been experienced from corrosion. Section switches are provided so as to isolate the lengths into which the up and down lines are divided. These switches are of the double-break air pattern, and are fixed on the top of the poles supporting the gantries. Each section switch is in addition duplicated, the connection from one contact wire to the section ahead of it being accomplished through a short section of switch wire which is connected by a choke coil and lightning arrester with a $\frac{3}{4}$ in. gap to the two contact wires (one in each section) before the line is switched through at this point. This arrangement was adopted to obtain a duplicate break as well as a short length of line into which the car could run without thereby bridging the two sections which it was required to isolate. The run-off from one section to the other is accomplished in a "three-pole" length of track by gradually curving away and raising the old wire and at the same curving in and lowering the new wire.

The section switches are provided with padlocks, as are the switches at the station, which enable the contact wire to be earthed in case of emergency. A certain amount of trouble has been caused by the air break insulators used on these switches. The first failure of the insulators occurred in April, 1909, about a year after the line opened, and since then there has been a number of others. The trouble in every case has been due to the cement used for fastening the caps on to the insulators. This cement consisted of a mixture of sulphur and ground glass. A further weak point that soon became apparent in the design of these insulators was that owing to the

Fig. 7.—The Old (Left) and New (Right) Construction compared on a Straight Stretch with Normal Height Poles.

blow caused by opening and shutting the switch falling upon the neck of the insulator the porcelain soon fractured. These difficulties were overcome by providing additional insulators so as to obtain a double insulation, and by giving a greater strength to the parts. There have been no failures since this was done twelve years ago.

Insulator Troubles.

As might be expected, the principal trouble experienced with the line equipment has been in connection with the various insulators employed. The insulators originally used were specially manufactured for the company and were tested very severely, but even before installation they were not found entirely satisfactory. The steel bolts supporting these insulators were incased with ebonite, the idea being to obtain practically double insulation with one insulator. The insulators themselves were also made in two portions so as to give as massive construction as possible. It was claimed for this design and its use with a twin catenary cable, that it would bring the side strain of the overhead gear below the level of the inside bolt and that as there was no bend at which the catenary cable up to the present time, *i.e.*, for twelve years. Experience in this connection goes to show that a small quantity of really sound porcelain, combined with a robust construction of the supports and fastenings, forms the best insulator for a high tension line.

An alternative means of improving the insulation was tried on the Lancaster-Morecambe section of the line, where the arrangement was adopted of replacing the original insulators by those of the Diabolo type, as clearly shown in Fig. 8. These, too, have given very satisfactory results, and there have been no troubles or failures of any kind with them since their erection in August, 1910.

Pull-Off Failures.

Perhaps, however, the greatest trouble, and certainly the most interesting way of overcoming it, has been in connection with the pull-off insulators. The first failure with these insulators occurred in February, 1911, when one of them broke down electrically during a heavy rain storm. This failure has been followed by many others. Experience indicates that the bursting, which has frequently occurred, is due to the absorbent nature of the litharge and glycerine

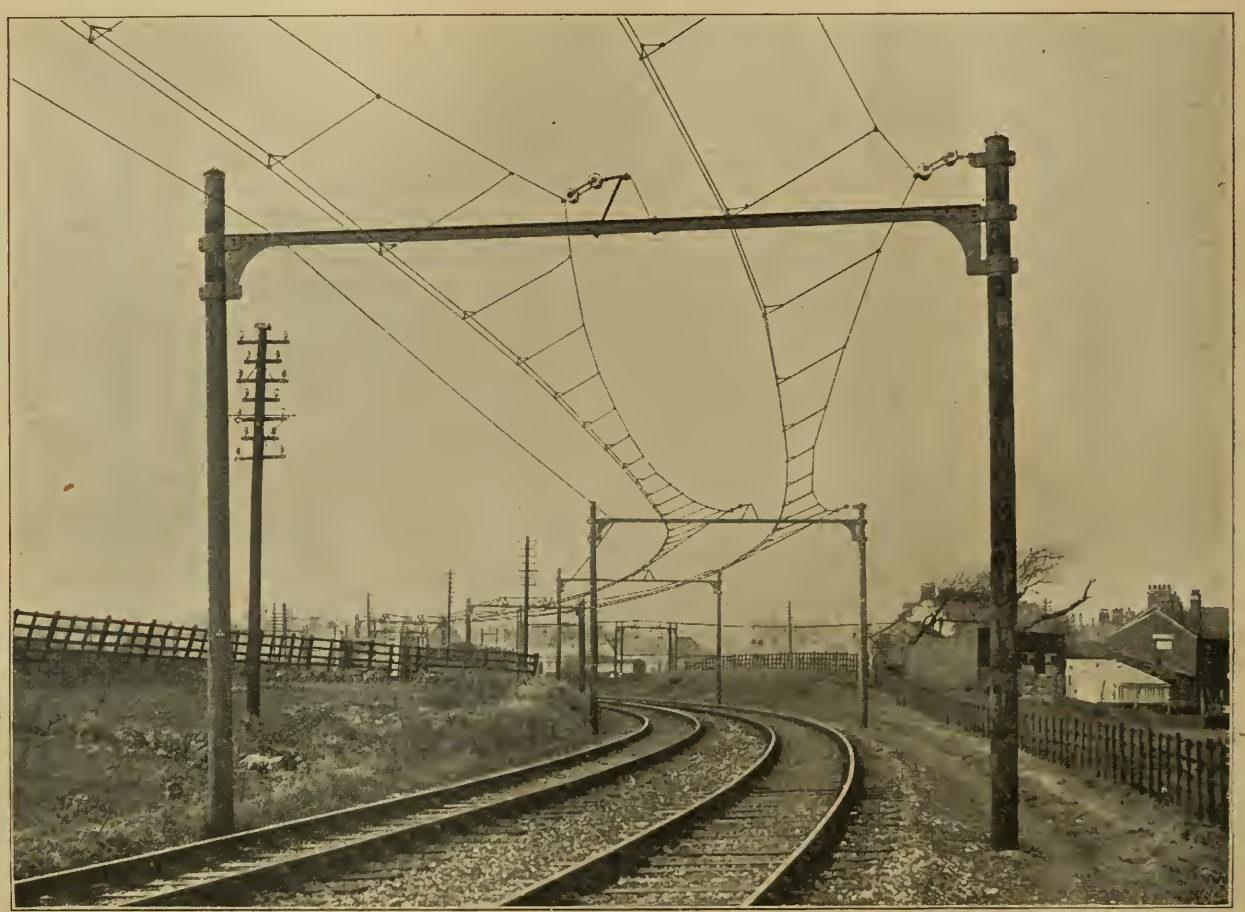

Fig. 8.—The New Construction on a 24 Chain Curve.

itself was deformed by the pressure of any clamp there was no point at which the mechanical waves would tend to break the wire at a point of reflection. In other words, the idea of eliminating to the fullest possible extent anything in the way of hard spots on the contact wire was carefully kept in view.

In spite, however, of the care taken in the choice and manufacture of these catenary insulators, trouble soon began to occur. In December, 1908, the first insulator failure took place with one of these insulators breaking down electrically and earthing the line. During the two following months four similar failures occurred. In every case these faults were found to be due to the absorbent nature of the litharge cement employed by the manufacturers for fastening the crown on to the main insulator. With a view to overcoming this trouble, as much as possible of the litharge was removed. The insulator was then halved and bitumen poured in. The whole of the catenary insulators on the line had been so treated in this way by the end of 1909.

In spite of this, however, the failures continued, until between May and September, 1910, steps were taken to improve matters on the Heysham-Morecambe section by providing additional insulators, known as catenary insulating links, on each side of all the main insulators. This arrangement proved successful, and there have been no further failures in connection with these insulators cement employed for fastening the metal caps on to the insulators, owing to the expansion of the cement causing a fracture of the porcelain.

Here, again, great success was obtained with two insulators of the Diabolo type which were fixed on poles near Morecambe as early as 1909. These are still in use, and have given no trouble whatever. In August, 1914, a white spool and strain pull-off insulator was fixed as an experiment on the up line near Morecambe. As this experiment proved successful, similar insulators were fixed on a number of other gantries.

In February, 1916, experiments were also made with a loop type of insulator. This insulator also behaved satisfactorily for some time, but in March, 1918, a heavy discharge was observed across it, at a time when it was covered with snow. It was then found that though three of the insulators forming it were broken there was still sufficient insulation available to prevent a breakdown of the line. The faulty insulators were replaced by others of the same pattern, but since then further failures have occurred and in 1920 the use of this pattern of insulator was abandoned.

Mechanical Failures.

In connection with the type of pull-off insulator originally installed there have been four cases of the shank becoming detached

from the back of the insulator and hanging foul of the loading gauge, being suspended from the contact wire by means of the pull-off pipe. The shanks of these insulators were fastened by means of red lead, raw linseed oil and tow, and it seems that the faults were caused by the leakage current burning the tow and so loosening the holding.

A Bold Step.

To overcome this trouble the shanks of a number of pull-offs were fixed into the insulators by a black cement, consisting of smithy ashes, resin and sand. This cement has proved quite satisfactory. Nevertheless, it has not been entirely tried out as the constant trouble caused by these pull-off insulators encouraged the bold step of dispensing with them entirely and of regulating the position of the contact wire over the track by staggering the catenary insulator positions as shown in Figs. 2 to 8 which give an interesting comparison of the old and new methods of suspension. In the new arrangement the contact wire is held upright by means of adjustable struts attached to special auxiliary loops and contact wire clips. This method of suspension was first introduced on the down line between Morecambe and Heysham at a time when it was temporarily out of use during the war. Since it has been in operation the numerous tension tests that have been made show that it compares favourably with the old methods in all conditions of weather. Trouble due to pull-off insulators is entirely eliminated; in appearance the new suspension is preferable as the contact wire follows the curvature of the line and hard spots are non-existent. This type of suspension is now in use throughout on the down line between Torrisholme Junction and Heysham, and on the up and down lines between Heysham and Torrisholme, as well as between Lancaster Green Ayre Station and Lancaster Castle. It has given entire satisfaction. It may be added that with this type of suspension there is very little tension, as even on the curves pull does not exceed 10 lb., there is no danger of running off and smooth running is ensured.

Figs. 4, 5, 6, 7, and 8 show the type of construction employed on curves and under bridges respectively. These are mainly self-explanatory. Under bridges the change in height of the trolley wire from the standard to that necessary to permit the passage of the bridge is effected in a "four pole" length, the gradient of the wire being usually about 1 in 100. The contact wires under steel bridges are protected by fire-proofed wood shields which extend 2 ft. beyond the bridge structure and slide into fire-proofed soft wood runners. This prevents damage from articles being dropped on the equipment from above, though as an experience at Lancaster showed, it is possible for a weighty human being to fall on the overhead equipment without the latter being injured.

It may be added that the original pull-offs are still used under the bridges and on curves, where special endeavours have been made to render the change in direction as easy as possible. As a means of protection from damage, gauges 16 ft. 9 in. high are provided at all the level crossings, of which there are a number on the line, to prevent loads which would otherwise come in contact with the overhead equipment being taken across the line.

(To be concluded.)

Progress in Industrial Research.

The Quarterly Review issued by the British Electrical and Allied Industries Research Association contains a record of the progress made during the past few months in the important research work conducted by this body. The work of the Association is carried out by Committees, each dealing with a different section of the work; these sections now number eleven.

Fibrous Insulating Materials.

Section A (Fibrous Insulating Materials) covers research on fabrics (untreated and treated), papers, fibres and boards, varnishes, &c. Specifications of the methods to be adopted in investigating varnished fabrics have been drafted. The clauses covering mechanical tests are now under experimental proof; but the development of tests for electric strength has indicated the desirability of a wider series of tests applicable to all materials with a fibrous base, and even of a series of tests standardised for every kind of insulating material. The study of untreated papers has yielded results shortly to be published as a document covering the methods of examination and the definitions of the materials and terms employed. Specifications have also been drafted for the study of pressboard, vulcanised fibre, varnish board, etc., and are undergoing experimental verification; a full report of these researches is in preparation.

New work in section B (Composite Insulating Materials) includes the formation of a committee for research in varnishes; the co-operation of all having special knowledge of this subject is invited. A comprehensive publication has been prepared of the test methods developed by the Association for the investigation and improvement of composite insulating materials. The publication includes a complete series of mechanical (*e.g.* tool wear and chipping tests) and electrical tests, with the exception of tests for inflammability, flash point, fire resistance, dielectric losses, action of solvents, and surface breakdown. These are still under consideration, though in some cases the researches have reached the report stage. The Committee of Section C (Porcelain) reports the completion of arrangements for porcelain research at Manchester University and the National Physical Laboratory.

Mica and Micanite.

The results of the work done by Section D on Mica and Micanite for commutators and condensers will shortly be available as a report. In the course of this work there has been found a general lack of physical data concerning certain features, and this led to the institution of a research on fundamental constants, and the examination of the particular characteristics of certain micas. Arrangements have also been made for the publication of data obtained by the E.R.C. The manufacture of micanite is under consideration, and co-operation is invited from manufacturers and users.

Insulating Oils.

The specification for insulating oils, prepared by section E and already submitted to the B.E.S.A., has met with substantial approval, and a final draft is under consideration. The researches on the electric strength and resistivity of insulating oils include the deterioration of oils by foreign matter, water, and products of arcing; particular interest is involved in the use of centrifugal apparatus in this research. Work still continues on thermal transference, specific and latent heats, &c. (at the N.P.L.), and on the action of catalysers and the analysis of deposits.

In Section F (conductors) the intermittent and overload ratings of buried cables continue to receive attention, the data collected from power-station engineers being included for analysis. Recommendations have been drafted dealing with the ratings of cable used on ships. The research on overhead lines has progressed as far as deflection and performance tests of standard "A" and "H" poles, inserted to various depths. In this research, the records were made with the aid of a cinema camera, which enabled a detailed examination of the behaviour of the poles to be made at leisure. This research is in the report stage, and the tests of long overhead lines are being pushed.

Electric Control Apparatus.

Section G (Electric Control Apparatus) deals with the phenomena of switching and arcing, mining switchgear, heavy-duty fuses, d.c. circuit breakers, and the resistivity of joints and contracts. The investigation of the phenomena of switching and arcing has involved as a preliminary the determination of the short-circuit characteristics of a large alternator at Carville Power Station, the development of devices for predetermining the instant at which a circuit is made or broken, and special apparatus for control of the power factor and energy flow. An adjustable switch has been designed and constructed. Pending the completion of arrangements on the site of the test, there has been made a survey of all available data on switching and arcing.

The tests on mining switchgear deal chiefly with the pressures developed in closed chambers; satisfactory workshop tests have been devised. The investigations on heavy-duty fuses have progressed, with the aid of tests on a large battery under short circuit conditions, to a point where test methods can be formulated. It yet remains to test makers' samples, of which a complete set has been collected. Preliminary tests of d.c. circuit breakers have disclosed unexpected difficulties in the determination of the physical constants of shorted circuits. When these have been overcome, it is hoped to secure the loan of apparatus suitable for large-scale tests, failing which it will be necessary to fall back upon the special apparatus built for the researches on switching and arcing.

Synthetic Resins.

A close study has been made by the committee of Section K of the whole question of the production in this country of synthetic resins. The scope of this work includes plans for the supply and production of raw materials, for test methods, and the collection of samples for tests. A report is expected shortly.

The activities of Section L, formed to deal with dielectrics in general, have resulted in an extensive programme of research on dielectric losses to be carried out in co-operation with the N.P.L. This will commence with observations at low voltages and at low and audio frequencies, and will later proceed to the development of test methods for high voltages and radio frequencies. The experimental work on the thermal resistivity of dielectrics in sheet form is proceeding; test methods for built-up insulation have been developed and are to be used in investigating various methods of construction.

The researches on condenser corrosion and on turbines, carried out in co-operation with other research associations, have reached the report stage. The report on the corrosion of metals is a most valuable *résumé* of the several years' investigations, and should go far to remove much of the guess-work hitherto inevitable in condenser maintenance and design.

Imperial Wireless Telegraphy—A Technical Report.

The report of the Wireless Telegraphy Commission which, in accordance with the suggestion of the Imperial Wireless Telegraphy Committee, was appointed in 1920 to make recommendations regarding the sites and apparatus for the stations of the Imperial Wireless Chain, contains a great deal of interesting information on technical wireless matters. It includes a discussion of the development of high-power thermionic sets, the cost of valve renewals, the choice of wave length, transmitting antennæ, masts and towers, the methods of reception and the design of receiving stations. Detailed recommendations for the equipment of the various stations in the Imperial Chain are also given.

The Wireless Telegraphy Commission, which was appointed by the Cabinet on Dec. 23, 1920, has issued its report (Cmd. 1 572). The Commission consisted of Lord Milner (chairman), Dr. W. H. Eccles (vice-chairman), Mr. L. B. Turner and Mr. E. H. Shaughnessy, with Lieut.-Col. C. G. Crawley as secretary. It was appointed as the result of a recommendation by the Imperial Wireless Telegraphy Committee, 1919-20, that the stations of the Imperial wireless chain should be planned by a wireless Commission of four members, and its terms of reference were to decide on the wireless plant most suitable for carrying out the scheme of Imperial wireless communications recommended by the Imperial Wireless Telegraphy Committee, 1919-20,* to make recommendations regarding the actual sites for the stations proposed by that committee, and to advise generally on the preparation of specifications for machinery and apparatus, the making of contracts, and the construction of the stations. Its contents are of the highest technical interest.

Development of High-Power Thermionic Sets.

The report begins by pointing out that the Imperial Wireless Telegraphy Committee recommended that the thermionic transmitter should be capable of delivering at least 120 kW to the antenna and that double this power appears to be within the bounds of possibility at an early date. As regards progress in these matters at home, the work of the Admiralty is especially notable; at the Signal School, Portsmouth, very large silica valves have been constructed and used. Every effort has been made by the Admiralty to hasten the establishment of an industry for the manufacture of these valves. At the present date the 2½ kW silica valves are being produced at the rate of about four or five per week.

In order to equip a typical Chain station with silica valves, about twenty-four would be required to deliver 120 kW to the aerial. The annual consumption of valves by such a set working twenty-four hours every day without cessation would be between 36 and 108 per station. Thus, on the basis of incessant operation, eight Chain stations would consume between 288 and 864 valves per annum. The silica valve industry is only gradually approaching the condition of being able to cope with the possible demands of the Chain stations over and above those of the Admiralty and other services.

If glass valves be used instead of silica about four times as many would be needed for equipment and renewals. In round numbers, between 1 080 and 3 240 glass valves would probably be required per annum by the Chain stations if all were to operate continuously. There is reason to believe that this demand could be met.

Cost of Valve Renewals.

The most important aspect of this question is the cost of valve renewals. Glass valves cost about £15 each. The above rates of renewal of glass valves may cost, therefore, between £2 025 and £6 075 per annum per station. The silica valves cost about £60 each, and the expenditure upon renewals would therefore be between £2 160 and £6 480 per annum per station. It is claimed, however, that burnt filaments can be renewed in either glass or silica valves at small cost, and that the above estimates of costs of renewal of silica valves can thus be materially reduced. These claims have not yet been tested practically by any large user. In all cases, it should be emphasised, estimates of the consumption of valves will be profoundly affected by the care taken in manufacture, and by the absence or presence of skilled attention during use.

The above estimates of the cost of renewals relate to the method of operation in which high voltage direct-current generators are employed. If alternating current were used the initial capital outlay on machinery would be greatly reduced, but the cost of valve renewals would be increased by 50 per cent. for the silica valves and by about 66 per cent. for the glass valves. The estimates are based upon an average filament life of from 6 000 to 2 000 hours, which can reasonably be expected to be achieved in the course of valve development.

Apart from the problem of manufacture of the valves, the problem of assembling them as thoroughly practical telegraphic transmitters remains. The Commission is collaborating with the Admiralty upon this problem. A set of valves which is designed to utilise 67 kW is now being erected at Signal School on the Commission's responsibility.

The Work of the Marconi Company.

Besides the Admiralty, the Marconi Company have in this country been very active in the development of large thermionic sets. They have established commercial traffic across the Atlantic by means of thermionic stations of less than 30 kW input at Clifden, Ireland, and at Glace Bay, Canada. In Central Europe the Telefunken Company have erected plants of about the same power at two stations. In the United States of America the development appears to have been confined principally to the laboratories, and the Commission have no information regarding the commercial working of large thermionic stations.

The Commission visited the Carnarvon station of the Marconi Company and took part in trials of the largest thermionic set yet constructed.† It is an assemblage of forty-eight glass valves and is capable of working with an input of about 100 kW. This is approaching the order of magnitude laid down by the Imperial Wireless Telegraphy Committee. The set was overloaded at the trials until the input was about 150 kW. The trials, which were of short duration, were very successful and included the transmission of messages across the Atlantic (of which receipt was acknowledged by wireless) and the transmission of messages to Australia and India during what are known to be the best hours of the day for reception in those parts of the globe. The engineers of the Marconi Company have spent much time and great ingenuity in building up this set, and the Commission are confident that they would now be able to erect a set fulfilling the minimum requirements laid down by the Imperial Wireless Telegraphy Committee.

Choice of Wavelength.

Into the problems of choice of wavelength two factors enter, the international and the physical. The former factor was discussed in Paris at a meeting of the representatives of the Governments of the Allied and Associated Powers. This international aspect of the matter has been borne in mind by the Commission in the formulation of their recommendations.

The physical factors in the choice of wavelength have been closely studied, both theoretically and experimentally, and by means of accumulated records. Mr. Turner spent September in Egypt observing the legibility of prearranged signals despatched from the Admiralty station at Horsea. For this purpose a thermionic set of about 30 kW input was used to emit a series of signals at various wavelengths at all hours of the day and night upon selected days. The conclusion is that for distances such as those in the links of the Imperial Chain the best signals are those obtained at night by the use of relatively short waves, while the best day signals are those using long waves. The month of the trials is one of the worst months of the year for atmospheric disturbances in Egypt.

Transmitting Antennæ, Masts and Towers.

The choice of an antenna for a new type of transmitter lies between low antennæ of great area and high antennæ of smaller area. In the case of thermionic oscillators, where plant large enough for the task is being made with difficulty, the high antenna of relatively small area is preferable. The preference is independently supported by a deeper study of the better wave-making properties of high as compared with low antennæ. From the nature of the thermionic oscillator, moreover, it can be shown that a symmetrical antenna is more suitable than an unsymmetrical one, whether a low or a high antenna is concerned.

The masts or towers used for supporting the antenna constitute the most costly item of a wireless station, and unless properly designed they affect and cause great loss of oscillatory energy generated. The ideal mast would be built of insulating material; wooden structures are an approximation to the ideal, but are unsuitable for the tropics. Steel structures are conductors, and cause considerable electrical loss. A great deal of this loss can be avoided by making the mast or tower in sections with insulating portions and standing the mast on an insulating base. There are some mechanical difficulties in this mode of construction, but they do not greatly affect the capital cost, and may be regarded as subsidiary detail. The above remarks apply alike to self-supporting towers and to masts supported by guys, the guys also being segmented by insulators in the latter case. The cost of masts is much less than that of towers.

It is recommended that earth screens and emergency receiving gear and operating apparatus should be installed at all stations.

Method of Reception and Design of Receiving Stations.

A number of alternative types of apparatus and several types of receiving antennæ were tested in Egypt by signals from Horsea, Leafield and other European stations. The Commission visited the Towyn receiving station of the Marconi Company and saw a demonstration of Mr. Franklin's double directional antenna. The demonstration proved nothing as regards the performance of this

* *See* The Electrician, Vol. LXXXV., p. 42, July 2nd, 1920.

† *See* The Electrician, Vol. LXXXVII., p. 714.

apparatus under the tropical conditions of many of the Chain stations, and an examination of the apparatus tends to confirm the opinion that it has no anti-atmospheric merits other than those possessed by various forms of directive apparatus.

The Arrangement of Receiving Posts.

The Imperial Wireless Telegraphy Committee recommended that each station of the Chain should be one-way duplex, but it would seem that better use of the plant could be made if each station were provided with as many receiving posts as there are stations with which it will communicate; and, further, that each of the Egyptian stations should be assumed to communicate with both East Africa and India. Such an arrangement is quite feasible and offers the following advantages:—(1) Until the routes are fully loaded it allows of improved working during periods when the flow of traffic in one direction is greater than in the other direction; (2) during periods when bad atmospheric conditions prevail at one station and not at the adjacent stations the one station can be sending to either of the others, and when the good reception period at the one station comes the time lost can to some extent be made up by receiving from all adjacent stations at once.

For economy of staffing and for traffic reasons it is highly desirable that all the receiving posts of one station shall be situated together. At each of the non-terminal stations, therefore (Egypt, East Africa, India, Singapore), the receiving posts should be grouped together at one spot, distant 20 to 40 miles from the transmitting station. In Egypt, East Africa and India, where the routes diverge through much less than a right angle, the line joining the transmitting site to the receiving site should be approximately perpendicular to the average direction of the signalling routes at the station; but at Singapore, where the branch to Hong Kong is nearly perpendicular to the average India-Singapore-Australia route, the receiving site should be situated approximately on the line joining Singapore to Hong Kong. In South Africa and Hong Kong the receiving site should preferably be situated 20 to 40 miles from the transmitting site approximately on the signalling route. In England the receiving post of the new station should preferably be placed with the existing receiving post at Banbury. In general the receiving site should be chosen so as to comprise a central plot, 250 yds. by 50 yds. for the operating building, and two other plots, 220 yds. square, each suitable for containing a mast 300 ft. high, about 550 yds. from the central plot and on opposite sides of it. The general direction of the three plots should lie along the average direction of the signalling route.

Atmospheric Disturbance.

Experience recently gained in England and Egypt has shown that atmospheric interference may be markedly reduced by each of three distinct methods, which may be referred to as: (*a*) Atmospheric balancing, (*b*) limiting, (*c*) barraging. Designs are in progress for applying all these simultaneously in Egypt. If the benefits obtainable justify the expenditure, the other stations of the Chain can be similarly equipped in due course.

The Windhuk Station.

The Imperial Wireless Telegraphy Committee recommended (1920) the use of the ex-German Windhuk station as the South African terminal station of the Chain, being under the impression that Windhuk was adequately connected by land lines with the political and commercial centres of the Union. Later information put before the Commission has shown that new land lines would be required, and that the maintenance of these lines would be costly. Under these circumstances, the Commission drew up a memorandum upon the possibility of erecting an entirely new station near Johannesburg as the terminal station of the African chain. The capital outlay would be greater than that needed for the adaptation of Windhuk, but the cost of maintenance would be less, much retransmission of messages would be avoided, and better conditions for the staff could be provided.

Buildings.

The advantages of a symmetrical antenna have been referred to above. In order to ensure symmetry, the buildings for housing the transmitting plant should be placed at the centre of the transmitting site. In general, there will be a boiler house, an engine room and a high frequency room, together with workshops and an emergency operating room; but when power can be drawn from an outside supply the boiler house is not required. In view of the recommendations of the Imperial Wireless Telegraphy Committee it is important to plan the buildings in such a way that the boiler house, engine room and high frequency room can each be extended easily. The form adopted in this Report is a very economical one; it consists of two or three equal bays, as the case may be, in parallel formation, with panelled ends, each lighted from the roof, which may be of sawtooth type. The buildings may be oriented in any direction appropriate to the locality.

General Recommendations.

The Commission recommend that:—

(1) The transmitting stations in England, Canada, Australia, the Union of South Africa, India and Egypt be equipped with thermionic valve plant in the manner described in detail below. But in view of the amount of skilled attention demanded by this plant in its present stage of development, and having regard to the isolated nature of the stations in East Africa, Singapore and Hong Kong, these three stations should be equipped for combined arc-valve transmission; the arcs alone should be installed immediately and the thermionic valve plant should be added after practice has become standardised.

(2) Each transmitting station should be capable of working with either of two wavelengths as may be appropriate to the time of day and the atmospheric conditions.

(3) Each receiving centre should be provided with antennæ and apparatus sufficient for working simultaneously with the other stations normally communicating with it, and all the receiving and operating apparatus should be in one and the same building.

DETAILED TECHNICAL RECOMMENDATIONS.

England: Transmitting Station.

(4) *Masts.*—The masts should be of steel, each 250 m high, guyed three ways with six concrete anchorages, both masts and guys insulated in sections, and designed to take a horizontal pull of 10 tons at the top and a wind load of 60 lb. per sq. ft. with a factor of safety of 3. Four masts should be erected, one at each corner of a square not exceeding 400 m. side. The site should allow of extension of the antenna by the addition of two masts at each end, and the whole area available should therefore be about 1 mile by $\frac{1}{2}$ mile.

(5) *Antenna.*—The antenna should be designed so as to reduce corona to a minimum, and should be especially highly insulated. Its electrical capacity should be about one-fortieth of a microfarad.

(6) *Earth Screen.*—The earth screen should be a series of copper wires radiating from the centre of the site to its edges, and supported at not less than 8 ft. from the ground by insulators.

(7) *Antenna Tuning Coil.*—The tuning coil should be designed for an antenna current of 500 A, provided with tappings for tuning the antenna to wavelengths between 3 000 m and 16 000 m. The high frequency resistance of the part in use should not exceed $\frac{1}{3}$ ohm at the corresponding frequency.

(8) *Thermionic Valve Set* (provided in duplicate).—A thermionic valve set capable of delivering at least 120 kW of high-frequency power to the antenna, with the necessary connexions to the antenna coil, with control gear and protective devices in the anode and filament circuits, with grid leaks and condensers, relay and hand keys, air-piping for valves and keys, compressor and instruments, all connected up. The set should be capable of sub-division in stages so that a convenient fraction of the total power may be taken to the antenna at will. It should also be capable of extension until 240 kW can be delivered to the antenna. Current may be supplied either from high voltage d.c. machines (10 000 to 12 000 V) or by rectifying alternating current; tenders will show which is preferable from the point of view of economy.

The set should be guaranteed with respect to constancy of wavelength, purity of wave, overall efficiency at each wavelength and average cost of renewals. It must be capable of transmitting continuously at hand speed and at ninety words per min. at full power, for reception at 2 500 miles.

The Marconi Company to Tender.

It is suggested that the Marconi Company be invited to tender for the apparatus recommended under the headings "earth screen," "Antenna Tuning coil" and "thermionic valve set." If their quotation should not be acceptable, thermionic plant, &c., could be designed by the Commission after the conclusion of the work now being undertaken at Horsea, erected in England, tested, and proved designs recommended to the Dominions and to India.

(9) *Power Supply and Electrical Machinery.*—For the generation of the electrical power supply water-tube boilers, burning oil or coal, should be used. The requirements are:—Three water-tube boilers, each evaporating 7 000 lb. or two each evaporating 10 000 lb. of water per hour, with superheaters and economisers, pipe work, water softeners, feed-pump, together with condensers and cooling plant; *two 250 kW turbo alternators, three-phase, 50 cycles, 3 000 V between phases; *two 250 kW three-phase transformers, giving 15 000 V; two turbines, each driving one 50 kW d.c. machine, 220 V, and *one 30 kW d.c. machine, 20 V, and high and low tension switch gear. The alternative mentioned in Recommendation (8) would require the substitution of the following two items for the three items marked with an asterisk: Two 200 kW steam-driven sets giving 10 000 to 12 000 V d.c., and two 20 kW sets giving 20 V d.c. Later extensions would be one boiler, one turbo-alternator (or one 200 kW, 10 000 to 12 000 V d.c. set), one transformer, one 20 kW 20 V d.c. set, one d.c. turbo-generator, switch gear, &c.

(10) *Buildings.*—The transmitting station buildings should be at the centre of the site. They comprise the sections mentioned in paragraph 28. A travelling crane is required in the boiler-house and the engine-room.

(11) *Emergency Receiving Gear and Operating Apparatus.*—

The emergency arrangements should comprise a small aerial, a receiving set of the Post Office pattern, perforators, automatic transmitters and recording apparatus.

Receiving Station for Duplex.

(12) The receiving station should be situated at Banbury, and be provided with two sets of apparatus similar to that being installed at Banbury for the Leafield-Abu Zabal link of the Chain, but supplemented by limiting apparatus. Details appear in paragraph 19. As soon as Canada enters the Chain scheme an additional aerial system and set of receiving apparatus will be needed. Telegraph lines in duplicate connecting Banbury to the transmitting station will be required.

Canada.

(13) Should the Canadian Government decide to have stations at Montreal and Vancouver, the former could maintain a good service with the station in England, and the latter would be able to communicate during part of the day with England and with Australia. Both stations might be as described above.

Australia.

(14) The transmitting station should be as described in Recommendations (4) to (11), unless an ample public supply of electricity is available. In this latter event the transmitting station might be similar to that described in Recommendation (16).

(15) The receiving station should have two aerial systems and three sets of receiving apparatus, with accommodation for a third outfit for direct communication with South Africa when desired. The aerial for this receiving station consists of a pair of horizontal wires each about 250 ft. long supported upon two 75 ft. poles. The site required is as indicated in paragraph 19. When a station is built in Vancouver additional receiving equipment will be required. Apart from this, additional receiving equipment will be necessary if the Chain station is required to work across Australia.

A 12 kW d.c. supply (public or oil engine) will be required for lighting, charging batteries, and running telegraphic apparatus.

Telegraph lines in duplicate connecting the transmitting station to the receiving station will be required.

The Commission have been informed that the Australian Government prefer to have the Chain station situated at Perth rather than at Port Darwin.

South Africa and India: Transmitting Stations.

(16 and 18) If the transmitting station is placed near Johannesburg the masts, the antenna, the earth screen, the tuning coil, the thermionic valve set and the emergency gear should be as described in Recommendations (4) to (8) and (11). The power supply and electric machinery should be: *Two 250 kW three-phase transformers, 15 000 V; *two 30 kW three-phase transformers, 20 V; two 10 kW lighting transformers, 220 V; two transformers supplying two 40 kW rotary converters giving 220 V d.c.; high and low tension switch gear; and overhead transmission lines in duplicate. Later extensions would be one single set of transformers and gear as scheduled.

The alternative mentioned in Recommendation (8) would require the substitution of the following two items for the two items marked with an asterisk:—Two 200 kW motor generators, 10 000 to 12 000 V d.c.; two 20 kW three-phase transformers, 20 V. In each of the above schedules a mercury rectifier may be substituted for each rotary converter.

Receiving Stations.

(17) The receiving station should have one aerial system and two sets of receiving apparatus in the first instance, with accommodation for a second outfit for direct communication with Australia when desired. Lighting and telegraph lines will be required as in Australia. For India the same recommendations are made as for South Africa.

Egypt.

(19) The transmitting station, unless placed at Abu Zabal, should be of the type described in Recommendations (4) to (11).

The receiving station should have four aerial systems and five sets of receiving apparatus.

The site should consist of a central plot 200 yds. by 50 yds., containing the operating building, &c., and two other plots 220 yds. square, each containing a 300 ft. mast 550 yds. away in opposite directions from the central plot. The three plots should be connected by cable.

East Africa: Transmitting Station.

(20) The masts, antennæ, earth screen, tuning coil and emergency gear should be as described in Recommendations (4) to (7) and (11).

(21) *Arc Converter.*—Two 250 kW arcs should be installed, each provided with chokes, condensers, contactors, resistances, instruments, keying inductances, keys and auxiliaries, similar to those at Leafield.†

(22) *Power Supply and Electrical Machinery.*—The hydroelectric project at Thika, reported upon by the Public Works Department, Nairobi, on March 30, 1914, should be carried into effect, at least in part, if, as seems probable, the wireless transmitting site can be near the Falls. For the purposes of the wireless station the water of the Thika is sufficient, and the proposed simultaneous utilisation of the Chania might therefore be reserved for any eventual enlargement of the wireless station. The electrical machinery should consist of two 250 kW water turbine-dynamo d.c. sets, delivering 350 A, with voltage regulation between 500 and 1 000 V; two 60 kW water turbine-dynamo d.c. sets, 220 V; switch gear; and two overhead transmission lines from the hydroelectric house to the wireless transmitting station.

(23) Should the hydroelectric project be for any reason impracticable, the electrical supply should be generated by steam, as described in Recommendation (27).

(24.) *Buildings.*—A hydroelectric building should be provided at Thika River.

Receiving Station.

(25) The receiving station should have three aerial systems and four receiving sets, with accommodation for the addition of a fourth outfit for direct communication with England.

The site should be so chosen as to permit of the erection of a pole line 250 yds. long across the central plot, but otherwise conforming to the description in paragraph 19.

Singapore: Transmitting Station.

(26) The masts, antenna, earth screen, tuning coil and emergency gear should be as described in Recommendations (4) to (7) and (11). The arc equipment should be as described in Recommendation (21).

(27) *Power Supply and Electrical Machinery.*—Three boilers, each evaporating 7 000 lb., or two each evaporating 10 000 lb. of water per hour, with superheaters, economisers, water softeners, feed pump, together with condensers and cooling plant.

Two 250 kW reciprocating-engine and dynamo sets, 350 A d.c., with voltage regulation between 500 and 1 000 V. Two 60 kW reciprocating-engine and dynamo sets, 220 V d.c., and switch gear.

(28) The buildings at the transmitting and receiving stations should be as indicated in the diagrams in Report.

Receiving Station.

(29) The receiving station should have three aerial systems and four sets of receiving apparatus. The site should be 250 yds. by 50 yds., with facilities for a pole line 250 yds. long running across it, and conform to paragraph 23.

Hong Kong: Transmitting Station.

(30) The masts should be of steel, 200 m. high, guyed three ways with six concrete anchorages, both masts and guys insulated in sections, and designed to take a horizontal pull of 10 tons at the top and a wind load of 60 lb. per square foot, with a factor of safety of three. Four masts should be erected, one at each corner of a square not exceeding 400 m. side.

The site should allow of extension of the antenna by the addition of two masts at each end, and therefore the whole area available should be about 1 mile by ½ mile. The antenna, earth screen, tuning coil, and emergency gear should be as described in Recommendations (5) to (7) and (11). The arc equipment should be as described in Recommendation (21). The power supply and electrical machinery should be as described in Recommendation (27). The buildings should be as described in Recommendation (28).

(31) The receiving station should be generally the same as that described in Recommendation (17).

Financial Details.

In the course of an explanatory foreword pointing out the severely technical nature of the report, Dr. Eccles remarks that the structural work and machinery at each station have been planned with the endeavour of keeping the probable cost within the approximate estimates submitted by the Imperial Wireless Telegraphy Committee in their report. That is to say, the average cost of the overseas stations will not exceed £160 000, exclusive of the cost of erecting residences for the staffs at some of the stations. The stations in England, Egypt, East Africa, Singapore and Hong Kong, for which the Imperial Government is presumably responsible, should not exceed in the aggregate the sum of £853 000.

Looked at as a whole, the report provides specifications sufficiently full for the immediate preparation of estimates. A later report will give detailed specifications. All the stations are planned to permit of easy extension of antenna, buildings and plant.

The Traffic Question.

It should be emphasised that during portions of each day much of the Imperial strategic, official and news traffic could be carried on by direct communication between any pair of principal centres, the intermediate stations being omitted; but the intermediate stations would be necessary for relay work during the less clear portions of the day, and also for handling their own local traffic. The news messages transmitted from the principal centres could be received at many stations in the Empire, for example in New Zealand, at the cost of an inexpensive addition to their existing receiving equipment. Foreign stations in many parts of the world would be able to pick up news and propaganda from one or other of the principal centres.

† *See* The Electrician, Vol. LXXXVII., p. 266.

The Electrification of Main Line Railways.

An important joint meeting of the Midland branches of the Institutions of Electrical, Civil and Mechanical Engineers was recently held in Birmingham, when the subject for discussion was "The Electrification of Main Line Railways." By kind permission of the Lord Mayor of Birmingham the meeting took place in the Council House under the chairmanship of Sir Henry Fowler, chief mechanical engineer of the Midland Railway. Sir Henry was supported by Mr. R. A. Chattock, Mr. E. C. R. Marks, Chairman of the Midland branch of the Institution of Mechanical Engineers, and Mr. A. W. Willett, President of the Birmingham Association of Civil Engineers.

Electricity Supply and Electric Traction.

Sir Henry Fowler, in opening the discussion, said that all over the country enquiries were being held as to the future arrangements for the supply of electrical energy. If a clear lead could be given as to transport demands, it would be of the greatest advantage. Apart from questions of expense, the difficulties which prevented electrification were few. Finance was especially the difficulty on lines with a low density of traffic, and the cost of the change over needed grave consideration.

No Engineering Difficulties.

Mr. W. Willox, ex-chief engineer of the Metropolitan Railway, referred to the successful results of electric traction on suburban lines in this country, and called attention to the number of cases in the United States where main line working had been conducted by the same means with the most favourable results, especially where there were heavy gradients and tunnels. The electric locomotive had proved itself superior to the steam locomotive, and there were no engineering difficulties in electrifying existing steam railways, even when the traffic was dense, by either the contact rail system or overhead equipment. It was thought that at points and crossings the contact rail system was dangerous to the maintenance gangs. His experience was that there was no special danger, and there had been no cases on the Metropolitan Railway where men had been killed or injured when ordinary care was taken. He emphasised this by referring to the rebuilding of Baker Street Station, where the position of every line in the station had been altered without stopping the traffic. Incidental advantages of electric traction was that power was available for lighting purposes and for operating both the semaphore and fog signals.

Overhead v. Contact Rail.

Mr. C. F. Bengough, chief engineer of the North-Eastern Railway, said that a consideration of the relative advantages of the overhead wire, and the third rail was important in connection with main line working, where the problem was quite different from that of suburban lines. In the case of a line electrified on the third rail system in order to make the sidings safe for shunters, the third rail would have to be fully protected and would form a serious obstruction, so that overhead equipment would appear to be the only practical form to use. The use of the third rail meant increased difficulty in maintaining the track, and this would be emphasised with high pressures. In case of derailment a very slight displacement of the vehicle would wreck the third rail, and when the train was worked with a single electric locomotive the long gaps necessary at level crossings or at junctions would have to be bridged by the erection of short lengths of overhead equipment. The great advantage of the third rail was its accessibility, and in the case of accidents, there was no obstruction to the working of the breakdown cranes. On the other hand, the overhead equipment formed an obstruction to the breakdown cranes; it was likely to be displaced from the engine bows during heavy gales, and inspection necessitated the use of tower wagons. On the other hand, the maintenance of the track was not interfered with in any way, and in the case of derailment a considerable displacement of a vehicle would take place before it would foul the supports. The balance of advantage was therefore with the overhead equipment and the question therefore arose as to which was the most economical form. Where only one contact wire was used as on part of the Shildon-Newport line, overhead equipment should be quite as cheap as the third rail, while experience in the Tyneside area showed that the maintenance costs were considerably in its favour.

Mr. Roger T. Smith, chief electrical engineer of the Great Western Railway, summed up the advantages of electric traction as being greater haulage power per ton as compared with steam, no stops for coaling or water and a longer period of usefulness per day.

Comparisons—A Word of Warning.

Mr. F. W. Carter, B.T.-H. Co., said that in making a comparison between steam and electrical operation it should not be forgotten that the methods of working the traffic would not be the same in the two cases. It might, therefore, be concluded that if an estimate of the performance and expense of electrical operation were based on the existing methods, better results would be obtained when the methods of working were more closely adapted to the new requirements. It was necessary to ensure that the data derived from electrical considerations and the data derived from traffic considerations should not be combined in such a manner as to lead to inconsistency. Electrical operation would modify the existing railway organisation from the fact that the electric locomotive was capable of much more continuous service than the steam locomotive and that closer co-operation would be possible between the traffic and operating departments. On a steam railway the trains were independent units, while on the electric railway they were tied in groups to sub-stations. The amount of plant that must be held at the disposal of the railway in generating stations and sub-stations depended on the maximum demand for power. The work done by it depended on the average demand, and the greater the load factor the more efficiently was the plant used. The economy in operation was therefore the greater the more uniformly the load could be distributed both in time and space. Mr. Carter gave some figures of the working on the Chicago, Milwaukee and St. Paul Railroad, which have already appeared in The Electrician, to emphasise this point.

Suburban and Main Line Electrification—A Difference.

Mr. H. N. Gresley, Locomotive Engineer of the Great Northern Railway, said that the electrification of railways had been strongly urged as a means of enabling railways to pay their way and to reduce their working expenses. This it had undoubtedly been successful in doing on suburban railways, not because it saved expense in working, but because it made money by creating new traffic. The problem of main line electrification was a totally different matter. The main lines of the country were not congested at the moment and much greater tonnage could be carried without doubling the lines. The electrification of main lines was, therefore, largely contingent on the price at which current could be obtained, and this price would have to be more attractive than it was at present before electrification could be favourably considered. There had been a tendency during the past twelve months to compare the best results that could be expected from electrification with the average results now being obtained by steam traction. No mention was made of the extra cost of the maintenance involved owing to third rails or overhead wires. Nevertheless, the electrification of suburban railways and of heavy terminal railways should be undertaken as soon as the necessary money could be raised at a sufficiently low rate.

No Savings in Maintenance.

Mr. J. A. Hickley, locomotive engineer of the North Staffordshire Railway, said that it was probably true that electric locomotive required little inspection and few repairs. But its first cost was greater and its life probably less than the steam locomotive, for which thirty years was quite a reasonable average. When the cost of repairs and power station and sub-station plant and the maintenance of the conductors were taken into account it was doubtful whether experience would show any saving on the maintenance side. Many of the advantages claimed for electrification, such as higher acceleration, and saving of time at terminals, hardly applied to main line traction, though the saving of time on plant and engine duties and on repairs and maintenance costs were equally applicable in the two cases. The objection against electrification that whole sections of the lines might be thrown out of use was more or less of a bogey, and if arrangement could be made to use water power where it was available the cost of energy would be much reduced. There was no doubt that where a new line was projected the case for electrification was very strong. One great advantage of electrification was the possibility of using regenerative breaking. It also would be justified owing to the increased average speed possible where the traffic was dense and where widening or doubling would have to be resorted to to cope with development. It was possible that further improvements in steam locomotives would alter the whole aspect of affairs before many years were passed, and in this connection the combination of the semi-Diesel engine with electric transmission would form an intermediate step by rendering possible the gradual electrification of a railway.

Electrification an Aid to the Civil Engineer.

Dr. F. C. Lea said the development of the steam locomotive was limited by the requirements of the civil engineer at the bridges, but these demands for load limitation would be very easily met while the train drawing capacity could be considerably increased by the electrification of main lines. Many of the civil engineers' most serious maintenance problems would be considerably diminished by the adoption of electric traction.

Electrification Means Altered Traffic Conditions.

Prof. W. Cramp said that it had been taken for granted that traffic on our main lines would be similar under electrification

schemes to what it was to-day, but if the conditions which had been an advantage to suburban traffic could be applied to main lines, the result would be a great increase in travelling. There was an enormous demand for short trains of high acceleration and high frequency from places like Birmingham and Oxford to London. The present long train was due to the steam locomotive, and the way to make a success of electric traction was to use shorter trains, of high acceleration and greater frequency. Some of them were dismayed at the decisions which had been arrived at by the Advisory Committee on Electric Traction. The 1 500 V direct current system might be a success, but this was not the time to lay down hard-and-fast regulations.

The Railway Load and the Supply Engineer.

Mr. R. A. Chattock said the railway load was valuable to the supply engineer owing to its high load factor, and if a power station could be operated with a high load factor it should be able to supply current at a low figure. Electric traction had meant more traffic on suburban lines and he did not see why the same thing should not happen on main lines. This applied equally to passenger and goods traffic.

A Single-Phase Advocate.

Dr. Gisbert Kapp, pointed out that it had been possible to adopt electric traction on certain lines in Italy during the war without any extra cost for strengthening bridges. He called attention to the use of the single-phase system in Switzerland and in Germany. The overhead system was preferable for several reasons, and 1 500 V direct current would not take us far. 3 000 V direct current could be employed, but even that meant numerous sub-stations; 3 000V on an overhead wire instead of 1 500 V meant half the cross section, but the sub-stations could be ten times as far apart. For direct-current working they required three-phase transmission with transformers and converters and a considerable staff. To some extent this had been overcome in America by the use of automatic apparatus, but he did not think they would trust such equipment in this country. The 15 000 V transmission system, such as was being used in Switzerland, would be no danger for a railway because it could be placed in the company's own ground. He hoped that, therefore, whatever system was chosen it would only be after careful consideration, because it could not be changed, and it was highly necessary that each railway should use the same system.

The Chairman, in summing up the discussion, said that Prof. Cramp's idea of smaller train units would mean an increase in labour charges. He did not look upon the Diesel locomotive as a competitor of the electrified main lines.

Gas Works and the Production of Light, Heat, and Power.

In an address delivered to the London and Southern District Junior Gas Association on "Gas Works and the Production of Light, Heat, and Power," Mr. A. H. Seabrook emphasised the value of versatility in engineering practice. A man who had spent a number of years in one branch of engineering, and then became associated with another, could often bring a new outlook to bear on existing methods. In his own case he had been associated with electrical engineering for twenty-five years, and during the last few years he had been connected with gas engineering. There were many advantages to be derived from closer relations between these branches. Both were primary public services of unlimited importance. Ultimately light and power stations should become as neutral, so far as the form of the light, heat, or power was concerned. The centre at which coal could be best dealt with was also the most suitable place for the joint production of gas and electricity. In travelling about the country he had been struck by the facts that gas works were found in the smallest towns, and that the engineers responsible had usually been happier in their choice of a site than those who settled the positions of electricity generating stations. Gas works almost invariably had a railway siding and plenty of water available.

Coke in Electrical Generation.

An important point, that was apt to be overlooked, was that the generation of electricity at a gas works permitted the use of coke as fuel, at a minimum transportation cost. The burning of coal in a raw state was generally admitted to be uneconomical; yet the Government was actively encouraging the installation of huge stations where raw coal was to be burned for the production of electricity. There were varieties of coal so poor in the yield of bye-products that they could be suitably used direct without an attempt at by-product recovery. But the use of coal rich in by-products direct should be eliminated so far as possible.

He was glad to note the growing practice of sandwiching coal and coke as boiler fuel. The proposal of some of the London electricity supply companies and the Gas Light & Coke Company to supply a portion of the electricity required for London from works at Beckton, was an important step. The arguments in favour of the arrangement seemed irresistible. There were ample storing facilities, plenty of space, ample water supply and a distinct inducement for the gas and electricity people to work together. The fuel used would have been coke, and the destruction of raw coal for the purpose would have been avoided. Electricity would doubtless have been produced more cheaply at Beckton than at the new super-station approved by the Government, lower down the Thames.

Generating Station Fuel as a By-Product.

Col. Woodhall, in November, 1919, had pointed out that the by-products of the gas works were more than ample to keep the ordinary town electricity stations provided with fuel. He (Mr. Seabrook) was, he believed, the first electrical engineer to fit suitable automatic stokers to large station boilers for the express purpose of burning coke breeze. This was done at Marylebone during the war. Various difficulties had been overcome. At one time the boiler house was unbearable owing to sulphur fumes, and motor goggles had to be used by the men to keep the coke dust out of their eyes. But by sheer persistence all difficulties had been mastered, and ultimately they got the same boiler evaporation with neat coke breeze as with the coal previously used, while boiler house conditions became normal. The experiment resulted in a material reduction in the cost of generating electrical energy, apart from the valuable conservation of coal. It was on such experience he had based his advocacy of the Beckton scheme, and it was difficult to understand why it had been turned down.

Advantages of Combination.

In many cases where the possibility of combining the generation of gas and electricity was being considered there were other advantages, such as the existence of buildings that could be readily adapted for a generating station. In some cases the electricity supply could be handled by coke gas producers and gas engines driving electric generators, but above a certain capacity coke-fired boilers and steam plant must be used. Mr. Bostock had recently expressed the opinion that the cost of producer gas per therm was about half that of town gas. In one or two combined works the use of blue water gas direct to the gas engine driving electric generators, was contemplated.

Municipal Control and Combination.

Under municipal control the creation of a combined power works entirely neutral as regards the merits of gas and electricity, should be fairly easy; even under company control the gas company and electricity company operating in a small works should be able to combine and pool their resources. He did not believe that huge undertakings, whether for gas or electricity, had necessarily an advantage over those of medium size. What was needed was such a size as would supply the entire light, heat and power requirements of a district. In addition to the Electricity Commissioners, a Government Department engaged in developing electricity supply, there should be a Gas Commission working on similar lines, followed by an amalgamation of the two as a Light, Heat and Power Commission.

Battery Vehicles and Coal Supply.

In a Paper read before the North of England Section of the Association of Mining Electrical Engineers on "Coal Loading by Road, with special reference to Electric Battery Vehicles," Mr. I. S. Mackenzie said that his main object was to draw attention to the fact that for short distance road haulage the modern electric vehicle was so reliable and economical that its adoption was a paying proposition. One particularly useful field was the transport of coal to the colliery workmen's houses.

The advantages and disadvantages of battery vehicles were dealt with at some length, and it was pointed out that a judicious selection of the battery size caused such disadvantages as limited mileage per charge to disappear. Battery charging should present no difficulties if suitable plant was installed, particularly at a colliery where skilled engineers were in attendance. Where an alternating-current supply was available, as at most collieries, there was no necessity for the installation of rotary plant, as mercury arc rectifiers could be used with advantage.

General experience tended to show that the single motor, chain-driven type of vehicle was the most satisfactory, and certainly had the fewest moving parts.

Working out the cost of delivering coals to workmen's houses by electric vehicles, including all standing and running charges, plus interest on capital outlay, &c., the author showed this to be of the order of 9·5d. per load of 15 cwt. delivered to a distance of half a mile from the colliery, and suggested that colliery managers should seriously endeavour to ascertain what it actually cost them to do the same work by the present methods.

Correspondence.

THE REVO ELECTRIC IRON.

To the Editor of THE ELECTRICIAN.

SIR,—I have read with interest the letter appearing in your last issue regarding the performance of a 100 V electric iron which was used on a 200 V circuit for twelve months. The result is, to say the least of it, unique, and although not wishing to doubt the good faith of your correspondent, calm consideration of some elementary facts leads one to doubt whether, after all, the iron was not incorrectly rated originally.

Presuming, however, that the article in question was an ordinary 4 or 5 lb. domestic iron rated to consume 400 W, at 100 V, and that it had a face area of 25 sq. ins. when 200 V were applied, the current consumption would rise to 1 600 W, or about 64 W per sq. in., a result which all the heating and cooking appliance manufacturers of the world, aided by all the resources of modern science, have striven for, and failed to achieve.

That the nichrome wire would stand up to the doubled voltage for a few minutes is understandable, but that it should survive regular use for a whole year is amazing, and one is tempted to enquire what the thermal efficiency of the iron would be if used on its rated voltage.

I would also submit that cheap advertisement of this description is not conducive to happy relationship between manufacturers and the trade, as it is likely to mislead the lay user of electric irons as to their adaptability to *any* circuit, no matter what voltage.—

I am, &c.

London, W. 9., February 1. WM. B. SCOURFIELD.

A Large Electrical Contract.

It is a matter for congratulation that, as we announced last week, the first order placed for the electrification of the Glencoe-Maritzburg section of the Natal Railway has, in the face of keen European and American competition, been secured by a British manufacturer, the METROPOLITAN-VICKERS ELECTRICAL COMPANY. The whole of the mineral traffic of the important Natal coalfields, for which Glencoe is a collecting centre, passes over this line on its way to the coast at Durban, and for many years the mountainous stretches of country between Glencoe and Maritzburg have been a bottle neck, with the limit of steam traction possibilities reached. Important economies will be effected by the introduction of electric locomotives; assuming a loaded traffic of 20 000 tons per day in one direction on a 1 per cent. up grade, eleven electric trains, each of about 1 800 tons, would be capable of this duty, for which fourteen steam trains would have to be employed. A valuable feature of electrification in these hilly districts will be the possibility of employing regenerative braking on the down grades, as obviating all the wear and tear on wheels and brake shoes inevitable with steam traction. This electrification will be one of the most important hitherto undertaken, comparing in this respect with the Chicago, Milwaukee and St. Paul undertaking. The locomotives will be designed to take a direct current supply of energy at a pressure of 3 000 V on the trolley.

A Press Association "Times" telegram from Bloemfontein states that a letter to the local Press from a prominent Nationalist alleges that the Union Government rejected a German tender for the locomotives, which was £425 000, or £5 000 per locomotive cheaper than the tender of the Metropolitan-Vickers Company.

Domestic Electric Appliances.

Mr. S. J. SEWELL, writing on the action against Harrods, Ltd., reported in our issue last week, states :—

"I have been for some years of opinion that it is essential that washing and sewing machines should be driven by fractional electric motors, and have, in my 'Sewing and Washing Machines Gazette,' preached this reform, but the action against Harrods, Ltd., which was a claim for damage to a lady's fingers through being caught in the wringer used as an adjunct to the 'Thor' washing machine, is, I fear, likely to give a set-back to electric washers, also to electric-driven sewing machines. I would like you to make public the fact that a similar result might have occurred had the washer been manual driven. The wringer was fitted with the latest safety devices, but the 'release,' fitted to both hand and power wringers, appears to have been utterly ignored.

"As with washing machines, so with sewing machines, it is impossible to make them 'fool-proof,' no matter whether they be driven by the hand or by an electric motor.

"The sales of electric washing machines during the past two years have been ever increasing. Up to the present they have been confined to those of American or Canadian manufacture, but many British manufacturers of washing machines have for some months been experimenting with electric motors, and last week Whittaker Brothers, of Accrington, completed arrangements for producing an English electric washer. As regards the use of electrical motors for driving domestic sewing machines, this country is far behind the United States. But I understand that there are a dozen British firms who are experimenting in the construction of these motors."

E

The Supervising Electricians' Dinner.

There was a large gathering at the annual dinner of the NATIONAL ASSOCIATION OF SUPERVISING ELECTRICIANS at Frascati's Restaurant, London, on Saturday evening last.

Major T. VINCENT SMITH, M.C. (President), occupied the chair, and was supported, "aregollically" (to use an expression of the late Willie Edouin's) by two old personal friends, Mr. J. S. Highfield, the popular Past-President, and Sir R. Burton Chadwick, M.P.

The GENERAL SECRETARY (Mr. A. Bramming) and the Entertainment Committee are to be congratulated upon the excellent repast which was provided, and also the musical entertainment.

In proposing the toast of "The President," Mr. F. W. SMITH said Major Smith had fully justified the confidence the Association had placed in him, and he was a very valuable asset to them. The Association had been through trying times during the past year, but it had achieved great things, and had won the respect of the whole electrical industry.

The PRESIDENT, replying to the toast, expressed his appreciation of the loyalty of the members, and of the way they turned up at the meetings and bombarded the authors of Papers with questions. Members of the Association hoped the parent Institution would look with favour on its children and regard with interest their activities.

Major E. J. HOGAN (Hogan and Wardrop), proposing the toast of "The Association," said he thought every branch and every shade of opinion in the profession had its own association, and there were also hybrids. He sometimes thought it would be better if all these were grouped in one big association, each branch having its own sub-section. No association had the right to exist unless it set out with the purpose of improving the status of its members. In their Association the educational side received the most careful study, and therefore it was an organisation everyone should support. The special educational facilities given to associates, and the low subscription demanded from them, were worthy of the highest praise. The benevolent side of the Association's work was also very valuable, as was the sense of mutual protection afforded by membership.

The Association's Progress.

Mr. C. G. WRIGHT, in responding, said the Association had passed through troubled waters with success. They had now a full-time secretary, who was looking forward to the presentation of a report at the meeting on Feb. 14 which would show great progress during the past year. If the Association continued to progress at the present rate, he thought they would have to enlarge their premises. They were now establishing branches in the provinces, which would help the Association very much. A start had been made with branches at Manchester and Ipswich. The branches would also occupy themselves with the provision of educational facilities. They hoped to enrol in the Association every foreman in the industry, and it would be well if every employer could assist by becoming an honorary member. Every full member of the Association was fully qualified to do the work he undertook.

Mr. J. S. HIGHFIELD proposed the toast of "The Visitors," and referred to the fact that Mr. Banister, the former hon. secretary, had done a great deal for the Association, and he and others who had helped him had laid the foundation for a real Association, based on the principle of service and proper efficiency amongst its members. He (Mr. Highfield) did not hold with the view that associations should coalesce into one gigantic body. There were present members of the technical Press, which had served the electrical industry extraordinarily well. They should also have had with them Mr. Beauchamp, of the Electrical Development Association, and he was sorry he was not there. The E.D.A. had not very much money, but had an immense amount of energy, and had now established itself on a firm foundation.

Sir R. BURTON CHADWICK, M.P., in reply, regretted that there were so few men in the House of Commons who were capable of speaking authoritatively on the subjects with which the electrical industry was bound up. It was left to members like himself, without any electrical knowledge, to criticise and discuss matters connected with the new electricity districts.

The Progressiveness of the Press.

Mr. T. H. WINDIBANK, in proposing the toast of "The Press," said there were no more retiring or modest men, nor men who sought less advertisement, than those connected with the Press. The progressiveness of the trade Press was always reflected in the industry it represented. It was the proud boast of the electrical industry that it had a free Press which never hesitated to speak its mind, either to criticise or to encourage those things which appeared to be for the good of the industry.

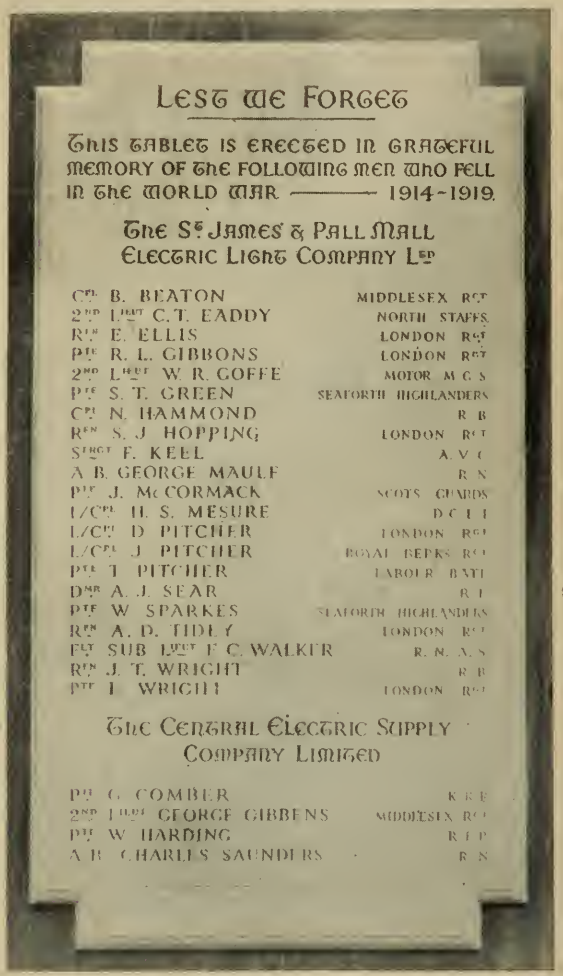
Mr. A. H. ALLEN, in replying to the toast, said over thirty years ago he nearly became a supervising electrician. He passed his apprenticeship in wiring, and was asked to supervise a squad of wiremen. He did not take it on, because the pay was not good enough, because there was no Association of Supervising Electricians in existence then. The Press noted with satisfaction the progress of the Association, and the movement for extending its activities to the provinces. As the Association sought to serve the industry, the Press sought to serve the Association in every possible way.

One of the features of Drury Lane's rebuilt theatre, which is to be reopened early next month, is an entirely NEW SYSTEM OF STAGE LIGHTING, which, though of British conception, will be capable of giving the same effects as the Continental methods.

Electricity Supply—War Memorial.

We reproduce herewith a photograph of a memorial tablet which has recently been erected in an imposing position on the wall of the main entrance to the offices of the St. James and Pall Mall Electric Light Company, Carnaby-street, Golden-square, W. 1.

The tablet is of Carrara marble mounted on a dove-coloured marble base—with blue lettering—and is erected in grateful remembrance of



Memorial Tablet erected by the St. James' and Pall Mall Electric Light Company.

twenty-one employees of the St. James' Company and four employees of its ally, the Central Electric Supply Company, who fell in the World War.

The memorial was unveiled on Tuesday, Jan. 24, in the presence of a large number of employees, by the Chairman of the St. James' and Central Companies, Mr. Walter Leaf, who, in fitting terms, referred to the honour and reverence in which the twenty-five men whose names are recorded on the tablet are held by the directors and employees, and said that the memorial would stand for all times as a monument of gratitude and appreciation.

North Lancashire Electricity District.

Only two of the Electricity Commissioners (Sir John Snell and Mr. H. Booth) attended the inquiry, which opened at Barrow on Tuesday, into the scheme for the reorganisation of electricity supply in the North Lancashire and South Cumberland Electricity District.

Mr. W. S. Kennedy, who appeared for the Committee who prepared the scheme, stated that when it was drawn up there was general agreement, but since then several of the local authorities had made objections as to area and other matters. If these authorities could supply electricity by better means they would be allowed to do so, and any scheme would be considered. It was proposed to make the fullest use of the Vickers plant in Cavendish Park, and negotiations had been opened, although for the time being they were in suspension. There was also a proposal to use water power from the River Leven at Backbarrow. If the Vickers Company required the plant for their own works in the future, then a new station would be erected at Barrow. If carried out, the scheme would cost £217 000 by 1925, and the supply would represent just over 20 000 000 units at a cost of a little over a penny per unit, compared with the 1920 supply of a little over 8 000 000 units costing slightly over 3d. per unit. Barrow Corporation claimed an increase of representation, based on the rateable value and units required.

Mr. Woolf, for Barrow Corporation, announced that on the previous day their General Purposes Committee decided not to come into the scheme, though they were anxious to assist the Commissioners in carrying out their duties under the Electricity Supply Act.

Mr. Hibbert, of Ulverston, put forward an alternative area, which would include Barrow, Ulverston, Dalton, North Lonsdale and Millom, and in reply Mr. Entwistle, Town Clerk of Morecambe (who also represented Lancaster and Heysham) admitted there was no chance of industrial development in the area. With Barrow out of the scheme they had no bulk-supply source in prospect. Special arrangements would have to be made to deal with Windermere and Kendal.

Sir John Snell said the Commissioners would want expert evidence on the proposal to include Millom in the area.

The inquiry had not concluded when we went to press.

Extensions at Loughborough.

At a meeting last week of the East Midland Sub-Centre of the Institution of Electrical Engineers, Mr. R. B. Leach, Borough Electrical Engineer, of Loughborough, delivered an address on the history and progress of the local electricity undertaking. The present generating capacity of the plant, he stated, was 2 850 kW. The maximum demand had increased to 1 950 kW. The capacity of the original plant was 500 kW, and this was found to be sufficient to meet all requirements for a period of seven years. The speaker described the additions and developments which had been made from time to time, and went into technical details of the production costs and selling price of the electricity supplied. In regard to the total costs, Loughborough tied with the Glasgow undertaking for twelfth place, with a total of 1·37d. per unit. In the cost of coal Loughborough tied for third place with Leeds, which was many times larger, the cost being 0·65d. per unit sold.

The scheme for a further extension of the undertaking included the installation of two turbo-alternators of 3 000 kW capacity each. The Electricity Commissioners, however, only sanctioned one 3 000 kW turbo-alternator, as they were of opinion that, by the time the second set would be required, all the needs of the undertaking could be met by taking a supply from the joint authority. Mr. Leach gave a clear description of the methods which had led to the successful results obtained at Loughborough, and showed numerous slides and portions of machinery.

The I.E.E. Commemoration.

The official programme of the meetings of the Institution of Electrical Engineers, which, as already announced in The Electrician, will be held on Feb. 21, 22, and 23, to commemorate the first meeting of the Society of Telegraph Engineers on Feb. 28, 1872, has now been issued.

On Tuesday, Feb. 21, at 3 p.m., an experimental lecture will be given by Prof. J. A. Fleming, M.A., D.Sc., F.R.S., on "Michael Faraday and the Foundations of Electrical Engineering." Note.—The annual dinner of the Institution will be held this day at the Hotel Cecil, Strand, W.C., at 7 p.m. for 7.30 p.m.

On Wednesday, Feb. 22, from 3.30 to 6 p.m., short discourses will be given on "Reminiscences and Experiences of Electrical Engineering in Both its Technical and Legislative Aspects," and at 8.30 p.m. Professor Fleming will repeat his lecture of the previous day.

On Thursday, Feb. 23, from 3.30 to 6 p.m., and from 8 to 10 p.m., the discourses on electrical engineering will be continued and concluded.

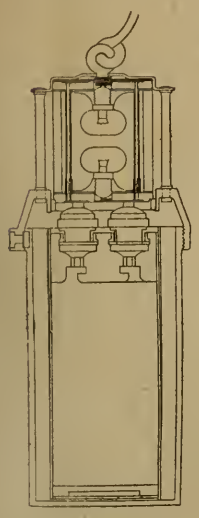
It is hoped that the contributors on the Wednesday evening, and on the afternoon and evening of the Thursday, will include the following:—Mr. Ll. B. Atkinson, Mr. Frank Bailey, Mr. O. H. Baldwin, Mr. G. Balfour, Sir T. O. Callender, Mr. R. A. Chattock, Col. R. E. Crompton, Mr. B. Drake, Mr. H. Edmunds, Sir K. Elphinstone, Mr. W. B. Esson, Mr. S. Evershed, Dr. S. Z. de Ferranti, Prof. G. Forbes, Mr. E. Garcke, Prof. Andrew Gray, Mr. F. E. Gripper, Mr. H. Hirst, Mr. J. H. Holmes, Mr. W. Judd, Dr. G. Kapp, Sir J. Kemnal, Sir Alex. Kennedy, Dr. A. E. Kennelly, Mr. J. E. Kingsbury, Sir Oliver Lodge, Prof. M. Maclean, Mr. W. H. Massey, Prof. T. Mather, Sir W. Noble, Lord Parmoor, Sir C. A. Parsons, Mr. G. W. Partridge, Mr. W. H. Patchell, Mr. J. H. Rider, Mr. F. H. Royce, Dr. A. Russell, Mr. A. Siemens, Mr. C. P. Sparks, Mr. G. Sutton, Mr. J. Swinburne, Mr. A. A. Campbell Swinton, Mr. J. C. Vaudrey, Mr. A. H. Walton, Prof. E. Wilson, Mr. C. H. Wordingham, and Mr. A. Wright.

A limited number of tickets will be available for visitors introduced by members. Early application for such tickets (not more than one per member) should be made to the Secretary. The tickets will be posted as soon as possible after Feb. 10, and in the event of the applications being in excess of the number of tickets available, a committee of selection will allot the tickets. No tickets will be required for members.

The British Commercial Secretary at Teheran offers to display catalogues of United Kingdom manufacturers of the following, among other articles: electrical gear, engineering appliances, hydro-electric gear, illuminants, and publications. Catalogues should be priced, and if possible, illustrated in colours.

The "Adams" Miners' Lamp.

The demand for better lighting in mines has caused a number of manufacturers to design and put on the market improved ELECTRIC SAFETY LAMPS. Already about thirty types of lamp have been approved by the Board of Trade for general use, and among the most recent of these is the "Adams" lamp, the general design of which is shown in the accompanying illustration. It comprises the following parts:—



1. A cylindrical metal case, with a screwed ring for the attachment of the cover or lantern.

2. An acid electric accumulator, with celluloid casing and fixed spring terminals, so constructed as to prevent the escape of any liquid, whatever the position of the lamp.

3. A cover or lantern containing the lamp bulbs. These are two in number, connected in parallel on a plate of inflammable insulating material in which are embedded segments of brass. The brass segments establish electrical connection between the lamp bulbs and the accumulator when the lamp is assembled.

4. A magnetic lock, which secures the cover to the case when the former has been screwed into position, and so constructed that the bolt can only be withdrawn by applying the pole of an electro-magnet to the face of the lock.

Among the advantages claimed for the "Adams" lamp are that the light obtained exceeds that produced by other types, for one bulb gives the same illumination as one bulb of any other lamp, and, therefore, the two bulbs burning simultaneously give double the light. The superior illumination obtained should result in a marked diminution of "miner's nystagmus," and thus reduce the cost of workmen's compensation. If one bulb should fail, the miner will still have one effective bulb, giving illumination equal to that of most other electric lamps. The fact of one bulb burning when the other is out of commission is a great advantage. The "Adams" lamp, which is made by Adams Brothers, Ltd., nominally gives 4 c.p. for eleven to twelve hours, and its weight is 5 lbs. 14 ozs.

L.C.C. Tramways.

New and cheaper THROUGH BOOKING BY THE LONDON COUNTY COUNCIL TRAMS and the London General Omnibus Company came into operation on Wednesday between North and South London suburban termini and the Mansion House, Ludgate-circus, St. George's Hospital, and Victoria-street. The present through bookings viâ Holborn, Southwark, Moorgate, and Victoria (excepting to Edgware-road Station) have been discontinued. The all-night tram services operating between Brixton (Water-lane) and Blackfriars, and between Tooting-broadway and Savoy-street (Strand), are now run as circular routes viâ the Embankment.

The Tramways Committee are adding 125 NEW CARS to their present fleet of 1 667 cars and 158 trailers. The new cars are similar in type to those now in use, the main points of difference being increased speed and greater comfort. The cars are equipped with 60 H.P. motors, as against 44 H.P. motors in the existing cars. Other advantages are better illumination and improved lighting effects (due to the white enamel finish of the ceilings), weather-protected air outlets on the top deck, improved ventilation, and protection from draughts in the lower saloon, and more efficient safety devices. By an arrangement of double trolley poles continuous illumination at the terminus is ensured, and the necessity for the conductor to walk round the car with a trolley rope is avoided.

The County Council have decided to complete the PURCHASE OF THE LONDON PORTION of the undertaking of the LONDON UNITED TRAMWAYS, LTD., on May 2 next. The Council will pay £235 000 for the lines in Hammersmith, the Chiswick power station, forty-five tramcars, depot and certain fixed plant, implements, &c. The company is to be at liberty to convert a part of the generating station into a transforming station, and to use the same for twenty-one years, but the company will provide free of cost during that period a sufficient supply of direct current for the tramways up to 1 800 000 units a year, the Council paying for any excess at a rate to be agreed or determined by arbitration. The Council may require the company to work the purchased lines exclusively for such time and on such terms as the parties agree, the company handing over to the Council gross receipts less working expenses and a reasonable sum for establishment charges, and the Council lending the company the forty-five cars. If the company are not required to work the lines, the Council are at liberty to run over the company's lines in Middlesex jointly with the company, and the company are at liberty to run over the lines purchased jointly with the Council, the mileage being equal, and each party accounting for gross receipts taken. The company will have access to the transforming station, and the Council to the depot.

For the six weeks ended Jan. 18 the LONDON COUNTY COUNCIL tramways carried 80 219 433 passengers, and the traffic receipts were £538 508, compared with 80 053 280 passengers and £609 155 receipts in the corresponding period of 1920-21.

Standardised Electric Traction.

In an address to his constituents at Hillsbro, Sheffield, last Saturday, on the schemes which are being promoted to increase employment, Mr. Arthur Neal, M.P., Parliamentary Secretary to the Ministry of Transport, said that the Ministry was in ACTIVE NEGOTIATION with some of the leading railway companies TO GET ELECTRIFICATION WORK IN HAND. In a subsequent interview on the matter, Mr. Neal said that he referred to the schemes which the three Southern railway companies hoped to arrange for the electrification of their lines. These railway companies were very anxious to do something in the matter, and as they were desirous of ensuring that the scheme would be one by which they could work in conjunction, he had, at their request, appointed a chairman, Sir Philip Nash, to preside over a small committee which was inquiring into the possibility of a standard scheme for the electrification of the companies, as at present all three companies wanted to adopt different systems.

The Ignition of Firedamp.

At a meeting af the MIDLAND INSTITUTE OF MINING, CIVIL, AND MECHANICAL ENGINEERS, at Doncaster, last Saturday, Prof. R. V. WHEELER, of Sheffield University, read a Paper on "The Ignition of Firedamp." Referring to the miner's lamp, he said that it was impossible to say with certainty whether or not the ignition of mixtures of firedamp and air could be caused by the filament of a miner's electric hand lamp. Nor did the numerous empirical tests made with the bulbs of such lamps afford definite information. The most that could be said was that ignition could be only by a filament at a very high temperature. It would seem that with a current of 2 V, the filament of a miner's lamp bulb, if designed to have a reasonable life, was not of a sufficiently high temperature to cause the ignition of any mixture during the short time of contact between the mixture and the undamaged filament that the breaking of the bulb allowed.

A discussion followed. Mr J. H. W. LAVERICK was of opinion that the use of the electric lamp made for safety in the mine. He was opposed to the practice of mixing oil lamps with electric lamps. Mr. A. C. F. ASSINDER considered the flame lamp a source of danger, and that the element of danger in an electric lamp was infinitesimal.

Prof. WHEELER said he thought it was practically impossible for the filament of an electric lamp, the bulb of which was broken, to ignite a mixture. In regard to Mr. Laverick's remarks on the use of oil lamps where electric lamps were in general use, he (Prof. Wheeler) was a member of a committee now going into the question of what was the best thing to do with regard to the provision for testing for gas, for which oil lamps were used. At the same time the modern flame lamp was an exceedingly safe thing. He had not been able to ignite the most easily ignited mixture with it.

Trade Facilities Act and the B.I. Fair.

With the passing into law of the Trade Facilities Act, British manufacturers and merchants are now able to give CREDIT FROM TWELVE MONTHS UP TO SIX YEARS, according to the commodity, to any of their foreign customers. This means that foreign buyers of all sorts of commodities can now buy British goods without putting down a single penny at the time of purchase. In a word the Act is an arrangement by which the British Government is prepared to grant credit on behalf of any responsible British manufacturer and merchant who needs it. Actually it is an extension of the Overseas Trade (Credits and Insurance) Act of Sept., 1919, but its scope is so much more generous and comprehensive that there is no doubt of the good results it will have for every kind of trade; one of its best points is that the buyer is not troubled over any transaction for the ultimate repayment of the credit. Where the credit is not required for more than a year, the British Government will back the bill for the total value of the invoice, and where longer terms are desired the Government backing will be to the extent of 85 per cent. of the bill. In short, foreign and overseas buyers of all nations who want credit, merely approach the British manufacturer or exporter of their choice, and he arranges everything with the Export Credits Department of the Department of Overseas Trade.

The value of this scheme to foreign and overseas buyers is too obvious to need any emphasis. It applies to every country in the world, except Russia and India, and can be used for any transaction, however small. There is already at least one case in existence where, under the old Act, a credit was applied for and given for a sale amounting only to £40. The fact that any British manufacturer or exporter can obtain these credits has already made itself felt in connection with the forthcoming British Industries Fair. As the facilities which the new Act offers become better known the more widely will the importance of the Fair to buyers of all countries be recognised.

The coming Fair is the eighth and most important of the series and will be held simultaneously in London and Birmingham from Feb. 27 to March 10 next. Practically all trades are included, and already the number of representative firms who have taken space makes it clear that 1922 will prove another great step in its progress. Special interest will be taken in Benn Brothers' stand, which, situated near the main entrance of the buildings at the Birmingham Fair, will contain all the books, journals, and directories published by the firm.

Legal Intelligence.

Is an Electric Truck a Light Locomotive?

At Southport Police Court, on Monday, Wm. Halton was summoned for driving along the public highway an electric truck belonging to the Electrical Vehicles, Ltd., without a licence. As the Superintendent of Police stated there was some doubt as to whether the truck came within the definition of a light locomotive, the case was adjourned to enable the local registration authority to communicate with the Ministry of Transport for a ruling on the point.

Claim for Electrical Goods.

In the Shoreditch County Court, on Monday, Carl Blombach (of Ronsdorf, Remscheid, Germany) sued Grimes and Hawkes, Ltd., for the recovery of £18 14s. 3d. for goods supplied.

Mr. Robinson, who appeared for the plaintiff, applied for an adjournment, as his client was in Germany.

After discussion, the hearing was adjourned, on the understanding that the costs were paid by plaintiff in seven days.

Conspiracy and Protection of Property Act Prosecution.

At Radcliffe (Lancs.) Police Court, on the 25th ult., R. Kirkpatrick, F. Hall, I. G. Ivers and W. Speak, four engine-room attendants employed by the Lancashire Electric Power Company at their power station at Outwood, were summoned for maliciously breaking their contract of employment, whereby they jeopardised the maintenance of the undertaking.

Mr. C. H. Pickstone, who prosecuted for the company, said that the proceedings were taken under an Act of Parliament passed in 1875 for the maintenance of public services, such as gas and water, and which, in 1919, was applied to electricity undertakings. There was no quarrel between the company and any trade union, and the trouble was between the defendants themselves. The men were on night duty on Jan. 9. It appeared that the switchboard attendant, a young man named Gore, was in the habit of having tea provided, as he was not allowed to leave the station without the sanction of the charge engineer. At eleven o'clock at night he wanted tea made, and Ivers, who objected to Hall making it, assaulted Gore. Words followed, and Ivers told the charge engineer he was going home. He was joined by the other defendants, and all four gave an hour's notice of their intention to leave. Efforts to avoid this did not avail, and the station was abandoned to two charge engineers, at 1.20 in the morning. Urgent messages sent to the staff due to come on for the morning shift were responded to, and when the position was explained to them they went on duty. But for nearly two hours the undertaking was jeopardised and public service in danger of being withheld. Happily no mishap occurred. The proceedings were instituted to show the illegality of the course pursued by defendants. The next morning the men claimed to have asserted a right in giving an hour's notice, but legally a week's notice on either side was necessary to terminate the engagement.

Mr. Kinsey (for the men) admitted almost every word Mr. Pickstone had used. Defendants thought that as Gore would have finished his shift at twelve o'clock, he might have waited for his tea. It was definitely in the minds of defendants that an hour's notice could be given, and they felt that with two engineers in charge nothing serious would happen. They were now sorry for what had taken place, and on their behalf he expressed regret. He hoped the justices would not send them to prison, and suggested that the case would be met by the payment of costs.

The justices regarded the offence as very serious indeed, and could not do less than order each defendant to pay £5, the prosecuting advocate's fee of five guineas, and the expenses of witnesses.

Extension of the Hunt Cascade Motor Patents.

On Friday, the 26th and 27th ult., Mr. Justice Sargant heard a petition by Mr. Louis J. Hunt and Sandycroft, Ltd., for an extension of patent No. 6 224, of March 14, 1906, granted to the petitioners (Sandycroft, Ltd., being then known as Sandycroft Foundry Company), for an invention relating to "improvements in alterating current dynamo electric machines"; and also Patent No. 15 711, of July 11, 1906, for "improvements in windings for alternating current dynamo electric machines." Counsel said the first invention consisted of a single winding in place of double stator windings and the provision of tapping points in particular positions upon the winding for control purposes. The other invention was a machine with a stator winding of the type in the first invention, but with separate rotor windings, one of which was connected to a commutator so that the machine could be used as a convertor for providing direct current through the alternating current supply and *vice versa*.

Mr. J. Hunter Gray, K.C., and Mr. Whitehead appeared for the petitioning patentees, and Mr. Dighton Pollock and Mr. Trevor Watson for the Crown.

The merit of the inventions was not opposed by the Crown, and Mr. James Swinburne described them as a distinct stage in the industry, and a stage that involved an immense amount of thinking. By the use of the inventions cascade motors could be built which had high efficiencies, and as the windings were constructed for a smaller number of poles than those required by an ordinary motor, it was possible to build a better commercial slow-speed machine than hitherto practicable. He explained how the inventions simplified and improved the characteristics of that class of motor, and why those machines could be given the starting and speed regulating features of slip ring motors, in spite of the fact that the rotors had very low tension windings and no slip rings or rubbing contacts of any sort. Witness pointed out the advantages those motors possessed for working in collieries, as they were free from sparking, and also that they were particularly valuable for industrial works where dust was prevalent; he also described how the machines operated efficiently at two or three different speeds, and expressed the opinion that there would be great developments in their application to the propulsion of ships.

Mr. John Gray said that if an extension of the patents were granted, the British Thomson-Houston Company would continue to manufacture under them.

Mr. H. A. Gill stated that the German patent, which was the equivalent of both the English patents, had been extended for five years on the ground of war-time losses.

Mr. W. C. Mountain, Mr. Evan Parry, Mr. Louis J. Hunt, and Mr. James Gilchrist, Secretary of Sandycroft Limited, also gave evidence in support of the petition.

His Lordship, in giving his decision, said the inventions were of great utility and involved a deal of scientific knowledge and experience. It appeared on the petition, and was clearly proved by the evidence that there was a great loss to the petitioners, owing to the war. He thought it would be proper in respect of the loss to allow an extension of four years, which would have this incidental advantage—although it had not influenced him in the relief he was granting—that if the four years were calculated from the date of the first patent, the extended term of the patent would very nearly coincide with the extended German patent. The extension would be granted on the terms that the British licences now existing for the manufacture of the inventions were continued.

Institution Notes.

At the anniversary meeting of King's College Engineering Society, to be held at the Institution of Civil Engineers, Great George-street, S.W. 1, on Friday, Feb. 10, at 5.30 p.m., Mr. F. W. Macaulay, of the Birmingham Water Department, will read a Paper on "Water Engineering."

The Institution of Electrical Engineers propose, if a sufficient number of candidates make application, to hold the Associate Membership Examination in London and at other places (at home and abroad) in April next. Particulars can be obtained from the Secretary of the Institution, Savoy-place, Victoria Embankment, London, W.C. 2.

The newly formed West Yorkshire Metallurgical Society held its first general meeting at Huddersfield on Saturday, when a debate on the subject, "That Physical Testing is the Duty of the Metallurgist Rather than the Engineer," was opened by Mr. J. R. Handforth, and opposed by Mr. F. Rawlinson. Mr. T. E. Hull, the President, who occupied the chair, stated that the Society had a membership of forty, drawn chiefly from Leeds, Bradford, Dewsbury, and Wakefield.

On Monday, Feb. 6, at the first of three informal meetings arranged by the Institution of Electrical Engineers, to take place at the offices of the Institution at Savoy-place, Victoria Embankment, London, Mr. J. Joseph will deliver an address on "Some Practical Applications of the Thermionic Valve." On Feb. 13 Mr. J. H. Parker will speak on "The Evolution of a Staff Trade Union," and "The Emergency Use of Oil Fuel During the Recent Coal Strike" will be the subject of an address by Mr. E. F. Hetherington on Feb. 20. The meetings will take place at 7 p.m.

Members of the various sections of the welding industry, at an inaugural meeting held on Jan. 26, at the Holborn Restaurant, adopted the proposal to form a new welding society embracing all systems of welding. A strong committee, with power to add to their number, representing the different interests, was elected to draft the constitution with a view to registration after it had been approved by a general meeting which will be called at an early date. The name agreed upon is The Institution of Welding Engineers, and all interested in the welding and allied industries will be eligible for membership. The temporary offices are at 30, Red Lion-square, London, W.C. 1, and Mr. C. Raggett is the hon secretary (*pro temp.*).

Educational.

Through the generosity of certain local firms, a new chemical research laboratory is to be set up at Birmingham Municipal Technical School.

The annual examinations for a Faraday Scholarship of 50 guineas per annum, tenable for two years in college and one year in manufacturing works, and for a Maxwell Scholarship of 50 guineas per annum, tenable for one year in college and one year in works, will be held at Faraday House on April 11, 12, and 13. Exhibitions may also be awarded to candidates who acquit themselves creditably. Particulars may be obtained from the Secretary, Faraday House, 62-70, Southampton-row, London, W.C. 1.

Electricity Supply.

It is estimated that HULL electricity undertaking will show a loss of £16 000 on the current financial year.

In addition to reducing the charges for light, LIVERPOOL Electricity Committee are contributing £60 000 towards the relief of the rates.

The recent reduction of 1d. per hour in the wages of manual workers represents a saving of £2 000 a year to the ERIGHTON and HOVE electricity undertakings. A reduction in the salaries of the technical staffs will, it is stated, effect a further economy of £300 per annum

The Theatres and Music Halls Committee of the London County Council have notified the Metropolitan Electric Supply Company that the special arrangement entered into in 1905, under which the Council recognised, subject to certain conditions, the two systems of electric light supply of the company as sufficiently independent to comply with the Council's regulation requiring TWO SUPPLIES BY SEPARATE COMPANIES AT PLACES OF PUBLIC ENTERTAINMENT is no longer operative, and that the Council cannot, therefore, accept the supply of the company for both the primary and secondary systems of lighting at cinematograph halls or any other premises licensed for public entertainment.

The necessity of GOOD LIGHTING for SHOPS was emphasised by Sir Chas. Higham, M.P., at last week's meeting of the British Association of Display Men in London. He said there were many shopkeepers who did not seem to realise that they paid half of their rent for their windows. The shop window was intended to draw attention to goods for sale, and without efficient lighting passers-by could not be attracted. If they were going to have a brighter London they had got to have brighter shop windows. If every shop in Central London illuminated its windows at night, London would be one of the most attractive places in the world, and it would pay handsomely.

In February, 1919, the CHESTER Electricity Committee reported that the first five years' working of the hydro station showed that 14 222 744 units were sold to consumers, of which 6 923 315 units were supplied by the steam station, the expenditure being £51 222 and the income £56 540; and 7 299 409 units supplied by the hydro station, the expenditure being £17 188 and the income £59 612. During the year 1920-21, 3 717 802 units were sold, of which the steam station supplied 1 699 101 units, the expenditure being £25 186 and the income £18 571, and the hydro station supplied 2 018 701 units, the expenditure being £5 498 and the income £22 070. During the period covered by the foregoing figures 21 855 038 units were sold to consumers, of which the steam station supplied 10 270 499 units, the expenditure being £106 003 and the income £91 503, and the hydro station supplied 11 584 539 units, the expenditure being £29 148 and the income being £103 223, showing the cost of electricity supplied by the steam station to be £14 500 in excess of the income, and the income from the electricity supplied by the hydro station to be £74 075 in excess of the expenditure.

New Schemes and Mains Extensions.

Steps are to be taken to light the HENLEY-ON-THAMES Town Hall by electricity.

GLOUCESTER City Council have decided to extend the Corporation Electricity Works, at a cost of £50 000.

RETFORD Town Council have decided to support the electricity supply scheme for the North-east Midlands.

SOUTHEND-ON-SEA Borough Electrical Engineer has been authorised to carry out mains extensions at a cost of £1 156.

Mr. A. J. Leigh, electrical engineer, has been instructed by the Council to prepare a scheme for supplying CONNAH'S QUAY with electricity.

SIDMOUTH Urban Council have decided to proceed with a scheme for supplying the town with electricity. The estimated cost is £10 000.

SWANSEA Electricity Committee recommend the Corporation to apply for a loan of £20 000 for services and extension of mains during the next three years.

As the result of a canvass to ascertain the probable number of electricity consumers, no further action is to be taken to form a local electricity supply company in BRACKLEY.

EGHAM AND STAINES Electricity Company have applied to the Electricity Commissioners for a Special Order to extend their area of supply to the parishes of Ashford, Stanwell, Uttraysbury, and Thorpe.

Application has been made to the Electricity Commissioners by MIDDLESBOROUGH Corporation for sanction to the borrowing of £6 000 for a sub-station and services in the Southfield-road and Linthorpe areas.

FULHAM Electricity Committee recommend the Borough Council to provide a sub-station, cables and switchgear, at a cost of £2 000, for a supply of electricity to the works of Manbre Sugar and Malt, Ltd.

The Minister of Transport proposes to confirm the AMMANFORD ELECTRICITY SPECIAL ORDER, 1922, granting electricity supply powers to Ammanford Urban Council, and any objections must be sent to the Ministry of Transport by Feb. 18.

EDINBURGH Town Council has received sanction to borrow a further sum of £516 314 for electricity undertakings in the city, particularly for the power station at Portobello. This makes the total amount authorised to be borrowed £1 632 514.

CARLISLE Corporation has received sanction to borrow £35 500 for the extension of the electricity undertaking by the installation of one 3 000 kW turbo-alternator and accessory plant. Sanction to borrow a further £3 000 for service connections is to be sought.

BRADFORD Electricity Committee has decided to apply for sanction to loans to cover excess expenditure to the extent of £73 514, incurred, or to be incurred, beyond the sums already sanctioned in connection with electricity plant extensions and £13 for converting plant.

Tenders for new sub-stations and all the necessary cable for the new Fairground extension, have been accepted by the SOUTHPORT Electricity Committee, and the work is to be proceeded with immediately. It is proposed to change over from the d.c. to the three-phase system.

On the recommendation of Mr. J. Christie, manager and engineer of BRIGHTON electricity undertaking, an experiment is to be made in the lighting of the sea front with a lantern similar to that recently introduced at Canterbury, which is said to secure better reflection and diffusion of light.

BOLTON Electricity Committee have decided to apply for sanction to borrow £31 200 for a new rotary converter for Spa-road sub-station, additional switch gear at Spa-road and Bradshawgate sub-stations, and for duplicate feeders from Back-o'-th'-Bank to Bradshawgate sub-station.

An inquiry was held on January 24 into the application of WINCHESTER Town Council for a loan of £1 200 for remote control gear for street-lighting purposes, but on the advice of the inspector, Mr. H. R. Hooper, the application was withdrawn, and the cost is to be met out of revenue.

BEDFORD Electricity Committee recommend that the borough electrical engineer be authorised to purchase an additional 350 kVA transformer for use as a spare to the transformers at the electricity works at a cost of £431 10s., and that the main be extended in London-road, at an estimated cost of £80.

DERBY Town Council proposes to apply for sanction to a loan of £90 000 for mains and motors, of which sum £35 000 has already been authorised, but not borrowed. The balance will be required during the coming year, when a further capital expenditure of £11 000 on new plant and extensions is contemplated.

LYME REGIS Corporation have applied to the Electricity Commissioners for a Special Order authorising the Corporation to generate and distribute electrical energy in the borough, and to maintain the generating station and other works at present belonging to the Lyme Regis Electric Light and Power Company, Ltd.

The members of the NEWHAVEN Urban Council are anxious to have a large electricity generating station established in their area, and have asked Lieut.-Col. Campion, M.P., to make representations to the Electricity Commissioners that the present is an opportune time to build a station, capable of supplying electricity to the whole of Sussex.

DUNDEE Town Council have decided to petition against the Provisional Order promoted by the Grampian Hydro-Electric Syndicate. The terms on which Dundee was prepared to accept supply were £2 per kW per annum as a fixed charge, plus 0·125d. for every unit used, against the syndicate's offer of £3 per kW per annum, plus 0·2d. per unit.

Lancaster Town Council have decided to put forward an alternative scheme to the proposal to form a NORTH LANCASHIRE and SOUTH CUMBERLAND ELECTRICITY SUPPLY AREA by establishing an area to comprise Lancaster and Morecambe, the urban districts of Carnforth and Heysham, and the rural districts of Lancaster and Lunesdale. The electricity works at Lancaster would also be extended at a cost of £40 000.

PETERBOROUGH CORPORATION are applying for a special Order to extend their area of electricity supply to certain parts of the Peterborough Rural District, Whittlesey Urban and Rural Districts, Thorney Rural District, Old Fletton Urban District, and Norman Cross Rural District, &c. Any objections must be sent to the Secretary, Electricity Commission, Gwydyr House, Whitehall, S.W. 1, by Feb. 20.

LIVERPOOL City Council will consider, this week, a proposal to apply to the Electricity Commissioners for a Special Order, enabling the Corporation to supply electricity for all public and private purposes to Bootle, and the urban districts of Waterloo and Seaforth, Litherland, and Great Crosby, and also authorising Liverpool to acquire the existing electricity undertakings of the Bootle Corporation and the Liverpool District Lighting Company.

There is some rivalry concerning electricity supply in the rural districts of Chester. The HAWARDEN Council some time ago appointed an electrical engineer to prepare a scheme which involved a bulk supply from the North Wales Power and Traction Company, Chester's offer of a supply from Queensferry having been rejected. The Hawarden scheme will be submitted to the Electricity Commissioners within two or three weeks. At a recent meeting, the

East Saltney ratepayers decided to support the Hawarden Council, who were recommended to make a canvass similar to that recently made by the Chester Council.

A considerable amount of work in connection with the linking up of WALLASEY with BIRKENHEAD has been carried out. An h.t. 6 600 V cable from Bentinck-street generating station has been laid to the Wallasey generating station; a similar cable has been laid from Beaufort-road through the area of big works and along the line of docks to the South-end generating station: a sub-station containing 500 kW of transformer plant has been built at Beaufort-road; a sub-station for 1 000 kW of plant is to be provided at Marshall-street; two new 500 kW sets have been installed at Bentinck-street; another 500 kW at the South-end generating station; and 500 kW at Clover, Clayton & Company's works. It is hoped that this plant, which will increase the existing capacity of the Birkenhead undertaking from 4 700 to 7 200 kW, will be working within a month. The object is the provision of a ring of h.t. mains around Birkenhead.

There is a sharp conflict of opinion between the electric supply undertakers in the MID-LANCASHIRE ELECTRICITY DISTRICT as to the most suitable method of reorganising the supply in the area. Burnley, Accrington, Colne, Darwen and other East Lancashire towns have prepared one scheme, but Preston and Blackburn Corporations have an alternative proposal. Preston is to erect a new station on the south of the Ribble, with two 10 000 kW turbo-generators at the outset, and the Preston and Blackburn undertakings will be connected by duplicate cables. The total cost of the station and of one of the cables is £489 000.

PRESTON Council have already approved recommendations to provide a new electricity generating station, at an estimated cost of £420 000, and to enter into an agreement with Blackburn to connect the stations of the two towns by means of duplicate mains which will save both towns from the necessity of adding 50 per cent. to their generating capacity. In the event of a breakdown in one of the towns, the other will be able to provide the supply for both.

Alteration of Charges.

Owing to the satisfactory accounts of KINGSTON electricity undertaking it is proposed to reduce the charges for lighting from 1s. to 9d. per unit, and to make a reduction of 10 per cent. in the charge for heating and power.

OSWESTRY Town Council have decided to oppose the application made to the Electricity Commissioners by the Oswestry Electric Lighting and Power Company for power to raise the price of electricity from 8d. to 1s. 3d. per unit.

STRETFORD Electricity Committee have decided to reduce the advances over pre-war rates for electricity as follows:—Power, from 125 per cent. to 85 per cent., as from March 1; lighting, from a maximum of 8d. per unit to 6½d. per unit, as from April 1.

Municipal Accounts.

A loss of £16 458 on HULL electricity undertaking is reported for the current year ending March 31. By five votes to four a resolution that a special rate be levied to raise the deficit was defeated at a meeting of the committee last week.

At last week's meeting of the LIVERPOOL Electricity Committee ret... were submitted showing the results of last year's working of ...tricity and tramways undertakings. Electric Traction.

BURNLEY Tramways Committee have decided not to issue contract tickets.

SMETHWICK Town Council has decided to oppose the BLACK COUNTRY TRAMWAYS BILL.

The BLACKBURN ratepayers have rejected the Corporation Bill to extend the tramways and run motor 'buses.

The Association of Municipal Corporations has decided to oppose the attempt of RAILWAY COMPANIES to secure ROAD TRANSPORT POWERS.

HASLINGDEN AND RAWTENSTALL CORPORATIONS are discussing the question of running through tramcars between Accrington, Rawtenstall and Haslingden.

The BIRMINGHAM Tramways Committee are going into the question of a revision of fares, with a view to the reintroduction of the 1d. stage. The minimum fare is now 1½d.

PLYMOUTH Corporation are applying to the Minister of Transport for an Order under the Light Railways Act, authorising the construction of certain light railways in Devonport.

HULL Corporation have applied to the Minister of Transport for an Order under the Light Railways Act, 1896, authorising the construction, &c., of a light railway from the western termination of the Corporation's tramway in Hessle-road to the junction of Hull-road with Southgate.

BRADFORD Corporation Finance Advisory Sub-Committee have approved of application being made for borrowing powers in respect of the following works:—Tram track reconstruction in Thornton-road (Listerhills), £17 242; tram track reconstruction in Thornton-road (on the new road at School Green), £19 008.

In connection with SHEFFIELD Council's scheme to provide work for the unemployed, the Ecclesall tramway track is to be extended to Millhouses-lane, and the track on the Intake route is to be doubled. The estimated cost is £31 000, and nearly 200 men will be employed for four months. A start has already been made on the Ecclesall extension.

The Minister of Transport has extended for one year from July 26, 1922, (1) the period allowed by the WIMBLEDON AND SUTTON RAILWAY ACT, 1910, for the construction and completion of the railways and other works and for the compulsory purchase of lands for such railways; and (2) the period allowed by the METROPOLITAN DISTRICT RAILWAY ACT, 1915, for the payment of interest out of capital.

The NEWCASTLE-ON-TYNE Transport and Electricity Committee have decided to increase the hours of the employees in the department from forty-four to forty-eight per week as from Feb. 26. On Monday the Committee met the men's representatives, who stated that they had the authority of their union to refuse to accept the new hours. In the case of a strike the Committee state that they have plenty of applications for employment on their books.

The negotiations between TAUNTON Corporation and the Taunton Electric Traction Company in connection with the purchase of the tramways were recently broken off, the Corporation ultimately deciding by twelve votes to seven against the purchase. The Trams Committee recommend that steps be taken to provide a service of motor 'buses for the borough by private enterprise. Arrangements are to be made for the removal of the tram track.

An inquiry on behalf of the Ministry of Transport into an application by the DONCASTER Corporation for an Order for the extension of the tramway system was held in the Mansion House, Doncaster, on Tuesday. The proposal is to construct a loop line from French Gate to the Station-road terminus by way of Trafford-street and Factory-lane, to double and remove a portion of the tramway track over part of St. Sepulchre Gate, and to double a portion of the track in Baxtergate, at a cost of £10 000.

The Labour Party's Policy for the FORTHCOMING LONDON COUNTY COUNCIL ELECTION includes a great and dangerous extension of the principle of municipalisation of public services. The party are in favour of the following:—The administration of municipal services as far as possible by local authorities covering small areas; the conferment of powers on local authorities "to enter into remunerative enterprises and to associate for the purpose of combating private rings and trusts"; and public ownership of motor omnibuses and underground railways.

The EDINBURGH Tramways Committee is to consider a proposal by Bailie Sleigh as to the advisability of applying for statutory powers to construct a tramway along George-street, connecting St. Andrew-square with the West End. Meantime, preparations are to be made to obtain powers in the Provisional Order which the Corporation are promoting in the near future. The electrification of the northern tramway routes at an early date is also to be considered, and the tramways manager is to prepare a report for the information of the Committee.

With regard to the gradients in the city and their relation to the running of electric tramcars, Mr. A. H. Campbell, Burgh Engineer, states that the new town gradients are not by themselves dangerous for electric traction. But in operating, dangers develop at the lower ends of gradients, where the lines curve sharply. Though precautions are available, both by car brake equipment and by permanent way design, he points out that serious accidents have occurred on tramway systems where the gradients are no steeper than in Edinburgh.

Personal and Appointments.

Dr. W. Rathenau, chairman of the Allgemeine Elektricitäts Gesellschaft, has been appointed German Foreign Minister.

Admiral of the Fleet Sir Henry Jackson has been elected President of the London Wireless Society, in succession to Major J. Erskine Murray. The Society was formed in 1913, and has now a membership of 380.

Dr. Arthur MacGowan has been appointed assistant physician and Dr Albert Bowie medical officer in charge of the electro-therapeutical department of the London Homœpathic Hospital, Great Ormond-street, W.C. 1.

Mr. J. V. Moinet, manager of the Scarborough Tramway Company, who is shortly leaving Scarborough to take up an appointment at Hamilton, near Glasgow, has been presented with a case of stainless knives and silver-plate forks from the Staff of the company.

The following officers of the Kent Fortress Engineers have resigned their commissions :—Capt. E. Leafaux, Lieut. A. P. Isard, Lieut. A. M'L. Atkinson, Lieut. J. C. de Wardt. The last three mentioned have been given the rank of captain on leaving the corps.

Mr. W. H. Patterson, who has been associated with the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pennsylvania, for the past sixteen years, has resigned to become vice-president of the Kaestner & Hecht Company, electric elevator builders, Chicago.

The Carnegie Heroes' Fund Trustees have awarded a medallion and an annuity of £100 to Dr. J. Hall Edwards, of Birmingham, one of the pioneers in radiography. It will be remembered that, as a result of X-ray experiments, Dr. Edwards contracted dermatitis, which necessitated the amputation of his left hand and forearm, and four fingers of the right hand.

Business Items, &c.

The address of the British Electrical Development Association is now 15, Savoy-street, Strand, London W.C. 2. (I.E.E. Building, East Entrance). The telephone number is Regent 4570, and the telegraphic address, "Electreda, Rand, London."

Mr. Arthur J. Cridge has resigned his position as manager of the Transformer Sales Department of Metropolitan-Vickers Electrical Company, in order to join the staff of the Brush Electrical Engineering Company, to sell that comapny's transformers.

Herbert Terry & Sons, Ltd., are organising a prize competition, open to all amateur physical culturists using Terry's Patent Steelspring Exercisers. Prizes amounting to £150 will be awarded. Full particulars of the competition can be obtained from the headquarters of the firm at Redditch.

Exhibition Notes.

A discount of 20 per cent. is to be allowed on tariff rates of freight for exhibits at the Malaya-Borneo Exhibition. All cases, &c., must be clearly marked as destined for exhibition.

The General Electric Company announce that an exhibition of industrial electrical labour-saving devices, including electric drills, grinders and polishers, is to be held in their Industrial Showroom at Magnet House, Kingsway, London. The exhibition will be opened on Monday, Feb. 6, and will continue throughout the week from 2.30 p.m. until 6.30 p.m. daily.

Irish motor traders and the Royal Irish Automobile Club have agreed to collaborate in holding an international motor exhibition in Dublin during February, 1923. The Society of Motor Manufacturers and Traders has agreed in principle to support the Irish motor show, and will co-operate to make it a success, provided that the new Irish Government raises no obstacles to trade in British cars.

No import or export licences are required for goods for exhibit at the Leipzig Sample and Building Fairs, and the Frankfort International Fair, provided the goods are cleared at the Chief Customs House at Leipzig and the Frankfort Customs House, respectively, and remain under Customs control until the time of re-exportation, which must be effected within two months of the close of the Fairs.

Benn Brothers' stand at the British Industries Fair, which is to be held at Birmingham from Feb. 27 to March 10, is in Building "A," No. 4, quite near the first entrance. All books, journals, and directories published by the firm will be on sale, and representatives will be in attendance to answer all enquiries. The Editor of "The Export World" has a block of the plan of the exhibition, showing the position of the stand, from which stereos could be taken if required.

An International Sample Fair is to be held at Zagreb (Agram), Jugo-Slavia, from June 3 to 15 this year. The Fair authorities are anxious that the United Kingdom should be represented. Customs duties will be remitted, and there will be a 50 per cent. reduction within the Kingdom on transport costs of exhibits and fares for exhibitors. The charges for space range, according to position and type, from 200 to 800 crowns per square metre. A limited number of application forms is available on application to the Department of Overseas Trade

Wireless Notes.

It is stated that there are between five and six thousand people in Great Britain with licences for amateur wireless apparatus for receiving purposes, and about 150 with transmission licences.

The Government took over the radio-telegraph stations in British North Borneo in 1916, and in that year 11 145 messages were transmitted. This number has increased gradually, until in 1920 the number had risen to 22 400, exclusive of Press messages. The service is proving useful for commercial and business purposes.

A lecture on "The Radiation of Electro-Magnetic Waves in Wireless Telegraphy" was given by Prof. G. W. O. Howe, of the National Physical Laboratory, at the Technical College, Bradford, on Saturday, in connection with the wireless exhibition organised by the Bradford Wireless Society. Practical demonstrations of music and speech by wireless were also given.

The Post Office authorities have agreed to permit the sending out by wireless telegraphy on certain fixed wave-lengths, of speeches and music, for half-an-hour on one day in every week, for the benefit of amateur wireless enthusiasts. It is understood that the Marconi Company will undertake all necessary arrangements at their high-power station at Chelmsford. The Wireless Society of London has been trying for about twelve months to secure this privilege for amateurs. It is hoped the permission will be formally granted this month.

Telegraph and Telephone Notes.

The Melbourne-Sydney new trunk-line is now being operated as a composite telephone and duplex telegraph circuit.

In the new Persian Cabinet which took office on Jan. 21, Ettelaes-Saltaneh has been appointed Minister of Posts and Telegraphs.

It was stated on Monday that, as the result of a severe storm, direct cable communication with Tangier had been interrupted.

Hull municipal telephones show a profit in the current financial year of £4 500 after the payment of £7 000 in rates and £10 000 in royalties to the Government.

The Chinese Ministry of Communications is preparing to install a long-distance telephone between Peking and Harbin via Fengtien and Tientsin, which will be in operation next year.

In connection with the Genoa Conference, to be held next month, the Italian Government are taking steps to double the telephonic, telegraphic and wireless facilities. The Minister of Posts and Telegraphs has applied for a credit of 1 000 000 lire for this purpose.

The Havre Chamber of Commerce is negotiating with M. Loth for laying a leader cable in the port of Havre. It would run out from the port to the lightship moored westward of Cap La Heve, and beyond the lightship in a direction parallel with the coast up to Cap d'Antifer, a total distance of about thirty miles. The cable would be laid in the navigable channel, and, although fogs are rare at Havre, the authorities are anxious that a French port should be the first to utilise a French invention of such importance.

Imperial Notes.

Negotiations have been commenced between this country and the United States on the proposed waterway between the Great Lakes and the St. Lawrence, it being believed that some international agreement should be reached before any action is taken by Congress.

A large amount of tramway track renewal will have to be carried out during the next two or three years by the Johannesburg Tramway and Lighting Committee, and the Council have decided that where there is no alternative route by which the traffic might be diverted, the work can be carried out by the use of portable crossovers.

In reply to a question in the House of Representatives, on Monday, Mr. Massey, the Prime Minister, stated that his Government had given a contract for hydro-electrical plant and supplies to a British firm, in spite of the tender being £15 000 more than that of a New Zealand firm handling American machinery. The preference tariff reduced the difference to £7 000.

The Postmaster-General of the Australian Commonwealth has given a definition of a "book" by eliminating the publications which he considers should not be included. In the excluded list are directories, Acts of Parliament, law reports, and statistical works, which are classified as printed matter chargeable at 1d. for every 2 oz. The rate for books is 1d. for every 8 oz. when printed in Australia, and when printed elsewhere 1d. for every 4 oz.

The proposal to erect a transmission line for the supply of electricity from Port Kembla Power Station, Sydney, N.S.W., to Bowral, Mittagong and Moss Vale, with a branch line to Picton, has been modified by the New South Wales Parliamentary Standing Committee. Only the line to Bowral, Mittagong and Moss Vale (about twenty-two and a half miles in length), will be erected, and it will be employed to convey the surplus power (about 1 000 kW) from Port Kembla to meet the immediate needs of the towns and districts mentioned for town lighting, water pumping, brickmaking and quarrying. The estimated cost is £32 000.

Foreign Notes.

It is stated that forty-nine United States railway companies have been ordered to instal automatic train control by July 1, 1924.

The N'zilo and Lufira Falls in the Belgian Congo are to be utilised by the Union Minière du Haut Katanga to provide electric power for the company's new copper ore treatment plant.

In consequence of the wages dispute between the United Electric Tramways Company of Montevideo and its employees, the Municipal Council of Montevideo have taken the high-handed step of seizing the company's property, and they are paying the men the increased wages demanded! The managers are retaining their posts on instructions from the board in London.

A considerable amount of industrial progress was made by Czecho-Slovakia during 1921, and, like most countries, the tendency is to form large combines. According to "The Times Financial and Commercial Review" of the year, the new issues amounted to 634 million Czsl.K., in which the East-Bohemia and the Moravo-Silesian Electricity Works participated to the extent of 118 million Czsl.K.

Miscellaneous.

The Amalgamated Engineering Union has rejected by 50 240 votes to 35 525 the proposed agreement regarding management and overtime.

Among the recommendations of the Geddes Committee, it is suggested, the "Manchester Dispatch" states, that the Ministry of Transport, the Road Fund, and the Electricity Commission be done away with, and the work at present done by these bodies be transferred to the Board of Trade.

Scarborough Town Council has fixed a basic rate of pay for its officials and workmen. Both are to be on the same basis, namely, that the basic salary or wage shall be generally at the rate of 25 per cent. above the pre-war rate, the difference between that and the present scale, salary, or wage to be regarded as bonus.

Mr. W. E. Mandelick, secretary of the Underground Electric Railway Company, and of the London General Omnibus Company, left estate of the gross value of £10 563, with net personality £8 802. His bequests included £1 000 to the Railway Benevolent Institution and £50 each to L. Burrows and A. Sheale, of Electric Railway House.

Booklets containing the general conditions of tender, applicable to calls for tenders issued by the Belgian Ministry of National Defence, Ministry of Railways, Post and Telegraphs, Ministry of the Colonies, and Ministries of Agriculture, Industry, and Public Works may be inspected at the Department of Overseas Trade. (Reference D.O.T. 13 561/F.W.).

Members of the Leicester Association of Engineers and friends to the number of 130 paid a visit to the works of Herbert Morris, Ltd., Loughborough, on Saturday, to inspect the latest type of transporting apparatus in operation, and also the means of producing the same. The firm's staff gave up their half-holiday for the occasion, and the directors spared no pains to make the visit a success.

During the year 1921, fuel, power and waterworks companies increased their capital by £33 797 932. Of this sum, electrical companies only accounted for £503 000. The total increase in the metal industries amounted to £12 247 849, of which total engineering and machinery companies accounted for £4 272 616, electrical companies £2 749 398, iron and steel companies £2 749 398, and other metals £1 330 833.

The nineteenth annual report and statement of accounts of Callender's Hospital and Distress Fund was submitted and approved at the general meeting held at the Belvedere works last Saturday, over which Sir Tom Callender presided. Owing to the unemployment caused by the coal strike, the number of members decreased, and the weekly subscriptions showed a decrease of £16 on the previous year, the total amounting to £745 17s. 6d., against £761 19s. 7d. The committee gratefully acknowledge additional contributions amounting to £73 2s., including £50 from Callender's Cable and Construction Company, and £5 5s. from Sir Tom Callender. The annual awards to the hospitals, convalescent homes, &c., amounted to £661 10s. (against £640 10s. last year), of which Guy's Hospital received £210 and the Royal Westminster Ophthalmic Hospital £63.

Trade Inquiries.

A British subject in Belgium is desirous of obtaining the agency of electrical or mechanical machinery manufacturers in the United Kingdom. Particulars from the Department of Overseas Trade (Ref. No. 95).

A Canadian firm manufacturing copper lightning conductors are desirous of receiving quotations from United Kingdom manufacturers for: (*a*) bright soft drawn copper wire, No. 17 B. & S. gauge 0·045 in. diameter; (*b*) copper tubes, No. 20 B. & S. gauge (·032 in.), $\frac{5}{8}$ in. outside diameter. Particulars may be obtained from the Department of Overseas Trade (Reference D.O.T. 7631/E.D./S.C.2).

Social Notes.

Old Students of the Finsbury Technical College held an informal dinner and smoking concert at the Engineers' Club, Coventry-street, London, on Friday, last week. Mr. W. G. Head (President of the Association) presided. Under the direction of Mr. L. N. Clark a well-varied musical programme was carried out.

The newly formed musical section of the Ferranti Recreation Club gave three performances of the Gilbert and Sullivan opera, "Trial by Jury," in the works canteen on Wednesday, Thursday and Monday, Jan. 18, 19, and 23, preceded by a miscellaneous concert. The performances proved a great success both musically and financially.

An informal dinner and reunion of past employees of R. W. Paul, late of New Southgate, was held on Saturday, Jan. 28, at the Great Eastern Hotel, London. Mr. Paul presided, and the evening was an unqualified success. Past employees who were not notified on this occasion are asked to send their names and addresses to F. Stroude, 20, Lea Bridge-road, Clapton, London, E. 5.

The Electrical Contractors' Association have arranged to hold a smoking concert at the Engineers' Club, Coventry Street, London, W., on Tuesday, Feb. 14, at 8 p.m., at which the President of the Association has promised to be present. In addition to the concert, matters relating to the electrical industry as a whole will be discussed, with special reference to the work of the E.C.A. Any London electrical contractor, whether a member or not, who wishes to attend, should apply to the secretary, Mr. L. G. Tate, for a ticket.

Companies' Meetings, Reports, &c.

The Electrical and Industrial Investment Company recommend a dividend at the rate of 6 per cent. for the year on the preferred ordinary shares.

Herbert Morris, Ltd., announce the usual half-yearly dividend to Jan 31 on the 6 per cent. (less tax) and 5 per cent. (tax free) cumulative preference shares.

Clontarf and Hill of Howth Tramroad Company have declared a half-yearly dividend at the rate of 3 per cent. per annum and a bonus of 1s. per share, both less tax.

Hong Kong Tramway Company have declared a final dividend of 1s. 7d. per share, making 2s. 7d. per share for the year on the 5s. shares, equivalent to a dividend for the year of 51 3-5 per cent.

The City of Buenos Ayres Tramways Company recommends a balance dividend of 1s. 3d. per share, making 5 per cent. per annum, less tax, placing £2 000 to general amortisation fund, and carrying forward £7 339.

The directors of the Tottenham District Light, Heat and Power Company recommend dividends for the half-year ended December 31, 1921, at the rate of 5 per cent. per annum on the preference stock, $7\frac{1}{4}$ per cent. per annum on "A" stock, and $5\frac{3}{4}$ per cent. per annum on "B" stock, all less tax.

The Stock Exchange Committee has ordered the following securities to be quoted in the Official List:—$5 567 000 5 per cent. first mortgage gold bonds of the Mexican Electric Light Company, $11 340 500 5 per cent. first mortgage gold bonds and $1 000 000 5 per cent. second mortgage 50-year bonds of the Mexican Light and Power Company, $10 298 000 general consolidated first mortgage 50-year 5 per cent. gold bonds and £1 250 000 6 per cent. 50-year mortgage bonds of the Mexico Tramways Company, and £800 000 5 per cent. first mortgage 50-year bonds of the Pachuca Light & Power Company, in lieu of deposit receipts now quoted.

The report of the Dublin United Tramways Company (1896), Ltd., for the year ending Dec. 31, 1921, shows a net profit of £95 778. Interim dividends, amounting to £19 530, were paid on July 30, and it is recommended that a dividend at the rate of 6 per cent. per annum, less income-tax, be paid on the preference stock for the half-year ending Dec. 31, and that a final dividend at the rate of 7 per cent. per annum, less income-tax (making 5 per cent. for the year), be paid on the ordinary stock for the same half-year; and £35 000 be set aside towards renewal of track. The dividends and sum set aside will absorb £83 300, leaving £12 478 to be carried forward.

Presiding on Tuesday at the annual meeting of the East London Railway, at the Great Eastern Hotel, E.C., Lord Claud Hamilton stated, with reference to the grouping of the railways, that under the Railways Act, 1921, the railways in the metropolitan area had been left to take their own course. So far they had considered no scheme of general amalgamation, but he believed that it would be in their own interests, and especially in the interests of the public, that they should form one group, which, of course, would include the East London. Unfortunately, the East London was not a free agent, and must be dependent on what might be the final destination of the six lessee companies. An abstract of the accounts was given in our issue last week.

At an extraordinary general meeting of the Calcutta Electric Supply Corporation, held in London last week, to consider a resolution authorising the borrowing of a sum not exceeding £500 000, the Chairman (Lord Meston) stated that to meet the growing demands both for domestic and manufacturing purposes, the generating plant capacity, which would this year be increased from

21 000 to 42 000 kW, would require to be further augmented next year by the addition of a 15 000 kW set; that for the latter and certain other urgent requirements another £500 000 would be required; and that if the members approved, the Trade Facilities Act Advisory Committee were willing to recommend to the Treasury that it should arrange a loan of that amount and guarantee on behalf of the Government both the capital and the interest. The resolution was carried unanimously.

New Companies.

The following list is compiled from information supplied by Messrs. Jordan & Sons, Ltd., company registration agents, 116-118, Chancery-lane, London, W.C. 2.

Gerald Cars, Ltd. (179 222), Norwich House, Southampton Street, Bloomsbury, W.C. Registered Jan. 24. To acquire certain patents for inventions in relation to variable speed power transmission gear, and to carry on the business of manufacturers of motor cars, motor cycles, &c. Nominal capital, £25 000 in 19 000 ordinary shares of £1 each and 120 000 deferred shares of 1s. each; Minimum subscription £7. Director: F. D. Gerald Taylor. Remuneration of directors £200 each. Chairman £250. Public company.

United Sugar Engineers, Ltd. (179 209), 115, Holland Road, W. 14. Registered Jan 23. Dealers in machinery for the manufacture of sugar. Nominal capital, £10 000 in 10 000 shares of £1 each. Director: R. Mitchell. Private company.

Veco, Ltd. (179 210). 6, Back York Place, King Street, Leeds. Registered Jan. 23. To manufacture and deal in electrical accessories. Nominal capital, £1 000 in 1 000 shares of £1 each. Directors: C. L. Douthwaite and R. Lindley. Qualifications of directors, five shares. Private company.

Watt Electrical Co., Ltd. (179 173). Registered Jan. 20. Electrical, manufacturing, mechanical and general engineers. Nominal capital, £600 in 600 shares of £1 each. Directors to be appointed by subscribers. Qualification of directors, one share. Subscribers: L. N. Abrey, 533, Lordship Lane, East Dulwich, S.E. (electrical engineer), and E. H. Whatton. Private company.

Catalogues, Price Lists, &c.

"Meldrum" Forced Draught furnaces are fully described in a loose-leaf illustrated pamphlet just issued by the firm.

The Electric Heating Company are circulating a folder giving illustrations and particulars of their fires, irons, and soldering stoves.

Wright Motors, Ltd., have issued a new price list of their single, two, and three phase induction motors, pipe ventilated, and totally enclosed induction motors and crane-rated motors.

Julius Sax & Company have published a new catalogue of their electric bell and light accessories. The book contains seventy-two pages, and is artistically produced and well illustrated.

In a descriptive folder, entitled "Universalize Your Home," L. G. Hawkins & Co. illustrate and describe a number of their "Universal" electric appliances, including grills, toasters, milk-warmers, coffee percolators, and irons.

G. N. Haden & Sons have issued a pleasing wall calendar for 1922. The monthly sheets, which measure 9½ in. by 12 in. each, contain a large photograph of some well-known buildings in which the heating installations have been provided by the firm. Below these photographs is printed in clear black letters the calendar for the month, on either side of which, in smaller figures, appear calendars for the preceding and following month.

Forty Years Ago.

(The Electrician, Feb. 4, 1882).

Eastern Telegraph Company.—The traffic receipts of this Company for the month of January, 1882, amounted to £53 648, and to £47 445 in the corresponding period of 1881, being an increase of £6 203.

Institution of Civil Engineers.—At the meeting of this institution on Tuesday next, a paper is to be read by Mr. Paget Higgs. The subject will be "The Measurement of the Candle Power of the Electric Light."

The Electric Light for the House of Commons. The "Daily News" says: "The electric light will not, for the present at least, be used for the illumination of the House of Commons; but should experiments in addition to those tried last year prove more satisfactory than the latter have turned out, it is probable the electric light will be laid on permanently during the Easter recess."

Electric Light and Gas in Belgium.—"L'Industrie Belge" for Jan. 26th gives the following comparative figures of the cost of the Jaspar system of electric lighting and gas. According to our contemporary, M. Jaspar's factory in the Rue Jonfosse, at Liege, was originally lighted by forty gas burners at a cost of 1.25 francs per hour. The expense of lighting the same with his lamps is: For carbons 20 centimes, coal and oil for motor and machine 15 centimes, calculated for wear and tear 15 centimes, total 50 centimes, or half a franc. M. Jaspar uses reflectors to a very large extent, thereby avoiding shadows and lighting up all corners.

Arrangements for the Week.

FRIDAY, Feb. 3rd (to-day).

Institute of Cost and Works Accountants.

2.30 p.m. At the Holborn Restaurant, London, W.C. Costing Conference on "The Necesity for Scientific Costing."

Institution of Mechanical Engineers.

6 p.m. At Storeys Gate, London, S.W. Discussion on "Some Observations on a Producer-Gas Power Plant," by Messrs. H. S. Denny, C.B.E., and N. V. S. Knibbs.

Junior Institution of Engineers.

8 p.m. At Caxton Hall, London, S.W. Lecturette on "Utilisation of Waste Heat from Internal Combustion Engines," by Major W. Gregson.

MONDAY, Feb. 6th.

Society of Engineers.

5.30 p.m. At the Geological Society, Burlington House, Piccadilly, London, W. Presidential address by Mr. T. J. Gueritte, B.Sc.

Institution of Electrical Engineers.
(Western Centre).

5.45 p.m. At the South Wales Institute of Engineers. Park Place, Cardiff. Address on "Commercial Development." by Mr. J. S. Highfield.

Institution of Electrical Engineers.
(Informal Meeting.)

7 p.m. At Savoy Place, London, W.C. Discussion on "Some Practical Applications of the Thermionic Valve," opened by Mr. J. Joseph.

TUESDAY, Feb. 7th.

Institution of Civil Engineers.

6 p.m. At Great George Street, London. S.W. Paper on "Hydro-Electric Installations of the Barcelona Traction, Light and Power Company," by Dr. H. F. Parshall.

Institution of Electrical Engineers.
(N.-Western Centre.)

7 p.m. At the Engineers' Club, Albert Square, Manchester. Paper on "The Interconnection of A. C. Power Stations," by Messrs. L. J. Romero, and J. B. Palmer.

Institution of Electrical Engineers.
(Students' Section, S.-Midland Centre.)

7.30 p.m. At the University, Edmund Street Birmingham. Paper on "Telephone Transmission through Submarine Cables," by Mr. A. Rosen, B.Sc.

Röntgen Society.

8.15 p.m. At the Institution of Electrical Engineers. Savoy Place, London, W.C. Papers on "A New High-Tension Generator for X-Ray and other Work," by Mr W. H. Wilson; "Canny Ryall Diathermy Apparatus," "Ionostat," "A New Iontoquantimeter," and "New X-Ray Protective Material," by Mr. H. C. Head; "The Taylor Jones Electrostatic Oscillograph," "A New Design of Gold Leaf Electroscope," by Mr. H. E. Donithorne; "A New Boiling-water X-Ray Tube," by Mr. C. Andrews; "Diathermy Apparatus," by Messrs. F. R. Butt and Co., Ltd., and "A New Model of X-Ray Table," by Mr. E. E. Burnside.

WEDNESDAY, Feb. 8th.

Industrial League and Council.

7.30 p.m. At Caxton Hall, London, S.W. Lecture on "Industrial Unrest: Does it make for Progress?" by Prof. A. W. Kirkaldy, M.A.

Liverpool Engineering Society.

8 p.m. At the Royal Institution, Colquitt Street, Liverpool. Paper on "Aerial Wire Ropeways," by Mr. J. W. White.

THURSDAY, Feb. 9th.

Institution of Civil Engineers.
(Students' Meeting.)

6 p.m. At Great George Street, London, S.W. Paper on "The Design of Modern Water-Turbines," by Mr. E. J. Kingston-McCloughry, D.S.O.

Institution of Electrical Engineers.
(Liverpool Students' Sub-Centre.)

7.30 p.m. At the University, Liverpool. Popular Lecture on "Wireless Telegraphy and Telephony," by Prof. E. W. Marchant, D.Sc.

National Liberal Club Political and Economic Circle.

8 p.m. At the Club, Whitehall Place, London, S.W. Lecture on "Incentives in a New Industrial Order: Will a New Order Work?" by Mr. T. Fisher Unwin.

FRIDAY, Feb. 10th.

Institution of Electrical Engineers.
(Scottish Centre. Students' Section.)

7.30 p.m. At the Royal Technical College, Glasgow. Paper on "The Sperry Gyro Compass," by Mr. H. M'Comb.

Tenders Invited and Accepted.

UNITED KINGDOM.

Warrington Corporation. Feb. 6.—Main e.h.t. switchboard extension. Specification, &c., from the Borough Electrical and Tramways Engineer.

Dublin Electricity Supply Committee. Feb 7.—One or two years' supply of extra high-pressure and low-pressure cables, cable laying, and supply of troughing, section pillars and joint boxes. Specification, &c., from the City Electrical Engineer, Fleet-street, Dublin.

Burton-on-Trent Board of Guardians. Feb. 8.—Installation of electric light at the hospital. Tender forms from the Clerk, Mr. H. E. Askew.

Midland Railway Company Northern Counties Committee (Ireland). Feb. 9.—Three, six, or twelve months' supply of stores, including telegraph ironwork, wire, batteries, electric lamps, carbons, &c. Forms of tender from the Stores Superintendent, York-road Station, Belfast.

Dundee Tramways Committee. Feb. 10.—One year's supply of stores, including anti-friction metal, armature coils, commutators, carbon brushes, insulated tapes, wire, lamps, switches, castings, oils, grease, trolley rope, &c. Specifications from the General Manager, Tramway Offices, Dundee.

Manchester Electricity Committee. Feb. 10.—One 2 000 kW induction motor-generator, complete with the necessary operating switch-gear. Particulars from Mr. F. E. Hughes, the Secretary, Electricity Department, Town Hall.

Leeds Corporation. Feb. 10.—Electrical Fittings. Particulars from Mr. W. T. Lancashire, City Engineer, Municipal Buildings, Leeds.

Manchester Tramways Committee. Feb. 14.—Tramcar type Ah meters, armature and field coils, lamps, bells, and cells, insulation material, overhead equipment material, power and lighting cable, &c. Particulars from Mr. J. M. McElroy, General Manager, Corporation Tramways, 55, Piccadilly, Manchester.

Cardiff Corporation. Feb. 15.—400 tons of steel tram rails. Specifications, &c., from the City Engineer.

Edinburgh Corporation. Feb. 15.—Auxiliary circuits and electric lighting and earthing for Westbank power station. Specification, &c., from the Electrical Engineer, Dewar-place, Edinburgh.

Islington (London) Borough Council. Feb. 16.—One year's supply of stores, including cables, electricity meters, fuse boxes, compounds, lamps, wires, electrical sundries, transformers, carbons, arc lamp globes, insulators, &c. Specification, &c., can be obtained at the Town Hall.

Bradford Corporation. Feb. 18.—Steel girder tram rails. Particulars from Mr. F. Marsden, City Engineer and Surveyor, Town Hall, Bradford.

Dublin Electricity Committee. Feb. 20.—Transformers for one or two years. Specifications, &c., from the City Electrical Engineer, Fleet-street, Dublin.

Great Western Railway. Feb. 20.—Stores for three months from March 1st, including telegraph instruments, electrical apparatus (insulators), &c., electrical wires and cables, telegraph ironwork, and tools, telegraph drysalteries, and electric lamps.

Hammersmith Borough Council. Feb. 22.—Stores for 3, 6, or 12 months, commencing on April 1, including electric light sundries, insulated wire, metals, packing and jointing materials, tools, joint boxes and connections, and meters. Particulars from Mr. G. G. Bell, Borough Electrical Engineer, 85, Fulham Palace Road, W. 6.

Metropolitan Water Board. Feb. 23.—Electric lamps, &c., for three, six, or twelve months. Forms of tender from the Chief Engineer, 173, Rosebery-avenue, London, E.C. 1.

Eston. Feb. 28.—The erecting and providing of plant in connection with the overhead lines, underground cables, transformers, sub-station equipment, and public lighting fittings required under Eston Electricity Special Order, 1921. Particulars from the Clerk, Mr. T. Belk, Cleveland House, Grangetown, S.O., Yorks.

Hampstead (London) Borough Council. March 15.—Supply of various stores for six or twelve months, including electrical engineers' stores and oils for the electricity station. Form of tender, &c., from the Town Clerk.

Aylesbury Corporation.—300 kW converter, with e.h.t. and l.t. switchgear. Specifications, &c., from the Borough Electrical Engineer.

Accrington Corporation.—Supply, delivery, and complete erection of 25 000 lb. water-tube boilers, economisers and brickwork. Particulars from Mr. A. W. Clegg, Engineer and Works Manager.

AUSTRALIA.

New South Wales Government Railways and Tramways Department (Electrical Engineer's Branch).—Feb. 22, 1922.—*Supply, delivery, erection and maintenance of one 5 000 kW 50 cycle turbo-alternator with condenser and accessories, at Zarra-street power house, Newcastle. (Contract No. 556.) Tenders, to the Secretary for Railways, Phillip-street, Sydney, N.S.W. Local representation is essential.

Postmaster-General's Department, Adelaide. April 5.—* Twelve adjustable condensers for use on telegraph duplex circuits. (Schedule No. 613.)

Postmaster-General's Department, Brisbane. April 19.—* Supply and delivery of testing and telegraph instruments, including d.c. ammeters, a.c. bridge condenser coil, condensers, cross-talk meters, detectors, milliammeters, polarised relays, and artificial telephone cable boxes. (Stores Schedule No. 549.)

NEW ZEALAND.

Public Works Department, Wellington. Feb. 28.—*Supply and delivery, ex ship's slings Lyttelton, of a bank of three 11 000 V reactances, complete, for the Lake Coleridge electric power scheme.

Dunedin City Council. March 31.—*Supply and delivery of one 150 h.p. three-phase induction motor and reduction gear for the Mornington Cable Service.

Auckland Harbour Board. April 25.—Four double-barrel electric winches for the Central Wharf, Auckland. Specifications from W. & A. McArthur, 18-19, Silk-street, Cripplegate, London, E.C. 2.

SOUTH AFRICA.

Municipal Council of Johannesburg. Feb. 9.—*Fifty 500 A and fifty 200 A knife switches, and the following cable, viz.: 6 160 yds. h.t. 0·15 by 0·15 sq. in., concentric, paper insulated, lead covered, and double tape armoured; 880 yds. h.t. 0·15 by 0·15, by not less than 0·212 sq. in.; and 6 160 yds. h.t. 0·25 by 0·25 by not less than 0 35 sq. in., twin concentric, paper insulated, lead covered and double tape armoured.

Durban Corporation Electrical Department. April 12.—* Two 500 kW rotary converter automatic sub-station equipments. Alternative tenders for mercury arc rectifiers may be submitted instead of rotary converters, the switchgear to be completely automatic and suitable for their proper operation and control.

ITALY.

Director-General of the Italian State Railways. April 30.—Electrification of the Bologna-Venice-Monfalcone line. Particulars from the Direzione-Generale, Ferrovie dello Stato, Rome.

SOUTH AMERICA.

Argentine Ministry of Public Works. Feb. 21, 1922.—*Nine electric motors, 36 tip waggons, 1 centrifugal pump with electric motor. Specification expected at the Department of Overseas Trade by Dec. 28.

State Electric Power House, Montevideo. March 21.—* Diesel set, comprising a 4-stroke Diesel engine directly coupled to a d.c. generator of 125 kW for a three-wire system at 2x235 V. Local representation is essential.

BULGARIA.

Bulgarian Department of Posts, Telegraphs, and Telephones. February 20.—*2 000 telephone instruments for table use, with local battery and magneto. Also for spare parts.

Bulgarian Department of Posts. Feb. 27.—*Electricians' small tools, including 900 pairs pincers, 20 brazing lamps, 100 soldering irons, 1 500 bits, 300 axes.

Bulgarian Department of Posts. March 8.—*Porcelain insulating tubes for telephones (10 000), insulating tubing (impregnated paper) for telephones (2 200 metres), ebonite caps (1 700), and insulated copper wire (1 000 metres).

Bulgarian Post and Telegraph Authorities, March 15.—* The supply of 1 A fuses, cartridge fuses for protection from lightning, 3 A fuses, line annunciators, carbon lightning arresters.

Bulgarian Postal Authorities, March 21.—*Telephone, pole-line hardware (4-pin carriers for insulators, bolts, etc.).

Bulgarian Postal Authorities, March 27.—*3 000 junction pieces for batteries. Delivery required within four months.

Salford Corporation have accepted the tenders of W. T. Glover & Company for 2 000 yds. l.t. cable, £446; and Enfield Ediswan Cable Company, 4 000 yds. ditto, £839.

Wimbledon Electricity Committee recommend the Council to accept the tender of the English Electric Company for h.t. switchgear at Raynes Park sub-station, £859 10s.

London County Council have accepted the tender of Steel, Peech and Tozer for 2 000 tramcar trailing wheel tyres at £1 16s. each. There were two lower tenders, which were not to specification. Seventeen offers were received, and in sixteen of these alternative figures were given for 2 000 and 1 000 tyres. The highest and lowest tenders for 1 000 were £5 and £1 1s. 6d. respectively, and for 2 000 £5 and £1 1s., while one offer was £27 per ton.

Keighley Town Council have accepted the tender of Babcock & Wilcox, amounting to £4 349, for the execution of the work and supply of all material required in extensions to the boiler-house and coal-conveying plant at the electricity works, the contract to contain a special clause providing that in the event of any reduction in the cost of labour or materials during the execution of the work the Corporation shall be entitled to the benefit of such reduction.

Spencer & Company, Ltd., Melksham, Wilts, have obtained from the Union Government of South Africa an order for grain elevator machinery of the value of £400 000 to £500 000. It is intended to erect a large shipping grain elevator at Durban and a smaller one at Cape Town, together with thirty-four elevators in different parts of the country. The elevator at Durban and the thirty-four country elevators will be erected by Messrs. Spencer.

* *Particulars from the Department of Overseas Trade.*

COMMERCIAL INTELLIGENCE.

The following information is taken from printed reports, but we cannot be responsible for any errors that may occur.

London Gazette.

Bankruptcy Information.

FIGGINS, James Victor, 3, Pottery-terrace, Alexandra-road, Newport, electrical engineer. First meeting, Feb. 9, 11.45 a.m., County Court Office, Dock-street, Newport. Public examination, March 14, 10.30 a.m., Town Hall, Newport.

ROTHWELL, Peter, 64, Higher Bridge-street, Bolton, in partnership with P. A. Rothwell (a minor), under the style of P. A. Rothwell & Company, electrical engineer. First meeting, Feb. 8, 3 p.m., Official Receiver's Offices, Byrom-street, Manchester. Public examination, Feb. 15, 2.15 p.m., Court House, Mawdsley-street, Bolton.

Notice of Intended Dividend.

BECKETT, Samuel (jun.), Deane-road, Bolton, Co. Lancaster, electrician. Last day for receiving proofs, Feb. 4. Trustee, J. G. Gibson, Official Receiver, Byrom-street, Manchester.

Notices of Dividends.

DOWNIE, Charles Philip Manners, 355A, Westborough-road, and 88, Ronald Park-avenue, Southend-on-Sea, Essex, electrical engineer and factor. Amount per £, 4s. 9½d. First and final. Payable Feb. 3, Official Receiver's Office, 29, Russell-square, London, W.C. 1.

HYDE, Thomas, 180, London-road, Croydon, Surrey, electrician. Amount per £, 1s. 9¾d. First and final. Payable Feb. 15, 29, Russell-square, W.C. 1.

WARING, Thomas Driffield, late 18, Waterloo-place, Coney-street, York, electrical engineer. Amount per £, 8s. 11d. First and final. Payable Feb. 6, Official Receiver's Offices, Duncombe-place, York.

Edinburgh Gazette.

In the sequestration of R. ANDERSON WILSON, electrical engineer, 19, Waterloo-street, Glasgow, James Andrew French, 116, Hope-street, Glasgow, has been elected trustee, and W. F. Strang, A. E. R. Copland, and T. Armstrong, of Glasgow, have been elected commissioners. The examination of the bankrupt will take place in Sheriff Boyd's Chambers, County Buildings, 70, Hutcheson-street, Glasgow, Wednesday, Feb. 1, at 2.15 p.m. The creditors will meet in the trustee's chambers Friday, Feb. 10, at 12 noon.

County Court Judgments.

[NOTE.—The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debts. They may be for actions. But the Registry makes no distinction of the cases. Judgments are not returned to the Registry if satisfied in the Court books within twenty-one days.]

BENNETT, Mr. W., 1, Richardson-street, Derby, electrician. £22 3s. 1d. Nov. 16.

ELECTRICAL EXCHANGE COMPANY, 43, St. Nicholas-street, Bristol, electrical factors. £41 13s. 6d. Nov. 22.

FALSHAW, Cyril, 69, Dragon-parade, Harrogate, electrical engineer. £17 3s. 5d. Nov. 18.

JAY, Arthur, 20, St. Thomas-square, Hackney, electrician. £30 2s. 2d. Nov. 22.

JOHNSON, Jas. Nelson, 62, High-street, Hull, electrician. £34 7s. 2d. Nov. 17.

THOMAS & EVANS, 5 and 7, Salubrious-place, Swansea, electrical engineers. £14 4s. 9d. Nov. 22.

WILSON, Bruce (and wife), 2, Senior-street, Moldgreen, Huddersfield, electrical engineer. £17 10s. 2d. Nov. 18.

WILSON, Wm., 27, Fowler-street, South Shields, electrical engineer. £11 17s. 6d. Nov. 15.

Mortgages and Charges on Limited Companies.

[NOTE.—The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, created by a Company after the commencement of the Act, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges which would, if created after the commencement of the Act, require registration. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced since such date.]

CULKIN & PARKINSON, LTD., Leeds, electricians. Registered Jan. 23, £400 debentures; general charge.

KEIGHLEY ELECTRICAL ENGINEERING COMPANY, LTD. Registered Jan. 20, debentures, to Barclay's Bank, Ltd., securing all moneys due or to become due to the bank; general charge. *£5 000. Nov. 30, 1921.

READING ELECTRIC SUPPLY COMPANY, LTD. Registered Jan. 16, trust deed dated Dec. 31, 1921, securing £100 000 debenture stock; charged on hereditaments specified in trust deed, also general charge. *£50 000. April 21, 1921.

SOUTHERN BRAZIL ELECTRIC COMPANY, LTD., London, E.C. Registered Jan. 23, £194 500 8 per cent. notes (including £176 500 already registered) (filed under Sec. 93 (3) of the Companies (Consolidation) Act, 1908), present issue £18 000; general charge. *£863 410. Dec. 29, 1921.

YORKSHIRE & DISTRICT ELECTRIC LAMP REPAIRING COMPANY, LTD., Sheffield. Registered Jan. 21, mortgage securing all moneys not ex. £1 500, which the mortgagees may pay under their guarantee to the company's bankers, to H. J. M. Cockayne, Sheffield, and others; charged on Heeley Mill, and other buildings, at Saxon-road, Heeley. *£1 500. Sept. 13, 1921.

Satisfactions.

KEIGHLEY ELECTRICAL ENGINEERING COMPANY, LTD. —Satisfaction registered Jan. 23, £5 000, registered Dec. 28, 1909.

SAUNDERS ELECTRICAL COMPANY, LTD., Coventry.—Satisfaction registered Jan. 25, £500, registered Sept. 14, 1920.

Receivership.

SIMOON ENGINEERING COMPANY, LTD. H. C. Chambers, 5, Chancery-lane, W.C., was appointed receiver on Jan. 14, 1922, under powers contained in mortgage debenture dated Mar. 26, 1920.

Bankruptcy Proceedings.

LANGSFORD, Edwin Growdon, 24, Bar-street, Burnley, late 74, Westgate, Burnley, Lancashire, electrician. The public examination of this debtor was held recently at Burnley. The gross liabilities were shown as £411, of which £397 were expected to rank for dividend, while there was a deficiency of £397. Debtor attributed his failure to ill-health. He commenced business with £20 capital. He was in business in Westgate for about a year before he joined the army. He was discharged shortly afterwards owing to ill-health. He returned to the shop, but was not able to book any orders for electrical work. Seven or eight years ago he had an administration order made against him by that court, and the debts were only partially cleared off. He was closely questioned regarding money which had been lent to him, and the examination was adjourned.

Private Meetings.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

BARDSLEY, J. N., 179, Katherine-street, Ashton-under-Lyne, electrical fitter, &c. The creditors interested herein met recently at Manchester, when a statement of affairs was presented which showed liabilities of £1 250, of which £725 was due to the trade, while there was one cash creditor for £195, and the bank were scheduled as creditors for £320. The assets totalled £387, thus leaving a deficiency of £863. The assets comprised: Stock-in-trade, tools, fixtures, fittings, &c., £100; motor van, £37; book debts, £251, expected to produce £150; and insurance claims, estimated to realise £100. A fire had taken place at the debtor's premises during the last few weeks, in respect of which debtor had made a claim, as shown in the statement of affairs. Debtor started in business in August, 1919. He attributed his position to lose through two motors not being of any use, and collision of one, illness of self, competition, and cutting of prices. Only a rough set of books had been kept, which had been imperfectly made up. It was eventually resolved that the estate should be dealt with under a deed of assignment to Mr. Arthur T. Eaves, of Manchester. The following are creditors: Crowther & Osborn, Ltd., Salford, £14; Samuel Gratrix, Junr., & Brothers, Ltd., Manchester, £241; The Park Electric Engineering Company, Manchester, £283; Beardsall, W. E., & Company, Ltd., Manchester, £15; B.T.T. Electric Lamp and Accessories Company, London, £42; Power & Lighting Supplies Company, Manchester, £14; Wholesale Fittings Company, Ltd., Manchester, £14; Giddings & Dacre, Ltd., Salford, £12.

FOUNTAYNE LAMP AND ENGINEERING COMPANY (1910), LTD. (in voluntary liquidation), Tottenham, London, N. The creditors of the above were called together recently in London. The shareholders had previously passed the usual resolution, and had appointed Mr. B. R. Heaton, of 8, New-square, Lincoln's Inn, to act as liquidator. The liabilities amounted to approximately £1 999, while the assets were only estimated to realise £100. It was stated that there was also a claim by the landlord in respect of dilapidations, and the present position had been largely brought about by the liquidation of Messrs. Butler and Wilson, Ltd., with whom the company had large stocks. No resolutions were passed, and the voluntary liquidation of the company will, therefore, be continued with Mr. Heaton as the liquidator.

Patent Record.

APPLICATIONS FOR PATENTS

October 24, 1921.

28 142 Turner. Electric arc welding.
28 144 Tucker & Co. & Line. Electric fuses.
28 146 Moore. Electric chronoscope.
28 160 Denner & Lepine. Electric wall, &c., plugs.
28 175 Anderson & Huntsworth. Coin-actuated electric apparatus for selling tickets, &c.
28 190 Hitchmough & Shade. Electric oven light.
28 192 Donisthorpe. Thermionic valves.
28 194 Norske Aktieselskab fur Elektrokemisk Industri Norsk Hypotek bank. Electric furnaces. (1/11/20, Norway.)

CONTENTS.

Notes of the Week.

Mr. Dunlop on the Electrical Industry.

If Mr. D. N. Dunlop only occasionally uses those gifts of eloquence and directness which he employed with such effect at the dinner of the Electrical Wholesalers' Federation last week he will have no need to complain of charges of reticence or that the B.E.A.M.A. are accused of too freely employing the methods of secret diplomacy. For ourselves we require from Mr. Dunlop not a constant flow of talk and propaganda, which leads nowhither, but succinct information regarding the principles which influence the policy of the important Association he directs and about the results which that policy has successfully attained. In this we represent the electrical industry. Moreover, we only ask a little where we have had almost nothing. By providing what we ask Mr. Dunlop would not only be assisting the Press, whose task it is to mirror the doings and thoughts of the electrical industry, but would be contributing not a little to the well-being of his own Association. Mr. Dunlop's speech went so far towards binding together the varying sections of the electrical industry that it would be a pity if his actions did not consolidate what his speech began.

Co-operation the Essential of Progress.

Mr. Dunlop's arguments are easily summarised, though not with the eloquence that he himself employed. They have, in fact, often been advanced before. The chief novelty is that it is Mr. Dunlop who now re-states them. In the old days, he said, the British electrical industry suffered mightily from foreign competition and trading methods. Its state was sickly, and the first task of the B.E.A.M.A. was to renew its health so that it could not only pay its way but also provide something for research and other necessary development work. This recovery of health has been achieved in spite of prejudices, in spite of the national vice of individualism, and in spite of more material obstacles. This is what the manufacturer in association has done. But the manufacturer requires the help of the wholesaler and of the contractor to sell his products, and is willing that, with certain exceptions, the sale of those products should only take place through them. The co-operation of these three bodies in the electrical industry, he added, should be stimulated until there was no opening for the foreign products. At the moment the manufacturer had to face foreign competition so cut-throat that to carry on was difficult, but with the assistance of every branch of the industry they should be able to obtain a stabilised home market which, with increased production, would enable many difficulties to be overcome.

A Statement and an Appeal.

This is at once a statement of the case and an appeal. It is a statement which we hope will be examined with care. It is an appeal which we hope will not be left unheard. As has happened before, the manufacturers, more than all other branches of the electrical industry, are feeling the effects of the depressing conditions under which we are now labouring. But if the manufacturers continue to suffer the whole of the electrical industry will soon be suffering with them. For all parts of the industry are so interlinked that what affects one must sooner or later affect the other. Depression can thus be best warded off by all pulling together for the common good. This may seem to be so trite that it is needless to state it. In fact, it is so trite that too many in the electrical industry neglect to recognise it as a necessary part of their policy. Too often even now (it was obvious at the Wholesalers' Dinner) one section of the industry is more eager to fight against another than to meet and settle differences—except, of course, in after-dinner speeches. It is not the least for this reason that Mr. Dunlop's speech will, we hope, be listened to and acted upon without delay. If it brings about a change of heart it will have done all that can be expected of it.

The North Lancashire Electricity District.

The inquiry into the scheme for the reorganisation of electricity supply in the North Lancashire and South Cumberland electricity district, which was concluded on Friday, revealed a peculiar state of affairs. It showed clearly, what we have long suspected, how difficult it is to get a group of small urban and rural authorities to co-operate with one another for any length of time. It was originally proposed to form a Joint Authority of thirty members for the district. This body would have taken over the five generating stations of the existing undertakers in the area, and would have constructed 33 000 V main transmission lines between the principal towns and 6 600 V lines from Lancaster to Morecambe and Heysham, and between Barrow and Dalton. It was also proposed to purchase the Cavendish Park generating stations of Vickers, Ltd., at Barrow, to erect a hydro-electric station on the River Leven, and eventually to lay distributing mains in certain areas which are at present without a supply.

Paper v. Practice.

On paper the scheme seemed a feasible proposition, but as soon as the Commissioners (Sir John Snell and Mr. H. Booth) had opened the inquiry they were met with the announcement that the Barrow Corporation, the principal supporters, had withdrawn and were separately represented by counsel. This defection was followed by the withdrawal of, or notice of opposition by, the leading councils in the district. Lancaster, Morecambe, Heysham, Windermere, Kendal, Ulverston and other places all wanted to be excluded or to put forward alternative proposals for dealing with portions of the area. This epidemic of defections were relieved by the desire of Millom to come in, but Sir John intimated that the Commissioners would want to hear expert evidence before that could be allowed. Apparently, Barrow's *volte face* is due to the lack of Government assistance, and, as this is not likely to be forthcoming, the outlook for the formation of a Joint Electricity Authority is indeed gloomy.

The Morley Award.

The employees of electricity undertakings have been deeply stirred by the publication of the award of Sir Wm. Mackenzie in the Morley case, to which we recently referred, and the various engineering and official associations affected are said to be considering the situation in order to take concerted action. We hope they will be successful. For though Sir Wm. Mackenzie is a very able and impartial arbitrator in industrial courts he is not the most suitable type of referee on the status of electrical engineers. In fact, we have not the slightest hesitation in asserting that the transformation of Morley from a generating station into a distributing bulk supply station involved such a loss of status as is contemplated by Sec. 16 (III.) of the Electricity (Supply) Act, and if an electrical engineer had been arbitrator he would have so found. We fancy that Sir William's judgment was swayed by the fact that Mr. Ellis and his assistant were being retained at their old salaries, but the salary is not the only, or even the chief, element in the status of engineering officials.

Need for Careful Revision.

As there will be many cases similar to that of Morley within the next few years, the situation should now be reviewed with care in order that the present case shall not establish a precedent. There are two courses open to those affected. First, they should make a strong and united representation to the Minister of Labour, whose province it is to nominate the arbitrators, to appoint an impartial electrical engineer, who will readily appreciate at their proper value all questions of status affecting the engineering staff. If this point be conceded, further action may not be necessary, but as the section permits the appointment of "a referee or board of referees," it may be advisable to have such a board in complicated cases, or an electrical engineer could sit as assessor on engineering questions. At all events, now is the time for the Electrical Power Engineers' Association and the Companies' Officers' Association to investigate the position fully in order that Sec. 16 of the 1919 Act may not prove something worse than a dead letter.

Details of the City Breakdown.

The breakdown on the Charing Cross Company's system, which deprived part of the City of London of its electricity supply for some hours on Thursday of last week, was an indication that every effort should be made by supply engineers and electrical manufacturers to secure additional plant to give them a margin to provide against such mishaps, and that neighbouring supply authorities should devise without delay an adequate scheme of interlinking. While it is true that interlinking will not prevent breakdown and may, as we showed a short time ago, bring with it dangers of its own, in the majority of cases it does mitigate subsequent trouble and permits the *status quo* to be established with a minimum of delay. That is, after all, the main thing.

The Trouble Explained.

The primary reason of the breakdown was the failure of one of the trunk mains supplying the City area from the Bow generating station. This failure caused an arc to take place at the back of the E.H.T. bus bars, resulting in a short circuit between the bars. The damage caused was so extensive that what actually happened is difficult to discover, and is therefore, perhaps, better imagined than described. The immediate result was the breakdown of about 7 000 kW of plant, the load on the station at the time being approximately 18 000 kW. Matters, bad as they were, were complicated by the fact that, owing to the difficulty in obtaining delivery of plant, a turbo-alternator, which should have been running in the early part of 1921, was not in commission. Had it been available to take up the load of the damaged machines it is probable that supply would not have been interrupted, or, at least, the interruption would have been very much shorter than it actually was. The efforts of the engineers concerned, who, as may be gathered, have been having a strenuous time during the past few days, have resulted in this set now being in running order, so that when the repairs have been completed on the damaged plant, which we understand will be in the very near future, the company will have sufficient reserve at its disposal to deal with any emergency that is likely to arise. It is only fair to point out that the supply was restored within 15 minutes in the major part of the area, and it was only in a comparatively small section that a delay of some hours was experienced.

The G.E.C. Grows Up.

The twenty-first anniversary of the foundation of the General Electric Co.'s engineering works at Witton was officially celebrated on Tuesday last by a visit of representatives of the technical Press. Unofficially it was also celebrated by the announcement made by Dr. M. Railing,

at the luncheon given in the Magnet Club at Witton, that the company had secured a contract for the supply of traction motors to the London, Brighton and South Coast Railway in connection with the extension of the electrically operated lines on that system. This is a matter upon which not only the General Electric Company, but the whole of the British electrical industry may be congratulated. It is, we hope—indeed, we feel certain—the forerunner of many similar orders, and it is a most satisfactory break with the bad tradition of going abroad for this kind of plant.

A False Argument.

The excuse for this procedure has, of course, been that foreign designers were more experienced in the production of traction equipment, and that, though by giving the contract to a non-British firm, manufacturers and labour in this country were adversely affected, in the end the result was for the good of the community generally. This argument contains much that is false, and at the present time, when not only is it necessary that British industry should be re-established by every means in our power, but when our own designers are in possession of sufficient experience to enable them to build plant of equal efficiency and soundness as that turned out by their foreign competitors, it is to be hoped that the example of the Brighton Railway will be widely followed. We shall look forward with interest to the designs which the General Electric Co. will provide in fulfilment of this contract and to the performance of the equipment when it is eventually delivered.

The Wimbledon Mess.

At the moment there is a lull in the Wimbledon affair. Having done their deed of shame, action no longer rests with the Council, unless they eat their resolutions without further prompting. But behind the scenes the E.P.E.A. are busy, though they have failed to persuade the Ministry of Labour to set up an inquiry under the Industrial Courts Act. At the inquiry all cards should be laid on the table, especially Mr. Sparks' report and Mr. Lee's comments thereon. For the Council's reticence and the innuendo of those who brought about Mr. Lee's dismissal are the worst points of the whole affair. We admit that it is within the right of any employer to dismiss an employee after proper notice or to make that dismissal instant by paying over an appropriate proportion of salary. But it is not within the right of any employer either to give no reason for his action or to give an obviously evasive reason, whose main effect is to cast an additional slur on the dismissed employee. The Wimbledon Council are guilty on both these counts. Officially, the party in power, as a party, refuse to give any reason whatsoever for Mr. Lee's dismissal, but certain members of the "party," as individuals, hint that it would be better in Mr. Lee's own interests that this request for information should not be pressed, or say that those who require further details "should read between the lines." That is adding insult to injury.

An Inquiry Essential.

The attitude of those who support Mr. Lee, whether on the Council or outside, is perfectly clear. Mr. Lee, they point out, has been given no opportunity to defend himself, nor can he defend himself until some charge is made against him. Moreover, until that charge is made no one can possibly say whether he deserves dismissal or not. If the Council's case is a good one they have nothing to fear and Mr. Lee has everything to lose. It is upon this point especially that the various protective associations which are supporting Mr. Lee are basing their action, for they argue cogently that if this procedure is allowed to pass unchallenged any municipal employee might be ruined by a group of councillors whom he had offended. All these points could be cleared by an inquiry. Unfortunately, the Ministry of Labour is disinclined to set up such an inquiry unless the situation becomes "dangerous," *i.e.*, apparently, unless the employees of electricity supply undertakings throughout the country threaten to enforce their demands by a strike. This is the most wooden-headed procedure that could be conceived. The only result will be to compel the E.P.E.A. to adopt methods which we have always deplored to obtain the benefit of legislation framed expressly to prevent local trouble from spreading. The case, therefore, not only throws an interesting light on the byways of local politics, but upon modern bureaucratic methods of dealing with urgent cases of injustice. There the matter must rest for the moment, but we cannot say that we are too happy as to its outcome.

Prof. Thomas Mather, F.R.S.

Many generations of electrical engineers will learn with interest, not untinged with regret, that after thirty-seven years' service at South Kensington, following upon two at Finsbury, Prof. T. Mather is retiring from the chair of electrical engineering at the City and Guilds (Engineering) College of the University of London. To some it will be yet another indication that they are growing old, to others it will come as a shock that the professor with whom they have only lately parted company, and whose work did so much to engender in them a real enthusiasm for electrical knowledge, is seeking a well-earned rest. To all it will mark the retirement from an active career of one who has exerted an unobtrusive, but not the less powerful, influence on electrical engineering progress, and of a worker whose researches during the very early days of the electrical industry have already placed him in one of those niches which are reserved for the famous dead. After strenuous labours any man is well entitled to a rest. We are only expressing the general wish when we hope that Prof. Mather will long be spared to enjoy his.

To Be or Not to Be?

London supply undertakings will shortly have to decide whether there is to be a District Joint Board for London, and a meeting to settle the question will be held within the next few weeks. It is true that some more or less ineffective meetings have already been held, but the forthcoming one is to be final. The matter is not altogether easy, for most of the important municipal undertakings want to set up a board, while the directors of London Companies have so far shown themselves in opposition to such a proposal. Once again then we are living in an atmosphere of uncertainty and indecision! The members of the E.P.E.A. who form the other side of the Board meantime patiently await the result. What is required is that every undertaking shall think out its policy and stick to it. Simply to do nothing will mean disaster, for the good relations between the technical staff and the management are at stake. The question is simply: Can those good relations be best maintained by a Board or otherwise? One thing is certain—they cannot be maintained by evading the issue. Every undertaking should, therefore, be represented at the meeting and both express an opinion and vote.

The Power Supply Problem in the U.S.

It is not surprising to find that the same problems are cardinal in the development of electricity supply in the United States as in this country. On the other side of the Atlantic, as here, the war caused an accelerated demand for electrical energy, over-loaded the existing plant and, for financial reasons, made extensions which would have been undertaken in the ordinary way more difficult to carry out and more unremunerative when completed. As here, it has been recognised that one of the best means of overcoming these difficulties and ensuring progress is by a thorough investigation of future electrical requirements and of the possible ways of meeting these requirements without interfering more than is absolutely necessary with existing conditions, or, more important, with those who are now successfully carrying out the work.

The "Super-Power Zone."

As a first step towards this end a Committee, of which Mr. W. S. Murray was chairman, was appointed by Congress rather over a year ago to examine and report on conditions in the "Super-power Zone" along the Atlantic border between Boston and Washington. This Committee has now reported and the report contains numerous facts and figures which cannot fail to be of interest to those concerned with electricity supply in this country, while certain fundamental omissions will be of no less interest.

The Extent of the Zone.

The zone examined by the Committee lies between the thirty-ninth and forty-ninth parallels and extends from the Atlantic coast approximately 150 miles inland. It embraces parts of the States of Maine, New Hampshire, Vermont, New York, Pennsylvania, Delaware and Maryland and the whole of the States of Massachusetts, Rhode Island, Connecticut and New Jersey. Its population is about one-quarter of the total of the United States. It is an industrial area and is already pretty well electrified. This is evident when we say that it contains 558 public electricity supply undertakings with a capacity in 1919 of 4 408 200 kW, 96 000 factories, 76 000 of which use electricity either bought or generated, with an average demand of 350 h.p., and 36 000 miles of single track steam railway. The electricity consumed in this area in 1919 was 12 650 240 000 kWh, and it is estimated that this will be increased to 31 000 000 000 kWh in 1930, the date by which it is assumed the super-power plant could be erected and the necessary extensions to existing stations made to deal with the load. As is obvious from the figures we give above such extension and concentration is eminently desirable.

Steam and Water Power—Capital Stations.

Under the super-power system the number of power stations required in 1930, including seven "extra super" stations, which it is suggested should be erected, will be reduced to 273, of which 218 will belong to existing undertakings. Four of the new large stations will be steam driven and will have capacities from 60 000 to 300 000 kW, with turbo-generator units not less than 30 000 kW. The remainder of these stations will be operated by water power and will apparently have an aggregate capacity of about 1 050 000 kW, though there seems a little discrepancy in the report on this point. Eventually the powers of the St. Lawrence and the Niagara River might be available for supplying the zone.

It is rightly recognised as of importance that the new power stations should be located so as to ensure the maximum economy both in generation and transmission, and that to do this existing plant which can be economically utilised will be employed to the fullest possible extent. From what we have already said it is obvious that this will be done where the stations make that course possible.

Some Financial Advantages.

A further argument for consolidation is shown by the statement that of the 12 650 240 000 kWh generated in 1919 about 9 311 440 000 kWh were developed in private stations, and only 3 338 800 000 kWh were purchased. Some striking figures are given of the financial, let alone the engineering, disadvantages of this individual growth. It is said, for instance, that the 96 000 establishments could save $190 000 000 annually above their fixed anual charges on the capital investment of $185 000 000, necessary to provide motor and other equipment for using electric power. Moreover, a capital sum of $856 000 000 would have to be provided by the present electricity supply undertakings to meet the demand for power in 1930, while under the super-power system this sum would be reduced to $693 218 000, or an annual saving of $16 300 000. As regards the cost of the power itself, it is estimated that in 1930 with the super-power system in working order, the cost at the bus bars of the present electricity undertakings, inclusive of fixed charges, would be 1·06 cents. per kWh, while under the independent system it would remain the same as in 1919, *i.e.*, 2·12 cents. per kWh. This is rightly stated by Mr. W. S. Murray as being a fundamental argument in favour of the change.

The Waste of Small Plants.

If further argument is needed on this point we may call attention to the statement that in 1919 it would have been economical to shut down 4 008 200 h.p. of prime movers in small plants and purchase energy to the amount of 5 623 800 000 kWh instead. The saving in coal thus effected would have been 13 502 100 tons, or 71 per cent. of the coal used by the industries for producing power, or 25 per cent. of all the coal used by the industries. In general it was found, as might be expected, that plants which require 500 h.p. or less can economically draw their energy from the mains, though an exception is made in the case of those which obtain power as a by-product of the industrial processes which they carry on.

Railway Electrification.

The matter is carried a step further in connection with railway electrification as the zone contains systems upon which the traffic is sufficiently dense to warrant a careful consideration of the savings that might be effected by making this change. It is pointed out that about $150 000 000 is already spent annually by the railways in extensions and improvements, and that this sum would in three or four years suffice to cover the cost of electrifying the 19 000 miles of track which could be profitably converted. We are glad to see in this connection that Mr. Murray insists that it is the business of the supply undertakings alone to generate electricity and that railways and other industries should purchase energy, not make their own.

Technical Advantages of the Zone.

From the purely engineering point of view the super-power zone scheme has many advantages. Though there is not so much water power available as, for instance, in California it will on the other hand be possible to erect three steam stations in the anthracite region at sites on the Susquehanna River where sufficient condensing water is

present to allow plant of a capacity of 300 000 kW to be used. In addition five hydro-electric stations on the Potomac, Susquehanna, Delaware, Hudson and Connecticut rivers will allow an aggregate capacity of 1 050 000 kW to be developed. Existing steam plant with a capacity of 2 677 000 kW or 79 per cent. of the total capacity in 1919 will be retained with an average capacity of 44 600 kW. Apart from extra super power stations fourteen further stations with an aggregate capacity of 3 930 000 kW will be required by 1930. The extra super-power transmission system will consist of 970 miles of line operating at 220 000 V and 4 696 miles of line operating at 110 000 V, and to these lines will be connected 5 600 000 kVA of transformers. In general 220 000 V will be the transmission voltage from the power stations at a considerable distance from the load, while 110 000 V will be used within the power area and between load centres.

Some Important Omissions.

Taking into account British conditions only these are figures at which the imagination boggles. It must, however, be noted that the problem differs, in degree not in kind from that with which we are faced in this country, and that this area, large as it is, is the one which industrially speaking is the most developed in America. It is a pity therefore that Mr. Murray's study could not have been extended to the entire country when it would have been easier both for American engineers and ourselves to envisage the conditions both in a more wholesale way and in the proper perspective.

Interesting and important as the report is, however, there are two important omissions. Nothing is said about either the financial or the legal means by which this Gargantuan development is to be carried out. Engineering problems are hard enough to solve, but as we know to our cost they become insignificant compared with these factors. Electrical engineers connected with the "super-power zone" are, we fear, only at the beginning of their troubles.

Rates and Rate Aid.

The engineer and manager of the Liverpool Corporation electricity undertaking is to be heartily congratulated on a successful year's working. Indeed, he has been a little too successful, for the net profit of the department for 1920 amounts to very nearly £147 000, of which enormous sum no less than £60 000 has been devoted to the relief of rates, the balance being transferred to the renewal fund. In view of the purchase of the undertakings of the Bootle Corporation and of the Liverpool District Lighting Company, nothing but good can be said about the latter allocation, but we are very much opposed to the policy of transferring so large a sum as that proposed to the consolidated rate fund. No doubt the ratepayers will be glad of any relief, however slight, in these days of crushing rates and taxes, but it will be so small that it would be much sounder finance, both for the individual and for the industrial prosperity of the city, if a reduction in the charges for electricity for power and lighting were now made. This is the only correct policy to pursue in a municipal trading department. For reduced power charges would enable manufacturers to lower their costs of production, and place them in a better position to meet competition at home and abroad. Only in this way will the industrial revival, of which we are glad to see signs, really arrive.

The Legal Position.

Unfortunately the law relating to the disposal of the so-called profits of municipal electricity undertakings is not very definite, and it would be well if it were amended to meet modern conditions. By Clause 7 of the Electric Lighting (Clauses) Act of 1899 the revenue of a municipal electricity supply department must be applied in payment of working and establishment expenses, maintenance charges and interest on loans, in providing sinking fund instalments, and in paying all the other expenses of executing the Special Order, not being expenses properly chargeable to capital. Subject to this, the local authority *may* create a reserve fund not exceeding in amount one-tenth of the aggregate capital expenditure, and then the net surplus in any year, as well as the annual proceeds of the reserve fund when amounting to the prescribed limit, *may* be carried to the credit of the local rate, or may be applied to local improvements, or in reduction of the borrowed capital. When, however, the net surplus exceeds 5 per cent. of the capital expenditure, the undertakers must make "such a rateable reduction in the charge for the supply of electrical energy as, in their judgment, will reduce the surplus to that maximum rate of profit."

Practice of Local Authorities.

It is obvious that, in addition to lack in clarity, the clause is mainly permissive. There is a wide choice of objects to which the net profit, until it exceeds 5 per cent. of the capital expenditure, may be devoted, and the practice of local authorities varies as widely. Some arrange matters by voting sums to the relief of rates and to other purposes, so that the 5 per cent. limit is never reached. This is scarcely fair to the consumers. It retards local industrial progress, and is detrimental to the best interests of the local authorities. We should, therefore, like to see it made illegal for any supply undertaking to relieve the rates until the prices of electrical energy for power and lighting were reduced at least to the pre-war figures. At present the Electricity Commissioners have not any very great authority over municipal finance, though they can exert a great deal of indirect pressure; and they may, and we hope will, use their influence to discourage rate relief until the supply is much cheaper than it is at present.

What is Capital Expenditure?

There is some doubt as to what is the precise meaning of the "capital expenditure" of a municipal electricity department at a given time. Loans are usually repaid either by annual instalments of principal and interest, or by means of yearly contributions to sinking funds, or by a combination of both methods. In the case of Liverpool the capital expenditure at the end of 1920 was returned at £2 699 423, but about £850 000 had been repaid, and the reserves and sinking fund amount to over £1 600 000. If, therefore, we take the repayments of capital, the reserves, and the sinking fund into consideration, the net capital outstanding is a comparatively small figure. But upon which of these items, the gross or the net capital, the 5 per cent. is to be calcalculated is not clear. By taking the former a local authority might postpone a compulsory reduction in price, and devote sums to relief of rates in a way which would not be possible if the calculation were based on the net, written-down value of an undertaking.

We have taken the Liverpool undertaking, which is one of the most progressive and best managed in the country, as an illustration, and we do not challenge anything in their business methods, except the allocation of so large a sum to the relief of rates.

Flux Distribution in Air Gap and Teeth of Dynamos.

By ALFRED STILL.*

This article deals with the flux distribution in the air gap and teeth of dynamos from the standpoint of fundamental laws and principles, it being found that in presenting such problems to engineering students it is as well to avoid many of the methods used by the practical designer. The subject is dealt with under the headings of permeance of the air paths, the air gap, and of the conditions in highly saturated teeth. Calculations of the tooth density in terms of air gap density and m.m.f., with a correction for the tapering of the teeth are made, the whole argument being illustrated by a numerical example.

Although this article explains the derivation of a new formula for use in calculating the ampere-turns required to overcome air-gap and tooth reluctance, its aim is not so much to contribute additional material for the use of the designer as to explain how the difficult problem of tooth and slot reluctance may be solved without the use of empirical constants or tables of design co-efficients. The writer finds that, in presenting design problems to engineering students, it is well to avoid many of the methods used by the practical designer, and base all arguments and calculations on fundamental laws and principles. If, at the same time, this leads to methods of calculation which are neither longer nor more tedious than those used by practical designers, they would seem to be preferable to all others, not only because they tend to keep in sight the physical aspects of the problem, but also because, when departures are made from standard designs, their application will generally yield more accurate results.

Permeance of the Air Paths.

To calculate the permeance of the air paths over one slot pitch at the centre of the pole face, when the density is low, the magnetic lines will be supposed to follow the paths indicated in Fig. 1. The tooth is drawn for convenience with parallel sides, and the magnetic lines entering the sides of the tooth are supposed to follow a path consisting of a straight portion of length δ, equal to the actual air clearance, and a circular arc of radius r, all as indicated in the figure. This is

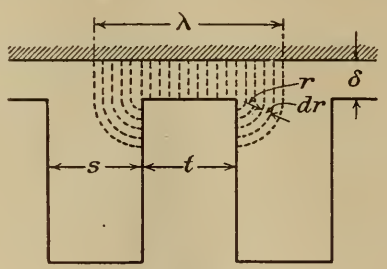

FIG. 1.

obviously an arbitrary assumption, but it is convenient for calculation and gives very good results. It agrees very closely with the results obtained by Messrs. H. S. Hele-Shaw, Alfred Hay, and P. H. Powell in their classic Institution Paper,† and also with the correct mathematical conclusions arrived at by Mr. F. W. Carter, based on certain assumptions, including that of infinite permeability of the iron in the teeth.‡

The Air Gap Analysed.

Consider a portion of the air gap 1 cm. long axially (*i.e.*, in a direction normal to the plane of the section shown in Fig. 1) and note that the permeance over the slot pitch of width λ is made up of two parts: (1) the permeance P_1 between pole face and top of tooth, of value $P_1=\frac{t}{\delta}$, and (2) the permeance $2P_2$ where P_2 is the permeance between the pole face and one side of the tooth. The permeance of any small section of thickness dr and depth 1 cm. measured axially, as indicated in Fig. 1, is:

$$dP_2=\frac{dr}{\delta+\frac{\pi}{2}r}$$

whence

$$P_2=\frac{2}{\pi}\int_0^{\frac{\pi}{2}}\frac{dr}{\frac{2\delta}{\pi}+r}$$

$$=\frac{2}{\pi}\log_\epsilon\frac{\delta+\frac{\pi s}{4}}{\delta}$$

The average permeance *per square centimetre* over the slot pitch at centre of pole is, therefore:

$$P_{sq.\,cm.}=\frac{P_1+2P_2}{\lambda}$$

$$=\frac{\frac{t}{\delta}+\frac{4}{\pi}\log_\epsilon\left(\frac{\pi s}{4\delta}+1\right)}{\lambda}$$

where the tooth pitch, λ, is expressed in centimetres.

The reciprocal of this quantity is the reluctance per square centimetre of air-gap cross section, or the length, δ_e, of what may be called the equivalent air-gap. Thus:

$$\delta_e=\frac{\lambda}{\frac{t}{\delta}+\frac{4}{\pi}\log_\epsilon\left(\frac{\pi s}{4\delta}+1\right)} \quad \ldots\ldots\ldots\ldots\ldots\ldots (1)$$

This is the length of air gap that would be necessary to give the same air-gap reluctance between pole and armature if the actual toothed armature were replaced by a smooth core armature. The formula (1), when applied to normal designs of dynamo-electric machinery, gives results very similar to those obtained by the application of the many and various formulas used by designers, some of which are approximations to the values obtained by using Carter's co-efficients, while others include empirical constants. No exact formula has yet been evolved, and, owing to the difficulty of allowing for variations in the permeability of the iron in the teeth, and also to the fact that such variations will cause corresponding changes in the length of the equivalent air gap, the designer need not look for any closer approximation than that obtainable from formulas now available.

A formula which is simpler to use than formula (1) is that proposed by Mr. T. C. Baillie §; it gives values for δ_e very closely approximating to those obtained from formula (1) and also from the use of Carter's co-efficient. When put in the same form as formula (1) it may be written:

$$\delta_e=\frac{\lambda}{\frac{t}{\delta}+\left(\frac{5s}{5\delta+s}\right)} \quad \ldots\ldots\ldots\ldots\ldots\ldots (2)$$

If the radial ventilating ducts in the armature are closely spaced, or exceptionally wide, the gap δ_e for the equivalent smooth-core armature, as given by formulas (1) and (2), might have to be slightly modified, but the calculation of fringing at the sides of vent ducts is usually an unnecessary refinement.

Conditions in Highly Saturated Teeth.

Consider now Fig. 2, which illustrates the extreme case of a highly saturated tooth. The lines of flux are shown parallel over the whole of the slot pitch, a condition which is

*Professor of Electrical Design, Purdue University, U.S.A.

§ THE ELECTRICIAN, Jan. 8, 1909, p. 494.

approached—but never attained—as the density in the tooth is forced up to higher and higher values. It is obviously only when the permeability of the iron in the tooth becomes equal to unity—that is to say, equal to the permeability of the air paths—that this parallelism of the flux lines would occur. This is an extreme, and, indeed, an impossible, condition ; but

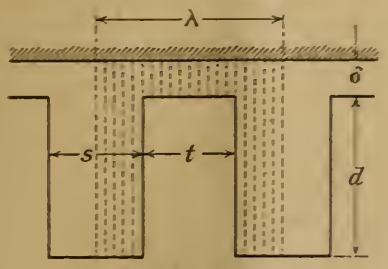

Fig. 2.

since, even at comparatively low flux densities in the iron of the teeth, there will be some flux passing directly from the pole face to the bottom of the slot in addition to the flux lines indicated in Fig. 1, a close approximation to actual conditions may be obtained by assuming a parallel field between the pole face and the iron at the bottom of the slot superimposed upon the field of Fig. 1. The resultant or actual field in the air gap and slot will then be somewhat as indicated by the flux in Fig. 3. With low values of tooth density, the m.m.f. between the tooth tops and the bottom of the slots will be small, and few flux lines will pass from the pole face into the armature core without entering the teeth ; but with higher tooth densities the m.m.f. to overcome tooth reluctance becomes large, and more flux will be diverted into the parallel path and pass directly from the pole face to the bottom of the slot. The amount and distribution of the flux in the air gap and slot will, therefore, change with every alteration in tooth density.*

Calculation of Tooth Density in Terms of Air-Gap Density.

Notwithstanding the fact that the inclusion of the flux component which passes directly from pole face to bottom of slot will modify the length of the equivalent air gap and cause this to be dependent upon the flux density in the teeth, no appreciable error will be introduced by considering the reluctance of air gap, teeth, and slots as consisting of two reluctances in series, (*a*) the reluctance of the equivalent air gap (as calculated by formula (1) or (2) for the centre of the pole face), and (*b*) the reluctance of the tooth and slot in parallel. The calculation of this latter quantity depends upon a knowledge of the actual flux density in the tooth. For low densities in the iron—up to about 14 000 gausses—the actual

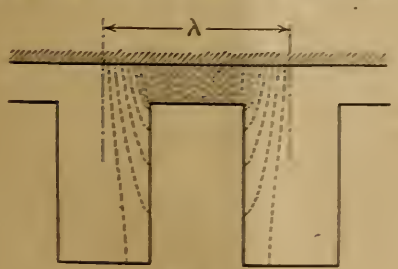

Fig. 3.

tooth density will be approximately equal to the apparent density ; that is to say, practically all the flux entering the armature over one tooth pitch will pass into the core through the root of the tooth. For densities exceeding 14 000 gausses, and even for lower values when the depth of slot is small in relation to the air gap, the calculations should take account of that component of the total flux which goes from the pole face to the bottom of the slot without entering the teeth.

*The method here outlined for attacking the problem of tooth and slot reluctance is similar to that proposed by Mr. F. H. Douglas in the "Electrical World," of Oct. 24, 1914 (Vol. 64, p. 812) except that he uses Carter's co-efficient instead of formula (1) or (2) in obtaining an expression for the equivalent air gap.

The following symbols will be used in the calculations :

B_g = the average air-gap flux density at armature surface ; i.e., the average density over one tooth pitch of width $(t+s)=\lambda$ and length l_a.

B_t = the actual flux density in the tooth.

μ = the permeability of the iron in the teeth.

B_s = the flux density in the slot and parallel spaces occupied by air or insulation.

l_a = the gross length of the armature core.

l_i = the net length of the armature core (iron only).

The other dimensions are given in Fig. 4.

M.M.F. Calculation.

The full m.m.f. necessary to overcome the reluctance of air gap and teeth acts between two cylindrical equipotential surfaces passing through the bottom of the slots and the roots of the teeth. The assumption is now made that this total m.m.f. is the summation of two m.m.f.'s acting in series, the one of value $B_g\delta_e$ required to overcome air-gap reluctance, and the other of value $\left(\frac{B_t}{\mu}\right)d_t$ to overcome the tooth reluctance. Since the flux component in the slots and parallel spaces not occupied by iron will depend upon the total m.m.f. between

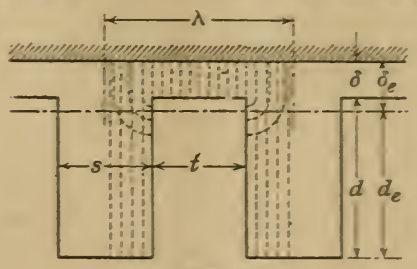

Fig. 4.

the two equipotential surfaces previously defined, we may write the equation :

$$B_t(d_t+\delta_t)=\frac{B_t}{\mu}d_t+B_g\delta_e$$

whence
$$B_t=B_t\frac{d_t}{\mu(d_t+\delta_t)}+B_g\frac{\delta_e}{(d_t+\delta_t)} \quad \ldots\ldots\ldots\ldots (2)$$

The total amount of flux entering the armature over the space of one tooth pitch is :

$$B_g\lambda l_a=B_t t l_a+B_s(\lambda l_a-t l_a) \quad \ldots\ldots\ldots\ldots (3)$$

By inserting for B_t in this equation the value given by (2), it is possible to express B_g in terms of B_t, the final expression being :

$$B_g=B_t\left[\frac{(d_t+\delta_t)+\frac{d_t}{\mu}\left(\frac{\lambda l_a}{t l_a}-1\right)}{d_t\left(\frac{\lambda l_a}{t l_a}\right)+\delta_t}\right] \quad \ldots\ldots\ldots\ldots (4)$$

By selecting a number of values for B_t, the corresponding values of μ can be obtained for the particular quality of iron used in the armature. The air-gap density B_g can thus be calculated, and a curve plotted giving the relation between B_g and B_t for the particular design under consideration and for any value of tooth density.

It is interesting to note the form taken by formula (4) for the limiting conditions of tooth saturation ($\mu=1$) and infinite permeability of the teeth. In the first case we have the condition $B_g=B_t$, which is obviously correct, while in the second case ($\mu=\infty$),

$$B_g=B_t\left[\frac{(d_t+\delta_t)}{d_t\left(\frac{\lambda l}{t l_a}\right)+\delta_t}\right] \quad \ldots\ldots\ldots\ldots (5)$$

a formula which will be sufficiently accurate for all practical purposes when the value of B_t is less than (say) 14 000 gausses.

The formula (5) shows that the actual tooth density is never quite equal to what is known as the apparent tooth density, which assumes all the flux leaving the pole face to pass through the teeth. On this assumption the relation would be :

$$B_g=B\left(\frac{t l_a}{\lambda l_a}\right) \quad \ldots\ldots\ldots\ldots (6)$$

(*To be concluded.*)

Auxiliary Features in Automatic Telephone Systems.*

An Impulse Converter.

By W. AITKEN, M.I.E.E.

In the Relay Automatic Telephone Company's system a device is used which responds to the dial, or other, impulses, and builds up a circuit to energise a relay associated with the called line to complete a connection. This device was for some time called a "selector," but there was confusion between this and the "Strowger" selector. It was then called a "recorder," which appears inapplicable, as it records nothing. I have taken the liberty of naming the device to be described a "converter," because it converts a set of impulses into a circuit that will call a line having that impulse code. In the commercial system a 100-line converter is used, in which a set of interacting relays, in response to impulses, first build up the tens and then the units circuit to energise a relay on the called line.

The impulse converter shown in the diagram is for a capacity of ten to fifteen lines, but could probably be developed farther. In its present form it might be used for small offices or for selecting groups of trunks. It is interesting as showing the number of lines that may be called by the manipulation of two wires and earth by the emission of two impulse operations only. This requires two wires and earth or three wires.

Contacts K1, K2, and K3 may be closed in any suitable way, as by keys. K1 and K2 are the impulsing contacts.

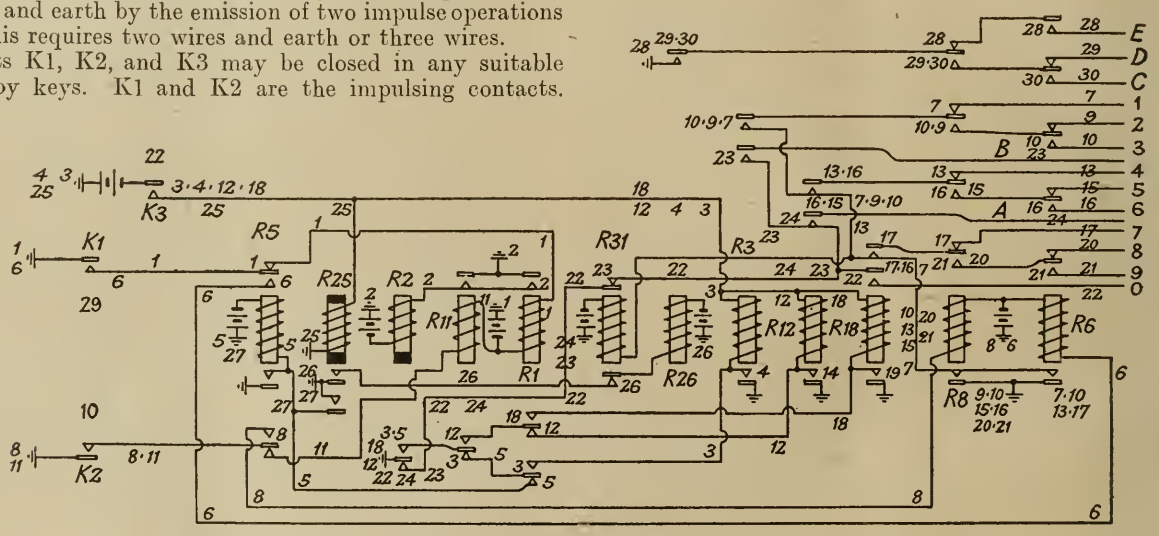

Diagram of the Impulse Converter.

A slow relay de-energises after the emission of one or after two impulses, as the case may be. The contact K3 is closed for a period corresponding to the other contacts except in the case of the three last circuits (E, D, E), when it is closed for a period prior to the impulses to give time for a slow-to-energise relay (R25) to energise.

Contacts K1 and K2 are in the two wires of the line circuit. The circuits are numbered as follows:

Contact K3 is closed in a suitable manner for a time sufficient to allow R25 to energise.

1. R1 energises when K1 is closed.
2. R2 (slow to de-energise) energises.
3. R3 energises.
   K1 opened and R1 de-energises but not R2 and R3—
4. R3 holding circuit.
5. R5 energises.
   R1 again closed.
6. R6 energised.
7. External apparatus may be energised over line No. 1.
   If K2 had been closed in a manner similar to K1—
8. R8 energised.
9. External apparatus on line 2 would be energised.
   If K1 and K2 had been closed together for the second impulse R6 and R8 would be energised—
10. An energising circuit would be completed over line 3.
11. If K2 closed for the first impulse R11 and R2 energise.
    If K1 closes for the second impulse—
12. R12 energises.
14. R12 locking circuit.
    K2 held open R5 energises in circuit 5.
13. Energising circuit over line 4.
    If K2 closed twice, R12 and R8 energise—
15. Energising circuit over line 5.
    If K2 is first closed, then K1 and K2 together R12, R6 and R8 energise.
16. Energising circuit over line 6.
    If K1 and K2 are closed together then K1 closed, R1, R11 and R18 energise.
17. Energising circuit over line 7.
18. R18 energises.
19. R18 holding circuit.
    If K1 and K2 are closed together, then K2 closed, R8 and R18 energise.
20. Energising circuit over line 8.
    If K1 and K2 are closed together twice, R6, R8 and R18 energise.
21. Energising circuit over line 9.
    If K1 and K2 are closed together once, and then released, R2 de-energises and R18 energises.
22. Energising circuit over line 0.
    If K1 closed once, R2 de-energises and R3 energises.
23. Energising circuit over line B.
    If K2 closed once, R2 de-energises and R18 energises.
24. Energising circuit over line A.
25. K3 is closed for a time sufficient to allow R25 to energise.
26. R26 energises.
27. R5 energises.
    K1 closed once, R6 energises.
28. Energising circuit over line E.
    K2 closed once; R8 energises.
29. Energising circuit over line D.
    K1 and K2 closed together once; R6 and R8 energise.
30. Energising circuit over line C.
    R31 may be introduced to further safeguard circuits C D. E, and be operated for circuits to lines 1 to 9.

Improved Handling Facilities at Docks.

Considerable activity prevails at many of the important ports in order to provide better handling facilities. At the new cold storage building of the Union Cold Storage Company at Alexandra Branch Dock No. 3, Liverpool, extensive use is made of modern handling machinery. There is an overhead meat conveyor, extending the full length of sections 14 and 15 of the north shed of the Alexandra Branch Dock No. 2, with an overhead cross conveyor connection to the new building. The Company will also carry out extensions at the Albert Dock, and provision will be made for the electrical operation of the machinery. The Mersey Docks and Harbour Board have purchased twenty-four warehouses in Bootle, and electric mains for lighting, power and heating are being laid.

Extensive additions are being made to their equipment by the Leith Harbour Commissioners. A large new shed has been erected on the north side of the Imperial Dock, and there are electric cranes both in the shed and on the quay. For the continental traffic additional railway sidings have been constructed, and cranes and capstans installed. Power capstans are also being provided throughout the dock area. New equipment is also being installed on the Clyde dock system, and at two docks hydraulic coaling cranes are being replaced by electric cranes and capstans.

THE LANCASTER-MORECAMBE-HEYSHAM ELECTRIC RAILWAY.

Some Experiences of Fourteen Years' Working with the Single-Phase Overhead System.

(*Concluded from page* 129.)

The Lancaster-Morecambe-Heysham branch of the Midland Railway was equipped with single-phase electric traction in 1908 to obtain experience which would be valuable in dealing with the wider problem of main line electrification. This article gives an account of the failures and modifications which have been shown to be necessary in various parts of the apparatus during fourteen years' working. Protective devices, bonding, induction effects, power supply and the traction equipment are dealt with.

Protective Devices and Earthing.

As regards lightning protection three sets of safety devices are fitted at Heysham Harbour. These consist of a choke coil to take off thunder discharges, a Moseiki condenser for high frequency discharges, and a Giles' valve for discharges of a more moderate frequency. A lightning arrester is also fitted on the overhead equipment every half-mile, and an earth wire connected to the gantries is run the whole of the line, being connected at intervals to heavy rubber insulated cable which in turn is connected to earth plates. Large earth plates are also fitted in duplicate at Heysham Harbour and at Morecambe at the end of the Midland Railway pier. These plates are of copper and for protection are enclosed in large iron caissons. At Lancaster the running rails are earthed to the cast iron columns of the bridge across the Lune, where water is always flowing. As a test of the efficiency of the various earths, recording ammeters were put in to indicate the proportion of current which returns by this route. It was found that this current was negligible, all the current being dispersed from the rails into the earths within a very short distance.

Bonding.

For bonding purposes the Forest City type bond is employed, the outer rail of each line being bonded throughout its length in duplicate. For protection the bonds are placed under the fish-plates. At all crossings and junctions the rails are bonded together for greater continuity, these bonds as well as those used for cross bonding being copper cable bonds of the ordinary type.

During the installation of the bonding very great care was exercised to prevent any moisture getting into the drill holes or on to the bond plugs, and this care has been justified by the comparatively few bonds which have had to be replaced under ordinary maintenance. Approximately, about 40 cable bonds of various lengths have, however, had to be removed at junctions owing to the copper strands having broken from vibration, while about 1 500 of the ordinary bonds have had to be removed at various times in consequence of re-laying operations or the removal of the rails. About 83 per cent. of the bonds thus removed have been rendered fit for further use by conversions into pin bonds. This has been effected by drilling the solid terminals. It was found that the damage to the bonds was very much less between Heysham Harbour Junction and Morecambe, where the permanent way is solid, than between Lancaster and Morecambe, where the permanent way is less solid, and the fish plates were therefore often badly worn.

Induction Effects.

A point which always arises with single phase railways is the effect their operation will have on neighbouring telegraph and telephone wires. Telephone and telegraph wires run alongside the line through the whole of the electrified section, and some valuable results as to inductive effects have therefore been obtainable. Inductive influence was to some extent removed by installing the earth wire which, as mentioned above, is fixed to the gantries between the high tension contact wire and the telegraph wires, while by arranging an electrostatic E.M.F. to counteract the induced E.M.F. on the A and B wires of the telephone complete silence has been obtained over the short lengths involved. Over long distances, however, it is probable that inductive effects would continue to cause trouble, and it is one of the points which those employing single phase traction will have to consider carefully, and especially to follow closely the work which has been done in this direction in America.

It may be added that for communication purposes portable telephones are provided at a number of places between the stations over which the engine driver may give information or receive instructions from the signal box. Both the signalling and the telegraph and telephone wires are protected by a link consisting of a carbon lamp.

Power Supply.

A few words may be said about the power house from which the line is supplied. This is situated at one end of the line at Heysham and was originally equipped with three sets of American built Westinghouse gas engines and generators, each with a capacity of 150 kW, for supplying the power load at the harbour. A battery with a capacity of 100 kW at the five-hour discharge rate was also installed. When the electrification of the Lancaster-Morecambe-Heysham section took place an additional engine with a capacity of 235 kW was added, this set being of the six-cylinder tandem British Westinghouse type. These engines are supplied from two Mond gas producers each with a 1 000 H.P. capacity with the necessary auxiliary blowing, steam producing and cooling apparatus. Steam for the gas producers is raised in a locomotive type boiler, using locomotive smoke box ashes as fuel, and by boilers using the exhaust gas from the engines. During the war it is interesting to note that advantage was taken of the gas-making plant to supply large quantities of ammonium sulphate, though the present day prices do not make the production of this useful chemical worth while.

Generating Changes.

At first the energy for traction was obtained from two E.C.C. motor generators, each with a nominal capacity of 175 kW single phase output, but capable of peak outputs as large as 700 kW. This latter output is occasionally obtained when three trains on the line start together. These sets were designed with very low constant losses, but notwithstanding this, the infrequency of the electric service over the greater part of the year brought down their overall efficiency to about 50 per cent. only. In 1914, therefore, the three original Westinghouse engines were replaced by two tandem sets, each with a capacity of 235 kW. These were coupled through helical gearing to the motor generators which thus became double current sets so eliminating the constant losses of one machine per set. Under this arrangement traction peaks are supplied first by the whole power of the engine being transferred to the alternator, any charging current that has been passing into the battery ceasing, and the battery taking over the harbour direct current load. Subsequently, any further access of alternating current load causes the direct current machine to motor from the battery and help the engine. A Westinghouse regulator controls the battery booster in place of the original and usual arrangement of control governed by variations of the direct current load. The station is of interest because, although it is equipped with gas engines, it deals successfully with very heavy load variations, and also because of its very small capacity in comparison with the peak loads with which it has to deal.

Traction Equipment.

Turning to the design and equipment of the rolling stock a very full description of the original cars provided by Siemens Brothers Dynamo Works and the British Westinghouse Company is given on page 363 of THE ELECTRICIAN, June 19, 1908. In general, these cars have proved fairly satisfactory during the thirteen years' operation, and further reference to their design and equipment is therefore unnecessary. We, however, give a few details of points which have received attention with sufficient information about the original equipment to make these clear. Two out of the three motor-cars provided for running the line were equipped with Siemens' equipment of German manufacture, and one was equipped with American Westinghouse equipment. The latter has straight series compensating motors and electro-pneumatic control and has been entirely satisfactory throughout.

Original Specifications.

It is true that nowadays the brush construction and brush gear wear would be considered excessive compared with direct current equipment, but it must be remembered that these cars are fifteen years old. The original specification called for two motors per car, both of which were to be carried on one bogey, it being considered both the more economical and the more mechanical arrangement to concentrate the motive power and reduce the number of parts as much as possible. The normal train was specified to consist of a motor-car and two trailers. The weight of these without any electrical apparatus or mountings is 25 tons and 17 tons respectively, with a total passenger capacity of 310 with 180 seats. The contractors were also required to make their equipments capable of being worked from the same master controllers, while the motors in the case of the Siemens set were nominally of 180 H.P. output, and in the Westinghouse set of 150 H.P. output. The specification required that these motors should be capable of delivering their declared

output for one hour with a temperature rise not exceeding 135°F. on the test bed and a temperature rise not exceeding 90°F. after having run the three-coach train for six double trips from Heysham to Morecambe, Morecambe to Lancaster and return. The collector bows which deviate a little from the standard practice usual at the time have given no trouble. The weight of the Siemens motor coach is 40 tons 10 cwt. and of the Westinghouse 37 tons 10 cwt.

Motor Details.

The two Westinghouse motors embody resistance strips in the armature connections to the commutator, but there is no record of strip failure on these equipments; electro-pneumatic control gear has also been entirely satisfactory. The equipment was of a type already in some use elsewhere and was standardised when it was purchased.

The Siemens equipments, on the contrary, were among the very early productions of their makers and embodied a number of features wherein theory was in advance of practice. They have therefore not been quite satisfactory, and, in fact, it is believed that the two Midland equipments are the only ones of the batch made to these designs which survive to-day in actual work.

The motors are series compensated type with the addition of a commutation winding, and also have resistance strips. In this case these have been the source of much trouble; there have also been other weaknesses, both mechanical and electrical.

Mechanical Defects.

The original lubricating system was very elaborate, and failed because its pump and pump drive would not stand up to the work. It was simplified to a simple reservoir and oil-pad arrangement with a new bearing and a motor end plate. The bearings originally wore too rapidly. They were bored slightly eccentric so as to carry the armature somewhat above the centre, and so relieve the weight. The spider mounting of the armature core did not give adequate bearing surface, the arms being too narrow so that the core worked loose. These arms had to be widened. The core looseness caused a great deal of breakage of connections the cause of which for some time was difficult to locate. Core looseness on traction motors, of course, is a defect not confined to single phase equipments.

Electro-Mechanical Defects.

In 1910 to 1911 a series of electrical troubles, which were finally traced to a mechanical fault, commenced and caused a very bad breakdown record for some six months. The faults consisted of short circuits between commutator segments, with consequent burn-outs of the winding sections; the cause was finally traced to bad mechanical design, inasmuch as the commutator quill was in two halves, which did not close up when the commutator was put together and tightened up. Access of dirt, &c., into the interior of the commutator was thus possible; in fact, copper and steel turnings were found inside most of the commutators and must have been there from the time of manufacture. Why they had not made their presence felt earlier is inexplicable.

Electrical Defects.

The earliest electrical troubles were short circuits on both armature and stator windings, resulting from dirt and carbon dust bridging the bare metal end connectors, which were too close together. Insulating distance pieces were inserted between each winding section, and the trouble was finally rooted out by cementing up the windings solid. Insulation failures to earth occurred mainly at the corners where the windings left the slots. These were attributed to vibration in the end windings set up by the a.c. current and damped down at the slot corners. This, also, was finally cured by cementing the windings. Earth faults developed due to dirt accumulating in the neighbourhood of the ventilating duct openings through the armature and stator. These ventilating openings were finally eliminated by rebuilding the armature and stator in solid form without them; a resulting gain of 1½ in. enabled the ventilation path to be reversed so as to blow from the windings to the commutator and not *vice versa*, an arrangement which blew all the carbon dust into the windings. So far as the stators in these motors are concerned this treatment has, practically speaking, entirely eliminated insulation breakdown both to earth and between windings.

Resistance and Connection Troubles.

Resistance strip and connection troubles have been the most difficult to overcome, the faults when driven from one point appearing elsewhere. By overheating and unsweating the commutator connection lugs, it was found that the area of connection between them and the resistance strips was not sufficient. The resistance strip was then soldered into a long tubular connector with which it had a large contact area and a copper wire connector was taken thence into the commutator.

Subsequently expansion of the straight resistance strips at both ends of the armature caused them to break; an "S" shaped bend was therefore embodied in them. Expansion trouble afterwards made its appearance inside the slots and occasionally under the binders, and this has not yet been altogether eliminated.

The main cause of the overheating of strips is the heavy current which passes at times of starting and the induced circulating current in the coils short circuited by the brushes when a motor is standing with current on.

Causes of Overheating.

Of these two causes of overheating it is believed that of the starting current is worse than that of the more infrequent case when a car fails to start at once (say on a gradient), and is not notched up quickly enough so that some coils remain short circuited for a period. The original type of strips accordingly have recently been discarded and other material of lower resistance substituted so to produce less heating from the starting current. The length of the strips has been increased to give added radiating surface and a square section has been used instead of the original flattened section in the slots so as to give added strength to resist the tendency to rising and kinking in the slots. So far this looks like being more satisfactory, the lower resistance rather improving commutation than otherwise.

Controller Defects.

Single phase all electric control gear has proved workable, but is more costly than d.c. in maintenance and inspection, and it is impossible to get rid altogether of the vibration which wears the working parts unduly. There have been a number of connection breakages which can only be attributed to this vibration arising from the a.c. drive. When these motors are in good condition their commutation is almost sparkless and their brush wear satisfactory, a mileage of 47 000 for one set of brushes having been recorded. The brushes are of the sliding type in box form brush holders, and though flexible connectors between brush and brush-holder are fitted, there is a good deal of brush-holder wear due to sparking between brush and brush-holder. This wears away the interior of the brush-holders and deteriorates the fit of the brushes in them, causing the brush to take up a different bearing as between one direction of travel and the other, and adversely affecting commutation by reducing the effective brush area. Re-lining of the brush holders is therefore necessary at intervals, and their complete renewal at longer intervals. An experiment tried with heavily coppered brushes and no flexible connection was unsuccessful, aggravating the above trouble though giving good enough operation at first.

Of course it must be borne in mind that these equipments, and particularly the Siemens ones, were among the very early single phase equipments. It is understood that most of the weak points brought out by the above history of defects have been eliminated in later designs; the latest American and British single-phase equipments, for example, have no resistance strips.

The work to which we have drawn attention in this article has been carried out under the supervision of Mr. J. Sayers, O.B.E., Telegraph Superintendent of the Midland Railway, and Mr. J. Dalziel, Chief Electrical Assistant in the Mechanical Engineer's Department. Mr. R. Meakin, chief draughtsman, and Mr. F. B. Holt, chief technical officer in the Telegraph Superintendent's Department, were largely responsible for the new design of overhead equipment.

Electricity Projects in Ceylon.

Though there has been much discussion in CEYLON about HYDRO-ELECTRIC DEVELOPMENT, so far little progress has been made. However, the recent visit of the Director of Public Works (Mr. Chapman) to Canada, Switzerland, France and Italy, and the visit of Lord Northcliffe to Ceylon have given a fillip to some of the proposals. Mr. Chapman is said to be now convinced that with an estimated cost of 7 cents per unit for electrical energy delivered at Colombo the existing industries could be revolutionised, while new ones would be readily attracted to the colony.

The Government have now decided to proceed with the Aberdeen-Laxapana hydro-electric project, but in partnership with an English electrical engineering firm. Of the necessary capital of about Rs. 14 000 000, the Government will contribute three-fifths by raising a special loan in England at an early date, and the remainder will have to be invested by the firm. The plans and estimates will be forwarded at an early date to the Crown Agents.

The sale of domestic electric appliances and small electrical goods locally has greatly increased. A year or two ago to find in Colombo daily newspapers a small advertisement referring to electric material was a curiosity; to-day it is quite common to find half a page devoted entirely to illustrating electrical goods.

Several British firms approached the authorities with a view to carrying out the scheme, but the Government are determined to finance the matter themselves, though they have no money available, and as the Colombo Municipality did not exercise the option to buy the Colombo electric tramways from Boustead Brothers, who have secured a renewed tenure of eight years, it was feared the Laxapana-Aberdeen electricity scheme would be shelved.

The Interconnection of Alternating-Current Power Stations*

By L. ROMERO and J. B. PALMER.

Since November, 1916, when Mr. J. S. Peck read a Paper on this subject, several interlinking schemes have been put into commission or projected, and the purpose of this Paper is mainly to show the importance of power-factor phenomena in interconnectors. While the conclusions arrived at apply with equal force to transmission lines which are not interconnectors, it is intended only to deal with the general problem of transmission lines connecting power stations.

In deciding the lay-out of an interconnector scheme the designer is confronted with the problems: What variation in power factor will result from interconnection with a given voltage "boost" applied to the interconnector? And conversely: What voltage "boost" will be required to transmit power at a given power factor of transmission. In the original Paper an appendix, giving formulæ for estimating these values, is included.

General Operating Conditions.

The division of load in any desired proportion between two a.c. power stations depends wholly on the adjustment of the steam supply to the prime movers. The adjustment of the field strength of the generators, or the raising of the voltage at the "sending" end only causes wattless kilovolt-amperes to flow round the circuit formed by the generators at the two power stations and interconnecting cable; the true power or kilowatts remains unaltered, except for the copper loss in the interconnector.

When current flows through a circuit having resistance and reactance (such as an interconnecting cable, with or without step-up and step-down transformers) the voltage at the two ends of the circuit will differ either in magnitude or phase displacement, or in both.

For a given load the position of the voltage triangle with respect to the current vector will vary with the difference in magnitude of the station voltages. The power factor of transmission at one end of the line can be controlled and kept constant by varying the voltage of one station with respect to the other, as the load varies.

There are three main conditions of voltage relationship under which power can be transmitted between two power stations, viz.:

(1) *Station voltages constant and equal.*—The mean power factor of transmission remains at a constant leading value. The power factors at the station ends of the interconnector vary (within small limits) in opposite directions as the load varies or reverses in direction.

(2) *Station voltages constant and unequal.*—The power factor of transmission varies with load in the direction of lag to lead as the load increases, and *vice versa* as the load decreases. This method is suitable only for transmission of power in one direction.

(3) *Station voltages varied by booster or other means as the load varies.*—The power factor may be kept constant at any desired value within the range of voltage variation available.

Station Voltages Constant and Equal.

Under condition (1) power may be transmitted in either direction without varying the voltage or mean power factor. The load in the interconnector is at a leading power factor throughout its length, the mean angle of lead depending on the ratio of reactance to resistance in the circuit. The power factor of transmission at the two ends of the line varies in opposite directions with the load, the mean power factor remaining constant.

This method might be used for a line connecting two stations each with a load at or near unity power factor, and where it was necessary to reverse at short notice the direction of transfer of power in the line. Under these conditions $\tan a = \frac{X}{R}$ where a is the mean angle of lead of the current, X is the reactance of the line, and R is the resistance of the line. By making X as large as would be safe from the point of view of synchronising power, the mean power factor of transmission might be fairly near unity. Power could then be transmitted in either direction without serious interference with power-factor values elsewhere. Unfortunately, most power stations are probably unable to receive and absorb into their systems a bulk supply at a leading (or even unity) power factor without serious disturbance to their operating conditions. This method has, therefore, a limited field of application unless special measures are taken to supply the large wattless component which might be required.

Station Voltages Constant and Unequal.

Under condition (2) the voltages are usually fixed to give the best power factor of transmission at full load. This method is used with success in some cases where load is trasmitted in one direction only. It makes it possible to transmit a fixed load at any desired constant power factor, but it is only suitable for transmitting power in one direction, as a reversal of power would flow at a low leading power factor. Further, the power factor varies with a change in load. Lastly, with a large voltage-difference in circuit it would hardly be practicable to operate without a regulator to reduce the voltage-difference when synchronism is approached or departed from; otherwise the sudden making or breaking of the large wattless current which would flow at no load would have serious effects on the busbar pressure at one or both stations. These considerations appear to rule out a fixed large voltage-difference, although this method gives fairly good results under favourable conditions, and where transmission is effected in one direction only.

Variable Station Voltages.

Condition (3) appears necessary in most cases. The variation of voltage may be obtained either (*a*) By varying the busbar voltages at one or both stations, or (*b*) By introducing "boost" in the interconnecting line.

For power undertakings distributing alternating current, variation of busbar pressure for this purpose is inadmissible since it means a corresponding variation in voltage at the consumers' terminals. This method can therefore only be used where the power to be transmitted is small and the interconnecting cable short. Almost invariably a fixed pressure is aimed at, and restored after longer or shorter periods of variation.

The introduction of boost into the interconnector is thus the only generally applicable method of varying the voltage relationship between the two stations. The variable boost in the line can be introduced by induction regulators, static boosting transformers with step-by-step regulators, or variable regulating tappings on the main transformers.

Types of Regulators.

In the original Paper the authors summarise the types of regulators that can be used, including the step-by-step and induction types. For large powers and high voltage the former type is at a disadvantage owing to difficulties in building the necessary remote-control switchgear. Contactor-type and face-plate step-by-step regulators are limited to pressures of about 3 000 V, and supplementary transformers are usually needed.

An induction regulator is in effect a transformer with one movable winding, and can be wound for pressures up to 11 000 V. At this voltage it is equivalent to two auxiliary transformers and switchgear as used in step-by-step methods, and is superior to it in simplicity and fineness of voltage regulation. In America, combinations of both types have been designed for the control of electric furnaces, and this field is promising. In three-phase induction regulators the secondary induced pressure is constant, the variation in resultant pressure (regulated) being obtained by an alteration of the phase angle between the applied and induced voltages. Where only two stations are interlinked there is not much objection to this method, but where more than two stations are concerned the phase angle thus introduced may lead to complications. Hence it is desirable to wind the regulator with its series winding in two halves, connected in reverse series. The resultant voltage is then in phase with the applied voltage.

Interlinking schemes are often required to be reversible. This simplifies the lay-out, as the plant at each end of the line can be in duplicate. However, the cost of the installation may be increased, and the requirement involves certain limitations. Where power is transmitted for considerable distances it is often desirable to instal regulating plant at each end of the line (each regulator half the total capacity), otherwise the voltage boost required by the regulator might bring the resultant voltage to a value too far above the nominal transmission voltage.

It appears that no regulators, either induction or step-by-step, have been developed for pressures above 11 000 V. In these circumstances regulators must be so connected as to operate by varying the pressure applied to the low-tension windings of the main transformers. This is feasible, but transformers required to give their full output over a range of primary voltage are larger and more expensive than those working at a fixed voltage. In the original Paper several alternative arrangements are illustrated.

Effect of Power-Factor Variation.

The power factor of transmission is important, since the capacities of the line, main transformers, and auxiliary apparatus, depend on it. Further (especially when the power factor of the normal connected loads on the interlinked power stations is different), it might happen that the station receiving power would find itself loaded with wattless kilovolt-amperes to such an extent as to neutralise the advantage anticipated from the interconnection.

Transmission from one station at unity power factor has some

* Abstract of a Paper read before the Institution of Electrical Engineers.

advantages. The capacity of line and transformers can be reduced and transmission losses are a minimum. The power factor at the second station is objectionably low. The excessive wattless component could be dealt with by a synchronous condenser, but its capital cost would not always be justified.

If synchronous condensers were installed, the most economical power factor of transmission would be unity. A small saving is obtained by their use, but they should only be installed when a substantial saving on the total cost of transmission could be effected.

Synchronising Power.

There are cases of interconnected alternating-current power stations where the synchronising power of the interconnecting line is not sufficient to produce satisfactory parallel running under the conditions of load fluctuation met with in practice. Trouble is unlikely to be experienced from this cause in the 33 000 V and higher voltage interconnection schemes to be laid down in this country in the near future.

It appears that the magnitude of the oscillations, and therefore the adequacy of the line from the point of view of satisfactory synchronous running, depends only on (*a*) the strength of the original desynchronising force, and (*b*) the synchronising power of the line.

The capacity of the stations would not, therefore, directly affect the magnitude of the oscillation. The authors are of the opinion that the adequacy of the synchronising power of a proposed interconnecting line should, if possible, be calculated theoretically before the line is installed, as the results of installing a line with inadequate synchronising power might be very costly.

Annual Exhibition of the Physical Society of London and the Optical Society.

(*Concluded from page* 99)

H. Tinsley & Company.

The exhibit of H. Tinsley & Company included several new instruments in addition to the apparatus already familiar to our readers. Among the novelties should be mentioned Shotter's integrator for flow meters, of which we hope to give a description at some later date. We also noticed an interesting design of disappearing filament pyrometer. This is a compact little instrument based on one developed by Messrs. Griffiths and Schofield, of the National Physical Laboratory, and made up complete with temperature indicator and rheostat so that it can be held in one hand, the cells being the only extraneous element. The special feature of

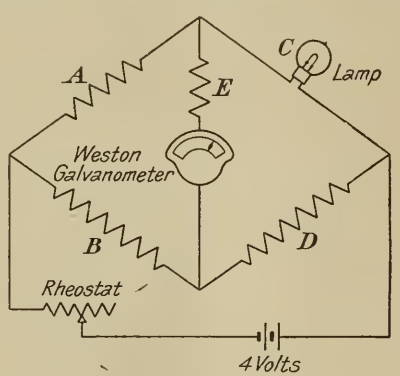

Fig. 21.—Diagram of Disappearing Filament Pyrometer.

the instrument is the arrangement of the electric circuits so that the lamp forms one arm of a bridge instead of being simply in series with a rheostat and a battery. Referring to Fig. 21, the arms A, B and D are of manganin, and the value of D is adjusted so that with the lamps running at some particular temperature, say 700°C, the bridge is balanced. The zero of the scale thus corresponds to 700°C. If now the current in the lamp is increased by adjusting the rheostat, thus increasing the current in all the arms of the bridge, the resistance of the lamp increases while the resistances A, B and D remain unchanged. There is then an out of balance current through the indicator, and consequently a deflection, which is a measure of the temperature. The resistance E is adjusted so that the upper end of the scale corresponds with the desired upper limit of temperature. This method has the great advantage that the range of temperature fills the whole length of the scale, whereas, if the indicator measures the current passing through the lamp then the temperature indications cover only a portion of the scale. This objection can be overcome by "setting back" the zero, but the controlling spring is then in a state of permanent strain. With the present arrangement the scale can be further extended by reversing the polarity of the battery. If the bridge is balanced at the mid-range point the deflections for temperatures below this value can, by reversing the battery, be made to be in the same direction across the scale as for those above this value. By this simple device the scale length becomes equivalent to 6 in.

A Low Frequency A.-C. Generator.

In some investigations it is necessary to have alternating current of very low frequency and of sine form. This is the case in investigating telegraph signals through long distance submarine cables. Apparatus for this purpose, however, is often not readily available, and therefore H. Tinsley & Company have produced a simple generator. This consists of a rheostat, over which a sliding contact travels through, being coupled to a rotating flywheel driven by a motor. A steady current is passed through the rheostat and thus a pure sine wave is obtained. By this means frequencies from 0·1 to 10 per second are possible. If higher frequencies are desired these can be obtained from slip rings fitted to the d. c. motor. The latter has been so designed as to eliminate harmonies.

A large inductance bridge for submarine cable investigations was also shown. The design is such that the lowest residual or resistance or impedance can be balanced out to a high degree of accuracy (to as many as 7 figures). Special attention is given to the time constants of the coils, and a compensated method of connection is used to maintain the inductance of the connections constant by having two separate studs for each coil.

Creed & Company, Ltd.

Messrs. Creed & Company exhibited their apparatus for high speed automatic printing telegraphy and gave demonstrations at intervals. Some of this apparatus was described fully in our columns a year ago. There was also exhibited a radio signalling key, which was primarily developed for the control of a 300 kW arc transmitter, as shown in Fig. 22, and diagrammatically in Fig. 23. The key, which is mainly pneumatic in its mechanism, is intended for control by an ordinary Wheatstone or other automatic transmitter or by a hand key. It is convenient to prepare the necessary, perforated paper tape for the control of the Wheatstone on a keyboard perforator, such as the Kleinschmidt. To those unfamiliar with ordinary line telegraph practice it may be explained that this is a machine resembling a typewriter which, on the depression of its keys, punches in a paper tape a series of holes grouped according to the characters of the Morse code. This tape is passed through and controls the Wheatstone transmitter, which is so arranged as to supply a small current in one direction until a signal is to be made, when the current is reversed for the duration of the signal. These currents in turn are passed to a Carpenter power relay A (Fig. 23), which operates the valve of a pneumatic engine C. This is known as the control engine. Reference to the diagram will show that this

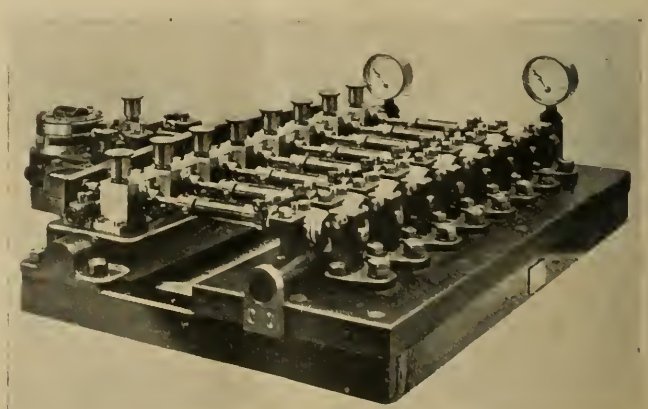

Fig. 22.—Signalling Key of 300 kW Arc Transmitter.

engine, through the medium of suitable link-work, is adapted to oscillate the rockshaft K. On this shaft are fitted saddle-pieces M to which are connected links operating the slide valves of a number of pneumatic engines P, as many as may be necessary for the power to be controlled, in this case eight. On insulated extensions of the

piston rods of these engines are mounted the silver-faced disc contacts R, which are thrust into contact with, or withdrawn from, the stationary adjustable contacts S. Beneath the row of contacts an air pipe, suitably slotted, introduces into the space between the opening contacts a ribbon-shaped draught of compressed air which cools the contacts, and helps to de-ionise the gaps. The de-ionising power of the silver contacts themselves is, however, mainly relied on, and provided the current to be broken is properly proportioned to the area of the contacts in use, much less flashing occurs in practice than might be expected. Moreover, the airblast required is of quite low pressure. It is found that, provided the current on contacts of the particular size fitted does not exceed 50 A, an air pressure of 14 in. of water is quite sufficient.

Perfect Synchronism Obtained.

It will be noted that the saddle-pieces M on the rockshaft are adjustable as to their angular position by means of their clamping screws. By this means it is possible to arrange for the contacts to open with almost perfect synchronism. The bias of the key may be adjusted by means of the buffer screws B B. Adjacent pairs of the moving contacts are connected together by laminated conductors, and corresponding pairs of the fixed contacts are connected to the ends of a single coil having mutual inductance with the A.T.I. The closing of the contacts reduces therefore the inductance of the A.T.I., thus altering the emitted wave-length.

The form of the key is such that any number of pairs of contacts appropriate to the power to be controlled may be used by the addition of extra pneumatic engines, and it will therefore be seen that there is practically no limit to the power for which keys can be built. The key shows good clear-cut signals at speeds up to about 120 words per minute Morse, with an air pressure of 2 kg per sq. cm. on the engines (28 lbs. per sq. in.)

This alteration of the emitted wave-length in order to effect the necessary signalling has been stated in the past to be more prone to cause interference with other stations than the method which utilises the complete starting and stopping of the oscillations in the aerial. It must be borne in mind, however, that extremely sensitive means of discrimination between the oscillations of different wave lengths exist, and that a very small percentage change in frequency is all that is necessary to effect signalling where a spacing wave is

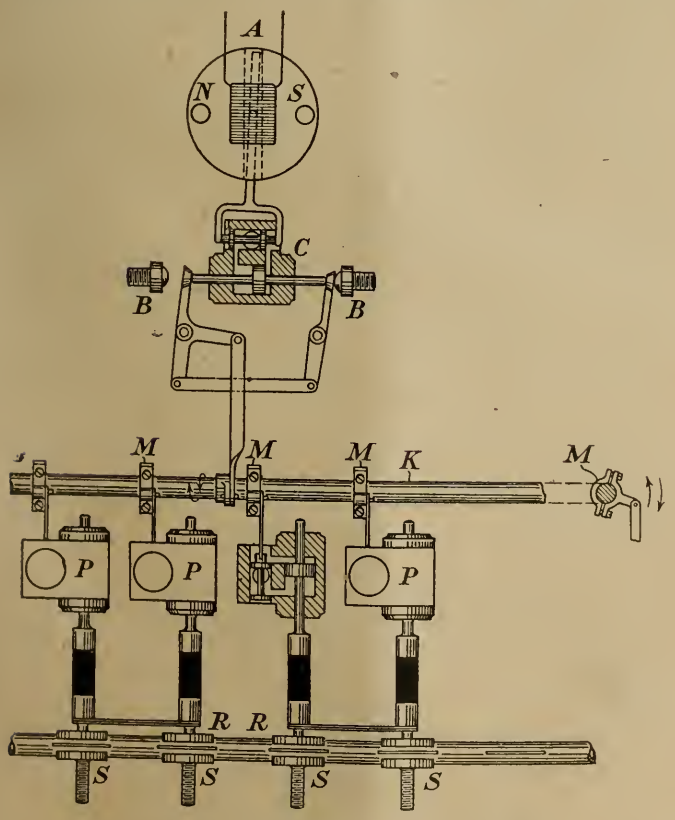

Fig. 23.—Diagram of Signalling Key.

permitted. If, however, it is desired to start and stop the oscillations in the aerial completely to effect signalling, it will be seen that at high telegraphic speeds and long wave lengths, the rate of growth and decay of the oscillations must be high, and it is clear that this high decrement radiation will give rise to serious jamming. It would seem that so far as high speed, long wave stations are concerned the change of frequency method of signalling is actually to be preferred to the other.

R. W. Paul.

Mr. R. W. Paul showed a beautiful piece of work in the form of a standard of mutual inductance. The design of this standard, evaluated from its geometrical dimensions, is due to Mr. Albert Campbell; special care has been directed to permanence and ease of setting up. The general construction can be seen from Fig. 24. The primary is of bare wire wound in a screw thread cut in a marble

Fig. 24.—A New Standard Mutual Inductance.

cylinder, and has two equal sections, each of a single layer, with a space between their inner ends. The secondary is a multi-layered coil wound in a groove in a marble ring; this surrounds the cylinder, and is adjustable both axially and radially in relation to the latter. It is set midway between the two primary helices, and has a mean diameter such that the field due to the helices is zero at the mean circumference; thus, for a given displacement from the correct position the change of mutual inductance is a minimum. Curves were exhibited showing variations of diameter and pitch of the primary as measured by the National Physical Laboratory. Calculated curves were also shown giving the consequent variations of mutual inductance. The resulting calculated value of the standard is $10{\cdot}0071_9$ millihenries.

Weston Electrical Instrument Company.

The Weston Electrical Instrument Company had a large exhibit of their well-known instruments. A new type of high frequency measuring instrument has been introduced, consisting of a thermo-couple embedded in a heating element, the couple being connected to a Weston d.c. permanent magnet moving coil galvanometer mounted in the same case. The indications are not affected by changes in frequency, and an overload of 50 per cent. is permissible. These instruments are made for various ranges, from 125 mA up to 750 A. The greater part of the scale is very open, and the accuracy is guaranteed to be within 1 per cent. For ranges above 100 A external heating elements are provided. The instrument can be checked by d.c. current, and the indications are not affected by changes in room temperature, compensation being provided. Galvanometers are also supplied, having scales uniformly divided so that the indications are proportional to the square of the current, such instruments being useful on wavemeters and in decrement measurements.

A new model a.c. and d.c. dynamometer type voltmeter, ammeter, and wattmeter has been introduced. These are guaranteed to an accuracy of $\frac{1}{10}$th per cent. on full scale deflection.

The Edison Swan Electric Company.

The Edison Swan Company showed some remarkable Pointolite incandescent lamps, the largest being of 10 000 c.p., and the next smaller size 4 000 c.p. They are intended for use in projectors where arc lamps have hitherto been used. Small Pointolite lamps, filled with argon, have been developed for portable sets combined with a 32 V battery. For photographic purposes lamps are arranged with a series resistance which can be short-circuited at

the moment of exposure, so that in the case of a 100 c.p. lamp the candle power for this short period is increased about three times and the life of the lamp is much prolonged. A cylindrical glass deflector is now sometimes fused into the top of the bulb so as to restrict the convection currents, and by this means a large increase in the life of the lamp is obtained. For use on a.c. circuits a mercury or other rectifier is fitted. We also noticed ordinary vacuum lamps having the bulbs so tinted that a fair approximation to daylight is obtained.

Gambrell Brothers.

At the stand of Gambrell Brothers much interest was shown in the variations of resistance of the human hand. Moistened electrodes were fixed to the back and palm of the hand, and the resistance was balanced so as to bring the spot of light to the centre of the scale. A slight mental shock to the patient (for example, a sudden and unexpected movement by the operator) usually produced a marked lowering of the resistance, with a pronounced time lag. The phenomenon was shown recently at the Royal Institution by Dr. Waller. The hand seems to be particularly susceptible in this respect, the effect not being necessarily obtained with other parts of the body.

Another item of interest on this stand was a new transmitter for wireless telephony. In most transmitters the aerial is oscillating continually, the modulating valve absorbing energy. This, of course, wastes power, and the valves, being continually fully loaded, get very hot and have a short life. In the present pattern there is practically no current in the aerial till the microphone is spoken into, when there are very large increases in the aerial current strictly in accordance with the speech waves. The microphone controls, but does not carry, the high tension current to the plate of the oscillating valve. The normal current from the generator is very small, but increases in conformity with the speech waves in the microphone. The advantage of this system, apart from saving in power and increased life of valves, is that the aerial radiation increases from an extremely low normal to large values during speech, thus minimising interference with other stations. We understand that speech is transmitted excellently, and that the instrument is very suitable for duplex working.

Isenthal & Company.

Electrostatic instruments to the design of Mr. G. L. Addenbrooke were exhibited by Isenthal & Company. These included an electrostatic wattmeter similar to the instrument which has been described in connection with Mr. Addenbrooke's work. With 200 V on the needle and one volt between the quadrants the deflection is equivalent to 2 000 mm. at 2 metres scale distance. Thus, at ordinary power factors, a reading of 200 mm. is obtained for a drop of 0·1 V between the quadrants. This sensitiveness can be doubled or even quadrupled for special purposes. The instrument can be used to measure the loss in condensers of 0·001 mfd. and at very low power factors.

We also noticed on this stand Zehnder accumulator batteries which are suitable for high voltages.

Miscellaneous Exhibits.

A large exhibit of potentiometers and measuring instruments was shown by Crompton & Company. The moving system of this firm's moving coil instruments has been designed with a view to easy removal, so that repairs can be readily effected. The moving coil and moving iron instruments are now identical in appearance and the connection studs are equally spaced in all sizes so as to facilitate interchange on switchboards.

Many interesting instruments were shown by John J. Griffin & Sons, Ltd., for laboratory work. We noticed particularly a subdivided wire wound megohm (ten equal coils) at a reasonable price. This firm's gyrostats were a source of popular interest.

Light Signals in Night Flying.

Speaking before the Illuminating Engineering Society last week, Lieut.-Col. L. F. Blandy described the illumination of the interior of the rigid commercial airship R. 36, which is carried out with ordinary 12 V metal filament incandescent lamps, the current being derived from five generators, one in each of the engine cars. He said that in the D.H. 34—one of the most modern British heavier-than-air machines for passenger traffic which would be flying this year—similar provision had been made for internal lighting. Difficulty had been found in obtaining the correct formula for the tinting of the coloured glasses. The usual signal red and signal green, manufactured to existing formulæ, did not give a satisfactory signal colour when high intensity filaments were used. The Board of Trade and the Air Ministry Research Department were now working in conjunction to determine satisfactory formulæ. Colonel Blandy described the various forms of illumination used to facilitate the landing of aircraft at night, and referred to a device with which the Research Department was experimenting—a high-power 12 V lamp which would withstand landing shocks. The weight of the complete lamp, he said, was 7 lbs., and it functioned from either the engine-starting accumulator or the general service battery.

The Institution of Electrical Engineers.

Electrical engineers who inhabit the Strand and City areas, among them the staff of The Electrician, felt it peculiarly appropriate that the Institution of Electrical Engineers should have devoted Thursday evening, Feb. 2, to a discussion on the interconnection of power stations, or, as some speakers preferred to call it, the interconnection of networks. The breakdown at the Bow Station of the Charing Cross, West End and City Electricity Supply Company is the reason, and this, perhaps, also explained why, in spite of the inclement weather, there was such a good attendance. It is to be feared they were not rewarded by a discussion of outstanding merit.

After the Paper, an account of which will be found on another page of this issue, had been read in abstract the President said that after the four names on his list had been exhausted he hoped the discussion would develop on more informal lines, and that they would see four or five gentlemen jumping to their feet at once, as was usual on Monday nights of the Institution.

Mechanical Causes Fundamental.

Mr. P. V. Hunter, in opening the formal discussion, said the essential point to recognise in any interconnection scheme was that the energy was entirely controlled by the steam side. Phase swinging for instance was purely due to mechanical causes. To interconnect stations with voltages that were constant and equal must be unsatisfactory, because the station supplying the energy did not supply the wattless current. Of the three types of regulator described by the authors he preferred the induction type, though it might be more expensive to instal. He objected to the title of the Paper because it was usually the networks that were interconnected and not the power stations, and the tables given in the Paper seemed to admit it. The arrangement shown in the Paper for the connection of two stations both generating at 6 000 V and using a transmission voltage of 33 000 V would, he felt, be the final practical solution.

The Voltage the Determining Factor.

Mr. F. H. Clough pointed out that the wattless component depended not on the steam end, but on the voltage. When one station was supplied by another, the former often required power on the inductive as well as on the energy side. To determine the voltage required to transmit energy meant the usual problem of calculating alternating current in an inductive circuit. That was dealt with more conveniently by using imaginary than trigonometrical quantities. If two stations were connected together through a low reactance the total capacity might be beyond the capacity of the switches at either of the stations.

Some Earthing Problems.

Mr. H. Brazil said that Mr. J. S. Peck, in the Paper he had read before the Institution in 1916, had suggested several methods of earthing the neutral points of interconnected systems, and the discussion on the Paper had favoured the method of placing reactance or resistance in circuit with the neutral point at each station. Opinions since that date had favoured the use of resistance rather than reactance. Too little notice had been taken of the loss due to earth currents between the neutrals. Mr. Peck in the Paper he had read in 1912 on earthing resistances had taken the view that this loss was not of any great importance. He (Mr. Brazil) gave figures which conflicted with that view. The ideal was to have a resistance which would reduce the circulating current to a very small figure and yet allow the full current to pass when a fault occurred.

Some Practical Points.

Mr. J. M. Donaldson said it was desirable to run such stations as Brimsdown and Willesden of the North Metropolitan Company in parallel, as that might allow the plant to be operated in an economical manner. The question of running plant load factor had a considerable influence on the running costs, far more than the load factor of supply. Another obvious advantage was that one power station could assist the other in event of trouble, though that advantage was counteracted to some extent by the fact that serious breakdown at one station might upset the whole of the network. In the case of the North Metropolitan system, they had come to the conclusion that the limiting feature was the ratio of the reactive resistance of the whole circuit. Any reactance that was inserted should be put in in the centre of the system, and not at one end, or both ends. The voltage was controlled from one or other of the power stations and all the other stations had to regulate their plant so that their power factor was about what it would normally be when they were doing their share. The current was interchanged only at the centre of the system, but with power stations that were interconnected, and specially with power stations which belonged to different undertakings, it would be as well to have an independent means of adjusting the voltage. Induction regulators, at least those of the three-phase type, were not made

in this country. They had an awkward phase angle which complicated matters, and he would, therefore, like to see their use ruled out. Variations of the tapping system patented by Mr. Berry, appealed to him as being a more satisfactory method.

End of the Formal Discussion.

This concluded the formal discussion and the PRESIDENT then invited informal speakers. Only two, Mr. G. W. Partridge and Mr. A. R. Everest responded, and they did so without any of that eagerness the President desired, both of them pointing out that it was only the informal character of the proceedings that induced them to rise at all.

Two Different Sorts of Interconnections.

Mr. G. W. PARTRIDGE said that there were two sorts of interconnected systems, one with power stations at a great distance apart and the other with power stations close together, as in London and Chicago. In the latter case, enormous short circuit currents might have to be dealt with at any time. In the first case, chances could be taken; but in the second, arrangements must be made so that if anything went wrong the system could be automatically subdivided by means of reactances or special switches. At Deptford they had no difficulty in running in parallel with the power station at Greenwich, the load being adjusted by means of the excitation. The power factor varied from 0·85 to 0·97 and from 5 000 to 6 000 kW was transferred as and when required. The reactance should never be less than the resistance, and he was inclined to agree that, in general, the induction regulator was the best to employ. He had had the same trouble with the automatic booster as had been described by the authors.

Mr. A. R. EVEREST remarked that the Paper clearly brought out a point of fundamental importance, that if two stations were interconnected at equal voltage the only exchange current passing was a leading current. If the station carrying the load only took leading current obviously the lagging current must be obtained elsewhere, which meant very heavy lagging loads on the machine. It was for this reason it was not practicable to run with equal voltages.

The Author's Replies.

Mr. J. B. PALMER, in reply, said that he was not clear as to the point made by Mr. Clough, about the receiving station having to carry the wattless component of the other station. Stations usually obtained all the wattless components they could deal with. With regard to Mr. Brazil's remarks, he thought that the Board of Trade regulation which prohibited the earthing of a system in more than one place would have to be altered. The Pacific Gas & Electric Light Company had about one hundred and sixty earths on their high-tension system without any trouble from inductive interference.

Mr. L. ROMERO, who also replied, did not agree with Mr. Hunter's statement that phase-swinging was only due to mechanical causes. Any de-synchronising force, such as a sudden increase of load, would cause swinging if the synchronising power of the line was inadequate. (Mr. HUNTER intervened to point out that an increase of load was a mechanical disturbing force, and was not primarily due to electrical phenomena.) To run with equal voltages might be a good plan in some cases and would, at any rate, save complication in boosting apparatus. A disadvantage would be that the receiving stations would always have to supply the extra wattless current.

During the course of Mr. Romero's reply the President announced that a certain member was urgently wanted on the telephone. About a dozen gentlemen occupying the back seats immediately left the room. Was this guilty conscience?

German Competition in Belgium.

There is an increasing demand for domestic electrical apparatus, motors, and electric lighting fixtures in BELGIUM, but serious complaints are being made of German competition at very low prices. The figures for German dynamos and motors are said to be 50 per cent. below American, and 20 per cent. under Belgian quotations. Metal filament lamps are largely imported from Holland, but some come from Germany, while France, Switzerland and Italy export electric heating and cooking appliances. A large Belgian lamp factory is to be erected by some Belgian and American firms in order to oust the foreign lamps. With the rapid extension of electric supply undertakings the demand for all electrical goods is likely to be maintained.

The BELGIAN bureaucrat seems to be remarkably like his British confrère—very slow and ineffective in action. It appears that it is within the province of the Ministry of the Interior to authorise changes in the price of electricity and gas. The Union des Villes et des Communes demand the suppression of the Government Committees who deal with the matter and the creation of an arbitration committee, composed of one representative of the supply company and one of the commune, with a third to be appointed by the Government or the other two members.

Correspondence.

HYDRO-ELECTRIC DEVELOPMENT.

To the Editor of THE ELECTRICIAN.

SIR,—In the "Notes of the Week" of your last issue you refer to certain hydro-electric problems, your comments on which appear to some of us to be somewhat misleading.

It is questioned whether our engineers are quite ready to begin the development of water power in Great Britain, on technical grounds. This idea has a certain degree of currency, which it is believed rests on quite an inadequate foundation, and has, in fact, done the engineers of this country considerable harm in the past, and is likely to become accentuated in the future, if efforts are not directed towards exposing this fallacy. It is unfortunate to find this repetition in one of our leading technical journals.

British engineers are rather forced to hide their light under a bushel for fear of the appearance of self-advertisement, which is not the case with some well-known engineers in other countries. This has tended towards certain important large hydro-electric installations being placed in the hands of foreign engineers in British Dependencies; and there appears even to be a tendency to invite their invasion of this country itself. That there is, in fact, no necessity for this attitude is evinced by the successful installations which have been put up in this country, in our Colonies, and abroad, in the past, under British supervision.

There is no doubt that we have a sufficient number of engineers experienced in hydro-electric work, capable of handling all projects of this nature in the Empire.

In another Note you refer to the shortage last year of electricity in Europe from hydro-electric installations on account of the drought. No doubt risks are run unwittingly where rainfall records are incomplete, but in many cases it is merely a question as to whether the cost of impounding sufficient water is justified financially. The broad facts are, that the driest year has a rainfall about 40 per cent. less than the average, and the three driest consecutive years each has 30 per cent. less than the average. In many instances cheap power is of more consequence than the remote risk of shortage of supply. Whether a standby of impounded water or a steam plant is desirable, depends on financial and local geographical considerations in each case, and the necessity or otherwise of an absolutely reliable supply. I am, &c.

London, S.W., Feb. 6th. F. BOLTON.

ELECTRICAL versus MECHANICAL ENGINEERS.

To the Editor of THE ELECTRICIAN.

SIR,—With reference to your article, also the correspondence, in THE ELECTRICIAN of the 27th inst. Is it really a question whether the "mechanical" or the "electrical" shall be "top dog" upon a railway or any other engineering concern? Is it not rather that the man shall be an "engineer"? For it appears to me that, to-day, the man who aspires to be an engineer, apart from civil engineering, is sorely lacking in essential qualifications unless he is well qualified both mechanically and electrically. An engineer will, of course, specialise as he progresses in life, but this would not cause him to show bias to either side. He will judge as an engineer, not as a "mechanical" or as an "electrical." There must be a "chief"; and he must be qualified to treat all branches of work upon its merits.

We have, unfortunately, a large number of men in the electrical world who are labouring under the misfortune of having no mechanical training or knowledge. To these the electrical industry owes many misfortunes.—I am, &c.,

WILLIAM B. PINCHING, A.M.I.E.E.

Winchmore Hill, N. 21, Feb. 6.

[We should be pleased to have other opinions on the point raised in our recent Editorial Notes.—ED. *E.*]

THE "REVO" ELECTRIC IRON.

To the Editor of THE ELECTRICIAN.

SIR,—As manufacturers of "Revo" Electric Irons we are particularly interested in the letter in your correspondence column over the name Wm. B. Scourfield. In reply, we confirm that the iron in question was correctly rated and that the testimonial referred to was an unsolicited one.

It is news to us that "all the heating and cooking appliance manufacturers of the world, aided by all the resources of modern science, have striven for, and failed to achieve" a loading of "64 W per sq. in." This has not been our ambition. Instead we have made it our aim to produce articles that besides doing their work satisfactorily will withstand a reasonable amount of rough use, and in this we claim to have been successful. In spite of your correspondent's remarks quoted above, several manufacturers have for years made and used successfully elements for 64 W per sq. in. and more.

Your correspondent is "tempted to enquire what the thermal efficiency of the iron would be." He bases his figures on a presumed

loading which is incorrect, and assumes a radiating area which is also incorrect. Might we suggest that Mr. Scourfield gets his information right before rushing into print. If your correspondent had considered for a moment he would have realised that an electric iron is never in use continuously; further, modern electric irons are frequently given a high loading for quick heating, and so that heavy damp work can be done; consequently, when the same iron is doing light work the current is only used part time—in fact your correspondent might have "presumed" that the current would be switched off sometime before the iron became red hot to allow ironing to be proceeded with.

Regarding the "adaptability of electric irons on *any* circuit, no matter what the voltage," we do not think it is necessary to explain in a technical journal that an electrical appliance should be used on a circuit of the correct voltage. The fact that a "Revo" iron intended for use on a 100 V circuit was used as a 200 V iron and withstood the "test" for a considerable time, as vouched for by an independent witness, will be satisfactory evidence to the majority of your readers, if not to Mr. Scourfield, that the appliance in question was built on substantial lines, and it is only because the iron was incorrectly used that there is anything remarkable in the incident. A manufacturer cannot always find out what treatment his products get, but when he hears of their being used in an abnormal and absurd manner and standing up to it, then, even if a sense of humour is lacking, there is some satisfaction in having produced a sturdy British article.

A little time ago we received another unsolicited testimonial regarding an iron similar to the one referred to above. This had been forgotten and left on circuit all night; in the morning it was found that the iron had burnt its way through a table—carpet and part of the floor. The iron was dropped into a bucketful of water, but after drying out the element and insulation were perfect.

In case your correspondent has missed the point of this also, we mention that the incident shows that a modern well-constructed iron like the "Revo" will withstand more than a little ill usage, but it is not our intention to recommend the "adaptability" of electric irons for other purposes than ironing.

In conclusion, we may say the originals of either of the testimonials referred to may be seen on application.—We are, &c.,

Tipton, Staffs. The Cable Accessories Company, Ltd,
February 6. P. W. Davis (Engineer).

North Lancashire Electricity Inquiry.

On the 1st inst., when the inquiry was resumed into the scheme for the reorganisaton of electricty supply in the North Lancashire and South Cumberland Electricity District,

Sir John Snell said he was sorry that, owing to bronchitis, he would not be able to continue to preside, and Mr. H. Booth would conduct the inquiry.

Mr H. R. Burnett, secretary to the North Lancashire and South Cumberland Joint Committee, said Barrow Corporation had agreed that Ulverston and Dalton were as far as they considered they could go with regard to area, but now they were opposing the whole scheme. There was a demand for cheap current in outlying districts, and the only hope for the scheme was for the whole district to come in. He was satisfied that a better scheme could not be devised than one that would take in the whole area. It was in the interests of the public that the whole of the generating stations in the area, and the mills and industries of those places, should be under one common scheme. The advantage of keeping the area in one was important, in view of the fact that they might take over Messrs. Vickers' plant at Cavendish Park, and also the Projectile Factory at Lancaster.

In cross-examination, Mr. Burnett said there was no reason why towns so far apart as Barrow and Lancaster should not be in one scheme, but the co-operation of Barrow was essential for success. Messrs. Vickers wanted £450 000 in 6 per cent. bonds for their station, but the Vickers' plant could meet the whole of Barrow's requirements at a cheaper rate than a Joint Committee could supply.

Railway Electrification.

On the 2nd inst., Mr. Burnett was examined as to the position of Morecambe and Heysham. He thought the question of railway electrification would not arise until after 1925, but there was a prospect that it would be considered before 1930, and, if so, current could be obtained from the transmission line en route. He did not agree that the scheme was unworkable as far as Kendal was considered, but the demand for current in the Kendal district was so small that a separate generating station was not thought necessary. He was agreeable to Windermere, Ambleside and Grasmere Urban Councils being left out of the scheme, but the committee desired to include these areas. The Lunesdale, South Westmorland and Ulverston rural districts were not important from a supply point of view, and he did not mind them being also excluded, if they desired.

Councillor T. Morton, a member of the Barrow Electricity Committee, said Barrow had decided against the scheme until they could get Government assistance. They had also decided that the Barrow plant should be taken over and compensation allowed for it. The Council had considered an alternative scheme, which would include Barrow, Dalton, Ulverston and certain rural parts of the Ulverston district. The supply for this smaller area could be produced at Barrow, and by arrangement they could also draw upon Messrs. Vickers' power-house.

Mr. S. E. Britton, City Electrical Engineer of Chester, said he had inspected the area of the Joint Committee's scheme, and thought the estimated expenditure was too low. He also considered that Barrow Corporation would be penalised financially under the schemes.

Questions of Area.

The inquiry was concluded on Friday, Mr. H. Booth being in the chair. Mr. A. Page attended as second commissioner.

Mr. Eastham announced that at a conference of parties representing the Windermere, Grasmere and Ambleside districts, an agreement had been arrived at to come into the suggested district if it was to be one area, but they had decided to remain outside the scheme until such time as they could derive any benefit from it. They would be put under no financial obligation, but if at any time it could be shown that they would benefit, then terms could be arranged with the Joint Electricity Committee or Board. The Windermere, Ambleside and Grasmere urban districts were willing, and also the Windermere and District Electricity Supply Company to contribute five guineas each each year to the Joint Electricity Authority, and they would be represented on the authority. The Lunesdale, South Westmorland and rural districts of Ulverston took up the same attitude, with the same contribution if it was one area, but if the area was split then Lancaster and Lunesdale would desire to be in a Lancaster area.

Mr. Kennedy proceeded with his cross-examination of Mr. S. E. Britton, who had given evidence on behalf of Barrow Corporation against the scheme. The witness did not agree with many of the figures in the scheme as it affected Barrow, and replying to Mr. Page, he said he had been struck with the large areas in the Joint Committee's scheme where no supply would be required.

The Chairman said he understood that in the whole scheme Barrow would not be charged with any transmission main past Backbarrow.

Mr. Kennedy said that was so, and Mr. Procter said that Kendal quite understood that.

Mr. Wooll, for Barrow Corporation, said the main objection of Barrow was to be included in the area, but another objection was that Barrow did not want to lose control of its plant. The Barrow proposal to include Ulverston and Dalton was not a piece of mere window dressing. Without Barrow no general scheme could go on.

Mr. Procter said Kendal had agreed to take up the same position as the Windermere group, and contribute five guineas to the administration costs. If the new scheme would represent a cheaper supply then Kendal would would come in. In the meantime they would be represented on the Joint Committee.

Mr. Alfred Taylor, on behalf of the London and North-Western, the Midland and the Furness Railways, said the immediate or early electrification of any part of the railway systems was not very probable. There were no plans for such electrification, and, judging by the present traffic, the capital cost would not be justified. The policy of the railways was to purchase supply in the cheapest market, whether from a Joint Committee or a private firm.

Major G. C. Milnes, electrical engineer of Lancaster, said he did not think there was any justification for including the Lancaster district in the scheme. For the purely local demand their own supply was sufficient.

Mr. J. Abady opposed the Committee's scheme on behalf of Millom and Bootle, and said Millom desired powers of its own to supply electricity; and Mr. H. Kirby, secretary of the Millom and Askham Hematite Iron Company, said there were gases at their furnaces which could be utilised.

After evidence by Mr. G. H. Cheetham and Mr. W. Lewthwaite against South Cumberland's inclusion, the inquiry was concluded.

Forty Years Ago.

(The Electrician, Feb. 11, 1882.)

Coalition.—The Ripon Town Council have been invited by the Birmingham Town Council to join them in protecting the interests of the corporations having gas works under their control against the Electric Lighting Bills.

The Telegraph and the Arabs.—In a lecture delivered recently before the Victoria Institute Mr. Rassam explained the Arab word "Tel" means "wire," and "Araph" "to know" or "expound"; hence "to know by wire" or "obtain knowledge by wire" is the Arab's explanation of the use of the telegraph.

The City Commissioners of Sewers.—At the first meeting of the newly-appointed commissioners, Mr. Felton, the chairman for this year, said that, "with regard to the electric lighting, he hoped that by the end of the year they would have extended it to all the principal thoroughfares in the east and west districts of the City."

Water Power and Electric Lighting.—It is stated that M Lortet, of Lyons, France, has made a preliminary trial of a system of generating electricity for lighting the house belonging to the Faculty of Medicine in that town by means of water wheels driven by the current of the Rhone. It is also stated that he is endeavouring to obtain permission from the authorities to enable him to permanently establish this system of obtaining power for electric light purposes.

The Electrical Wholesalers' Federation.

The annual dinner of the ELECTRICAL WHOLESALERS' FEDERATION was held at the Trocadero Restaurant, London, on Thursday, Feb. 2, under the chairmanship of Mr. H. Bowden-How.

The Need of Closer Co-operation.

Mr. R. ALBRECHT, in proposing the toast of the "Kindred Associations," said that the first few years of the Electrical Wholesalers' Federation's existence had been spent in settling the principles of living and working. They were now able to take stock, and were conscious that out of individual weakness had come co-operative strength. But the added sense of responsibility had brought the discovery that they were only a cog in a large machine. They had sought to get into closer touch with the other electrical associations, and most of their work had been in the direction of the B.E.A.M.A., though there they had made little progress. Now they asked for a lead which would help to bring the two associations more into harmony. Failing a proper selling organisation the manufacturers had organised something for themselves. But the duty of the factor and contractor was to build up better organisation than the manufacturers, and the manufacturers would then be only too pleased to come into line. This was the first step towards betterment of trading conditions.

Mr. Dunlop on the Electrical Industry.

Mr. D. N. DUNLOP, in reply, said that the initial experiences of the B.E.A.M.A. had been very similar to those of the Electrical Wholesalers' Federation. Many complications had to be met before the electrical industry could be placed on a level with similar industries in the United States and Germany. They had to face cartels and price cutting, which affected every branch of the industry, and their first work, therefore, was to make the whole body more healthy, and to establish the different branches of the industry in a position where it could pay decent wages and have something left over for research. In doing this they had come up against certain prejudices and difficulties, owing not a little to the multiplicity of articles with which they dealt. Now, however, their endeavours had been partly successful, and there were committees co-operating with all the other bodies in the industry.

The Reticence of the B.E.A.M.A.

It was obvious that a national industry could not be built up on losses, but efforts to obtain profits and reasonable conditions of contract had met with opposition. The B.E.A.M.A. had often been criticised for its reticence, but in such negotiations as he had mentioned secret diplomacy was necessary. A drawback to closer relationship was the national characteristic of individualism. But there were many points upon which they could co-operate, and at any rate the industry must not be allowed to get into so decrepit a state that it would have to be subsidised. Manufacturers should not have selling organisations, but should arrange with wholesalers and contractors to work for them, except for the largest products. Every contractors' window should be a display of the manufacturers' goods, so that in the end there was no opening for foreign products.

How to Brighten the Future.

He thought they must recognise they would have to face competition from foreign countries working with an exchange in their favour at full speed, and flooding the English market with cheap goods at a price at which, to give labour a decent living wage, we could not afford to sell. No manufacturer wanted to cut down labour charges, but if he was faced with competition from abroad at prices at which he could not afford to make, he could not go on without assistance from all those concerned. Some way must be found out of these difficulties. We were not going to shut up shop, but every branch of the industry must work to get all the advantages, and none of the disadvantages, of co-operation. With the help of the Press and the backing of the Electrical Wholesalers' Federation and other associations they should be able to stabilise the home market, increase production, and fight this competition. Help was wanted to solve the problems which alone would make the electrical industry of Great Britain second to none in the world.

The Gasfilled Lamp Case.

Mr. J. Y. FLETCHER, who also responded to this toast, said that the gasfilled lamp case had not been fought to bind the Electrical Wholesalers' Federation, but to enable further agreements to be made in their favour. The result of this case gave a reasonable chance of business in legitimate markets. The lamp market made it easy to have a factoring policy, and that was the permanent policy of the Electrical Lamp Manufacturers' Association. The E.L.M.A. was also wedded to a contractors' policy, and they had entered into satisfactory arrangements with both the Electrical Contractors' Association and Electrical Wholesalers' Federation to everyone's benefit.

Co-operation with Labour.

Mr. J. MCGREGOR, in supporting the toast, said that the Cable Makers' Association had started a general industrial council to solve labour troubles, and it had solved them. From that had grown the idea of bringing in every branch of the industry into those councils. He agreed that existing difficulties could only be solved by bringing parties together round the table. Such co-operation was necessary for mutual defence and support.

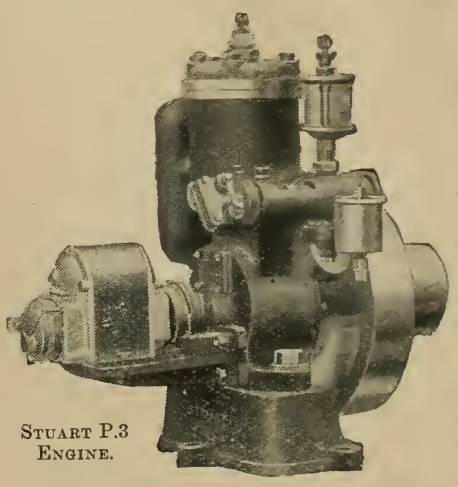
The toast was also supported by Mr. L. G. TATE, who said the contractors wished to get into closer touch with other bodies of the electrical industry, and Mr J. W. BEAUCHAMP, who said that a sort of reservoir was required between manufacturer and user, so that the manufacturer could pump out his product continuously and the user take it as he required. The wholesalers should be able to fulfil this useful function. In England the ideal to work for was a reasonable percentage of co-operation on top of the national initiative.

In the course of the evening a presentation was made to Mr. A. G. Beaver, the late general secretary of the Association, of a handsome silver tea and coffee service and tray, with a cheque for £100, as a mark of the appreciation of the members for the work he had conducted in initiating and organising the Association.

Farmhouse Lighting Plant.

Owing to the convenience and economy of electric lighting the demand for small independent lighting plants for farmhouses and isolated country houses is increasing steadily. Though several firms cater for this class of business there is probably no firm who have made a closer study of the subject, and who have such wide experience of farmhouse requirements as STUART TURNER, engineers, of Henley-on-Thames. Consequently the firm claim that their "Stuart" electric light plant is one of the best on the market. The plant is made in three sizes to meet varying requirements.

The ½ kW plant is designed for any house or farm using up to a maximum 900 c.p., or say thirty-30 c.p. lamps. The standard voltage (25) permits the use of gasfilled lamps of moderate size in the living rooms, whilst for passages and offices quite small metallic filament lamps may be employed. It is claimed that a plant of this size has ample capacity for the suggested output, and the cost of fuel and oil is rather less than that of gas light. The ½ kW plant will give all the conveniences of abundant electric light at a very moderate cost, and fans and small motors are quite within its capacity. For those who wish to do heating and cooking by electricity the firm supply larger sets of 1½ and 3 kW. The plant is claimed to be as near fool-proof as well designed and constructed machinery can be.



STUART P.3 ENGINE.

The engine is rated at 1 H.P., with bore 2¼ in. and stroke 2¼ in. It is of the two-stroke three-port type and has no valves, tappets or valve gear to get out of order.

The engine is completely enclosed and gas tight, cannot leak or throw oil about. It will run equally well on petrol, benzol or gas. The firm also manufacture the F.S. 1 (1½ kW) and F.S. 2 (3 kW) lighting sets.

Patent Reversible Toaster.

The "Universal" patent reversible toaster, which we illustrate, entirely obviates the necessity of touching the bread. It is merely necessary to touch a tiny lever and the bread rack automatically

"UNIVERSAL" REVERSIBLE TOASTER.

reverses, so that both sides can be toasted without handling. The rack has a half-way position, which is handy for removing the toast when finished. The consumption is only 340 W. This "Universal" appliance is supplied by L. G. HAWKINS.

Legal Intelligence.

An Electrician's Fraud.

Last week an electrician was sent to prison for four months by the Liverpool Stipendiary, for stealing two sums—£7 5s. and £5 5s., which had been entrusted to him to pay a lighting deposit to the Liverpool Corporation. It was stated that in January, 1920, a local draper employed defendant to wire his premises, paying him for the work. Three months after a sum of £7 5s. was paid to him to obtain a meter from the Corporation electric lighting department and to pay the lighting deposit. He was also given a further £5 5s. to perform a similar service for another consumer. The stipendiary described the case as one of gross and deliberate fraud.

Re Cordoba Light, Power and Traction Company.

On Tuesday Mr. Justice Astbury sanctioned a scheme of arrangement between the Cordoba Light, Power & Traction Company, Ltd., and its debenture stockholders, loan creditors who held promissory notes, and the preference shareholders. Mr. Jenkins, K.C. (for the company), said it was a sound undertaking, but it had been hampered of late years by reason of the increase in the cost of materials. It was formed in 1908 for carrying on in Cordoba and the Argentine an electric power undertaking and the operating of tramways. It acquired the undertaking by purchasing the shares of two companies, one registered in the United States and the other in the Argentine. The present authorised share capital was £1 000 000 in £1 shares. The company had carried on business very successfully. It had to spend its cash on its undertaking, and there was a sum of £106 205 standing to undivided profits account. It had performed all its obligations and it paid its preference dividend down to Sept. 30, 1915. Since then, although making large profits, the company had had to use its cash in other directions, and there were six years' arrears of the preference dividend, amounting to £75 000. In order to put the company on a sound basis the scheme of arrangement had been prepared.

Licence Duty on Tramway Repair Wagons.

In the Falkirk Sheriff Court, last week, the Falkirk and District Tramways Company were summoned by Stirling County Council for having, on June 6 last, used a motor tower-repair wagon for which a licence was not in force. The Council maintained that the duty payable on the vehicle was £25, but the company contended that they were not bound to pay more than 5s., as the vehicle came under the category of a tractor carrying only its own gear, and used solely for repair purposes, and not for commercial purposes.

Mr. D. Hays, the manager of the Tramways Company, admitted that the company had no licence for the vehicle. Through an oversight the 5s. duty which was due had not been paid at the time; but as the County Council demanded £25 for a licence the case was considered one of considerable importance, and pending a legal decision no tender was made. Glasgow Corporation, who possessed several vehicles similar to the one owned by the company, had refused to pay the higher licence.

The Procurator-Fiscal argued that the case depended entirely on the interpretation of the Finance Act and the Roads Act of 1920, and the vehicle was one for which a £25 licence should be taken out.

Sheriff Robertson said the question was one for the High Court, and should be settled by judgment there. It would be better to have the question settled by a special case to the Court of Exchequer or something of that kind. There was no question, however, that the company ought to have had a licence, and he must convict them. A penalty of £2 2s. was imposed.

Electric Coal Cutters in Gassy Mines.

Last week Sheriff Fyfe, of Glasgow, delivered his considered judgment in a test case against Nimmo & Co. by an injured miner, who claimed damages at common law or, alternatively, under the Employers' Liability Act of 1880, in respect of an explosion on June 1, 1920, when two men were killed and several were injured. The Sheriff dismissed the action, but reserved it for assessment (if need be) of compensation under the Workmen's Compensation Acts.

In his written judgment the Sheriff examined the various statutory regulations, and concluded that the pursuer had not established any cause-and-effect relationship between negligence of the mineowners and his injury, and so no claim at common law had been established; and that, even had it been, the claim was barred by the doctrine of common employment, the accident having been proved to have been caused by the negligence of fellow workmen in failing to screw down the cover of the switch-box of an electric coalcutter which was being used in the mine, and so permitting a flame to emanate from the coalcutter and ignite the gas in the mine. The Sheriff found that the coalcutter itself and its cable connection were in perfect working order, and that taking off the switch-box cover and replacing it, as occasion may require, was not a skilled electrician's job, but an ordinary mechanical operation in using the coalcutter, the responsibility for doing which efficiently was with the machinemen, as part of their duty of operating the machine.

In regard to the suggestion that a coalcutter should not have been used at all in the mine because of the presence of gas, the Sheriff said there was no evidence in the case to support such a proposition; and he was, fortunately, not called upon to pronounce any opinion upon that large question. It would be a very serious proposition for the coal industry in Scotland if it was to be regarded as unsafe to use a coalcutter, merely because there was more or less gas found in a mine. There were coalcutters specially designed for use in gassy mines, and the evidence in the case showed that the machine in question was a flame-proof machine of modern type, and was in perfect working order.

Leave to appeal was granted, it being understood that the case was regarded by the Miners' Federation as a test case, involving important questions as to safety in mine working, and that it would be carried to the higher courts.

Anglo-German Tribunal Decisions.

On Monday the Anglo-German Mixed Arbitral Tribunal gave its reserved judgment on the claim of Chamberlain & Hookham, of Birmingham, against the Solar Zählerwerke Ges. (m. b. H.), a subsidiary company in Hamburg in which they held all the shares. Before the war the claimants supplied the German company with parts of electricity meters, which were assembled in Hamburg and sold in Germany, and at the outbreak of war there was a debt of £23 921 due to the English company by the subsidiary company. A claim for this amount in sterling (with interest) had been lodged with the Clearing Office for Enemy Debts, but was rejected by the German Office on the grounds that the creditor and debtor were the same persons, that there was never an obligation to pay the debt, and that the German company was not a German national within the meaning of the Treaty.

Delivering judgment in favour of the claimants, the President of the Tribunal (M. Borel), said it was clear that both in English and in German law a company was a legal entity, distinct from its shareholders, and that in the event of a liquidation of the German company before the war the claimants could only have ranked as creditors, and could not have claimed the whole assets as shareholders. On the point of nationality, both the Treaty of Peace Orders 1919 to 1921 and the corresponding German orders of Aug. 31, 1919 and April 13, 1920, defined "nationals" of any State as including any company or corporation incorporated therein according to the law of that State. On this point also the contentions of the German Clearing Office failed. There were certain items in dispute, and on some of these the claimants had given way. Judgment was given for the claimants for £20 438, with £100 costs.

The Tribunal has also given its decision on the claim made by Isaac Spencer & Company, of Aberdeen, against G. Schlotterhaus & Company, a German firm, for the repayment of £600 paid for extraction plant costing 36 000 marks. At the outbreak of war the machinery was ready for shipment, but was not delivered, and claimants had already paid one-third of the purchase money (12 000 marks). M. Borel said that the contract was dissolved in August, 1914, and the consequences of such dissolution were not expressly regulated by the Treaty. The question in dispute had, therefore, to be decided according to the principles of equity. The debtors had spent a considerable sum of money in manufacturing the machinery, and that loss did not appear to have been covered by the value of the machinery. The Tribunal thought it equitable that the creditors should receive £400 in respect of their claim, and no order was made as to costs.

Electrical Company's Contract Claim.

Sir H. Courthope-Munroe, K.C., as Arbitrator appointed by the President of the Institution of Electrical Engineers, sitting at the Surveyor's Institution, Westminster, held a preliminary hearing on Monday to determine certain questions of law in a claim by the Metropolitan-Vickers Electrical Company against the Chinese Engineering & Mining Company. The claim was for £2 750, alleged to be due in respect of two contracts, dated March 16, 1915, and May 15, 1915, for the supply of turbo-generators, condensing plant, transformers, and spare parts. The total of the contracts was £31 364. The Arbitrator had to deal with questions of law in the construction of the contracts before entering into questions of fact as to an alleged interference by the Government with the claimant's workmen and factory.

The purchasers, by way of defence, relied upon the provisions of a schedule to the specification contained in the contract of March 16, 1915, which was as follows :—"The contractors undertake to deliver the first set f.o.b. British port, after testing, within twenty-eight weeks from March 16, namely, by Sept. 28, 1915, and to deliver the second set, together with the other parts, f.o.b. British port, after testing, within thirty-two weeks from the said date, namely, Oct. 27, 1915, and on these deliveries being effected at the dates stated the purchasers will pay the contractors the sum of £25 426 18s. Should the delivery of either set be effected at a later date than that stated above, then the purchasers will pay a reduced amount, which will be computed by subtracting £250 per week for each week's delay from the £25 426 18s. The number of weeks' delay for this purpose shall be taken as the quarter of the two numbers representing the number of weeks' delay in delivery of the first set and the number of weeks' delay in the delivery of the second set, and the maximum deduction for the purpose of this computation shall not exceed £2 750, being a reduction equivalent to a delay of eleven weeks." The purchasers alleged that the claimants did not deliver the first set by Sept. 28, 1915, nor the second set by Oct. 27, 1915, and did not deliver them until after a delay of more than eleven weeks. Therefore, it was submitted, the contract price payable by the purchasers for the two sets was less than the sum claimed by £2 750.

The claimants, in reply, alleged that the schedule was in the nature of a penalty clause, and that the purchasers were not entitled to the benefit of it or to make any deduction except on proof of

damage caused by delay on the part of the claimants in making deliveries under the first contract, and that no damage was or could be alleged by the purchasers. Secondly, it was provided by the schedule that the purchasers should grant under their hand such extension of time for the completion of the works as might seem reasonable to them in the event of the Government at any date subsequent to March 16, 1915, by virtue of the Defence of the Realm Act or any amendment of it, interfering with or commandeering the employees or portion of the contractors' or subcontractors' factory, either or both of which were essential for the construction and due delivery of the works. In the construction and delivery of the works, it was pleaded, the claimants' workmen and factory were interfered with by the Government within the terms of the clause, the purchasers had notice thereof, and in consequence the claimants became entitled to an extension of time for the delivery of the works. The purchasers, it was submitted, did not comply with a covenant as to granting an extension of time or giving notice of any limited extension, and in consequence the claimants became released from all liability to deliver the goods or any of them by any fixed date. Thirdly, it was pleaded, on the true construction of the contract, the claimants could not be called upon to commence any work which was of the nature required—building or structure—for the reception or efficient installation of the works, and which building or structure had to be provided by the purchasers unless and until such building or structure should be in a condition sufficient for the reception or efficient installation of the plant; and that the contract should be extended *pari passu* with the delay in providing any such building or structure. In fact, it was submitted, at the time it was claimed the plant should have been delivered the buildings for its reception had not been completed, and that therefore the claimants were not liable for the delay in delivery. Finally, it was said, the purchasers had expressly or impliedly waived compliance by the claimants with the terms of the schedule as to the dates of delivery.

The ARBITRATOR reserved his award, which is to be stated in the form of a special case.

Electric Lamp Patent Litigation.

On Monday Mr. Justice Astbury commenced the trial of an action by the British Thomson-Houston Company against the Corona Lamp Works, for an injunction to restrain an alleged infringement of patent.

Sir A. COLEFAX, K.C., appeared with Mr. J. C. Gray, K.C., Mr. Whitehead and Mr. Trevor Watson, for the plaintiffs; and Sir D. KERLY, K.C., and Mr. Frost for the defendants.

Sir ARTHUR COLEFAX said the patent (No. 23 775 of 1912) was for improvements in and relating to evacuated vitreous containers having sealed-in conductors. The patent had been sometimes referred to, he thought rather erroneously, as the leading-in wire patent; at any rate it was a patent which was concerned with the seal between the glass and the leading-in wires in an incandescent electric lamp. So far as the infringement went there were certain admissions of fact. As regarded the alleged infringement, there was no question, so far as the facts outside that issue, of whether this was an infringement or not, were concerned.

Sir D. KERLY : We sold the lamps.

Sir A. COLEFAX said there were two cases, one of one lamp and the other of twelve lamps. With respect to the issues raised by way of defence, and so far as the particulars of objection went, they were the usual issues. The defendants denied novelty, subject matter and utility, and they pleaded prior user. As to the subject matter of the invention, counsel said electric lamps dated back forty years, or rather more, and from the early days in their history until the days of gasfilled lamps (about which they had been talking recently in another place) the effort had been consistently to obtain a better and better vacuum. Incidental to that, it was important that they should have a perfect seal to the bulb, and it was also necessary to be able to conduct the current to the filament that they were to render incandescent. For a very long period of time platinum was alone used. Platinum had a co-efficient of expansion somewhere near the glass used, but what was more important it was non-oxidising. It was used for a very long time, but it had throughout been very expensive, and from the early nineties one proposal after another was made to obviate the use of platinum for the leading-in wire in the incandescent lamp. Notwithstanding those proposals, until the date of the patent in question, with one or two exceptions, platinum was universally used, and since the date of the patent plaintiffs' invention had steadily displaced platinum, until to-day among the biggest manufacturers of lamps plaintiffs' invention was employed and platinum was no longer used. The embodiment of the invention as practised to-day was this :—An alloy was taken in the form in which it was most generally used; it had got a co-efficient of expansion which, in fact, was less than glass, and with it a composition wire was made. This core was then coated with something that, in fact, was independent of any question of expansion or contraction, it was given a sheath which presumably had a different co-efficient of expansion (in the form and embodiment in which it was used copper was taken, which had a higher co-efficient of expansion than glass), but whatever was selected for the sheath it was something which was oxidising, and whose oxide was easily soluble in the glass into which the leading-in wire was used in the operation of sealing. In the specification of the patent the alloy was nickel-iron, the ratio being 46 per cent. nickel and 54 iron. In the alleged infringing lamps the alloy in the composite wire was 29 per cent. copper, 28·43 per cent. nickel, and 42·4 per cent. iron—99·83 per cent., there being a little [illegible] in analysis.

Evidence in support of the plaintiffs' case was given by Mr. JAS SWINBURNE, ex-President of the Institute of Electrical Engineers, who said that, platinum being expensive, the object of the inventor in the case was to get some other metal with the advantages of platinum. In the case of platinum they must have a bright surface and a co-efficient of expansion the same as glass. If they got away from platinum they must have a base metal and use it in such a way that the glass would adhere, and that the expansion would not break the glass. These two properties were found in the metal in those lamps.

On Tuesday the witness was cross-examined, and in reply to Sir D. Kerby, who asked if it was common knowledge at the date of the patent that if one wanted to use any leading-in wire, the co-efficient of expansion of the wire and of the glass they were using must be approximately the same, Mr. Swinburne said he should hardly say it was common knowledge. If the wire was small they could seal such a thing as copper in. It was only when they got wire fairly large that the co-efficiency of expansion played an important part. How far it was general knowledge he did not know. He thought everybody at this date would suppose that it was an advantage to get it exactly the same, and that they ought to have it certainly the same. Not only in the case of leading-in wires, but in many kinds of scientific instruments it is necessary to seal metal and glass together. In many other things besides lamps, although lamps may be and are the most important, a glass vessel had metal wires sealed into it, and had to be subjected to variations of temperature. The variations of temperature were not really the important thing; the real variation of temperature was a difference of temperature between the time of sealing and the atmosphere; it was very seldom it was raised above or came anywhere near those limits afterwards in practice.

The hearing was adjourned.

Public Works in Batavia.

The Public Works Department of BATAVIA has officially announced that all work temporarily suspended for reasons of economy is to be resumed immediately. The resumption of this work foreshadows a considerable demand for constructional material and engineering accessories, and while no official authority has been given for starting on new works planned, it would appear, the Department of Overseas Trade states, that there may be important openings for United Kingdom firms. In the case of contracts for materials for public works, dredging plant, cables, &c., United Kingdom firms may lodge tenders with the Colonial Office at The Hague without the necessity for local representation in Holland.

Water Power in Jugo Slavia.

H.M. Commercial Secretary at Belgrade reports that the Zagreb journal, " Agramer Tagblatt " recently published an article concerning the FORMATION OF A SYNDICATE for the development of hydro-electric power schemes which would be worked in collaboration with the Government. This syndicate was formed at Vinkovci in November for investigating the water power of the Bosna and Drina, and it has been decided to erect, near Modric, a water-power station of 8 000 H.P., and to construct another station on the lower Drina between Kovilјaca and Janje of 29 000 H.P. The projected power stations are intended to provide electricity for Posavina, Podrinje, Slavonia Syrmia, Backa, Djakovstina and Osijek, and will be linked up with the projected overhead electrical system of the State. It is also intended to connect these systems, via Zabgreb, with the power system of Fala, so that the project of the central Government to provide an organised network of electric power lines in an east to west direction could be accomplished without great delay. The undertakings are assured of State co-operation, and the participation of foreign capital will only be permitted if native resources are insufficient.

Electricians' Wages.

At a conference between the National Federated Electrical Association and the Electrical Trades Union, held on Jan. 26 the following clauses were added to the NATIONAL STANDARDISED WAGES AGREEMENT :—

Ship Work.—The N.F.E.A. rate for electrical work on ships to be the ship rate of the district for the same class of work.

Shore Work.—Wiring or installation of any new work in new or old buildings not to be undertaken at less than the N.F.E.A. rate. The rates agreed between the E.T.U. and the Engineering and the Shipbuilders Employers Federations to be restricted to maintenance work and to exclude all new wiring or installation work.

In accordance with the National Wages Agreements, it has been agreed that the variation in the cost of living justifies a 16 per cent. reduction in wages in lieu of the previous reduction of 10 per cent., and the net hourly rates of pay applicable to the respective grades of the agreements are as follows :—Grade A. 2s. 1½d.; Grade B. 1s. 10¾d.; Grade C. 1s. 9d., and Grade D. 1s. 7¼d. an hour. These rates came into effect this week, and remain current up to the first pay day in June next

Electricity Supply.

The Minister of Transport has revoked the RICHMOND (SURREY) ELECTRICITY (TEMPORARY INCREASE OF CHARGES) ORDER, 1919, as from Jan. 31 last.

PONTYPRIDD Chamber of Trade has accepted an invitation from Mr. J. E. Teasdell, the electrical engineer, to inspect the new sub-station and electrical power works of the Council.

MARLBOROUGH Town Council has decided to apply for the revocation of the Provisional Order granted in 1913 to the Marlborough Electric Supply Co., who have failed to carry out their obligations.

The Borough Electrical Engineer and Manager of BLACKBURN (Mr. P. P. Wheelwright) has been instructed to prepare, in three months' time, a report of the working of the new WHITEBIRK ELECTRICITY STATION.

SITTINGBOURNE Gas Company has applied for authority to charge a maximum of 25s. per quarter where premises are lighted by electricity and gas is laid on merely as a stand-by. The Urban Council has referred the matter to a committee for a report.

The new electric light plant on BANGOR Pier was formally started last week by Mr. W. R. Jones, chairman of the Pier and Ferries Committee. The installation, which replaces the old gas lamps, consists of twenty lights of 100 c.p. each.

The Minister of Transport proposes to confirm the SHOREHAM-BY-SEA AND LANCING SPECIAL ORDER, 1922, made by the Electricity Commissioners to be granted to Mr. Frank Gibbs, Beach Shipyard, Shoreham. Any objections should be sent to the Ministry of Transport by March 2.

A petition has been circulated in Wimbledon for signature by burgesses asking the Mayor to call a town's meeting to discuss the Corporation's action in connection with the dismissal of Mr. H. TOMLINSON LEE, chief engineer to the Corporation for over twenty years. Many ratepayers have signed the petition.

London County Council, having considered the proposals of HAMPSTEAD Borough Council to take electricity in bulk from Marylebone Council, have decided to offer no objection to the scheme. Hampstead Council propose to shut down their Lithos-road generating station, and three-phase current at 6 600 V, 50 periods, will be supplied by Marylebone to Hampstead and transformed down to 105 and 210 V for local distribution.

The Electricity Commissioners have prepared analyses and summaries from the four-weekly returns of FUEL CONSUMPTION, &c., rendered by 501 ELECTRICITY STATIONS in GREAT BRITAIN during the year ended March 31, 1921. A tabular statement embodying the summaries, with an explanatory letter, was issued to the engineers of all the power stations in question. The general position during the year is indicated in four tables.

At the monthly meeting of the BELFAST Corporation, last week, a recommendation of the Electricity Committee that the electricity staff should be reorganised, and that, in view of the increased responsibility owing to the enlargement of the undertaking, a chief electrical engineer of experience in the management of large undertakings, and of greater administrative ability than Mr. Bloxam be appointed. It was further recommended that Mr. Bloxam be granted a retiring allowance of £480 per annum. There was a very warm debate over the recommendation of the committee; finally it was carried, by thirty-three votes to twelve, an amendment to delete the name of the chief engineer having been first defeated by the same vote. Several members of the Corporation said that Mr. Bloxam was being made a "scapegoat."

At the last meeting of the directors of EDINBURGH Chamber of Commerce, a communication was read from an important manufacturing firm in Edinburgh, drawing attention to the increase which had been made in the charge to consumers of electric current from 1⅞d. per unit to 2d. per unit, and complaining that the raising of the charge constituted a serious grievance and handicap to manufacturing industries using electric power. The directors were of opinion that rather than maintain the increased price the Electricity Committee should bear the burden of a temporary small loss, and they strongly recommend that in any case an assurance should be given by the Electricity Committee that six months hence a reduction in the charge for current would be made. The matter was before the Council at its meeting on Thursday last.

New Schemes and Mains Extensions.

All the houses on the Welling Estate, BEXLEY, are to be wired for electric lighting, the cost per house chargeable to the scheme not to exceed £6.

LEEDS Corporation has received sanction to borrow £38 500 for the provision of overhead wires and electric service for the municipal housing scheme.

It is proposed to erect electricity works in BALLYMENA, Ireland, at a cost of £5 500. A limited liability company is to be formed, and the prospectus is in course of preparation.

WALMER Urban Council has, subject to proper protection being afforded, decided to support a proposal to establish electric supply works by a local company about to be formed.

There are thirty-five petitions against the GRAMPIANS ELECTRICITY SUPPLY ORDER, but the majority of them are by landowners in order to get protective clauses. The opponents, however, include five electric supply and power companies, five county councils, and the Glasgow, Dundee, and Perth Corporations, besides several minor local authorities.

CREWE Town Council has applied for a loan of £10 000 for additional plant at the electricity works and for cables. It is proposed to establish a department for wiring private houses.

A motion that the Electricity Committee be instructed to prepare a scheme for the wiring of premises and the fitting of electric fittings at cost price was defeated at last week's meeting of DERBY Town Council.

At a meeting last week of the ratepayers of SLEIGHTS (Yorks) a committee was appointed to ascertain the cost of lighting the village by electricity. The village is also to be canvassed to obtain the number of prospective consumers.

The Minister of Transport gives notice that he proposes to confirm the BLACKBURN ELECTRICITY (EXTENSION) SPECIAL ORDER, 1922. Objections may be sent to the Secretary, Ministry of Transport, 6, Whitehall-gardens, London, S.W. 1, until Feb. 25.

BURNLEY Electricity Committee, who recently postponed the supply of electricity to the Rosegrove and Lowerhouse districts pending the erection of a sub-station, have now authorised the Electrical Engineer to prepare a report of the estimated cost.

TUNBRIDGE WELLS Council have decided to apply for a loan of £12 975 for extensions of mains, services, transformers, sub-stations, and sub-station pillars for the ensuing three years, and for £4 378 to cover the increased cost of the installation of the new turbo-alternator, condensing plant, pipe-work and switchboard.

ACCRINGTON Corporation has received the consent of the Electricity Commissioners to extend the plant at the electricity works. The Electricity Committee have authorised the borough surveyor to proceed with the work, and tenders for the plant are to be invited. Blackburn Electricity Committee is considering the proposals for linking up Blackburn and Accrington stations.

BLACKPOOL Finance Committee have sanctioned an application to the Ministry of Health for a loan of £5 000 in respect of mains and services for the housing estates. The Electricity Committee recommend application for sanction to borrow £220 000 for new generating plant, high tension transmission mains and other plant required in connection with the electricity undertaking.

The LIVERPOOL Electric Power Committee has received sanction to borrow £17 082 for mains and services and sub-station equipment in connection with the Cherry-lane housing scheme addition, subject to the applicants paying a portion of the cost. Nine mains extensions are to be proceeded with. The Works Sub-committee of the Health Committee has authorised the City Engineer to order three ELECTRIC PUMPS, with CABLES AND STARTERS.

A proposal to introduce electricity supply for lighting and industrial purposes was discussed on Friday at a joint meeting of the HOLYWELL Urban and Rural Councils. It was reported that the North Wales Power Company would shortly be laying a cable from Dolgarrog generating station in Carnarvonshire, through Flintshire, to Wrexham, and if the Holywell area agreed, provision would be made for a transformer station near the town. A joint committee was appointed to make further inquiries into the proposal, and to present a report at the earliest possible date.

Alteration of Charges.

As from the December, 1921, readings, CROYDON Town Council have decided to reduce the electricity charges for power, heating, and cooking from 125 per cent. to 100 per cent. over pre-war rates.

DARWEN Town Council have reduced the charges for electricity as follows: Lighting, 8d. to 7½d.; power, up to 100 units 5½d. to 4¾d.; 100 to 500 units, 4½d. to 4d.; second 500 per quarter, 3d. to 2¾d.; over 1 000, 3d. to 2¾d., and over 2 000 per quarter, 1¾d. to 1½d.; for domestic purposes, for first 30 units, 4½d. to 4d.; in excess of 30, 2½d. to 2¼d.; public lighting, 6d. to 5½d.; theatres, 6d. to 5½d.

SALFORD electricity charges are to be reduced from 75 per cent. to 40 per cent. for lighting, and from 100 per cent. to 65 per cent. over pre-war rates for power, heat, and bulk supplies. This reduction has been made possible owing to the decreased cost of coal and the improvement in its quality, to the existence of the new plant, and the improvement in the condensing facilities. This is the second reduction which has been made by the Department in three months, and is undoubtedly the right course to adopt in view of the present industrial depression.

The following reductions in the charges for electricity, as from the end of the December, 1921, quarter, have been approved by the LIVERPOOL Tramways Electric Power and Lighting Committee, and the recommendation will come before the City Council: Ordinary consumers 25 per cent. off the increased charge of 100 per cent.; special consumers having agreements containing coal clause, &c., 25 per cent. instead of 40 per cent. increase; rateable value consumers, 50 per cent. off the increased charge of 100 per cent. on the rateable value charge, and 25 per cent. off the increased charge of 100 per cent. on the basic rate per unit.

On Saturday the Cardiff magistrates sentenced a man named Sullivan to a month's imprisonment for OBTAINING TWELVE ELECTRIC LAMPS (valued at £4 10s.) BY FALSE PRETENCES from Messrs. Simpson and Baker, a local firm of electrical engineers.

Electric Traction.

Darwen Town Council have reduced the charges for electricity for the tramways from 2½d. per unit to 2¼d.

Accrington Tramways Committee have acceded to a request for a reversion to the original guaranteed week of forty-eight hours.

Application to the Ministry of Transport is to be made by Hull City Corporation for authority to extend their electric tramway to Hessle.

Rishton Urban Council will oppose the Bill of Blackburn Corporation for the extension of the borough and for constructing new tramways and running omnibuses.

Leeds Corporation have decided to lay a double tramway track along Belvidere-road and Devonshire-road, instead of a single track as recommended by the Tramways Committee.

Ald. Higham, chairman of Blackburn Tramways Committee, holds out no hope for a reduction in tram fares in the near future as the rate of wages are still considerably higher than the revenue per mile.

Glasgow Corporation have adopted the proposal of the Tramways Committee that in the interests of public safety pedestrians should be instructed to keep to the left. Notices to this effect are to be affixed to the lamp posts and in the tramcars.

The amalgamation of the London & North-Western and Lancashire & Yorkshire Railway Companies having been completed, it is announced that the directors of the L. & N.-W. Company are now occupied with the question of bringing the Midland Railway Company into the group.

The Scottish Commercial Motor Users' Association are opposing the Aberdeen Corporation Provisional Order, the Glasgow Corporation Provisional Order and the Ayr Burgh Provisional Order, under which the Corporations are taking powers to run omnibus services beyond the Corporation or burgh boundaries.

Barrow Town Council are opposing the Bill promoted by the London & North-Western, Midland, and Furness Railway Companies for powers to run road vehicles. At a meeting of the Town Council on Monday it was stated that the tram service was losing £200 a week. Penny fares for shorter stages were advocated.

Lewisham Borough Council have resolved to oppose the L.C.C. Bill for the construction of railless trolley trams from the boundary of the borough at Sydenham to Lee-green via Catford. Hackney Borough Council are also opposing the Bill in order to get certain conditions inserted, but the general principles of the Bill have been approved.

In the Bill of the Nottinghamshire and Derbyshire Tramways Company power is sought to construct a double line of tramway, in order to connect up its existing system at Heanor with the Ilkeston tramways, which have now been transferred to the company. It is proposed to give a through service, and for this purpose it is proposed to alter the gauge of the Ilkeston Tramways from 3 ft. 6 in. to 4 ft. 8½ in. The capital required is to be provided by empowering the company to raise the balance of its unissued capital of £96 470 as preference capital, and to borrow upon its issued capital the sum of £126 765.

The subject of omnibus stop signs has been under the consideration of the Road Department of the Ministry of Transport, and owing to the divergent views of Borough Councils, efforts are being made to adopt a uniform, standardised pattern. Some councils demand £1 per sign, others require that tramcar and omnibus stopping places be at least 30 yards apart and others that the sign be illuminated by electricity or gas by night. The Metropolitan Boroughs Standing Joint Committee have approved of the principle of erecting signs in the interest of public safety, and urge councils to adopt a similar attitude.

The accounts of Exeter Tramways for the past year show a surplus of about £3 000 on the year's working. Expenditure on general repairs and maintenance for the year is estimated at £4 922, compared with £9 366 and £8 862 for the two preceding years. In view of the expenditure that will be further required and the reduction of the reserve fund in the past two years, it has been decided that £2 000 of the £4 000 carried into the district rate for the current year be paid into the reserve fund. Mr. F. Chick, moving the adoption of the report at the Council meeting last week, said the committee had not made a profit of £3 000, but they had saved that amount on maintenance charges. Perhaps it was false economy. An amendment that the committee's recommendation be re-considered was defeated, and the report adopted.

For several months omnibuses have been running between Hanley and Burslem and Hanley and Stoke, with the result that the traffic on the tramcars has been affected, and the Potteries Electric Traction Company have reduced their fares. Some time ago the fare on the route between Hanley and Stoke, which is the most important and busiest in the district, was cut down to 1½d., but the omnibuses and chars-a-bancs continued to be well patronised at 2d. On the other sections, where there is no omnibus competition, the Tramway Company have made no reduction of fares. Now, however, they have still further reduced the fares on the Hanley-Burslem-Stoke sections to 1d. for the journey, which is roughly two miles. Several of the omnibus proprietors have declared their intention to transfer for the time being their competition to the sections where the Tramway Company have not reduced fares if they are forced by the 1d. fare to abandon the Hanley and Burslem and Hanley and Stoke routes.

Personal and Appointments.

Sir Charles Parsons has been elected Master of the Shipwrights Company.

Mr. E. E. Pope has been appointed mains superintendent of the Maidstone Municipal Electricity Works.

Mr. P. C. Larkin has been appointed High Commissioner for Canada in London, in succession to Sir George Perley.

Mr. H. W. Huntington Richards, electric traction engineer of the L.B. and S.C. Railway, has been elected a member of the Institute of Transport.

The present secretary of the South African Institute of Electrical Engineers is Mr. H. C. Luke, and his address is P.O., Box 5 907, 94, Cullinan-buildings, Simmonds- and Main-streets, Johannesburg.

Hackney Borough Council have appointed Councillor H. J. Mead, Chairman of the Works and Open Spaces Committee, and the Borough Engineer and Surveyor their representatives on the London "Safety First" Council for the current year.

We are pleased to learn that Sir John Snell, Chairman of the Electricity Commissioners, had so far recovered from the attack of bronchitis from which he has been suffering that he was able to return from Barrow-in-Furness to London on Monday, and, if no unforeseen relapse occurs, it is believed that he will be able to resume his duties about the end of the present week.

The International Commission on Illumination has appointed an Editing Committee, composed of the following:—English language, Major K. Edgcumbe (to represent the U.S.A. and Great Britain); French language, MM. Laporte and Blondin. The following officers have been appointed for the ensuing three years:—President, Dr. E. P. Hyde; vice-presidents, M. F. Rouland (France), M. G. Semenza (Italy), and Major K. Edgcumbe (Great Britain); hon. secretary and treasurer, Mr. C. C. Paterson.

The Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., announces that Mr. T. H. Hays has been appointed manager of the Indianapolis (Indiana) office of the company. Until further notice Mr. Hitchner, assistant to the manager. Industrial Department, in general charge of the mining and electrochemical industries, will have general charge of the sections formerly handled by Mr. W. H. Patterson, who, as we announced in our last issue, has resigned his position to become vice-president of of the Kaestner & Hecht Company.

After thirty-seven years' service in the City and Guilds (Engineering) College, following two years' service at the Finsbury Technical College, Prof. T. Mather is retiring at the end of the present session. Prof. Mather succeeded to the Chair in Electrical Engineering on the death of the late Prof. W. E. Ayrton, with whom he had been closely associated in the organisation of the department. The City and Guilds (Engineering) College forms the engineering section of the Imperial College of Science and Technology under the Delegacy, representing the Imperial College, the City and Guilds of London Institute and the Goldsmiths' Company. The Delegacy will proceed shortly to consider the appointment of a successor to Prof. Mather, and are inviting applications.

The following re-arrangements in the staff of Liverpool Electricity Department have been approved by the City Council:—Mr. E. L. Morland, mains superintendent, to be distribution engineer, at £525 per annum and bonus; Mr. C. M. Lucas, assistant electrical engineer, to be assistant distribution engineer, at £350 per annum and bonus; Mr. A. E. Aird, assistant engineer, to be assistant electrical engineeer, at £270 per annum and bonus; Mr. W. Mayhew, h.t. inspector, to be assistant engineer, at £205 per annum and bonus; Mr. T. B. Owens, h.t. switchboard inspector, to be assistant engineer, at £210 per annum and bonus; Mr. J. B. Higgins, mains engineer, to be h.t. engineer, at £235 per annum and bonus; Mr. J. H. Murray, mains engineer, to be district mains engineer, at £215 per annum and bonus; Mr. C. F. Reid, mains engineer, to be service mains engineer, at £190 per annum and bonus; Mr. C. L. Eagle, assistant mains engineer, to be district mains assistant, at £125 per annum and bonus; Mr. F. C. Carmen, mains assistant, to be senior mains assistant, at £235 per annum and bonus; Mr. A. E. Lewis, mains assistant, to be senior mains assistant, at £230 per annum and bonus; Mr. S. R. Holliway, station engineer, to be shift engineer, at £220 per annum, plus the E.P.E.A. bonus; and Mr. T. Herbert Thomas, shift engineer, at £220 per annum and bonus.

Exhibition Notes.

The Second International Samples Fair to be held at Trieste is to take place from Sept. 3 to 18.

Plans are being made to hold an International Exhibition at the White City at Shepherd's Bush, London, in 1924.

Stand 201, Block O, Building B, has been secured by A. Reyrolle & Company, of Hebburn-on-Tyne, at the forthcoming British Industries Fair to be held at Birmingham from Feb. 27 to March 10. Their exhibits will include their well-known armour-clad switchgear and switch pillars for use in fiery and non-fiery mines.

The Second Orient Fair (Pressburg) will be held from July 9 to 16. The Fair, which is international in character, is intended to foster the Balkan trade in conjunction with the efforts now in progress to develop the importance of Bratislava as a Danube port. Applications for space should be sent by May 31 to Secretariat, II. Orient Fair, Bratislava (Pressburg), Czecho-Slovakia.

Institution Notes.

The fifth Silvanus Thompson memorial lecture of the Röntgen Society will be delivered by Sir Oliver Lodge at the Institution of Electrical Engineers on Tuesday, March 21.

The second annual meeting of the British Electrical Development Association, on Wednesday, Feb. 22, will be followed by the annual luncheon at the Hotel Cecil, Strand, W.C., at 1 for 1.15 p.m. The chair will be taken by Councillor E. C. Ransome (President-Elect, E.D.A.; I.M.E.A. Council; Chairman, Ransomes, Sims & Jefferies, Ltd.). Other speakers will be: Mr. Arthur Neal, M.P. (Parliamentary Secretary of the Ministry of Transport), Mr. Hugo Hirst (President, E.D.A., 1921-22, and Chairman of the General Electric Company, Ltd.), Mr. J. S. Highfield (President of the Institution of Electrical Engineers), Sir Archibald Denny (Chairman, William Denny and Bros., Ltd.), and Mr. A. F. Berry (Chairman of Council, E.D.A., 1919-20-21-22).

At a meeting of the Chelmsford Engineering Society last week Mr. A. Haskins in the chair, Mr. G. H. Ayres, of Industrial Waste Eliminators Ltd., gave an illustrated lecture on "The Reclamation and Utilization of Waste in Factories." Various methods of recovering oil from metal turnings, dirty wipers, and cotton waste were dealt with. The apparatus recommended was the turbine type of centrifugal extractor. The peripheral speed of the extractor should be 6 000 to 7 000ft. per min., and by having the turbine blades fastened direct to the under side of the cage, this could be easily obtained. One manufacturing firm in six months treated 834 cwt. of metal turnings, 8 cwt. of rags, and 134 gross of sponge cloths, and recovered 2 440 gallons of oil. Another concern was stated to recover 1 200 gallons of cutting oil per week, while the Lancashire and Yorkshire Railway, using 6½ millions of sponge cloths per annum for cleaning purposes, recover more than a gallon of oil from each gross of cloths.

Under the chairmanship of Dr. C. S. Desch, Mr. A. Glynn Lobley, Lecturer in Electro-Metallurgy in the University of Sheffield, and Reader in Electro-Chemistry in the University of Manchester, last week gave a lecture on electric furnaces before the Sheffield section of the Institute of Metals. The lecturer gave a brief survey of the basic principles involved, the classification, and the evolution of electric furnaces, showing slides of the pioneer types. He followed this with a review of the characteristics of the furnaces used for non-ferrous metals, contrasting the merits and demerits of the three chief types, arc, induction, resistance. A comparison of the electrical load with the ordinary power station load was given, showing the advantage of the electric furnace from the power station viewpoint. He made a plea for a more extended use of the simple and reliable wire-wound furnace In order to dispel the notion that electric furnaces are necessarily expensive, he quoted examples from his experience in which electric furnaces of his own design, not only proved economical in use, but were often cheaper to install than fuel furnaces. He urged that furnaces should be made as simple as possible in order to reduce the first cost. A comparison of the thermal efficiencies of various types of fuel and electric furnaces was given.

Business Items, &c.

Dieny & Lucas, 329, High Holborn, London, W.C. 1, have been appointed exclusive agents in Great Britain and the Colonies for the Société Alsacienne de Constructions Mecaniques of Belfort and Mulhouse, manufacturers of electrical machinery.

Mr. S. Utting, 82, Victoria-street, London, has received the order for the equipment of two large Babcock C.T.M. type boilers for the Hague electricity works. The "Prat" draft system is to be installed, and the air heaters are of the "Thermix" type. This order is the fourth received by Mr. Utting for these important works, and is the outcome of the success of the first contract.

The Baroda State Railways have placed an order with Hollings & Guest, Ltd., for a horizontal four-throw chain-driven hydraulic pump, and a large hydraulic accumulator, for use at the Baroda workshops. The East Indian Railways also have recently ordered a hydraulic press from the firm. In addition, many other British and Foreign railway companies have installed similar presses for various purposes, such as solid tyre fitting, wheel forcing, scrap metal bundling, and forging.

Simplex Conduits, Ltd., announce that they have completed arrangements for a joint sales service with their associate company, Credenda Conduits Company, Ltd., whereby all Simplex and Credenda productions will be available throughout the branches and depots of both companies. The arrangement is essentially one of sales organisation, but as such deals only with actual productions of the companies, leaving untouched the usual factored lines, in which each will continue its own course of action as before. The manufacturing policy of neither company will be effected.

A series of novel electrical appliances, known by the trade name of "Adix," have been placed upon the market by Mr. Chas. Soukup, 15, Farringdon-avenue, E.C. 4. These include boilers, tea kettles, coffee percolators, irons, &c. The heating element and the vessel being separate, so that no contacts are attached to the container, forms a special feature. Should the element burn out it can easily be replaced by removing a few screws. The appliances are constructed for use on universal voltages and are designed to pack into a small compass. Mr. Soukup is sole agent for the appliances and factors, and others are invited to apply for fuller particulars.

Imperial Notes.

Westbury (Tasmania) Council have engaged Mr. H. A. Masters to report on the subject of electricity supply for the town.

It is understood that tenders for Grahamstown's (S. Africa) electric lighting scheme, estimated to cost £65 000, will be called for in June or July next.

Ballarat (Victoria) Finance Committee recommend that the City Council send a deputation to the State Electricity Commissioners to discuss the subject of the supply of electrical energy in Ballarat.

Negotiations are in progress for the supply of electrical energy by the Mount Lyell Company from their Lake Margaret power station to the Tasmanian State Hydro-Electric Department, and for its re-sale by them to Zeehan Municipality.

Imports of electrical goods and machinery in South Africa continue to increase, states the "British and South African Export Gazette." The value of elevators and lifts imported last year amounted to £75 000, compared with only £27 271 in 1920.

Amongst revised charges for electricity recently recommended by Sydney (N.S.W.) Electric Supply Committee was a proposal that where a supply of current is required continuously for water heating the charge shall be 5s. 3d. per month per 100 W of demand.

Singapore Municipal Commission have approved a scheme, involving the expenditure during the next ten years of 100 million dollars, for the provision of public utilities on the island, including the provision of further tramway facilities, and public and private electric lighting.

It is proposed to erect a h.t. transmission line from New South Wales State power-house, Port Kembla, to Moss Vale, and a supply from this line having been offered to Mittagong Council, the Council have decided to borrow £4 800 for the distribution, network, &c.

Adelaide (South Australia) Tramways Trust have just installed a 6 000 kW Curtis turbo-alternator, made by the British Thomson-Houston Company, and a condenser, manufactured by G. W. Kelly & Lewis, of Melbourne, and capable of condensing 75 000 lbs. of steam per hour.

Benalla (Victoria) Shire Council are considering the advisability of establishing electricity works for the town, with plant driven by suction gas, crude oil, or steam, and also a proposal for hydro-electric works, which would obtain power from the Holland's branch of the Broken river.

Up to the end of December last, 75 miles of the Melbourne Suburban Railways, or slightly more than three-fourths of the lines, had been converted to electric traction. Automatic substations are now being equipped, each of which will render its own section of line dead when not in use, and re-establish the circuit when a train approaches.

The Electrical Federation (Victoria) has been formed to take over the work of the Electrical Traders' & Contractors' Association of Victoria, and the latter association is being wound-up. The officers of the new Federation include T. M. Ritchie, President; L. G. Henwood, Vice-President; G. L. Just, Hon. Treasurer; and, for the time being, Messrs. Rankin, Marrison and Company, 314, Collins-street, Melbourne, are acting as secretaries.

The elimination of double taxation of income as between Australia and the United Kingdom has now been achieved. The arrangement is that where the British tax is greater than the Commonwealth and State taxes combined, the taxpayer will in future pay in the aggregate only the British rate, but where the combined Australian rates exceed the British rate he will pay only at the combined Australian rates. The higher rate will always be charged, and the lower tax will be rebated.

A manufacturers' agent in Halifax, Nova Scotia, representing several Canadian firms for telephones, electrical heating appliances, bells, &c., desires to represent United Kingdom manufacturers of electric, incandescent lamps, transformers, Wh meters, galvanised iron wire, stranded steel guy wire, and pole line material, on a commission basis, for New Brunswick, Prince Edward Island, Nova Scotia, and Newfoundland. Applications for names and addresses must be sent to the Department of Overseas Trade. (Ref. No. 127.)

In connection with the bann on German engineers to supervise the erection of briquetting machinery at Morwell brown coal mines, the Victorian Attorney-General recently stated that it was impossible to obtain the plant from any other country than Germany. The Federation of British Industries have been investigating the matter, and find that not only could the type of briquetting plant required be obtained in this country, but that a Birmingham firm actually quoted for this particular order. The Federation is taking every possible step to rectify the erroneous statement.

In a statement on the financial position of the Tasmanian State Hydro-Electric Department, made in the Tasmanian Parliament by the Hon. J. B. Hayes, it is explained that the estimate, given in 1919 as £2 500 000, of the cost of carrying out the Great Lake scheme to the point of being able to supply 57 200 h.p. of electrical energy had now to be amended by the addition of 25 per cent., due to increased cost of labour, plant, interest on loans, &c. In addition to the supplies to the Electrolytic Zinc Company and the Carbide Company, a supply has been provided for Messrs. Cadbury's chocolate works at Claremont, and applications have been received from two companies for large quantities of power for new industries.

Foreign Notes.

The Chinese Ministry of Communications has approved the registration of the PEKING TRAMWAY COMPANY.

The Arizona Bureau of Mines is patenting an ELECTRIC PROCESS for LOCATING UNDERGROUND ORE BODIES. The director, Dr. G. M. Butler, states that it indicates the depth, size, and other information regarding concealed copper ore. The device has, it is stated, proved accurate by tests in the mining regions in Arizona.

What is probably the HIGHEST VOLTAGE ever employed in URBAN DISTRIBUTION is used in BERLIN, where 100 000 V overhead lines have been erected in the centre of the city. High voltage is also used in some American towns, as at Seattle and Niagara Falls, where the lines run across the cities, but the pressure employed is much lower than in Berlin.

A scheme for the distribution of electricity for lighting and power throughout EAST FLANDERS has been prepared. The existing generating stations will be utilised as far as possible; but for new works and h.t. lines the Provincial Council will advance money to the communes and the local companies. The cost of the distribution network is estimated at about 10 000 000 francs.

The electrical manufacturers and contractors of HOLLAND are complaining of the serious effect of German competition, and the Vereeniging van Fabrikanten op Electrotechnisch Gebied has asked the Minister of Industry and Commerce to restrict the imports of electrical goods and to make the present five per cent. duty caluculable on the intrinsic value of the money of the country of origin.

A meeting of the UNION INTERNATIONALE DE TRAMWAYS ET DE CHEMINS DE FER D'INTERET LOCAL will be held at the rooms of the Société Générale de Belgique, 34, Rue Royale, Brussels, at 3 o'clock on February 18, to consider changes in the constitution of the Association which has been rendered necessary by the war. Among these changes are the addition to the title of the words "Transports Publics Automobiles," and the restriction of the membership to undertakings in friendly or neutral countries.

An AMERICAN ELECTRICAL (the BUCK-HEWLETT SUSPENSION INSULATOR) PATENT, which has been the subject of litigation for eleven years, has recently been declared invalid by the U.S. Circuit Court of Appeals. The patent related to a freely suspended system operating at 60 000 to 10 000 V, periodically dead-ended to cross-arms using a special disc insulator and a freely suspended jumper. It was held that the invention was anticipated by a line erected in 1900, and that an insulator of a special type and an insulator of a more general type in combination with expedients appropriated for the art were not inventions.

We learn from the "Electrical World" that the Lockwood Legislation Committee has ordered an INVESTIGATION of the AFFAIRS of the GENERAL ELECTRIC COMPANY of New York, to ascertain if it has violated any Federal laws. If any violations are discovered the company will be proceeded against. The Department will investigate the following questions:—Whether the company maintains an unlawful monopoly of tungsten incandescent lamps, whether it has made unlawful contracts, whether it has manipulated its accounts and evaded payment of excess profits taxes, and whether it has been operating in violation of a 1911 decree of the Federal courts.

Openings for Trade in the Netherlands.

The "Handelsbelangen" for Dec. 28 gives particulars of the following contracts for which tenders are likely to be invited in the near future:—

The firm of P. Hildebrandt, Bergen n/Oss, meat preserve manufacturers, intend to build a new factory on modern lines. The date of commencement of the building will probably be March or April.

Plans have been prepared for the erection of a new large pumping station at Boonersluis, probably in the coming summer. Plans have been designed by Ir. A. C. Loeff, who is attached to the Hoogheemraadschap (High District Council) van Delfland, Oude Delft 167, Delft. Plans for the Gouda-Boskoop-Alphen Railway are in the hands of Engineer Ch. W. Ankersmit, afd. W. 12, Weg en Werken, Nederlandsche Spoorwegen at Utrecht, and will probably be put into execution at the end of this year.

G. P. Larsen & Zn., shoe and leather manufacturers, of Keulschevaart, Amsterdam, intend building extensive works, and commencement with the building may be expected in March or April.

Plans have also been prepared for the extension of the refuse destructor installation at Amsterdam. (A. W. Bos, Director of Public Works, Town Hall, Amsterdam.) N. V. Hollandsche Hout en Bouwbedrijf voorheen Louis Mohrmann en Zn. (Asterweg, Amsterdam) intend to extend their wood-working factory; and Scholten en v. Heek, of Bandstraat, Enschede, will shortly commence the construction of their new textile mills.

In connection with the above and other projected works, H. M. Consul-General of Rotterdam points out that United Kingdom firms interested in supplying material likely to be required should communicate direct with the firm or individuals named, and, if necessary, apply to the Consulate-General at Rotterdam or to the Commercial Secretary at The Hague for further information.

Telegraph and Telephone Notes.

An automatic telephone exchange is being established at DURBAN.

The new automatic telephone exchange at HULL, which is capable of accommodating 1 000 subscribers, was opened on Monday.

The Spanish Government took over the BARCELONA TELEPHONE SYSTEM of the Campañia Peninsular de Telefonos in December last. The company's employees working the service were taken over by the State.

The Lisbon "O Seculo" announces that the United States Minister has been discussing with the Portuguese Minister of Commerce the question of a concession for laying a NEW SUBMARINE CABLE from NEW YORK, *via* the Azores, to EMDEN, GERMANY. The representative of the Commercial Cable Company is also in Lisbon on the same business.

The "Times" MELBOURNE correspondent states that the Postmaster-General proposes to ask Parliament next Session to sanction a loan for £8 000 000 to improve and expand the telephone system throughout Australia and to build trunk lines. His idea is to adopt a continuous scheme which will be independent for three or four years of the annual Parliamentary Votes. There are now 12 000 unsatisfied applications in the principal cities for telephone connection, besides thousands in the country districts for communication with the main systems. The Cabinet has made available £200 000 as the first instalment.

In a communication to "Lloyd's List" a correspondent calls attention to the delay in CABLE COMMUNICATION BETWEEN THIS COUNTRY AND INDIA, and complains that the method of obviating the delay by paying three times the usual rate for urgent messages is an abuse, for as long as senders are willing to pay treble rate there will be no desire on the part of the Cable Company to expedite ordinary rate messages. We desire to point out, however, that urgent messages were not introduced by the Telegraph Company, which is totally opposed to the system. It is recognised by all the members of the International Telegraph Union, of which telegraph companies are not members, and the correspondent's best course is to communicate with the Postmaster-General.

Wireless Notes.

METEOROLOGICAL FORECASTS to twelve districts in France are now being sent daily from the Eiffel Tower FOR THE BENEFIT OF FARMERS. They will indicate the weather for the following day, the direction of the wind, the state of the sky, and the possibilities of dangerous phenomena for agriculture, such as frost, storms, hail, &c., and the variation of temperature. The messages will be transmitted at half-past four daily, and in summer, the "Daily Telegraph" correspondent states, it is intended to send a second message at daybreak. This will contain the same information, only the minimum temperature of the night will be replaced by the maximum temperature of the day.

Mr. Fisk, of Amalgamated Wireless, Ltd., stated at a recent luncheon at the National Club, Sydney, that his company would be prepared to give a first-class service of COMMUNICATION BETWEEN AUSTRALIA AND ENGLAND at one-third less than the cost of cable communication. The cost of establishing the service would be £1 000 000, of which the company already had £450 000. They could obtain the balance, but preferred that the Government should have the control.

Obituary.

The death is announced of MR. P. MARSHALL, local manager of the Eastern Extension Telegraph Company at Shanghai.

ERNEST JAGGER, an electrical apprentice to the Mansfield Engineering Company, became entangled in the shafting of an electri motor motor last week, and died from his injuries.

SIR FRANCIS BARKER, whose death we announced in our last issue, received his early business training in his father's bank in Constantinople, and subsequently became private and confidential secretary to Sir Edgar Vincent (the present Lord D'Abernon), at that time Director-General of the Imperial Ottoman Bank at Constantinople. During this period he travelled extensivly in Syria and other parts of Asia Minor. In 1899 the Parsons' Foreign Patents Company, Ltd., was formed to exploit on the Continent of Europe Sir Charles Parsons' patents for marine and land turbine work. Sir Francis was appointed manager of this company, and as such was instrumental in forming subsidiary companies in various foreign countries, and in establishing works under the Parsons' Patents for the manufacture of land and marine turbines in those countries. He maintained his association with the Parsons Foreign Patents Company, Ltd., and at the time of his death was a director of the company.

The LATEST ELECTRICAL HEATING DEVICE, as might be expected, hails from America, and is intended for the use of those who fear forgery of their cheques. The device consists of a stylographic pen which contains a heating element instead of ink. The current passing through the element is sufficient to make a stylus hot enough to scorch the paper so that an indelible record is made.

Miscellaneous.

The will of the late Mr. ARTHUR BARRETT, managing director of Bailey, Grundy and Barrett, Ltd., shows gross estate of £7 909.

The eleventh annual dinner of the BIRMINGHAM AND DISTRICT ELECTRIC CLUB will be held at the Grand Hotel, Colmore-row, Birmingham, on Friday, Feb. 24, at 6.30 for 7 p.m. The chair will be taken by the President, Mr. Norman Deykin.

Johann Kremenezky has applied for the RESTORATION OF PATENT No. 18 278/1908, for "Improvements in the process of sealing the filament carrier into the bulb of electric incandescent lamps," which expired on Aug. 31, 1915, owing to non-payment of renewal fee.

Mr. C. ATKINSON, K.C., the arbitrator appointed to deal with the claim that CALCIUM CARBIDE should be brought within the SAFEGUARDING OF INDUSTRIES ACT, has come to the conclusion that the substance is not a synthetic organic chemical, and is not improperly excluded from the Act.

William Aaron Davis, electrician, of Farnley, Leeds, has, after several hearings, been remanded on EIGHT CHARGES of OBTAINING SUMS OF MONEY, ranging from £100 to £250, from persons in various parts of the country in connection with partnerships and alleged bogus companies. The alleged frauds involve about £10 000 in all, and complaints are still being received from persons who have been victims. Since 1919 accused has been carrying on business under different names in Leeds as an electrician, as the Leeds Battery Company, the Alliance Cycle and Motor Company, &c.

An important conference of representatives of commercial, industrial, and financial organisations, convened by the Association of British Chambers of Commerce, was held last Friday to consider the REDUCTIONS NECESSARY IN EXISTING POSTAL CHARGES. A suggested list of reductions, drawn up by a special committee of the Association, recommending a return to pre-war rates by three instalments by the end of the year, and the immediate restoration of the Sunday collection of letters, was adopted. If the present rates are continued next year it is estimated that they will produce a surplus income of £10 000 000. This surplus Sir Robert Horne wants to annex for the reduction of taxation, but Mr. Kellaway proposes instead to reduce the rates. There is no doubt as to the public wish in the matter.

In an ADDRESS ON ELECTRICITY, which he gave to the members of the Manchester Rotary Club last week, Mr. E. O. Walker pointed out that it was difficult to make electricity pay, even at 8d. a unit, in suburban districts, where there was little or no demand for it for power purposes. In the case of householders who merely turned on a few lights for a few hours in the winter, a shilling a unit would not be too high a charge. Referring to the multiplicity of uses to which electricity is now put, Mr. Walker said that this country was still very far behind the Continent and America. One catalogue in his possession contained forty pages of advertisements of electric washing machines alone. Electric cooking was cheaper than gas, because there was no waste of heat in the process and no loss of weight in the food.

"RADIO BROADCASTING NEWS," a weekly newspaper, has been established to mark the first anniversary of KDKA, the radio telephone broadcasting station of the Westinghouse Electric & Manufacturing Company at East Pittsburgh, Pa. The newspaper is believed to be the first of its kind in the United States. About one year ago the Westinghouse Electric & Manufacturing Company broadcasted its first programme from KDKA, which was the first station in the world to give nightly broadcasting programmes. Interest in the programmes became so great that, in the latter months of 1921, there was an insistent demand on the part of "listeners in" that they be informed "in advance" of the programmes to be broadcasted from KDKA. With this demand, "Radio Broadcasting News" was born. To-day, with only a few issues off the press, it is stated to be a fixture.

Books Received.

"The Microscope." By Conrad Beck. (London: R. & J. Beck.) Pp. 144. 2s. 6d. net.

"Mechanical World Year Book, 1922." (Manchester: Emmott & Co.) Pp. 266. 2s. 6d. net.

"Is Trade Unionism Sound?" By J. H. Bunting. (London: Benn Brothers.) Pp. x. + 98. 2s. 6d.

"Lexique Technique Anglais-Français." By G. Malgorn. (Paris: Gauthier Villars et Cie.) Pp. 216. 10 fr.

"Heat." Part I. By G. Thompson and G. H. Leslie. (London: Cassell & Company.) Pp. xii. + 160.

"Chemistry." Part I. By G. Thompson and G. H. Leslie. (London: Cassell & Company.) Pp. xi. + 160.

Catalogues, Price Lists, &c.

BAXTER & CAUNTER, LTD., have issued their February price list of electrical accessories, and will be pleased to send a copy on application.

SIEMENS BROTHERS & COMPANY have published a new edition of their Catalogue No. 106, "Twin Flexible Cords," in which the prices show considerable reductions.

The advantages claimed for the "New System" automatic intercommunication telephones are set forth in a circular issued by the NEW SYSTEM PRIVATE TELEPHONE COMPANY.

We have received from A. HINDERLECH two leaflets, E. 2015 and E. 2030, dealing respectively with asbestos woven resistance nets and grids, and wrought copper cable soldering sockets.

The LUBRICINE OIL & TRADING COMPANY, 168, Regent-street, W. 1, have issued their current price list of lubricating oils. The company supply dynamos and high-class machinery oils and lubricants for all purposes.

"Guarding the minute," the latest pamphlet circulated by the INTERNATIONAL TIME RECORDING COMPANY contains details and coloured illustrations of the latest models of time recorders manufactured by the firm.

A thirty-five page booklet published by Griffiths Brothers & Company, London, Ltd., gives brief descriptions of the various INSULATING VARNISHES and COMPOUNDS manufactured by the firm, and the purposes for which they are suitable.

THE GENERAL ELECTRIC COMPANY have just issued Catalogue Section X (4) dealing with condenser protective gear for dissipating voltage surges. This section has been issued to cover the apparatus, the use of which is described in the firm's Bulletin No. 10.

The B. E. Company (of London and Birmingham), Ltd., have sent us a leaflet giving some details of the "J. H. M. PERFECTO" TIME SWITCH. The clock is claimed to be absolutely reliable, and is mounted above the switch, which is 10A double pole, ironclad.

Twenty-three additional leaflets, illustrating their various types of iron-clad switchboards, distributing boxes, a.c. starting panels, h.t. truck type switch gear, and h.t. cubicle type switch gear, have been issued by MAJOR & COULSON for inclusion in their last switchgear catalogue.

A striking showcard of the ROYAL "EDISWAN" FULLOLITE GAS-FILLED LAMP has been sent us by the Edison Swan Electric Company. The card, which measures 16 by 12 in., is dark purple and black, with bold white letters. A picture of the lamp, which is also white, stands out in bold relief.

Payment on the instalment system is announced by L. G. Hawkins & Company in regard to their "Universal" washing machines, heavy ranges, and vacuum cleaners. Under the title of the UNIVERSAL DEFERRED PAYMENTS PLAN the company have made arrangements with the Financial Trust Company to finance time payments for the above appliances.

HOLLINGS & GUEST, LTD., have just put on the market a new hydraulic 50-ton tyre press for fixing solid rubber tyres of motor-bus and other commercial vehicle wheels. This press has been designed to meet the demand for a smaller and less expensive press than the standard tyre presses of 150-200 tons. It embodies all the features of the larger and more powerful presses; it has four columns with close-fitting guides to prevent tipping of the table; and it has also the divided head, so that wheels can be carried right into the press.

The February issue of HIGGS BROTHERS' monthly magazine contains the usual mixture of powder and jam, the powder being the information regarding the various types of motors made by the firm, and the jam the lighter literary efforts, a perusal of which should assist in the increased sale of these same motors. It is human to love a joke, and human also to deduce that a firm who can make good jokes must also make good motors. Special attention may be drawn to the stirring story of a terribly tall tragedy, which we fear may land the firm in a libel suit. Of more direct use to those employing motors, Higgs or otherwise, are hints and tips on ball bearings.

The issue of the seventh edition of "LEKTRIK" LIGHTING CONNECTIONS, by A. P. Lundberg & Sons, is sufficient indication of the usefulness of this booklet. It contains illustrations and descriptions of no fewer than 119 circuits. These are in general designed to obtain lighting effects of various kinds, though there are a few circuits which refer to fire alarms. Various types of switches and accessories are also illustrated and described, as are the methods which have been designed to demonstrate the changes that take place in the circuits when various switches are used. We notice that in 1912 we remarked that "the control of lighting circuits is a matter which needs greater attention at the hands of electrical contractors, and wiring consultants." If in the intervening years it has not received that attention, it is no fault of Lundberg & Sons, for this is a book which should be in the hands of every wireman and most electrical engineers.

One of the most useful wall calendars we have received this year has been sent us by HOLLINGS & GUEST, LTD. The monthly slips are placed below a photograph of one of the firm's erecting shops, taken from a 20-ton overhead electric travelling crane, and the black figures, which are nearly 1 in. in depth, stand out clearly on a pale-tinted background.

Tenders Invited and Accepted.

UNITED KINGDOM.

Walton-on-Thames Urban Council. Feb. 13.—Electric wiring and fitting in "Elm Grove," Hersham-road, Walton. Specifications can be seen at the Council Offices.

Manchester Tramways Committee. Feb. 14.—Tramcar type Ah meters, armature and field coils, lamps, bells, and cells, insulation material, overhead equipment material, power and lighting cable, &c. Particulars from Mr. J. M. McElroy, General Manager, Corporation Tramways, 55, Piccadilly, Manchester.

Gloucester Corporation. Feb. 14.—Two 1 500 kW geared d.c high-pressure steam turbo-generators, with surface condensing plant. Specification, &c., from the Town Clerk.

Cardiff Corporation. Feb. 15.—400 tons of steel tram rails. Specifications, &c., from the City Engineer.

Edinburgh Corporation. Feb. 15.—Auxiliary circuits and electric lighting and earthing for Westbank power station. Specification, &c., from the Electrical Engineer, Dewar-place, Edinburgh.

Islington (London) Borough Council. Feb. 16.—One year's supply of stores, including cables, electricity meters, fuse boxes, compounds, lamps, wires, electrical sundries, transformers, carbons, arc lamp globes, insulators, &c. Specification, &c., can be obtained at the Town Hall.

Oldbury Urban Council. Feb. 18.—Wiring and fitting the public buildings and library. Specification, &c., from the Council's Engineer and Surveyor.

Bradford Corporation. Feb. 18.—Steel girder tram rails. Particulars from Mr. F. Marsden, City Engineer and Surveyor, Town Hall, Bradford.

Hull Corporation. Feb. 20.—500 or 1 000 tons girder tramway rails. Forms of tender, &c., from the City Engineer.

Dublin Electricity Committee. Feb. 20.—Transformers for one or two years. Specifications, &c., from the City Electrical Engineer, Fleet-street, Dublin.

Great Western Railway. Feb. 20.—Stores for three months from March 1st, including telegraph instruments, electrical apparatus (insulators), &c., electrical wires and cables, telegraph ironwork, and tools, telegraph drysalteries, and electric lamps.

Hammersmith Borough Council. Feb. 22.—Stores for 3, 6, or 12 months, commencing on April 1, including electric light sundries, insulated wire, metals, packing and jointing materials, tools, joint boxes and connections, and meters. Particulars from Mr. G. G. Bell, Borough Electrical Engineer, 85, Fulham Palace Road, W. 6.

Burton-on-Trent Corporation. Feb. 22. 6 000 kW three-phase turbo-alternator, with condenser and switchboard; and two 40 000 lb. water-tube boilers, with economisers, coal-handling plant, &c. Specifications from the Borough Electrical Engineer.

Metropolitan Water Board. Feb. 23.—Electric lamps, &c., for three, six, or twelve months. Forms of tender from the Chief Engineer, 173, Rosebery-avenue, London, E.C. 1.

East Grinstead Urban Council. Feb. 24.—Oil engine driven generators, motor balancer, motor booster, steam engine and dynamo, storage batteries, main switchboard, super-heater, feed-water heater, cable system, street lamps and travelling crane. Specification from the Clerk of the Council, 102, London-road, East Grinstead.

Skipton Urban Council. Feb. 25.—Supply, laying, &c., of four core, paper insulated, lead covered, steel tape armoured cable. Specification, &c., from Mr. W. Emmott, 35, Commercial-street, Halifax.

Leeds Corporation. Feb. 27.—One year's supply of stores and materials to the Tramways and Highways Departments, including copper bands, electrodes, electrical sundries, engineers' furnishings, ironmongery, &c. Specifications from the General Manager, Tramways Department, 1, Swinegate, Leeds.

Eston. Feb. 28.—The erecting and providing of plant in connection with the overhead lines, underground cables, transformers, sub-station equipment, and public lighting fittings required under Eston Electricity Special Order, 1921. Particulars from the Clerk, Mr. T. Belk, Cleveland House, Grangetown, S.O., Yorks.

Hampstead (London) Borough Council. March 15.—Supply of various stores for six or twelve months, including electrical engineers' stores and oils for the electricity station. Form of tender, &c., from the Town Clerk.

Aylesbury Corporation.—300 kW converter, with e.h.t. and l.t. switchgear. Specifications, &c., from the Borough Electrical Engineer.

Aylesbury Corporation.—1 500 kW or 1 000 kW turbo-alternator, condenser and switchboard. Specification from the Borough Electrical Engineer.

Accrington Corporation.—Supply, delivery, and complete erection of 25 000 lb. water-tube boilers, economisers and brickwork. Particulars from Mr. A. W. Clegg, Engineer and Works Manager.

AUSTRALIA.

Commonwealth of Australia. March 8.—Switchboard apparatus and parts (schedule 545). Particulars from the Supply Officer, Room 101, Australia House, Strand, London, W.C. 2.

Victorian Railway Commissioners. March 8.—*Thirty-five cabin transformers for power signalling. (Contract No. 34 863.)

Postmaster-General's Department, Brisbane. March 8.—*Telephone switchboard apparatus and parts, including calculagraphs, caps, plane convex lens, retardation coils, cords, generators, indicators, jacks, keys, lamps, pegs, plugs, meters, relays, telephone sets &c. (Stores schedule No. 545.)

Deputy Postmaster-General, Brisbane. March 15.—*Protective apparatus, including arresters, carbon blocks, fibre fuses, protectors and terminals. (Stores schedule No. 546.)

Commonwealth of Australia. March 15.—Protective apparatus. Particulars from the Supply Officer, Room 101, Australia House, Strand, London, W.C. 2.

Postmaster-General's Department, Adelaide. April 5.—*Twelve adjustable condensers for use on telegraph duplex circuits. (Schedule No. 613.)

NEW ZEALAND.

Public Works Tenders Board, Waikato Power Scheme. March 6.—*(Section 45) two 2 500 kWa alternators, three-phase, 50 cycle, 5 000 V, at 166⅔rds rev. per min., with a power factor of .8. Excitation at 220 V. (Section 46) two 3 100 H.P. water turbines of the double-runner Francis type to operate the generators mentioned in Section 45. (Section 47) two exciter sets, each consisting of one 200 kW d.c. generator, and one 350 H.P. asynchronous motor, together with a Tirrill regulator. The generator shall have an output of 220 V, with a full-load current of 7 000 A. The motor shall be of 350 H.P., with a power supply of 400 V, three-phase, 60 cycle. The synchronous speed of the sets shall be 750. (Section 48) four Stoney sluice gates for the pits, appertaining to the turbines mentioned in Section 46. Tenders to the Secretary, Public Works Tenders Board, Government Buildings, Wellington.

Dunedin City Council. March 31.—*Supply and delivery of one 150 H.P. three-phase induction motor and reduction gear for the Mornington Cable Service.

Auckland Harbour Board. April 25.—Four double-barrel electric winches for the Central Wharf, Auckland. Specifications from W. & A. McArthur, 18-19, Silk-street, Cripplegate, London, E.C. 2.

SOUTH AMERICA.

State Electric Power House, Montevideo. March 21.—*Diesel set, comprising a 4-stroke Diesel engine directly coupled to a d.c. generator of 125 kW for a three-wire system at 2x235 V. Local representation is essential.

Ayrshire Education Committee has accepted the tender of Mr. W. G. Dodd, Ayr, for wiring St. Margaret's Schools at £115.

Orders for five "Straker-Clough" trolley omnibuses for Bloemfontein and four for the Teeside Railless Traction Board have been received by Clough, Smith & Co.

The managers of the Central London School District have accepted the tender of the Metropolitan Electric Supply Company to lay l.t. mains in the central block of the school, at an approximate cost of £356.

London County Council have accepted the tender of A. Hawkins & Sons (lowest tender received) for wiring and fitting Belleville-road, Battersea, school, £718 10s. (Seven tenders were received, the highest being £1 060.)

Despite the fact that there was a difference of nearly £4 000 in the tenders, the Worthing Town Council have decided by twenty votes to three to accept the tender of the British firm of Mirlees, Bickerton & Day in preference to that of a German firm, for the supply of a new Diesel engine and generator for the borough's electricity generating station. The net inclusive price of the accepted tender was £11 375, as against £7 810.

The following tenders have been accepted by Manchester Corporation:—Alliance Electrical Company, electric wiring at Chester-street school; Building Guild, Ltd., electric wiring at Thomas-street school; Allen, West & Company, transformer neutral earth resistance; Nalder Bros. & Thompson, indicating instruments; Metropolitan-Vickers Electrical Company, W.R. meters; W. H. Henley's Telegraph Works Company, adhesive tape; Connollys (Blackley), Blackley tape; Siemens Bros. & Company, dry batteries for flash lamps; Callender's Cable & Construction Company, box compound and bittite tape; Dussel Bitumen Company, box compound; Le Carbone, Ltd., and Morgan Crucible Company, carbon brushes; W. Patterson, Ltd., dynamo brushes; Siemens Bros. & Company, fuse boxes; W. T. Glover & Company and W. T. Henley's Telegraph Works Company, rubber tape, &c.; General Electric Company, Ltd., auto-transformers and auto-balances; British Insulated and Helsby Cables, Ltd., e.h.t. trifurcating boxes; Johnson & Phillips, l.t. trifurcating boxes; Siemens Bros. & Company l.t. trough box; London Electric Wire Company and Smith's, wire; Brotherton Ediswan Tubes and Conduits, tubing and accessories; Hawkins Bros. & Company, tinned copper and pure tin fuse wire; Titan Trackwork Company, manganese steel crossings; E. M. Evans & Sons, electric light wiring and subsidiary service wiring of certain houses on the Gorton, Catterick Hall and Newton Heath estates. Callender's Company have been permitted to sub-let their conduits contract to J. Place & Sons, and A. Reyrolle & Company to sub-let to Siemens Bros. Dynamo Works, Ltd., a contract for trip-circuit batteries.

---

* *Particulars from the Department of Overseas Trade.*

Companies' Meetings, Reports, &c.

The total revenue of the Anglo-Argentine Tramway Company in 1921 amounted to £4 203 369, compared with £3 997 565 in 1920, an increase of £205 824.

Smithfields Market Electric Supply Corporation have declared a dividend at the rate of 5 per cent. for 1921. The sum of about £1 550 is carried forward.

The Westminster Electric Supply Corporation has declared a final dividend for the half-year to Dec. 31 at the rate of 12 per cent. per annum, making 10 per cent. for the year 1921.

After transferring £37 545 to the depreciation fund, the accounts for 1921 of the Central Electric Supply Company show a loss of £7, and the surplus brought forward is reduced to £8.

An extraordinary meeting and a separate meeting of the holders of the preference shares of J. G. White & Company are to be held to-day (Friday) to consider a scheme of capital reorganisation.

Fairbairn, Lawson, Combe, Barbour, Ltd., are this week offering for subscription £350 000 7½ per cent. 15 year notes at 94, in registered notes of £50, £100, and £500, and 150 000 ordinary shares of £1 each at par.

After deducting dividends amounting to £2 10s. per share, free of tax (including 15s. 3d. per share from equalisation of dividends fund), the accounts of the Indo-European Telegraph Company for 1920 show a credit balance of £16 620, which is to be carried forward.

The directors of St. James' & Pall Mall Electric Light Company recommend a balance dividend on the 7 per cent. preference shares for the half-year ending Dec. 31 1921, of 3s. 6d. per share, and 8s. 6d. per share on the ordinary shares, making, with the interim dividend paid thereon, a total distribution of 12 per cent. for the year.

The accounts of the Yorkshire (West Riding) Electric Tramways Co. for 1921, after providing for debenture interest, show profit of £33 071, which has been appropriated as follows: Dividend of 6 per cent. on preference shares, £9 715; to renewals, depreciation and reserve fund in lieu of accident insurance, £19 126; carried forward, £4 230.

The accounts of the Tyneside Tramways and Tramroads Company for the half year ended December last show a surplus of receipts over expenditure of £4 971, to which is added £140 brought in. A dividend of 2½ per cent. on the ordinary shares for the year, less tax, is declared. The sum of £500 is placed to reserve and depreciation, leaving £591 to be carried forward.

The Stock Exchange Committee have ordered the following securities to be quoted in the Official List:—$1 500 common stock of Consolidated Gas, Electric Light & Power Company of Baltimore; £200 000 4 per cent. debenture stock of London Electric Railway Company; 40 000 £1 fully paid ordinary shares of Waygood-Otis, Ltd. Dealings in £823 300 7 per cent. 50-year prior lien A bonds of the Barcelona Traction Light & Power Company have been specially allowed.

The Metropolitan Railway Co. have declared a final dividend for the half-year ended Dec. 31, at rate of 3 per cent. per annum, making 2¼ per cent. for the year. The sum of £50 000 is placed to general renewals reserve, and £17 800 is carried forward. For the second half of 1920 the dividend was at the rate of 2 per cent. per annum (making 1½ per cent. for the year), a similar sum was placed to general renewals reserve, and about £15 416 was carried forward. The dividend on the surplus land stock is again 3 per cent. for the year, and £1 320 is carried forward (against £1 940). In 1920 the sum of £1 000 was placed to reserve.

The adjourned twenty-first and twenty-second annual meetings, and the twenty-third annual meeting of Chadburn's (Ship) Telegraph Company were held last week, Mr. William Chadburn, Chairman of the company presiding. After explaining fully the present position of the company, Mr. Chadburn said he hoped they might now be able to resume their pre-war programme and hold their annual meeting within the few months of the termination of the financial year. He assured the shareholders that every effort was being made to reduce expenditure and bring figures back to as near pre-war values as possible. An abstract of the report and accounts was given in our issue of Jan. 27.

The report for 1921 of the City of Buenos Ayres Tramway Company (1904) states that the annuity payable by the Anglo-Argentine Tramways Company has been received. The net revenue for the year, including £3 940 brought in, was £71 339. A balance dividend of 1s. 3d. per share is recommended, making 5 per cent., less tax, for the year, or the same as for 1920. The sum of £2 000 (against £3 000 last year) is placed to general amortisation fund, and the "carry forward" is increased by £3 399 to £7 339. The amortisation fund for the debenture stock, with accrued interest to date, amounts to £20 235, and the general amortisation fund for the redemption of the share capital now amounts to £79 396.

The directors of the Electric & Railway Finance Corporation, which was registered in December, with a nominal capital of £500 000, in £1 shares, are: Mr. Frank Dudley Docker, Sir Edward Ernest Pearson, Mr. D. Heineman, and Mr. Bernard D. F. Docker. Among the shareholders are Mr. F. D. Docker (235 000 shares), Whitehall Securities Corporation (100 000), Sir Algernon Firth (48 997), Sir Edward Pearson (25 000), Mr. Heineman (20 000), and the Société Financière de Transports et d'Enterprises Industrielles (20 000). The registered office is 4, Central-buildings, Westminster. The company will be interested chiefly in railway electrification, but it will carry on all or any of the businesses usually carried on by trust, land, mortgage and agency companies.

The accounts of the Sunderland District Electric Tramways, Ltd., for the year ended October 31, 1921, show, after providing for depreciation, &c., a balance of £11 051, to which was added £1 542 brought in. After deducting interest on the prior lien bonds and first mortgage debentures, £7 100; sinking fund instalment, £500; a balance of £4 993 10s. remains. From this the directors recommend the payment of interest at the rate of 5 per cent. per annum (less income-tax) on the first and second income bonds, which will absorb £4 065, leaving a sum of £928 to be carried forward to the credit of the current year. Capital expenditure amounting to £13 739 was incurred during the year in the purchase of new cars, additional plant and machinery, extension of car sheds, and other works. The net result of the year's operation shows a decrease in the operating profit of £3 758 over last year.

After providing £149 712 for depreciation, &c., and £29 000 for corporation tax, the net revenue of The British Colombia Electric Railway Company for the year ended June 30 last amounted to £421 277, which compares with £412 827 for the previous year. A final dividend at the rate of £1 3s. 8d. per cent. per annum (tax free) is recommended on the preferred ordinary stock, making £4 13s. 8d. (tax free) for the year, against £4 13s., while the deferred ordinary stock receives a balance dividend at the rate of £2 14s. 2d. per cent. per annum (tax free), which makes £6 4s. 2d. (tax free) for the year, against £6 4s. at this time last year. The balance of £23 999 carried forward compares with £12 646 brought into the accounts. Notwithstanding the depression which has existed for some time past, the indications from traffic returns and from light and power department results are that the earnings of the company will be maintained during the year to June next. The demand for light, power and gas continues to be brisk in consequence of the large amount of building now going on in various districts. While there has been a falling off in the consumption of some power customers, particularly in the lumber industry, this appears to be only temporary, and with a renewal of the demand for lumber by the prairie markets the mills may soon be expected to resume operation. There have been many valuable power customers added during the year.

The total net income of the London Brighton & South Coast Railway Company for the year 1921 amounted to £1 344 256, which, with £35 512 brought forward and an appropriation from railways compensation suspense account, being part of £720 971 received under an allocation scheme prescribed by the Railways Act, 1921, of £205 000, gives a total of £1 584 768. The balance available is £479 672, and enables the board to recommend dividends of £4 5s. per cent. on the undivided ordinary shares (making 5¼ per cent. for the year), £97 384; £4 per cent. on the preferred ordinary shares (making 6 per cent.), £163 114; £4 10s. per cent. for the year on the deferred ordinary shares, £183 503; leaving £35 671 to be carried forward. The capital account for the year shows a net expenditure of £149 893. In the report the directors call attention to the fact that at the outbreak of the war active progress was being made towards the completion of a scheme for the electrical equipment and working of a large part of the suburban railways of the company, and that although it became necessary to cancel the main contracts for the work it was found possible to proceed with certain portions of it. This course was followed because the board was and still is convinced from its experience of electrical working, so far as it has been brought into operation, that no better policy can be pursued, at the proper time, than to extend that mode of working. The work now in progress, namely, the equipment of the railway between Balham and West Croydon, is approaching completion, and relying upon the assent of the proprietors the board proposes to proceed to complete the surburban scheme interrupted by the war so soon as financial and other conditions permit.

The advantages of electric traction on suburban services were clearly brought out in the course of the proceedings at the annual meeting of the East London Railway Company last week. Though there was a decline in the number of passengers carried and in gross receipts, this was not more than was expected. The line was electrified just before the war, but the development of traffic that ensued accrued to the Government. The Board made four unsuccessful attempts during the control to obtain some financial concession, having regard to the large increase in receipts due to the adoption of electric traction, but an application for compensation is being drawn up for submission to the Railways Amalgamation Tribunal.

Replying to a series of questions by Mr. Olsson, the chairman (Lord Claud Hamilton) stated that having regard to sect. 76 of the Railways Act of 1921 the amount payable to leased undertakings in the form of a percentage of gross receipts was limited to rates and fares in operation in 1913. Leaving out of consideration the arrears on electrification interest, but taking into account the annual amount that had to be provided for on that score, about £130 000 gross earnings were required to pay all dividends down to and including the full 4 per cent. on the third debentures and the annual interest on capital to lessee companies. To pay full interest on all debenture stock gross receipts amounting to £171 500 would be required. The approximate amount of arrears of interest to Dec. 31, 1921, was £18 772, and after liquidating that electrification amount the future annual payment would be approximately £3 320. From Aug. 15 any excess of earnings (calculated at 1913 rates and fares) over and above the minimum rental would go in reduction of arrears of interest on electrification.

New Companies.

CLARKE'S (MANCHESTER), LTD. (179 362). Private company. Registered Jan. 31. Capital, £500 in £1 shares. Electrical and general engineers, &c. First directors: H. C. Bagshaw, Mrs. E. M. A. Leslie, G. W. Leslie, and C. E. Warren Roberts. Qualification, 100 shares. Secretary, M. Leslie. Registered office: 134, Wellington-road, Eccles, Lancs

COLLIERY EXPLOSIVES COMPANY, LTD. (179 341). Private company. Registered Jan. 30. Capital, £6 000 in £1 shares. To acquire and turn to account any inventions for improved explosive compounds and processes for moulding cartridges and apparatus therefor, and for protecting, preserving or packing explosives, &c., and to carry on the business of manufacturers of explosives, electric fuses and detonators, &c. First directors: T. Abbott, A. J. Jordan, and G. A. Jordan. Registered office: 112, Market-street, Earlestown, Lancs.

COOPER & SMITH, LTD. (179 462). Private company. Registered Feb. 3. Capital £12 500 in £1 shares. To acquire the business of electric motor and cutter manufacturers and dealers lately carried on by the Portable Electric Motors (1919) Ltd., at 121, Victoria-street, S.W., and elsewhere. First directors: J. Cooper and J. W. F. Smith. Registered office: Station-row, Maldon, Essex.

CHARLES JONES, JUNIOR, LTD.—Private Company. Registered in Dublin, Jan. 26. Capital, £2 000 in £1 shares. Electrical and mechanical engineers, contractors, manufacturers. &c. The first directors: C. Jones, Junr., C. F. Beckett. Secretary, C. Jones, Junr. Registered office: 3, Astons-quay, Dublin.

NEWCASTLE GENERAL SUPPLY COMPANY, LTD. (179 438). Private company. Registered Feb. 2. Capital, £500 in £1 shares. To take over the business and assets (but not liabilities) of C. Jack, trading as the "Newcastle & General Supply Company," at 156, Northumberland-street, Newcastle-on-Tyne, and to carry on the business of factors of and agents for electric lamps, and all kinds of electric or similar goods, electrical engineers, agents, publishers of books dealing with electrical engineering, &c. Permanent directors: R. J. J. Bigley, J. McDonald, and G. B. Pawson. The directors may borrow up to the amount of the paid-up capital. Qualification, 50 shares. Registered office: 156, Northumberland-street, Newcastle-on-Tyne.

PARKINSON, POLSON & COMPANY, LTD. (179 414). Private company. Registered Feb. 1. Capital, £2 000 in £1 shares (500 7 per cent. cumulative preference and 1 500 ordinary). To take over the business of automobile engineers and electricians, carried on by H. E. F. Parkinson and C. J. Polson at 30, Commercial-road, Eastbourne, as "Parkinson, Polson & Company." First directors: H. E. F. Parkinson, C. Polson and J. G. Enoch (all permanent). Solicitors: Billinghurst, Wood & Pope, 7, Bucklersbury, E.C. 4.

H. E. WEATHERLEY & COMPANY, LTD. (179 402).. Private company. Registered Feb. 1. Capital £500, in 450 6 per cent. cumulative preference shares of £1, and 1 000 ordinary shares of 1s. each. Electrical and mechanical engineers, manufacturers of, and dealers in, engines of all kinds, &c. Permanent directors: A. E. Showell, A. L. Pailthorpe and H. E. Weatherley. Qualification, £1. Solicitor: Kenneth E. Bartlett, 9-10, Fenchurch-street, E.C.

WESTERN RUBBER & BRATTICE CLOTH COMPANY, LTD. (179 356). Private company. Registered Jan. 30. Capital £3 000, in £1 shares. Manufacturers of and dealers in electrical goods and appliances, colliery requisites, &c. First directors: (Permanent) R. P. Kilminster, managing director, and J. Stevens, works manager. The subscribers have power within the first twelve months to appoint other directors. Registered by W. B. Porter, 10, Commercial-street, Newport, Mon.

WHEATLEY BROTHERS (ALDINGTON), LTD. (179 357). Private company. Registered Jan. 30 Capital £3 000. in £1 shares. To take over the business of motor, agricultural and general engineers and electricians carried on by Wheatley Brothers at Aldington, Kent, and to carry on the same and the business of engineers, &c. First directors: D. Y. Wheatley, manager, and J. W. Pickering. Qualification. £500. Registered office: Goldenhurst Works, Aldington, Kent.

FREYN, BRASSERT & COMPANY, LTD., has been registered as a "private" company with a nominal capital of £5 000 in £1 shares, to take over the business carried on in England by Freyn, Brassert & Company, a company incorporated under the laws of the State of Maine, U.S.A., and to carry on the business of designers, equippers and erectors of blast furnaces, steel plants, rolling mills and all classes of engineering works (particularly in connection with the iron and steel industry), iron and brass founders, engineers, electrical engineers, &c. The signatories to the memorandum of association (each signing for one share) are: W. A. Walber and H. B. Robinson. The signatories are to appoint the first directors. Secretary: H. B. Robinson. Registered office: 38, Victoria-street, S.W. File number: 179 435.

ELWORTHY-SADET, LTD., has been registered as a "private" company with a nominal capital of £1 100 in 1s. shares. The objects are: To acquire all or any of the shares of the Russian companies, M. Helfferich Sadet, Ltd., of Kharkoff, and R. and T. Elworthy, Ltd., of Elizabethgrad, and the businesses of these Russian companies, to acquire and hold shares, stocks, debentures, and obligations of any company in any part of the world, and to carry on in Russia or elsewhere the business of electrical and general engineers, &c. First directors: R. P. Elworthy (Chairman), W. R. Elworthy, A. J. Youngman, J. R. Caoul, C. Blakey, P. W. Robson, W. F. A. Fletcher, and J. Gillespie, each of whom may retain office till 1927 unless otherwise determined by the company. Solicitors: Johnson, Weatherall & Company, 7, King's Bench-walk, Temple, E.C. File number 179 465.

Arrangements for the Week.

FRIDAY, Feb. 10th (to-day).

PHYSICAL SOCIETY.

5 p.m. At the Imperial College of Science, London, S.W. Papers "On the Measurement of the Radium Content of Sealed Metal Tubes," by Dr. E. A. Owen and Bertha Naylor, B.Sc.; "The Crystal Structure of Ice," by Sir William Bragg, F.R.S.; and "A Method of Exciting Vibrations in Plates, Membranes, &c., based on Bernouilli's Principle," by Dr. Kerr Grant.

INSTITUTION OF ELECTRICAL ENGINEERS.
(SCOTTISH CENTRE. STUDENTS' SECTION.)

7.30 p.m. At the Royal Technical College, Glasgow. Paper on "The Sperry Gyro Compass," by Mr. H. M'Comb.

ELECTRO HARMONIC SOCIETY.

8 p.m. At Cannon-street Hotel, London, E.C. Concert. (Ladies' Night.)

INSTITUTION OF ELECTRICAL ENGINEERS.
(IRISH CENTRE.)

8 p.m. At the Royal College of Science, Upper Merrion-street, Dublin. Paper on "A Method of Regulating the Voltages on the Two Sides of a Three-Wire C.C. System Equalised by Static Balancers," by Mr. R. D. Archibald.

SATURDAY, Feb. 11th.

BIRMINGHAM AND DISTRICT ELECTRIC CLUB.

7. p.m. At the Grand Hotel, Birmingham. Lecture on "Illumination," by Mr. C. G. A. McDonald.

MONDAY, Feb. 13th.

INSTITUTION OF ELECTRICAL ENGINEERS.
(INFORMAL MEETING.)

7 p.m. At Savoy-place, London, W.C. Subject, "The Evolution of a Staff Trade Union," opened by Mr. J. H. Parker.

(NORTH-EASTERN CENTRE.)

7.15 p.m. At Armstrong College, Newcastle. Paper on "Rotary Converters, with special reference to Railway Electrification," by Mr. F. P. Whitaker.

(DUNDEE SUB-CENTRE.)

7.30 p.m. At University College, Dundee. Paper on "Publicity and Electrical Development," by Mr. J. W. Beauchamp. (To be read by Mr. G. Fowler.)

TUESDAY, Feb. 14th.

(EAST MIDLAND SUB-CENTRE.)

6.45 p.m. At the College, Loughborough. Paper on "High Power Mercury Arc Rectifiers," by Mr. R. L. Morrison.

(NORTH MIDLAND CENTRE.)

7 p.m. At the Hotel Metropole, King-street, Leeds. Paper on "The Cyc-Arc Process of Automatic Electric Welding," by Messrs. L. J. Steele and H. Martin.

JUNIOR INSTITUTION OF ENGINEERS.
(NORTH-EASTERN SECTION.)

7 p.m. At Armstrong College, Newcastle-on-Tyne. Paper on "Steam Locomotive Economy," by Mr. T. Grime.

INSTITUTION OF ELECTRICAL ENGINEERS.
(SCOTTISH CENTRE.)

7.30 p.m. At 207, Bath-street, Glasgow. Lecture on "The Uses of Wireless, Past and Future," by Major J. Erskine-Murray.

(NORTH-WESTERN STUDENTS' CENTRE.)

7.30 p.m. At Houldsworth Hall, Deansgate, Manchester. Paper on "Hydro-Electric Power Supply," by Mr. A. Tustin.

WEDNESDAY, Feb. 15th.

INSTITUTION OF RAILWAY SIGNAL ENGINEERS.

3 p.m. At the Institution of Electrical Engineers, Victoria Embankment, London, W.C. Annual General Meeting and Presidential Address by Mr. W. C. Acfield, O.B.E.

INDUSTRIAL LEAGUE AND COUNCIL.

7.30 p.m. At Caxton Hall, Westminster, London, S.W. Lecture on "Industry and Its Relation to Finance," by Sir George Paish.

THURSDAY, Feb. 16th.

INSTITUTION OF ELECTRICAL ENGINEERS.

6 p.m. At Savoy-place, London, W.C. Paper on "Rotary Converters, with Special Reference to Railway Electrification," by Mr. F. P. Whitaker.

NATIONAL LIBERAL CLUB. POLITICAL AND ECONOMIC CIRCLE.

8 p.m. At Whitehall-place, London, S.W. Lecture on "The Provision of Capital and Finance," by Mr. H. Ward, J.P

FRIDAY, Feb. 17th.

INSTITUTION OF MECHANICAL ENGINEERS.

6 p.m. At Storey's-gate, St. James's Park, London, S.W. Annual General Meeting and Paper on "Electric Welding Applied to Steel Construction, with Special Reference to Ships," by Mr. A. T. Wall.

BRITISH ELECTRICAL DEVELOPMENT ASSOCIATION.

7.30 p.m. At the Chartered Institute of Patent Agents, Staple Inn-buildings, W.C. Salesmanship Conference. (No. 4.) "Salesmanship in Relation to Electric Lighting." Speaker, Mr. H. Harrison.

JUNIOR INSTITUTION OF ENGINEERS.

8 p.m. At Caxton Hall, London, S.W. Lecture on "Water Purification for Boiler Feed Purposes," by Mr. W. J. Leaton.

COMMERCIAL INTELLIGENCE.

The following information is taken from printed reports, but we cannot be responsible for any errors that may occur.

London Gazette.

Partnerships Dissolved.

INMAN, William Hodgson, INMAN, Joseph Edward, and INMAN, Dick, electrical engineers, 38 and 40, North-road, Lancaster, under the style of W. H. INMAN, by mutual consent as from Dec. 31, 1921. Debts received and paid by W. H. Inman, who will continue the business.

MITCHELL, George, MYERS, Frederick Stephen, and ROSCOE, Daniel, electricians, at Market Bridge Mill, Burnley, under the style of GEORGE MITCHELL & COMPANY, by mutual consent as from Feb. 1, 1922. Debts received and paid by G. Mitchell and F. S. Myers, who will continue the business.

SMEAD, Ernest, and BORLACE, Walter John, electricians, &c., at 6A, The Avenue, Ealing, Middlesex, under the style of THE HOUSEHOLD WORK COMPANY, by mutual consent as from Oct. 31, 1921. Debts received and paid by E. Smead, who will continue the business.

WALKER, Percy, and FERRIER, Frederick Charles, electrical engineers and contractors, 283, New King's-road, Fulham, London, under the style of the HURLINGHAM ELECTRIC COMPANY, by mutual consent as from Dec. 12, 1921. Debts received and paid by P. Walker, who will continue the business.

WATSON, Frederick, WATSON, George Parker, and BENNETT, George, electrical engineers and electrical factors, 11, Northumberland-alley, E.C. 1, under the style of F. WATSON & COMPANY & ADVANCE ELECTRIC LAMP & ACCESSORIES COMPANY, by mutual consent as from Jan. 23, 1922. Debts received and paid by F. Watson and G. Bennett.

Bankruptcy Information.

SCOTT, Thomas, and CAMPBELL, James, under the style of T. SCOTT & COMPANY, 42, Handyside's-arcade, Percy-street, Newcastle-upon-Tyne, wholesale electrical suppliers. Receiving order, Feb. 2. Debtor's petition. First meeting, Feb. 21, 11 a.m., Official Receiver's Office, Pearl-buildings, 4, Northumberland-street, Newcastle-upon-Tyne. Public examination, Feb. 23, 11 a.m., County Court, Westgate-road, Newcastle-upon-Tyne.

WATMOUGH, Arthur Appleby, 41, Town-street, Horsforth, and 1, Back James-street, Harrogate, Co. York, electrical engineer. Receiving order, Jan. 31. Debtor's petition.

Companies Winding-up Voluntarily.

FREEMAN, J., & COMPANY, LTD. R. H. Bridgwater, 3, New-street, Birmingham, appointed liquidator. Meeting of creditors at Birmingham Chamber of Commerce, 95, New-street, Birmingham, on Tuesday, Feb. 14, at 2.30 p.m. Particulars of claims to the liquidator by Feb. 28.

GOODALL ELECTRIC, LTD. A. G. Turner, Liberty-buildings, School-lane, Liverpool, appointed liquidator. Meeting of creditors at 64, County-road, Walton, Liverpool, Wednesday, Feb. 15, at 2.30 p.m.

RAWCLIFFE, FRANK, & COMPANY, LTD. W. Brittain, 15, Pilgrim-street, Newcastle-upon-Tyne, appointed liquidator.

Winding-Up Petition.

GILLITT & COMPANY, LTD. A petition for winding up of this company has been presented by Fenwick, Ltd., and is to be heard at the Court House, Westgate-road, Newcastle-upon-Tyne, on Feb. 16. Blacket Gill, 26, Northumberland-street, Newcastle-upon-Tyne, solicitor for the petitioners.

County Court Judgments.

[NOTE.—The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debts. They may be for actions. But the Registry makes no distinction of the cases. Judgments are not returned to the Registry if satisfied in the Court books within twenty-one days.]

FROST, Ernest W., 15, Herbert-street, Loughborough, electrical engineer. £24 13s. Aug. 22.

LOWTHER & CO., Gradua Works, Porthcawl-road, Lower Sydenham, electrical engineers. £47 19s. 3d. Nov. 30.

PLANET ELECTRIC COMPANY, LTD., registered office, 5, St. George's-road, S.E. 1, electrical engineers. £16 11s. 4d. Nov. 24.

TROWEL, William Puckhaw, Nutfield, electrical engineer. £11 1s. 6d. Oct. 24.

WOLSTENHOLME, Alfred, 25, Meadow-road, Pinner, electrical engineer. £16 12s. Nov. 24.

Mortgages and Charges on Limited Companies.

[NOTE.—The Companies Act of 1903 provides that every Mortgage or Charge, as described therein, created by a Company after the commencement of the Act, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges which would, if created after the commencement of the Act, require registration. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced since such date.]

ELECTRICAL SPECIALITIES COMPANY, LTD., Sheffield. Registered Jan. 30, £2 500 debentures, to Mrs. J. Dunkerley, 12, Oakdale-road, Sheffield; general charge; also registered Jan. 30, £12 500 debentures (filed under Sec. 93 (3) of the Companies' (Consolidation) Act, 1908), present issue £4 000; general charge. *Nil. Feb. 2, 1920.

JONES & PORDES, LTD., London, W., manufacturers of electrical batteries. Registered Jan. 25, £1 000 debentures, to Mrs. J. Jones, 6, Stanley-road, Broadstairs; general charge.

OSWESTRY ELECTRIC LIGHTING & POWER COMPANY, LTD. Registered Jan. 25, £1 500 debentures (filed under Sec. 93 (3) of the Companies (Consolidation) Act, 1908), present issue £800; general charge. *£1 800 overdraft at bank not to exceed £1 500 secured by debenture £788 15s. 7d. Oct. 25, 1921.

SHEERNESS & DISTRICT ELECTRIC POWER & TRACTION COMPANY, LTD. (late COUNTY OF KENT ELECTRICAL POWER DISTRIBUTION COMPANY, LTD.). Registered Jan. 27, £200 second debentures, part of £12 500; general charge. *£28 280. June 21, 1921.

Satisfactions.

BANBURY & DISTRICT ELECTRIC SUPPLY COMPANY, LTD. Satisfaction registered Jan. 27, £100, part of amount registered March 31, 1913.

SHEERNESS & DISTRICT ELECTRIC POWER & TRACTION COMPANY, LTD. (late COUNTY OF KENT ELECTRICAL POWER DISTRIBUTION COMPANY, LTD.). Satisfaction registered Jan. 27, £200, part of amount registered Feb. 15, 1915.

Receiverships.

HOWARD PNEUMATIC ENGINEERING COMPANY, LTD. S. Nugent, of 33, Upperton-gardens, Eastbourne, was appointed receiver on Jan. 23, 1922, under powers contained in mortgage debentures dated Jan. 13 and 20, 1913, and March 4 and May 4, 1920.

RUSHMORES (1919), LTD. Sir Basil E. Mayhew, K.B.E., of 20, Alderman's House, E.C., was appointed as receiver on Jan. 27, 1922, under powers contained in debentures dated Nov. 30, 1920.

SUTTON-IN-ASHFIELD MOTOR AND ELECTRICAL ENGINEERING COMPANY, LTD. A. G. Mellors, of 1, King John's Chambers, Nottingham, ceased to act as receiver on Jan. 22, 1922.

SWIFT ELECTRICAL, LTD. Louisa Butler, of 94, Woodlands Gardens, N. 10, was appointed receiver and manager on Jan. 21, 1922, under powers contained in debenture dated Oct. 18, 1921.

Bankruptcy Proceedings.

DEPLEDGE, Robert Adrian, 53, late 102, Frodingham-road, Scunthorpe, Lincolnshire, electrical engineer. The public examination of this debtor was held on Feb. 2. The statement of affairs showed gross liabilities of £3 017, of which £1 545 was expected to rank for dividend, and there was a deficiency of £814. Debtor attributed his failure to bad trade, want of capital, and loss on forced sales under executions. The following are creditors:—Baxendale & Company, Ltd, Manchester, £76; Crossley Bros., Ltd., Manchester, £158; Callenders Cable Company, Ltd., Nottingham, £105; General Electric, Newcastle-on-Tyne, £103; Morley, T. B., & Company, Hull, £139; Premier Accumulator Company, Ltd., Northampton, £52 Quibel, D. J. K. Scunthorpe, £457; Thursfield, C. J., Birmingham, £13; Verity, E., Leeds, £33.

FAWCETT, Ernest, 20, St. Anne-street, Liverpool, electrical and heating engineer. The first meeting of creditors was held last week. The receiving order was made on debtor's own petition. The statement of affairs showed unsecured liabilities of £348, while the net assets were estimated to realise 14s. 11d. Debtor served an apprenticeship to an electrical, heating, and hydraulic engineer, and was for a number of years in the employ of various engineering firms. In August, 1920, he invested in and became one of the directors of an electrical company, and in the following November he guaranteed jointly and severally with the other two directors the bank overdraft of £500. Owing to the slump in trade the company went into voluntary liquidation on June 1, 1921. On July 21 last year debtor entered into partnership with another person, and the two carried on business at 20, St. Anne-street, Liverpool, as electrical and heating engineers. His partner provided the whole of the partnership capital, and the agreement was that the partnership should be dissolved on the bankruptcy of either

partner. The debtor estimated that his interest in the partnership was at present valueless. In connection with the partnership a firm of business agents had obtained judgment against the debtor personally for £25 and costs for commission in introducing the partner with capital. No books of account were kept by the debtor in connection with his private estate. He became aware of his position in June last. The matter was left in the hands of the Official Receiver as trustee.

HEATH, Edward Fuller, trading as FULLER, HEATH & COMPANY, electrical and mechanical engineer, 26, Buckingham Gate, S.W. The receiving order in this case was made on Jan. 18, on the petition of the Danish Machine Company, creditors for £300, and the statutory first meeting of creditors was held last week at the London Bankruptcy Court. Mr. F. T. Garton, official receiver, who presided, said that the debtor began business as an electrical engineer in January, 1919, at Cannon Street House, E.C. Owing to the liquidation of a large electrical company, through which he lost £1 000, he executed a deed of assignment. Six months later he recommenced business as an electrical and mechanical engineer at 26, Buckingham Gate, with a capital of £100. Owing to strikes and other difficulties he was unable to carry on successfully. His failure was also due to ill-health and lack of capital. No statement of affairs had been lodged, but the liabilities were estimated at £2 000, and assets £135. The case was left in the hands of the official receiver for administration in bankruptcy.

PHONOPORE CONSTRUCTION COMPANY (THE), LTD., Phonopore Works, Scott's-road, Southall, Middlesex. The winding-up order in this matter was made on Nov. 10, 1921, and the statement of affairs shows liabilities £6 019, of which £2 445 is due to unsecured creditors. The assets are estimated to realise £1 957, from which preferential claims of £1 000 have to be deducted, leaving net assets £957, which are not sufficient to meet the claims of the debenture holders, which amount to £4 531. The company was registered as a private company March, 1916, and was formed generally to carry on the business of manufacturing telephones, &c., and to take over interests under an agreement with the New Phonopore Telephone Company, Ltd. The company is stated to have carried on the business of manufacturing telephones for the army until June, 1917, when the works were commandeered by the War Office, being restored only in Jan. 1919. On Oct. 19, 1921, a resolution for the voluntary liquidation of the company was passed, and a liquidator appointed, but that appointment has been superseded by the winding-up order. The following are creditors :—Canning, W., & Company, Ltd., London, £40; Caversham Motors, Ltd, Reading, £35; Collins Electrical Company, Ltd., London, £14; Hatcham Mfg. Company, London, £43; Micanite & Insulators, Ltd., Walthamstow, £24; Mica & Micanite Supplies, Ltd., London, £470; Phœnix Telephone Works, Ltd., London, £180; Sheath Bros., London, £20; Submersible Motors, Ltd., Southall, £24; Sterling Telephone Company, London, £22; Telegraph Condenser Company, Ltd., London, £102; Varley Magnet & Company, London, £203.

SMITH, James Joseph, trading as J. SMITH & SON, electrical engineer, 1, Central-street, E.C. 1. The above-named debtor appeared for his public examination at the London Bankruptcy Court on Feb. 7, and his statement of affairs showed ranking liabilities £321, and assets nil. Debtor stated that he was born in London in 1885, and was in employment as an electrical engineer until about 1910, and from that date until 1919 he carried out electrical work from his private address at 130, Chestnut-avenue, Walthamstow. In March, 1919, he took premises at 1, Central-street, St. Luke's, E.C., and commenced to trade there with a capital of about £60, under the style of J. Smith & Son. The business was at first profitable, but owing to strikes in the coal and electrical trades it fell off. Although he had traded as J. Smith & Son, he did not have a partner. He carried on the same sort of work as he did when trading as an electrical engineer from his private address. His work was nearly all for the trade. In May, 1921, execution was levied at 1, Central-street, his effects being valued at £10, and his father-in-law paid that sum to the sheriff. The tenancy was transferred to his wife in October, 1921, and his father-in-law having given the goods which he purchased from the sheriff to her, she had since carried on business there under his management. He attributed his insolvency to loss of business owing to strikes, and to slump in trade. Examination was concluded.

WILLCOX, Albert John, The Garage, Farnham Common, Bucks, electrical engineer, &c. The statement of affairs shows liabilities £2 190, while the assets are estimated to realise £928, from which preferential claims of £58 have to be deducted, leaving net assets of £870, or a deficiency of £1 320. Debtor attributes his failure to shortness of capital, and borrowing money at a high rate of interest. He commenced trading on his own account in Sept., 1917, when he purchased for £1 318 his present business, in which he had for some time previously been employed as manager. He borrowed £600, giving a charge on the lease and fixed machinery as security, and paid £518 on account of the purchase, arranging to pay the balance of £800 by four yearly instalments, with 6 per cent. interest, but has paid £204 and interest to Oct., 1919. Having no capital, he, some time ago, had recourse to moneylenders. He became aware of his position about twelve months ago.

Private Meeting.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

STOCKWELL & OHMS, LTD. (in voluntary liquidation), electrical power contractors, 164A, Pentonville-road, N. A meeting of creditors took place on Friday, at the offices of Haissen Wilson & Co., 2, Fenchurch-avenue, E.C. A statement of affairs was submitted, showing the position of the company as at Jan. 13, 1922, the date of the resolution for winding up. The liabilities amounted to £2 268, all due to unsecured trade creditors, while the assets were estimated to produce £468, and there was thus a deficiency disclosed of £1 800. Mr. Holmes, the liquidator of the company, stated that the company had only been in existence a comparatively short time, and the present position had been brought about in consequence of the drop in values, and the falling market generally. The directors of the company were Mr. Mepsted and Mr. Hayward, while Mr. Stockwell was the managing director. It appeared that the managing director had given out contracts to Crompton & Co. and Siemens Bros. to the extent of £5 000 for machines, and the deliveries were to be arranged over a subsequent twelve months. From October, 1920, however, the market prices were continually falling, and to such an extent that it was impossible to realise the purchase price of the goods. In these circumstances the managing director asked the various creditors concerned to delay deliveries. Eventually it was found that the company could not go on, and the matter was brought to a head by Siemens' obtaining a judgment against the company for the amount of their debt. Questions were asked with regard to the deliveries made by certain creditors, and it was stated that the last balance-sheet of the company was got out in October, 1920, and this showed a profit of £380. Asked as to the stock which was held, it was stated that this included various Siemens' machines, D.C. motor, while Hurst had supplied two machines which they claimed were sold on sale or return. The sales of the business since October, 1921, had been £1 107, while the payments to creditors and other expenses of the business were £950. The opinion was expressed that the position was very unsatisfactory, and several creditors urged that the trade should be represented in the liquidation. In the result it was decided that Mr. W. Osborne, of Corfield & Cripwell, should be appointed as joint liquidator with Mr. Holmes, with a committee of inspection consisting of the representatives of Crompton & Company, English Electric Company, and the General Electric Company. The following are creditors :—General Electric Company, £136; Siemens Bros., £25; Simplex Conduits, Ltd., £12; Crompton & Company, Ltd., £1 270; Edison-Swan Electric Company, £15; English Electric Company, £908; English Electric & Siemens Company, £69; Marshall & Plumtree, Ltd.; £40; Tucker, J. H., & Company, Ltd., £30.

Prices of Metals, Chemicals, &c.

Rubber.—Para fine, 11$\frac{1}{4}$d.; plantation 1st latex 8$\frac{1}{2}$d.

The metal prices are supplied by British Insulated & Helsby Cables, Ltd., and the rubber prices by W. T. Henley's Telegraph Works Company, Ltd.

Patent Record.

SPECIFICATIONS PUBLISHED.

The following abstract from some of the specifications recently published have been specially compiled by Messrs. Mewburn, Ellis & Co., *Chartered Patent Agents, 70 and 72, Chancery-lane, London, W.C.*

Complete Specifications.

141 354 Hammabrack, L. S. Adjustable standard for electric lamps. (4/4/19.)
142 090 Wilson, Welder, & Metals Co., Inc. Process and apparatus for electric welding. (4/4/19.)
144 669 Soc. Anon. des Etablissements L. Bleriot. Means for automatically controlling the temperature of electric heating apparatus. (5/2/19.)
145 034 Western Electric Co., Ltd. Telephone systems. (14/6/19.)
145 066 Western Electric Co., Ltd. Electric signalling systems specially applicable to telephone systems. (31/8/15.)
145 423 Siemens-Schuckertwerke Ges. Vacuum rectifiers with rotating electric arc. (23/10/15.)
147 431 Ges Für Drahtlöse Telegraphie. Production of high-power currents of constant frequency. (31/12/15.)
147 462 Latour, M. Electro-magnetic wave signalling systems. (11/11/15.)
147 879 Siemens-Schuckertwerke Ges. Electricity meters. (15/3/18.)
148 317 Huth Ges, Dr. E. F. Arrangement for carrying wireless stations. (30/10/13.)
148 359 Soissan, L. de. Electric heating apparatus. (19/12/13.)
158 842 Festa Akt.-Ges. Electric liquid heaters. (11/2/20.)
168 568 Hastings, R. C. M. Party line telephone systems. (1/3/20.) (Divided Application on 168 377.)
168 611 Crowe, D. C. Automatic or semi-automatic telephone systems. (4/3/21.)
168 630 Harris, H. K. Recording mechanism for use with electric sign telegraphs. (6/5/20.)
168 641 Crabtree, J. A. Electrical plug socket and switch combinations. (1/6/20.)
168 642 Dodgson, F. L. Relay contacts and method of making same. (1/6/20.)
168 649 Woodell, S. F. Indicating or adjusting devices for wireless direction finding coils and other devices. (2/6/20.)
168 650 Petersen, H. M. Method of and means for electrically synchronising apparatus over a long distance. (2/6/20.)
168 660 Lea, N., & Radio Communication Co., Ltd. Modulated signalling systems particularly applicable to wireless signalling. (4/6/20.)
168 661 Edwards, L. A. Electric foot and food heater and vapouriser. (4/6/20.)
168 669 British Thomson-Houston Co., Ltd. (General Electric Co.). Filaments and like bodies. (5/6/20.)
168 697 Aoyagi, E. Electro-metallurgical process for manufacture of ductile bodies of high fusing metals and alloys of same. (17/6/20.)
168 706 Austin Motor Co., Ltd., & Walker, C. B. Automatic electric switches for use more especially in relay circuits. (22/6/20.)
168 707 Coates, W. A., Gittins, G. E., Davies, D. R., & Metropolitan Vickers Electrical Co., Ltd. Electrical switch gear. (22/6/20.)

APPLICATIONS FOR PATENTS

November 7, 1921.

29 545 Butler & Chinn. Voltmeters and ammeters.
29 558 Crowe. Portable electric lamps.
29 559 Foxton. Dynamos for lighting sets of motor vehicles.
29 579 Caley & Talbot. Commutators of electric ignition systems.
29 581 Reyrolle & Co. & Owen. Lightning, &c., arresters for electric conductors.
20 614 Vinolto (Lorrain). Electric lighte-.
29 625 Falk, Stadelmann & Co. Globes, &c., for electric lamps.
29 634 Siemens-Schuckertwerke. Means of regulating electric motor cascades. (9/12/20, Germany.)
29 635 Siemens-Schuckertwerke. Starting 3-phase induction motors. (30/12/20, Germany.)
29 642 Naamlooze Venootschap Hengelosche Elektrische &c., Fabriek. Induction motors. (12/5/21, Holland.)
29 663 Farrar & Longbottom. Devices for containing electrical conductors, &c.

November 8, 1921.

29 677 Sullivan. Submarine, &c., cables.
29 702 Morgan, Elsmere, Williams & Evans. Electro-magnetic driven generator and switching arrangement
29 707 Paterson. Electric beer engine and air compressor.
29 732 Bennett. Switch bolders for electric lamps.
29 752 Henley's Telegraph Works Co. & Moor. Fuse carriers, &c.
29 754 B. T.-H. Co. (G. E. Co.). Switches
29 777 Béthenod. Electric installations. (8/11/20, France.)
29 793 Allgemeine Elektricitäts Ges. High tension cable with paper insulation. (8/11/20, Germany.)

November 9, 1921.

29 822 Cowper-Coles. Electrolytic production of tubes, &c.
29 848 Austin. Electric cables.
29 865 Sayers. Electric conductors.
29 868 Bunch. Motor vehicle electric lamps.
29 874 Mawdsley. Dynamo electric machines
29 882 B. T.-H. Co. & Whittaker. Systems of electric distribution.
29 883 B. T.-H. Co. Illuminating devices.
29 885 B. T.-H. Co. (G. E. Co.). Circuit breakers.
29 895 Angus. Apparatus for supplying electricity to instruments or circuits.
29 906 McKenzie, Holland & Westinghouse Power Signal Co. Signalling systems employing light-emitting devices. (2/3/21, U.S.)
29 918 Preston & Shearing. Signalling in wireless telegraphy.

November 10, 1921.

29 929 Waterhouse. Electric adaptor fitting
29 973 Blake. Carriers for storage batteries
29 979 Donisthorpe. Thermionic valves.
29 989 B. T.-H. Co. (G. E. Co.). Insulating elements.
29 993 White. Mounting and driving magnetos.
29 997 Somajni. Dynamo-electric machines. (10/11/20, Italy.)
30 016 Best & Lloyd. Chains for electroliers, &c.
30 036 Pollak (Siemens & Halske A. G.). Telephone instruments.

November 11, 1921.

30 059 Bosch (R.) Akt. Ges. Magneto-electric ignition apparatus. (14/5/21, Germany.)
30 065 Cuppleditch. Means for handling loads on electrically driven trucks.
30 073 Hadwen & Willis. Slings for supporting electric cables.
30 087 Neyret. Dynamos. (3/3/20, France.)
30 107 Bailey. Coupling dynamos, &c., to internal combustion engines.
30 109 Mackay & Shimwell. Wind-driven electric generators.
30 114 Nalder Bros. & Thompson & Lipman. Alternating current instruments for indicating synchronism, power factor, phase difference, &c.
30 118 Penfold. Electric cut-outs.
30 136 Angus. Devices for causing electricity to be supplied to instruments or circuits.
30 139 Cambridge & Paul Instrument Co. & Collins. High-speed recording indicators.
30 140 Measurement, Ltd. & Holden. Electricity meters.
30 152 & 30 153 Johnson & Phillips, Barton, Scase & Stigant. Tapping switches for changing voltage ratios of transformers, &c.
30 158 Ehrich & Graetz. Electric cooking utensils.
30 159 Ehrich & Graetz. Electrically heated coffee-making machine.
30 160 Curtis. Electric switches or controllers for vehicle head-lamps.
30 183 Maschinenfabrik Oerlikon. Clamping arrangements for sheet metal stator teeth of electrical machines. (17/11/20, Switzerland.)
30 185 Brown. Relays.
30 189 Preston & Shuttleworth. High-frequency coils.

November 12, 1921.

30 192 Miller. Electric cycle lamps.
30 193 Miller. Bulb holders for electric cycle lamps.
30 194 Miller. Electric lighting dynamos.
30 195 Miller. Friction driven electric lighting dynamos for bicycles.
30 197 Davis. Electric lamps for road vehicles
30 227 Western Electric Co. Telephone receiver. (2/12/20, U.S.)
30 239 Cox. Electric generator.
30 242 Hannah. Apparatus for rendering electric system on motor-cycles inoperative.
30 245 Sterling Telephone, &c., Co., Bell & Clark. Indicating ringing of electric bells, &c., to operators.
30 248 Savidge & Terrey. Current economiser and regulator.
30 251 Mackay & Shimwell. Switch gear for battery charging circuits.

November 14, 1921.

30 268 Barlow. Slab inductances for wireless telegraphy or telephony.
30 275 Cowan & Goodwin. Electric lighting of vehicles, &c.
30 296 Morrison. Electrolytic engine.
30 302 Mead. Electrical apparatus for locating faults in ignition circuits.
30 303 Baddeley. Machine for converting a.c. into d.c.
30 327 B. T.-H. Co. (G. E. Co.). Electric terminals.
30 337 Mackley. Switches.
30 338 Sayers. Dynamo-electric machines.
30 357 Johnsen & Rahbek. Relay, oscillograph, telephone, automatic current regulator, &c.
30 371 Automatic Telephone Mfg. Co. Automatic switches for telephone, &c., systems. (23/11/20, U.S.)
30 372 Contell. Alternator.
30 353 Norbs. Electric heating and cooking apparatus
30 397 Roberts. Electric cables, &c.

November 15, 1921.

30 424 Automatic Telephone Mfg. Co. & Remington. Mine signalling systems, &c.
30 434 Krupp (F.) Akt. Ges. Arc lamps for projection. (22/10/21. Germany.)

The Editorial, Advertisement and Publishing Offices of "The Electrician" are at 8, Bouverie Street, London, E.C. 4. Telegrams: Benbrotric, Fleet, London. Telephone: City 9852 (5 lines).

The subscription to "The Electrician" is £2 12 0 per annum in the United Kingdom, and £2 14 0 per annum Abroad. Advertisement Rates can be obtained on application to the Manager. Advertisement copy and blocks should be received on the Friday preceding date of publication.

THE ELECTRICIAN

ESTABLISHED 1861.

THE OLDEST WEEKLY ILLUSTRATED JOURNAL OF

Electrical Engineering, Industry, Science and Finance.

No. 2283. [Vol. LXXXVIII. No. 7.] FRIDAY, FEBRUARY 17, 1922. Prepaid Subscription U.K., £2 12s. per ann.; Abroad, £2 14s. Price 1/-

CONTENTS.

Notes of the Week.

The Geddes Reports.

We assume that, in the days intervening since last Saturday, electrical engineers have not been behind other classes of the community in studying and discussing the Geddes Reports. These documents are, indeed, of the highest national interest, and we are not surprised that the demand for them has only been equalled by that for the most popular of novels. If they were novels we should commend their directness of style; as it is, the matter is much more important than the manner of presentation. From the reports two things stand out clearly: That we are paying out of all proportion more than we were paying for similar services in 1913, and that the birth of new Departments for effecting all sorts of possible and impossible improvements in the social habits of the people has added a burden to the taxpayer which he cannot bear without undue strain. That is the keynote which cannot be too clearly sounded in any discussion of these important documents.

Specific Instances of Waste.

As a specific instance of both classes of over-payment, it may be mentioned that the cost of education to the taxpayer rose from £17 200 000 in 1913-14 to £60 500 000 in 1921-22. This increase, which does not take into account the equally large increases in the rates due to the same service, is mainly caused by the rise in teachers' salaries, by special facilities connected with the children's welfare, by administration, and more than all by the pernicious system of grants-in-aid, whereby the Board of Education has little or no control over the expenditure for which it is nominally responsible. In addition, the school age has been extended at each end of the scale, State scholarships have been augmented, and a non-contributory pensions scheme for teachers has been started. Other examples of the same dual expansion are to be found in the egregious finance of the housing schemes, in the electronic emission from the larger Departments of self-contained branches, such as the Power, Transport, and Economic Department of the Board of Trade, in the many divisions of that grandiose and moribund conception, the Ministry of Transport, and in such excrescences as the staff employed in connection with the Registration of Business Names, the Census of Production, and in the Mercantile Marine Office.

The Taxpayers' Duty.

It might be, and is already being, argued by interested parties that expenditure in certain of the branches of Government activity which are scheduled for deforestation by the Geddes axe is essential for the well-being of the community. We confess that, as far as some of the educational proposals are concerned we are in sympathy with this view. But, in our present financial straits, personal predilections and theories must be sunk, every way of reducing national expenditure must be explored, and the suggestions for economy that this exploration brings to light loyally supported. In the face of enormous difficulties, Sir Eric Geddes and his Committee have produced documents which are worthy of the highest rank in British history for their fearlessness, enterprise, and insight. They are designed to provide the taxpayer with a much-needed relief. It is the taxpayer's interest, no less than his duty, to take the course these reports open up, and to force the Government to follow. There is a clear-cut issue. It must not be allowed to become clouded.

The B.O.T. Unit Redivivus.

There are two minor recommendations in the Geddes Report to which some attention may be drawn. The first is that the Electricity Commissioners should not be abolished (we never thought they should), but should return to the fold of the Board of Trade, or, more precisely, should remain a separate entity, with the President of the Board of Trade as their representative in Parliament. The chief difference that this will make is that those who prefer to use the term

" Board of Trade unit " will now have some justification for doing so. The other is that the subsidy of £2 800 per year paid to the Eastern Extension, Australasia and China Telegraph Company in respect of the cost of maintaining the cable from Chefoo to Wei-hai-Wei, should be discontinued, especially as the Government is to give up Wei-hai-Wei. There is little doubt that the company will accept this philosophically, as the cost of running the cable amounted to more than the subsidy they received. They would prefer, in fact, that the cable should be shut down altogether, as it probably will be. This is not surprising.

Power-Station Economy in Great Britain.

An interesting analysis of the fuel consumed at, and the units generated in, the 501 electricity supply stations of Great Britain, during the year ending March 31, 1921, has been issued by the Electricity Commissioners. The figures are based on the returns made under Section 27 of the Electricity (Supply) Act, by authorised undertakers, and on the voluntary returns from stations owned by railway and tramway authorities and non-statutory undertakings. The analysis is made in four Tables. In the first the stations are classified according to output, and it is interesting to note that, by a short head, the station with the lowest coal consumption is in the group which generates less than 3 000 000 kWh per annum. This is due to the fact that it is one of those phenomenal cases where anthracite and producer gas are successfully used. When it comes to thermal efficiency, however, the largest stations are easy winners, though here again the smallest stations come off second-best. Even so, the figure given for the best of the largest stations, 17·75 per cent., shows how large is the gap between unit and station efficiency, if we take the figure of 25·87 per cent., which was recently stated to have been obtained by one set at Carville, as a measure. This gap, it is fair to add, is decreasing, and is likely to decrease. A more important point, however, is the need for making every effort to increase the figures of thermal efficiency, as these, when expressed in percentages of the total energy cost, are still pitiably small.

Coal and Fuel Consumption.

Returning to fuel statistics, the coal consumption in lbs. per unit generated varies from 2·71 in the largest stations to 6·42 in the smallest, which indicates the advantages of using modern machinery. A classification by areas is also made. As might be expected, Northumberland leads with a consumption of 2·08 lbs. per unit, while one station reaches the low figure of 1·78 lbs. In aggregate, nearly 8 000 000 000 units were generated from 463 steam stations, 161 500 000 from waste heat stations, and 23 700 000 from oil-engine stations, while water power only accounted for 4 700 000 units and gas-driven stations for rather less. We are glad to learn that the new form will enable data on the use and thermal efficiency of oil fuel to be obtained, but in these days of economy it may well be asked whether it is necessary that the returns upon which this interesting summary is based should be required as often as once a month. In that period the changes that will have taken place in most of the data will be very small, and the compilation will, therefore, mean work which is out of all proportion to the useful information provided.

Temperatures Attained in Gasfilled Lamps.

It is common knowledge that the temperatures reached in gasfilled lamps cause inconvenience if the latter are injudiciously employed. Particularly is this the case in respect to the charring of insulation round the wires entering the sockets of the ordinary bayonet lamp. An interesting study of the temperature attained is given in a recent contribution by Messrs. C. L. Dows and W. C. Brown to the " Transactions " of the American Illuminating Engineering Society. It is rather curious that, according to the author's analysis, the percentage of energy radiated in the form of light is not very different in the vacuum and the gasfilled lamp; in one it is about 6 per cent. and in the other 8 per cent. The chief difference is the much greater loss by heat gas-convection in the latter (20 per cent. as compared with 8 per cent.), the proportion of ordinary heat-radiation being correspondingly reduced. Values are given for the temperature attained in various lighting units, bulb-temperatures approaching 500° F. being recorded.

Charring and Heating Temperatures.

Naturally, therefore, charring occurs if draperies, silks or other materials are wrapped closely round the bulb and deposits of certain varieties of dust may also lead to " smoke." But it is suggested that the higher consumption and the greater brightness of filament have caused inspectors to form erroneous ideas on the danger of fire when such lamps are used, leading them in certain cases to impose conditions so severe that the use of gasfilled lamps has been greatly hindered. Inflammable films, it is mentioned, curl at 172° F., melt at 320°, and ignite at 365°; wood tends to char at temperatures much over 400°. Hence the obvious desirability of avoiding bringing any such materials into contact with the bulb. Much attention has also been given to ventilation of fittings. It is interesting to note that ordinary ventilation, while cooling the bulb, may actually increase the temperature of the wire and the socket parts. The idea that a surrounding high temperature shortens the life of the lamps has apparently little justification. Totally enclosed and unventilated units have been designed for use in munition works, &c., and there is a good deal to be said for the non-ventilation theory. Units so designed are cooled by radiation rather than by ventilation.

An Argument for Regenerative Braking.

It is a little significant that in the frequent discussions on the advantages of electric traction so little is made of economies obtainable by the employment of regenerative braking. This, as is well known, has been successfully and economically employed on long-falling gradients in the United States and elsewhere, but it is not so generally realised that it could with equal advantage be used on many of our electric railways. Take the section of the London Underground Railway between South Kensington and Mansion House as an example. On this section there are normally eight station stops in a distance of four miles. In addition there are, at busy times, at least, frequent inter-station stops. To maintain a service with the headway now usual, therefore, means rapid acceleration and equally rapid retardation, or, in other words, braking. This being the case, it is not surprising to learn that the watt hours per ton mile on this section have increased considerably since the line was first converted to electric traction. Such increase is indeed a natural corollary to an increased service conducted by present-day methods. But this rise could be avoided and the original energy consumption probably reduced by fitting the free axles on a train with regenerative braking equipment as a supplement to the present devices. To obtain full advantage from this

arrangement it would be necessary to begin braking somewhat earlier than is now usual, and so reduce the average speed slightly. But from an economic point of view it would be certainly worth it. We hope the directors will consider the matter, and at least the possibility of giving the system a trial.

Rating of Machinery.

That hardy annual, the Rating of Machinery Bill, is, we are informed, to make its appearance in the present session of Parliament. Except during the period of the war, the Bill has been regularly introduced into the House of Commons every year for many years, but, like the majority of private members' legislative efforts, it has always been among the slaughtered innocents. If the Bill is to succeed, greater efforts will have to be made by the engineering and trade organisations to impress upon the Government the necessity for a reform of the law relating to the assessment of property, and more particularly of machinery, for rating purposes. At least one member of the Government, Sir Alfred Mond, who happens to be a business man, seems to have a proper appreciation of the disadvantages of the present system, for he recently informed the Association of British Chambers of Commerce that he had brought the question of the reform of methods of valuation and rating to the attention of the Cabinet.

Organised Effort Required.

This is good news for the promoters of the Rating of Machinery Bill, and a little pressure from the Federation of British Industries, the B.E.A.M.A., and similar associations, might induce the Government to take up the matter, or to give facilities for passing the Bill. No one disputes that there is urgent need for a drastic reform of the law, but the agricultural interests, who fear that if industry be relieved by the exemption of machinery from rating they would have to bear an extra burden, are opposed to the proposed Bill, and the Government will, therefore, have to be persuaded that it is for the good of industry and for the nation as a whole before they will deal with the matter. At present Scottish and Irish manufacturers have an advantage over their English brothers, and apart from the inherent justice of the demands of machinery users, there is no reason why this inequality should be allowed to continue. In Scotland the Lands Valuation (Scotland) Amendment Act, 1902, excludes from the valuation of a building used for business, manufacture or trade any machinery which can be removed without necessitating the removal of any part of the building, with the exception of machinery for producing or transmitting primary motive power or for heating or lighting the building. Even in Ireland, under the Valuation (Ireland) Act, 1860, the value of machinery in a mill, factory or building may not be taken into account in valuing the premises, except machinery used for the production of motive power. In view of the heavy burdens of taxation and rates which manufacturers have to endure nowadays, we hope that a combined and well-directed effort will now be made to put the law of rating on a more rational basis.

Quis Custodiet Ipsos Custodes?

The recently-developed zeal of the London County Council in suppressing the smoke nuisance, induces us to make use of a well-known tag in combination with a large question mark, as the heading of this Note. For the Public Control Committee of the Council have been making investigations into the smoke issuing from the chimneys of the forty-two electricity stations in London, and tell us that in only four cases have they observed anything serious enough to report. In two instances out of the four improvements have been effected as a result of representations made by the Committee and official pressure is being exerted in the other two. This will all help to the inauguration of that brighter London which is our desire; but, without being ungracious, we should like to know whether the Committee has also investigated the smoke nuisance at the Council's own stations. That they are not always blameless we know from experience. And in beautiful summer weather we have also been poisoned by black smoke issuing from fire floats on the Thames. But who hangs the public hangman?

Where a Good Example is Needed.

By law the County Council are entrusted with powers under their General Powers Act of 1910, and the Public Health (London) Act, 1891, to take proceedings against those who permit black smoke to issue from their chimney shafts, but the sanction of the Ministry of Health must first be obtained. Now that there is no restriction upon the purchase of coal, there ought to be little excuse for the commission of this sort of nuisance. But if the Council are really going to enforce the law, and Islington Borough Council are threatened with a prosecution, we think they should begin on their own departments. It would be such a good example to others.

Some Supply Companies' Dividends.

Though the annual reports of all the electricity supply companies are not yet available, it is gratifying to find in so many cases the dividends for 1921 have been maintained, and even in a few instances an increased allocation has been possible. When allowance is made for the difficult conditions prevailing, the restrictions that were imposed on supply owing to the miners' strike, the depressed condition of trade, and other troubles, the results are surprisingly good. We heartily congratulate the directors of that pioneer supply company, the London Electric Supply Corporation, upon being able to increase the ordinary dividend from 2½ to 4 per cent. The outlook for the company, particularly in regard to traction and power demands, is good, and the current year should see a further improvement. The North Metropolitan Electric Power Supply Co. is in a position to advance the ordinary dividend from 7½ to 10 per cent., the highest distribution yet made by a power company, while the Yorkshire Electric Power Co., whose net profits show an increase of nearly £10 000, again declare an 8 per cent. dividend, but its reserve and carry-forward are higher than in 1920. The Westminster Electric Supply Corporation, the St. James's and Pall Mall, and the Smithfield Markets Companies make the same distributions as in the previous year, viz., 10, 12, and 5 per cent., respectively. As we go to press we notice that the County of London Electric Supply Company, one of the most progressive and best managed of the supply companies, has decided to make the same distribution (8 per cent) on the ordinary shares as in 1920, but as the profits are greater there are increased allocations to reserve. This is a policy to which no exception can be taken.

The District Dividend.

Both the directors and shareholders of the Metropolitan District Railway are to be congratulated on the 1 per cent. dividend that, as a result of the recent increase in fares, it has been possible to pay on the ordinary stock. Small though the distribution is, it is none the less a signal

event, for it is the first time that a dividend has been paid for thirty-nine years. The holders of the stock cannot therefore either be stigmatised as profiteers or accused of living in guilty splendour on the labour of others. This distribution, which we hope is only the first term of a series, is probably the long-delayed first fruits of the electrification policy (using the term in its widest sense) which was adopted some years ago. But for the employment of electric traction the system would have become more and more derelict, while by its use it is possible to run long or short trains on short or long headways as the immediate demands of the traffic require. It is also possible to deal with rush traffic by methods of compression, and generally to conduct the system in, from the directors' point of view, the most economical way. It has been stated by high authority that it is only in this way that the railway can be made to pay. It certainly seems so.

Research Workers' Inventions.

The proper method of recompensing inventors who are paid from public funds is a subject which has been much discussed. For while the Admiralty, War Office, and Air Ministry have always had full power to forgo the commercial rights in any invenions made by their officers, on the other hand, patents for inventions made by those employed in the Department of Scientific and Industrial Research are taken out in the joint names of the inventor and of the Imperial Trust for the Encouragement of Scientific and Industrial Research, inventors undertaking to assign all their rights to the Trust. This practice is inequitable in operation, and has been greatly resented. An Inter-Departmental Committee was, therefore, appointed to consider the whole question, and to devise a uniform method of dealing with all inventions made by research workers and Government servants. The Committee's report has now been published, and the findings should go far to settle the problem on an equitable basis.

Suggested Principles.

The Committee propose that, pending a decision by a "competent authority," all rights in inventions made by Government servants should be held in trust for the Government. If the inventor can prove that he had no assistance from the Department in making the invention, he is to be entitled to all rights in his invention, except where it has to be kept secret for reasons of State. Whether an inventor should, in addition to the enjoyment of usual commercial rights, receive any other reward, is to be left to the decision of the "competent authority," and the method of dealing with inventions is to be uniform for all Government Departments. So far so good. We do not, however, like the suggestion that where the rights in an invention which is capable of commercial exploitation belong to the Government the invention should be developed for the benefit of the latter. The development of a patent involves a good deal of experimental work and an equal quantity of commercial acumen. No Government Department, therefore, is capable of doing it, and, moreover, if the suggestion were adopted, we should have a Government Department, subsidised by the taxes, competing with private enterprise. It would be much better, therefore, to either sell the patent or to grant a licence or licences to manufacture the article.

A Patents Board.

It is proposed that the "competent authority" for dealing with all patents made by research workers shall be an Inter-Departmental Patents Board, with an Exploitation Committee for arranging the commercial exploitation of inventions. We should, however, have little confidence in such a Committee, and we hope that the proposal will be dropped. On the other hand, the constitution of the Patents Board for dealing with awards, settling the rights of parties and deciding matters of administration, is sound. It would contain no representatives of the research workers, or of the Government Departments directly concerned, and it would, therefore, be likely to command general confidence. Such a board need not involve the appointment of any new officials, as the Patents Branch of the Board of Trade and other Government Departments could easily spare the necessary officials.

Workmen's Compensation in 1920.

The statistics of compensation and proceedings under the Workmen's Compensation Acts and Employers' Liability Act for the year 1920 discloses a serious increase in the number of accidents for which compensation had to be paid. There were 3 531 fatal and 381 986 non-fatal accidents, or a total of 385 517, compared with 368 469 in 1919. There was also a sharp rise in the amount of the payments to workmen and their dependents, but this was mainly due to the increased amount of compensation payable under the War Addition Act of 1917. The sum of £755 657 was paid for fatal, and £5 222 352 for other accidents, in seven specified industries, against £4 616 723 in the previous year. These figures are disquieting, and seem to show that the preventive measures, such as those recommended by the Safety First Council, are not sufficiently widely adopted. One satisfactory feature, however, is the large decrease in the amount of litigation. According to figures supplied by the Employers' Liability insurance companies to the Board of Trade in respect of employers' liability insurance, the income from premiums was £8 851 607, or, including interest from reserves, £9 047 559. Only £2 980 755, however, went in payments under policies, while £2 921 959 was spent on commission and management expenses, £1 476 869 being transferred to reserves, and £1 667 976 being set aside for profits. These administrative and management expenses seem unduly high, especially as, after transferring 16 per cent. of the receipts to reserve, 19 per cent. was allocated as profit. However, it is estimated that when the various charges and expenses are taken into account, the total charge for compensation in the seven great industries cannot be less than £8 500 000.

Railway Amalgamations and Electric Traction.

In the breasts of the cynical-minded the forthcoming amalgamation of the railway companies into a few small groups should generate feelings of unholy joy. Two groupings which, we are informed, will shortly take place are the Midland with the augmented London and North-Western system, and the South-Eastern and Chatham, London and South Western, and London and Brighton and South Coast Railways. The Lancashire and Yorkshire section of London and North-Western group use both high-tension and low-tension direct current traction with the contact rail. The Midland uses the single-phase system, with overhead equipment. In the Southern group the South-Western uses low-tension direct current with the contact rail, the Brighton Railway high-tension single-phase, with overhead equipment, and the South-Eastern wishes to use the high-tension direct-current system of a special brand due to Mr. A. Raworth, their electrical engineer. The problem is: What is going to happen?

The Birth of Magneto Optics.

THE articles, by Sir OLIVER LODGE, on the discovery of the Zeeman effect, which we are reproducing in another column from THE ELECTRICIAN of twenty-five years ago, will recall to many of our readers the birth of one of the greatest advances of modern physics. The full significance of the discovery of this phenomenon cannot be realised unless we remember that, at that time, the electron was nothing but a product of the physicist's imagination—a hypothetical entity which was indeed, suggested by various facts, but whose separate existence had never been detected. It was not until over three years later that Sir J. J. THOMSON announced the isolation of the actual electron. Bearing this in mind, we can hardly conceal our surprise and admiration at the accuracy with which the nature and properties of the electron were foreshadowed by the experimental work of Dr. ZEEMAN, a message from whom we are glad to be able to print to-day, and the theories of Sir J. LARMOR and Dr. LORENTZ. Indeed, the most striking feature of the notes with which Sir OLIVER LODGE has supplemented his original articles is the small number of modifications which, after twenty-five years of unprecedented progress in the study of radiation and atomic structure, he has found it necessary to make.

The Crowning Point of a Fascinating Research.

The Zeeman effect is, indeed, the crowning-point of one of the most fascinating researches in the history of physics —the quest after the connection between magnetism and light. We owe it to FARADAY'S unerring instinct that the problem has received the attention it deserves. Time and again it occupied his thoughts, and he succeeded at last in laying the foundation stone of magneto-optics by his discovery of the rotation of the plane of polarisation by a magnetic field—or, as he picturesquely described it, by "magnetising a ray of light and illuminating a magnetic line of force." Although he sought for what is now known as the Zeeman effect—and must, indeed, actually have obtained it—his appliances were too imperfect to show him the result he was seeking. The next definite step was made by MAXWELL, who in his electromagnetic theory of light, showed that the most intimate connection between light and magnetism was in the highest degree probable. Finally, in 1896, the discovery by Dr. ZEEMAN of the influence of a magnetic field on the actual source of light put the electromagnetic nature of light beyond doubt, and opened a new department of physical investigation.

The Effect in Practice.

Though the Zeeman effect has not as yet received any direct practical application, it has had important influences on some of the more practical branches of science. The discovery by PRESTON that lines of the same spectrum series, and of corresponding series in related elements, are similarly affected by a magnetic field, has become, in the hands of PASCHEN, a useful means of analysis of spectra. In astronomy, also, the effect has led to HALE'S great discovery of the existence of a magnetic field in a sunspot, and though the exact connection between this and the phenomena of terrestrial magnetism has not yet been traced, there can be no doubt that the connection is very close.

Important Theoretical Aspects

But it is the theoretical aspect of the effect that is at present of the greatest consequence. Sir OLIVER LODGE has described how LORENTZ, by his electron theory, was able to predict the effects which Dr. ZEEMAN brought to light Nothing adds to the prestige of a theory so much as a successful prediction; and when, as with the Zeeman effect, the verification extends to matters of detail, such as the polarisation phenomena to which Sir OLIVER LODGE refers, we are almost inclined to regard the theory as an established law of Nature.

Yet here we may notice that, despite its almost complete success in explaining the Zeeman effect, the Lorentz theory in its original form is no longer tenable. It proceeded from the assumptions that the emission of spectrum lines resulted from electronic motions whose components were simple harmonic vibrations, and that the frequencies of the lines emitted were the frequencies of such vibrations. This conception has been found totally inadequate to interpret the actual phenomena of line spectra. These, it appears, can at present only be explained by supposing that the revolutions of electrons in atoms do not result in radiation at all, but that radiation takes place when an electron suddenly changes its orbit. The frequency of the spectrum line produced is not the frequency of revolution of the electron, but is proportional to the difference of energy of the electron in the two orbits concerned. On these lines, BOHR has been able to account for the Zeeman effect for hydrogen, though the mathematical difficulties connected with more complex atoms have so far proved intractable.

The Metamorphosis of Electronic Hypotheses.

The original Lorentz theory, then, apparently so convincing and final in its account of the Zeeman effect, seems destined to share the metamorphosis which has of late years characterised the whole field of electronic hypotheses. It is possible, no doubt, to place it in the lumber-room of science, and, in moments of disinterested reflection, to marvel at one more example of the measure of truth which may issue from false premises. There is greater wisdom, however, in another attitude. Can we not see, in facts such as these, the hall-mark of fundamental things? For it is not the immediately perceived, derivative phenomena that call forth alternative explanations. The rainbow, the seasons, echoes, these things are "explained"—so far as explanation can be given—once for all. It is the profounder secrets of Nature that are many-sided. The most sublime conceptions of science, ideas that have embraced vast areas of observed facts and guided progress by their predictions—it is these that, by virtue of their own excellence have become merged into still more comprehensive views.

The Passing of Ancient Conceptions.

We have seen, or are now seeing, the passing of such conceptions as the Ptolemaic cosmogony, Newton's law of gravitation, the elastic-solid theory of light, the nebular hypothesis, Darwinism. We cannot call these conceptions "false." They have increased the sum of knowledge, and, after all, grapes do not grow upon thorns, or figs upon thistles. Perhaps we are hardly justified in placing the Zeeman effect among the phenomena embodied in such ideas as these. It has not their comprehensiveness, and is, moreover, but one aspect of the ultimate relation between magnetism and light. But it is essentially of the same nature, and we shall be surprised if, when the history of the next twenty-five years of scientific progress comes to be written, the Zeeman effect is not found to have played an even greater part than it has done in the past.

Zeeman's Discovery of the Action of a Magnetic Field on a Source of Light.

In this article are reproduced two communications by Prof. now Sir, Oliver Lodge, which appeared in The Electrician *of February* 26 *and March* 12, 1897, *respectively, commenting on and discussing the discovery by Dr. P. Zeeman of the action of a magnetic field on a source of light—the well-known Zeeman effect. The twenty-fifth anniversary of this discovery has recently been celebrated at Leyden, and we have therefore reproduced the articles, together with some interesting notes by Sir Oliver Lodge, bringing the whole matter up-to-date. At the conclusion of the article some comments by Dr. Zeeman on the modern possibilities of his discovery are given.*

At a time when the Institution of Electrical Engineers is celebrating the jubilee of its existence, it is not inappropriate that attention should be called to an event which occurred twenty-five years ago in Leyden. This event, though it has as yet received no practical application, is of the highest importance theoretically, and may be termed, without any great exaggeration, the birth of the science of magneto-optics; its conception having been begun by Faraday long ago (1845), when he rotated the plane of polarisation by a magnetic field. This event is the discovery of the Zeeman effect.

There is reason for some comment on this event, for, as pointed out by Sir Oliver Lodge in the issue of "Nature" for January 19, in the course of a review of "Verhandelijen van Dr. P. Zeeman over Magneto-Optische Verschijnelen," in a quarter of a century a new generation of physicists has arisen, "many of them so intently occupied with their own admirable investigations that perhaps the origin of much of our present knowledge of Nature is liable to be submerged. Especially may they fail to realise the anticipations of the great theorists, which enabled a little seed-fact to fit immediately into its cranny and quickly to develop magnificent blossoms." It should also be emphasised, in order that ideas on the subject may be quite clear, that Sir J. J. Thomson's isolation of the electron was not announced until the meeting of the British Association at Dover in 1899, some three and a half years later.

In the article in "Nature" to which we have referred, Sir Oliver Lodge says that the announcement of Zeeman's discovery to the Royal Academy of Sciences at Amsterdam, and its reception in this country were equally modest, and would probably not have attracted much attention had not Sir Joseph Larmor been on the look out for some such effect. He had determined theoretically that such a result was necessary, and had gone on to calculate the amount of displacement or broadening to be expected, but found the effect too small to be observed. "For, like everyone else at that time, he considered that the radiating body must be an atom or part of an atom with an $e/m = 10^4$. So directly Zeeman got an effect and found that e/m was of the order of 10^7, Larmor perceived that not the whole atom, but the charge only—the electron part of the ion, or an electron itself—was a free radiator," and suggested that Sir Oliver should confirm the result. In a week he had done so with such appliances as were to hand; though not without sufficient difficulty to make him realise the naturalness of Faraday's failure to see anything, he being wholly unguided by theory, and to admire the skill of Zeeman in detecting the effect.

Sir Oliver's results were communicated to the Royal Society, and also to The Electrician in an article which was published on February 26, 1897, under the heading of "The Latest Discovery in Physics." This matter is of such great interest that we have thought well to reproduce here this article and another of a fortnight later; and Sir Oliver Lodge has been good enough to annotate them, for, as he says, they are worthy of reference by anyone interested in scientific history.

To make what follows quite clear it should be noted that the matter in the smaller type consists of the original articles by Sir Oliver Lodge which appeared in The Electrician during February and March, 1897. The interpolated paragraphs (*e.g.*, *Note B*, 1922), in the larger type, are Sir Oliver Lodge's annotations written during the past few weeks. Sir Oliver Lodge's conclusion and the letter from Dr. Zeeman also, of course, bear the date 1922.

The Latest Discovery in Physics.*

By Prof. OLIVER LODGE, D.Sc., F.R.S. [Date, 1897.]

In the year 1862, Faraday, who never lost an opportunity of probing into the connection between magnetism and light, tried yet one more experiment, said to have been his last, to see whether the lines of the spectrum were in any way influenced when the source of light was in an intense magnetic field. He arranged a sodium flame to burn between the poles of a magnet, and then examined it spectroscopically from a direction across and also along the lines of force. He saw no effect. And anyone to-day [1897] repeating the experiment with a modern grating, without immense care, would be liable also to notice no effect, beyond perhaps a slight alteration in brightness of the lines due to the magnetic or diamagnetic motions of the flame.

Faraday's Pertinacity.

The pertinacity with which Faraday pursued, in every form, the connection between light and magnetism is very remarkable. He must have had an instinctive feeling of its importance, though he could hardly have had an intuition of the great discovery then looming in the near future—the electromagnetic nature of light (Clerk-Maxwell, 1865).

Zeeman's Discovery.

However, although the chief fact of the interaction between light and magnetism had been wrenched from Nature by Faraday in 1845, long before any niche was ready for it, and before it could be properly appreciated by his contemporaries, the latest outcome or development remained hidden till the end of last year [1896], when a young Dutch physicist, Dr. P. Zeeman, now Professor at Amsterdam University, then working in Dr. Kamerlingh Onnes' laboratory at Leyden, made another attempt of the same kind as Faraday's in 1862, and, employing modern spectroscopic appliances, succeeded in discovering a new phenomenon. The lines of the spectrum were seen to broaden when the magnet was excited.

Sodium or lithium salts introduced into a Bunsen flame between pointed poles, and the light examined by a large Rowland grating, will show the effect; but an oxyhydrogen flame is better than an ordinary Bunsen, because of the higher temperature.

Experimental Details.

Zeeman was not satisfied with examining emission spectra only, because of the danger of spurious and commonplace causes of the effect; so he arranged a porcelain tube containing sodium between magnet poles, heated it intensely by a flame, and passed a beam of electric light through it into the spectroscope; in this way he was able to see the dark absorption D lines, and to obtain them of uniform width by rotating the tube on its axis so as to avoid inequalities of density; and he was then able to observe, when the magnet was excited, the same kind of broadening in the absorption spectrum as he had seen in the emission spectrum.

Then he considered the fact established, and published it. An abstract of the communication to the Amsterdam Academy, appeared in "Nature" for December 24, 1896, p. 192.

To those who had been working in the domains of electro-optics and the connection between ether and electricity, the general meaning of the fact was clear. Dr. J. Larmor wrote to me at once that it was a result which would follow from his theory; that, indeed, he had already deduced that there must be some effect on the spectral lines, but had concluded that it was probably too small to observe. It appears also that Professor Tait, being impressed with the theoretical probability of exactly the kind of phenomenon now observed, made an attempt in 1875 to see it, but failed.

The views of Dr. Johnstone Stoney with regard to the motions of ions or electrons in a source of radiation must also be mentioned as the kind of views likely to receive confirmation and enlargement from the new fact.

Theory of Lorentz.

Independently of all this, however, Dr. Zeeman himself had at hand a mathematical physicist of the highest eminence, in his own countryman, Prof. H. A. Lorentz, of Leyden; and on mentioning his discovery to him was at once informed that it chimed in

* From The Electrician, Vol. XXXVIII., p. 568. February 26, 1897.

exactly with Prof. Lorentz's theoretical views concerning the nature of radiation, and that if he looked at the broadened edges of the lines he would find their light to be polarised. If he looked across the lines of force at the flame he would see the extreme edges of the broadened sodium lines plane-polarised, with the plane of polarisation coincident with the magnetic lines of force; but that if he used perforated poles, and looked at the flame along the lines of force, then he should find the broadened edges of the spectral lines to be composed of circularly polarised light, right-handed on one side of the line, left-handed on the other. (The analysers must be inserted before the light reaches the grating, of course, because of its depolarising action.)

The whole of this prediction has been fulfilled to the letter, and it is scarcely possible any longer to doubt the correctness of the observation.

Spurious Anticipations.

It is not, however, the first time that some such thing has been noticed. It appears that in 1885 a M. Fievez brought before the Belgian Academy of Sciences a Paper on the influence of magnetism on the character of the spectral rays, and described certain experimental results, which, if they were due to anything more important than mere magnetic disturbances of the flame, were of a very remarkable character. The lines are said not only to have widened and brightened, but reversed and doubly reversed. From the description, it appears likely that a variety of unimportant causes of disturbance must have been present, and that if the true effect was seen at all, it was so mixed up with spurious effects as to be unrecognisable in its simplicity, and so remained at that time essentially undiscovered.

The Importance of the Discovery.

The importance of the discovery lies, of course, in its theoretical bearing, in the evidence it can furnish as to the nature of the motions which enable matter at high temperature to disturb the ether, and in the conclusion that can be drawn from it as to the physical nature of a radiating or absorbing body.

It has for some time now appeared likely that radiation could only be excited by the motion of electrified particles, not by the vibration of inert particles of matter themselves, but by the vibration of the same particles when electrified, each probably with its atomic or ionic charge. Ions in vibration or in revolution have been shown to be competent to excite electromagnetic waves, and hence a source of light has been supposed to contain such ions. Some philosophers have doubted about the existence of, or necessity for, any material nucleus beyond the electric charge itself; such a charge, when in motion, would behave as if it had inertia, in accordance with well-known electrical laws, as worked out by Mr. Heaviside, Prof. J. J. Thomson, and others; and accordingly the idea of radiation excited by the motion of *electrons* pure and simple has been steadily gaining ground.

For myself, I see at present in the facts nothing which will permit one to discriminate between these two hypotheses, or, rather, these two modifications of one hypothesis; but the main idea itself, that radiation is excited by the motion of electric charges (whether associated with material particles or free), will probably be found to be substantiated and established by the discovery of Zeeman.

Note A. 1922. Radiation, though certainly due to the oscillation or rotation of an electric charge, might be caused either by the charge revolving freely like a satellite, or by a charge oscillating to and fro in a conductor, as it does in a Hertz vibrator or in a modern wireless station.

At that date (1897) the notion of a charge oscillating on a conductor seemed the most natural and likely one. And Dr. Zeeman's approximate measurement of the electrochemical equivalent of the radiating body, which he found to possess a value of e/m of the order 10^7, instead of the atomic order 10^4 for hydrogen and about 400 for sodium, showed that the radiating entity had virtually or really about one-thousandth of the mass of a hydrogen atom. That did not prove that it was a free satellite electron; for though this idea was in the minds of several people—Johnstone Stoney, Lorentz, and Larmor—and though—as appears from the preceding paragraph—I too had some notion of the kind, and therefore probably many other people, yet the real discovery of the experimental separation or isolation of an electron was announced to the British Association at Dover, three and a half years later, by Sir J. J. Thomson.

The Elementary Aspects of the Theory.

[1897] The elementary aspects of the theory of the effect are as simple as possible. Superpose a rotation upon a simple harmonic motion, after the manner of a Foucault pendulum, and not only is the path altered, so that a rectilinear path becomes a hypocycloid, and an elliptical orbit becomes a spiral or rotating ellipse, but also the period of the oscillation or revolution is slightly altered too. Not, indeed, on the average, for whereas any right-handed rotation might be accelerated, a corresponding left-handed rotation would be equally retarded, and consequently on the average motion as a whole there would be no effect. Nevertheless, the range of oscillation frequency would have been increased. In addition to all the modes of vibration which had been possible and present before the superposition of the rotation, there will now be a further set of somewhat shorter periods, and another set of correspondingly longer periods. And if we have the means of analysing the motion and sorting it out into all its grades of frequency—a means with which a diffraction-grating or a prism at once furnishes us—we shall see not only the original modes of vibration, represented as a line in the spectrum of a certain width, or of a discontinuous set of such lines, we shall also see, to the right and left of every such line, an extension, either separated from it by an intervening dark space or else merged and gradating into it, in accordance with the circumstances of the case.

If every form of possible motion with a definite frequency had been originally present, and that is what we must assume as likely in the case of an incandescent vapour, then the extensions caused by the superposed rotation will be lateral wings shading off with perfect gradualness into the original line, and with no intervening dark space at all. In other words, the line will be simply widened; it will not be tripled.

Random Molecular Motion.

Note B. 1922. This notion of the random motions of the molecules of a gas, as having any close connection with the Zeeman effect, rather obsessed me for a few weeks at this time. I evidently did not realise as clearly as Lorentz did that it was an intra-atomic phenomenon, that it was concerned with the internal parts of each individual atom, and that the motion of the atoms as a whole was insignificant.

The facing-round power of the magnetic field, spoken of in the next paragraph, is exactly what is operative; but, as the electronic orbits have kinetic inertia, the effect is not simply to tilt the orbits, in the way a disc would be tilted, but to make the orbits revolve round an axis, with a motion at right angles to the deflecting force, exactly like the precessional motion of a spinning top that is not "asleep." This kind of electronic motion—predicted by Lorentz, and also in 1891 by Johnstone Stoney—was completely verified by Zeeman.

Other Interesting Phenomena.

[1897] On the other hand, if the magnetic effect be something more than an acceleration and a retardation of right and left-handed components respectively; if, in addition to that, it has any facing-round power like that observed in diamagnetism on Weber's theory: then, if the field is intense enough, there will be other interesting phenomena to observe; but these at present are not known to have any existence.

The elementary treatment of the general idea of the Lorentz theory of the effect is so extremely simple that such of your readers as are not mathematicians may like to have it here popularised with the help of a few symbols. An electric charge e, moving with velocity v across a field of magnetic force of intensity H, experiences a force, at right angles to the lines of force and to its motion, of magnitude eHv, the effect of which is to deflect it to the right or left according to its direction of motion. This is, in fact, the electrostatic edition of the ordinary force experienced by a conductor conveying a current in a magnetic field, to which the power of every electric motor is due.

Note C. 1922. The only justification for the use of the word "electrostatic," here, is the fact that the current is analysed into e and v, that is to say, is definitely regarded as intrinsically a moving charge. It would not have been justifiable at that date to assume that *every* current—in solids, liquids, and gases—was also due to the locomotion of unit electric charges. And, indeed, the exact nature of conduction in metals can hardly be considered finally settled even now.

[1897] Any motion or component of motion which the electrified particle possesses *in the direction* of the lines of force is unaffected by this force, which does not act at all in that direction. Consequently, if we take the magnetic lines as the axis of z, the effect of the motion we have to consider lies in the plane xy; and so long as it is an undisturbed simple harmonic motion it is characterised by the equations:

$$\left.\begin{aligned} m\ddot{x} + kx &= 0 \\ m\ddot{y} + ky &= 0 \end{aligned}\right\},$$

which express the equality of the restoring force to the mass-acceleration of the particle, and give all the circular, elliptical and

rectilinear motions possible to a weight suspended by a long string, or a particle constrained by simple elasticity k about a fixed point; and the period of the motion is $2\pi\sqrt{\frac{m}{k}}$.

So far, the moving particle has only possessed inertia (m); but now confer upon it an electric charge e, and let it move with a velocity whose components are $\dot{x}$, $\dot{y}$ and $\dot{z}$ in a field H parallel to z. Then at once it experiences a new force, whose x component is $eH\dot{y}$, and whose y component is $-eH\dot{x}$. Inserting these forces into the above equations they become:

$$\left.\begin{aligned} m\ddot{x}+kx&=eH\dot{y}\\ m\ddot{y}+ky&=-eH\dot{x}\end{aligned}\right\},$$

and at once the path becomes a little more complicated, and the period of the motion is slightly altered.

The new period is given by:

$$\frac{2\pi}{\sqrt{\left\{\frac{k}{m}\pm\left(\frac{eH}{2m}\right)^2\right\}}},$$

so the modification in the frequency is:

$$\frac{eH}{4\pi m};$$

and this is the quantity to be observed.

Note D. 1922. Here I made a slip in the algebra, which I corrected in a subsequent issue, as appears below. The modification of frequency as stated in the last line is correct, except that to keep dimensions right and sensible it is always best to retain the factor μ, so as to be independent of any systems of units and true in them all. If this were done more frequently and systematically a lot of trouble would be saved when numerical interpretation in either of the main systems was desired, and there would be no need to specify the system, or the kind of units intended, except in connection with a numerical specification; for all *algebraic* expressions would be true in every unit that ever was devised—metric, British, e.g.s., electric, magnetic, thermal, &c., &c.—as they ought to be. May I ask students to save themselves and others trouble by attention to this, and to the opening paragraphs of the article, "A Few Further Notes," which immediately follows? Too few teachers even now realise the beauty and simplicity of really absolute measure, though probably none are aware of what they miss by unconscious and unsuspected inattention to it.

The Amount of Widening.

[1897] The effect is small, and a strong magnetic field is required; but what is more important is to have high dispersive power and good optical arrangements; the effect is best seen when a bright sodium flame is formed by an oxyhydrogen jet between the pointed poles of a large electromagnet, and when the spectrum is examined by a large Rowland grating, with each line well focussed and sharply defined. Under these circumstances the discoverer says that the widening may amount to one-fortieth of the distance between the D lines, but I do not know that I myself have seen it quite so much as this.

As soon as the effect has been plainly obtained, it is not difficult to examine the light for polarisation, by interposing between the flame and the grating a nicol prism, or else a quarter-wave plate and a nicol.

I found it rather more difficult to see the effect along the lines of force than across them, but that was probably only because the perforation of one of the poles interfered with the concentration of the field along the axis of vision.

The circular polarisation can be seen in several ways; *e.g.*, with the aid of a rhomb of Iceland spar, a double image of the slit can be formed so that the pair of sodium lines are doubled; the light having first passed through a quarter-wave plate; then, by rotating the spar, the two pairs can be placed end to end exactly, and on now exciting the magnet one pair moves relatively to the other slightly to the right; while on reversing the magnet it moves correspondingly slightly to the left. This is in consequence of the opposite circular polarisations.

The plane polarisation of the light which goes to form the broadened edges of the lines, in the beam *across* the lines of force, is seen with comparative ease, and it can be verified that the polarisation is such that the electric oscillations or revolutions which are most affected by the magnetism are in a plane normal to the lines of force: as, of course, is directly indicated by the elementary theory.

I hope that before long Dr. Larmor will let us have the benefit of his views as to the new phenomenon, for it is evidently of considerable interest in the light of the magnificently comprehensive theory of the physical universe which of late years he has been partially communicating to the Royal Society.

The second of Sir Oliver Lodge's articles, in which he made a few corrections in his previous argument and added some additional matter, follows.

A Few Further Notes on Zeeman's Discovery.*

By Prof. OLIVER LODGE, D.Sc., F.R.S. [Date, 1897].

Units and Dimensions.

[1897] In the article on page 569 it would have been better if B had been everywhere written instead of H. The force experienced by a moving charge is not directly dependent on the magnetic potential-gradient of field intensity, but it is directly dependent on the induction density, the number of lines per unit area across which it is moving. Introducing the factor μ therefore, wherever H occurs, everything becomes of right dimensions; μeHv or eBv is a real mechanical force, and $\mu eH/4\pi m$ or $eB/4\pi m$ is really a frequency, *i.e.*, a number per second.

In the interests of those students who may possibly have been puzzled by considerations about units and dimensions, in a way which they never need be if proper care is taken to express correctly and fully every physical quantity which occurs in an expression, you will allow me to make this apparently insignificant correction.

Correction in Formula.

One other correction. The period of the disturbed motion is not exactly as printed near the end of page 569, but, in so far as there is an exact period for a motion which may easily involve incommensurable terms having no common multiple, it is:

$$\frac{2\pi}{\sqrt{\left\{\frac{k}{m}+\left(\frac{eB}{2m}\right)^2\right\}}\pm\frac{eB}{2m}}.$$

The quantity squared under the root is too small to need taking into account in that place, and it has only the positive sign attached to it. In so far as it operates at all, it may be said to represent the disturbance of the radius vector, while the quantity outside the root, with the alternative sign, represents the chief part of the acceleration or retardation of the periodic time, or frequency, as correctly stated in the next line of page 569.

[*i e.*, in the formula just above note D.]

Numerical Significance of the Formula.

And now that I am on elementary matters I may as well indicate the numerical interpretation and significance of the formula for the change of frequency, $\pm eB/4\pi m$. First of all then, e/m is the reciprocal of the electrochemical equivalent of the substance; and for the case of sodium in the ordinary electrolytic condition it equals 1·16 ampere hours, or 4190 coulombs, per gramme. There is no guarantee that the same charge attaches to the atoms in the sodium flame, but, for lack of better information, that may be assumed as a first hypothesis, to be corrected, if necessary, by facts; and so we initially suppose e/m to equal 419 in ordinary C.G.S. units of the electromagnetic system.

A great induction density to get even between pointed poles is 30 000 lines to the square centimetre, and when we want to see a very small effect we may aim at this; if we have to put up with a weaker field it is easy to apply a proportional allowance.

Thus, then, $\pm eB/4\pi m$ comes out $419 \times 30\,000 \div 4\pi$, or, say, a million vibrations per second, increase or decrease of frequency, due to the magnetism.

Now, the natural rates of vibration corresponding to the two D lines are 509·3 and 508·8 billions per second respectively; that is to say, the distance between the D lines corresponds to a range of vibration of five hundred thousand million vibrations per second; whereas we have just calculated, on the strength of a bare assumption with regard to the value of e/m, that the widening of either line by the assumed magnetic field would only amount to one million vibrations per second either way. Such a widening, only the 1/250 000th part of the interval between the D lines, could not be seen.

Note E. 1922. This arithmetic is rather interesting historically, since it shows the prevailing uncertainty as to what inertia the radiator actually possessed. The calculation proceeds on the stated assumption that the atom is the radiator: an assumption which the Zeeman result proved to be wrong. But this must have been the *kind* of thumbnail calculation which Larmor made when he decided that the result he expected

---

* From The Electrician, Vol. XXXVIII, p. 643, March 12th, 1897.

theoretically would be probably too small to observe, as mentioned near the beginning of the preceding article.

Zeeman had not then given any arithmetic of this kind, but had said that he estimated the broadening of one of the sodium lines as about one-fortieth of the distance between them. This was all the data I had to go on in what follows.

Zeeman's Estimate of e/m.

[1897] The effect observed by Zeeman is much greater than this, consequently it would appear to follow that the value of e/m in the flame is much greater than the customary electrolytic value.

Supposing his estimate correct, viz., that he has witnessed a widening of each line equivalent to one-fortieth of the D line interval, in a field which we will suppose contained 15 000 lines to the square centimetre, we should have:

$$\frac{e}{m}\cdot\frac{B}{4\pi}=\frac{5\times10^{11}}{80} \text{ vibrations per second,}$$

whence

$$\frac{e}{m}=\frac{2{\cdot}5\pi\times10^{10}}{15\,000}=\frac{1}{2}\times10^{7} \text{ C.G.S.}$$

(or fifty million coulombs per gramme).

Zeeman's own estimate for e/m is 10^7, though he does not give any details; and accordingly I suppose that he considers his field had the moderate intensity of 8 000 C.G.S.; though twice that strength would have seemed more likely to be used in so notable an attempt.

The remarkable and immense discrepancy between the order of magnitude for e/m, deduced from the first rough measurement by the discoverer, and the ordinary well-known value obtained in accordance with Faraday's law from exact experiments in the liquid state of salt solution, viz., 10^7 on the one hand and 419 on the other, seems to me at present a considerable outstanding difficulty.

[*N.B.*—The 419 is for sodium, or about 10^4 for hydrogen.]

Too Hopelessly Small to Observe.

No wonder that previous contemplators of the possibility of some such effect, led thereto by purely theoretical considerations, should, like Dr. Larmor, have come to the conclusion that it was probably too hopelessly small to observe.

The most likely direction in which to look for an explanation of the remarkably high value of e/m, as compared with the electrolytic value, is probably that which has just been suggested to me privately by Professor Fitzgerald, viz., that the whole inertia of the particle is not concerned with the radiation motions, but only a very small fraction of the whole mass.

The electric charge being supposed the usual monad ionic charge, if the effective inertia is only 4×10^{-5} or 0·00004 of the whole atomic mass, the discrepancy would be explained.

Note F. 1922. This paragraph shows that we did not then know, what everyone knows now—thanks to workers in the Cavendish Laboratory, Cambridge—what the mass of an electron was, even if it had a separate existence. It is here estimated, on the basis of the Zeeman effect alone, which had then been only known in this country for a couple of months, that the mass of the radiating part of an atom was the twenty-five-thousandth part of a sodium atom, or about the thousandth part of a hydrogen atom; which is the right order of magnitude.

Fitzgerald's Comments.

[1897] Professor Fitzgerald also adds a line which indicates how simply the theory can be put if a frankly circular orbit is assumed for the motion of the radiating particle, revolving with angular velocity $\omega=2\pi/T=2\pi n$, under the action of a force directed towards a fixed centre and proportional to the direct distance; n being the frequency. For the centrifugal force is $mr\omega^2$, while the centripetal force is in two portions, one the ordinary undisturbed force, which we may write as mk^2r, and the other the magnetic force, normal to the motion and therefore also radial, viz., $\pm eBv$, which we may write as $\pm2mc\omega r$, where $c=eB/2m$. Hence we have as the equation to express the circumstances of the motion:

$$r\omega^2=k^2r\pm2c\omega r,$$

from which r cancels, showing that the result is independent of the amplitude, *i.e.*, independent of the brightness of the light; and the solution for the angular velocity is:

$$\omega=\sqrt{(k^2+c^2)}\pm c.$$

This is approximately the same as

$$2\pi n=k\pm c;$$

so the normal frequency is $k/2\pi$, and the disturbance of frequency either way is $c/2\pi$, that is $eB/4\pi m$.

Another, and the shortest possible mode of putting the elementary theory, is to say that the radial magnetic force, $eB\omega r$, causes a change in the centripetal force, $mrd\omega^2$,

whence

$$d\omega=\frac{eB}{2m}.$$

Note G. 1922. This is certainly the simplest and shortest mode of expressing the main part of the theory of a magnetic perturbation applied to orbital motion of an electrically charged body, if it be passed as sufficiently valid for elementary exposition; and as it is intended to be absolutely simple I repeat it here rather more fully. The centripetal force that has to act on a particle m revolving in an orbit of radius r with velocity v or angular velocity ω and frequency n, so that $v=r\omega=2\pi rn$, is $m\omega^2r$; while, if the particle is charged with the quantity e, the magnetic force exerted upon it by a magnetic field of induction density B (that is to say with B lines per unit area) is eBv. This will cause a change in the centripetal force such that

$$d\,(mr\omega^2)=eBv$$

so if r is constant, or the orbit a circle, we get

$$2\,mr\omega d\omega=eBr\omega$$

$$\text{or } d\omega=\frac{eB}{2m}$$

Whence the change of frequency is

$$dn=\pm\frac{eB}{4\pi m}$$

[1897] This, indeed, applies straightway to orbits of all shapes, and emphasises the independence of the effect from radius of curvature.

The most remarkable circumstance is, as Zeeman points out, that the radiation appears to be due solely to the motion of a *positively*-charged particle; at least, in the case of such substances as sodium and lithium. This is ascertained by the sign of the circularpolarisation at either edge of the widened line; for if the magnetic force is such as to accelerate the speed of a right-handed circular positive current, then the edge of the line which is widened towards the violet consists of right-handed circularly polarised light, while the edge of the widened line facing towards the red end of the spectrum consists of left-handed polarised light.

A Curious and Instructive Error.

Note H. 1922. This is a curious and instructive error, made at first by Zeeman himself when stating the sign of the effect. It is so easy to interchange right for left, and the mistake was speedily corrected. But it shows how little certain anybody was then that the electron or radiating particle was a unit *negative* charge. It was equally easy at that time to suppose that a very light positive unit was the mobile entity, and the sign of the Zeeman effect had to be carefully attended to and re-criticised in order to give us the true fact; which elevated the negative charge into a position of importance from which only quite recent researches into the constitution of the nucleus of an atom has partially dethroned it.

[1897] If it had been a rotating *negative* charge of electricity to which the radiation was due, this state of things would have been just reversed. It is not, indeed, likely that the molecule contains no equal opposite charge, nor is it likely that this oppositely-charged portion of the molecule is perfectly stationary: but it is possible that its motions may be unconcerned with the production of the particular radiation which goes to produce the sodium lines, and although the radius *per se* does not affect acceleration, yet great mass, which accompanies small radius, does.

Here, at any rate, is ample field for experiment.

The magnetic action on an electric charge revolving in an orbit round the lines is quite analogous to the strengthening of any current flowing in a circuit coincident with the orbit and enclosing the same lines. A material circuit would have resistance, and in that case the strengthening of the current would be only temporary, and a cessation of the magnetism would be accompanied by an inverse current; but with a molecular or ideal circuit it will not be so; the rise of current caused by the magnetism will continue as long as the lines persist, and when these are removed the current will simply sink to its original undisturbed value.

There being no resistance, it is self-induction which controls the rise of the current; and the additional number of lines will equal the rise of electromagnetic momentum, in other words:

$$dN=LdC.$$

Note J. 1922. This is what happens in a lead ring at or near absolute zero, according to the remarkable recent discovery of Kamerlingh Onnes; and it may be regarded as a foreshadowing of the ring electron, to which Dr. H. S. Allen has devoted so much attention. It was evidently possible even at that date to contemplate the electric constitution of matter, so that the whole of the mass of the radiating body might be due to its electric charge. See also the concluding paragraph below, where the size of an electron is reckoned merely from the Zeeman effect.

I suspect, however, that it did not strike me, at that time, that a ring electron would not radiate, at least not by reason of its own constitutional motion, and that even two electrons situated at either end of a diameter would radiate extraordinarily less than either of them separately.

Moreover, the law of force contemplated above was that of the direct distance, whereas it is now customary to consider it as obeying the inverse square law. And the radiation responsible for spectral lines appears really not to be due to any regular orbital motion, but to a perturbation of that motion, or to a fall from one orbit to another. Nothing of that kind is here foreshadowed: though the fact that radiation is only excited by some kind of "chemical clash," or violent shock, was not by any means unsuspected, and in all probability was already known to a few; to Sir J. Larmor certainly.

Identification of the Moving Charge.

[1897] The simplest way of identifying the moving charge with a current is to suppose it distributed uniformly all round its orbit, with a linear density $\lambda = e/2\pi r$, in which case the sum of all the current elements (or moments of current, as they are sometimes called) is given by either of the two following expressions:

$$e\omega r = 2\pi r C,$$

or, what is the same thing, $$C = ne = \frac{e}{T}.$$

Introducing this into the equation of centrifugal force (see above) we get

$$d\omega = \frac{eB}{2m} = \frac{eN}{2mA} = \frac{eLdC}{2mA} = \frac{e}{m}\cdot\frac{L}{A}\cdot\frac{ed\omega}{4\pi}$$

whence

$$L = 4\pi A\frac{m}{e^2} = 4\pi^2 m\frac{r^2}{e^2} = m\left(\frac{2\pi r}{e}\right)^2 = \frac{m}{\lambda^2} = \frac{8\pi\mu}{3a}\pi r^2,$$

which gives the electromagnetic inertia coefficient; the penultimate term taking a material view, the last term an electrical view, of inertia. To check it we may observe that the energy of the current $\frac{1}{2}LC^2 = \frac{1}{2}Le^2\omega^2/4\pi^2 = \frac{1}{2}(mr^2)\omega^2$ as it ought.

The velocity of an ion or electron revolving in an orbit of molecular dimensions sufficiently fast to give sodium light is not small, for it must rotate 5×10^{14} times per second, and so its speed is $u = 2\pi an = \pi a\times10^{15}$, which, if $a = 10^{-8}$, gives 3×10^7 cm. per second, or one-thousandth of the speed of light.

Not an Ultimate Explanation.

Note K. 1922. This sort of speed for an electron is now known to be quite reasonable.

The attribution of electrical inertia to displacement currents set up in the ether, which follows a few lines lower down, is correct; and this accords with the view, which though inevitable is often masked, that the electrical explanation of inertia is not an ultimate explanation, but postulates an unknown property, akin to tremendous massiveness—a property responsible for all observed atomic inertia—as existing unexplained in the continuity of the ether of space

[1897] So long as the motion is not still more rapid than this, it was shown in 1881, by J. J. Thomson, that a moving charge behaved as if it had a constant inertia; so that, in addition to whatever inertia the body holding the charge may possess, the charge itself has an inertia which is expressible as $\frac{2\mu e^2}{3a}$, where a is the radius of the sphere holding the charge. As the speed of motion approaches the speed of light the inertia increases, and assumes a much more complicated form (see Heaviside, "Electrical Papers"; vol. 2, pp. 495, 514, &c.). But at 1/1000th the speed of light, this complication need hardly be taken into consideration.

Now it is just possible that this electrically-explained inertia, due to the displacement-currents which are set up in the dielectric by the motion of any charged body, may be the only inertia concerned in radiation at all. That is, that it is the motion of the electron only which is emitting the observed spectrum lines.

If so, Zeeman's rough measurement for e/m, viz., 10^7 C.G.S. means that

$$\frac{e\times3a}{2\mu e^2} = \frac{3a}{2\mu e} = 4{\cdot}5\times10^{21}a = 10^7,$$

since $\mu e = \frac{1}{3}\times10^{-21}$ C.G.S. units; wherefore, the size of the electron which will suffice to attain Zeeman's quantitative result, without the necessary motion of any "matter" at all, is $a = \frac{1}{4}\times10^{-14}$ cm.; about a millionth of the linear dimensions of the sphere of molecular activity commonly known as the "size" of an atom.

Conclusion by Sir Oliver Lodge. [1922.]

On seeing my article in "Nature," of Jan. 19th, 1922, reviewing the reprint of his Papers which had just been issued by his friends in Holland as a memorial of the discovery, and of which the title is given above in the editorial introduction to this historical reproduction, Dr. Zeeman favoured me with a letter, from which a few extracts will be of interest to readers of The Electrician:

> "Your announcement in 'Nature' of the reprint of my magneto-optical Papers has taken me back to a happy time, and made me feel twenty-five years younger. A reprint of your early articles on the subject, as they appeared in The Electrician, would be interesting to the younger generation of physicists. Could they not appear in a new edition of your book, 'Electrons'?
>
> "It is rather remarkable that the new theory of quanta is still at a loss to understand some of the complicated, extremely regular, magnetic separations, such as the nonet of the green mercury line, or the cadmium line 5086.
>
> "In the 'Zeitschrift für Physik," recently, important Papers on the subject, by Landé, have appeared, but there is still something wanting.
>
> "February, 1922. P. Zeeman."

It is in accordance with Dr. Zeeman's wish, therefore that the Editor of The Electrician has reproduced the twenty-five year old article above.

Telegraphy, Telephony and Wireless.*

This book forms one of a series entitled "Common Commodities and Industries." The author has had the difficult task of condensing into a small book of 120 pages the main features of telegraphy, telephony, and wireless. The difficulty was increased by the fact that the author could not assume that his readers already had a fair knowledge of electrical units and phenomena.

The first chapter necessarily deals with Elementary Electricity. It is astonishing to find that it is possible to cover so much ground in a chapter of twelve pages. The matter is concisely put and well connected together. Mechanical analogies are used at times, and were it not for the necessity for the utmost brevity it would have been desirable to extend their use when explaining the behaviour of condensers, inductances, &c.

The Telegraphy section contains brief but "pithy" descriptions of most of the important instruments and methods of working, from Cooke and Wheatstone's needle to the Baudôt. Good descriptions of the Wheatstone automatic and Baudôt systems are given in two and three pages respectively, inclusive of illustrations. The only fault to be found is in the statement that the perforated tape in the Wheatstone transmitter is fed forward in "very rapid jerks."

The information on Submarine Telegraphy is not in keeping with the rest of the book. Lord Kelvin's siphon recorder for "The newly-laid Atlantic cable" is described, the pattern being a very early one with electrified ink. No attempt has been made to indicate the modern methods of working and relaying. The above criticism does not apply to the Telephony section, which is well covered from the Bell telephone to automatic exchanges. The Wireless Telegraphy and Telephony chapters are good, and the principle that no important feature should be omitted is well upheld.

Flux Distribution in Air Gap and Teeth of Dynamos.

By ALFRED STILL.*

(*Concluded from page* 153.)

This article deals with the flux distribution in the air gap and teeth of dynamos from the standpoint of fundamental laws and principles, it being found that in presenting such problems to engineering students it is as well to avoid many of the methods used by the practical designer. The subject is dealt with under the headings of permeance of the air paths, the air gap, and of the conditions in highly saturated teeth. Calculations of the tooth density in terms of air gap density and m.m.f., with a correction for the tapering of the teeth are made, the whole argument being illustrated by a numerical example.

Correction for Taper of Teeth.

The assumption of parallel sides to the tooth is justified only when the diameter of the armature is large relatively to the slot pitch, or when taper slots are used in order to provide a uniform cross-section throughout the whole length of the tooth. The dimension t in formula (4) should preferably be the width at the centre of the tooth. When the field system revolves, as in most alternators, the armature teeth will usually be wider at the root than at the top, and but little error will be introduced by taking for t the average width for the purpose of calculating the average tooth density and the corresponding ampere turns required for the teeth.

The case of a tooth with considerable taper, in which the density at the root is in excess of (say) 12 000 gausses, may be dealt with by the application of *Simpson's Rule*. Owing to

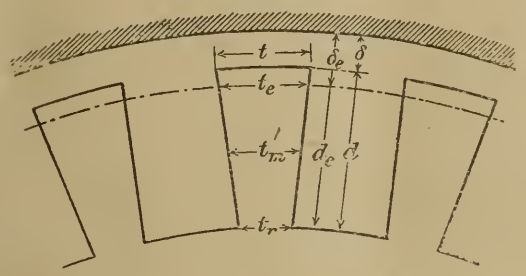

Fig. 5.

the fact that a portion of the flux enters the tooth at the sides, the flux density in the top of the teeth will not be very high, and the reluctance of the tooth over the portion of its length equal to the difference $d-d_e$ (see Fig. 5) may be neglected; the tooth will, therefore, be considered as having a total length d_e with a width t_e at the top, t_r at the root, and a mean thickness of t_m half way between these two sections. In order to simplify the calculations, the assumption is now made that the total flux in the tooth remains unaltered through all other cross sections.†

The value of the magnetizing force H (or, if preferred, the ampere turns required per unit length) can then be determined for any section of the tooth by referring to the B-H curves for the iron used in the armature. It is sufficient to determine H for three sections only. If these values are :

H_r at the narrowest section

H_e at the widest section

H_m at the centre section (*i.e.*, where the value of B_m is $\frac{B_r+B_e}{2}$)

then, on the assumption that the portion of the B-H curve involved is a parabola, *Simpson's* approximation is :

$$\text{average } H=\tfrac{1}{6}H_r+\tfrac{2}{3}H_m+\tfrac{1}{6}H_e \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (7)$$

Referring to Fig. 5, it will be seen that H_e is taken at the section which would be the top of the tooth if the air gap were increased from δ to the "equivalent" value δ_e. This is recommended as a good practical compromise, and the m.m.f. in gilberts required to overcome the reluctance of the tooth is $H\times d_e$ where d_e, the "equivalent" length of tooth, must be expressed in centimetres. Obviously, the formula (7) can easily be modified to give an average value for the ampere turns per inch.

* Professor of Electrical Design, Purdue University, U.S.A.

†This is not a correct assumption when the root density is very high, because in that case flux will leak out from the sides of the tooth to the bottom of the slot, and at some distance from the bottom of the slot (the taper being as indicated in Fig. 5) the total flux in the tooth will be greater than at the root cross section.

Numerical Example.

In order to illustrate this method of calculation, numerical data will be assumed and the manner in which a curve may be plotted giving the relation between the average density (B_y) in the air gap and the field ampere turns necessary to overcome the combined reluctance of air gap and tooth will be explained. The assumed quantities are :

Outside diameter of armature core = 19·5 in.
Gross length of armature core = 11 in.
Net length of armature core (iron only) = 9 in.
Length of air gap δ = 0·25 in.
Depth of slot d = 1 in.
Width of slot s = 0·5 in.
Width of tooth at top t = 0·576 in.
The calculated slot pitch is λ = 1·076 in.

The equivalent air gap as calculated by formula (2) is :

$$\delta_e=\frac{1\cdot076}{\frac{0\cdot576}{0\cdot25}+\left(\frac{5\times0\cdot5}{5\times0\cdot25+0\cdot5}\right)}=0\cdot288 \text{ in.}$$

The next step is to plot a curve giving the connection between air-gap density and tooth density at the centre of the tooth. The calculated values of tooth width at the four sections indicated in Fig. 5 are : t=0·576, t_e=0·572, t_m=0·519, t_r=0·466.

The value to use for t in the formula (4) is preferably the thickness at the centre, or 0·519 in.

Now select arbitrary values of B_t and make the calculations as indicated in the table. Note that μ is supposed to be obtained from data referring to the particular sample of iron used for the armature punchings. The air-gap density B_y is calculated from formula (4), but for tooth densities below 14 000

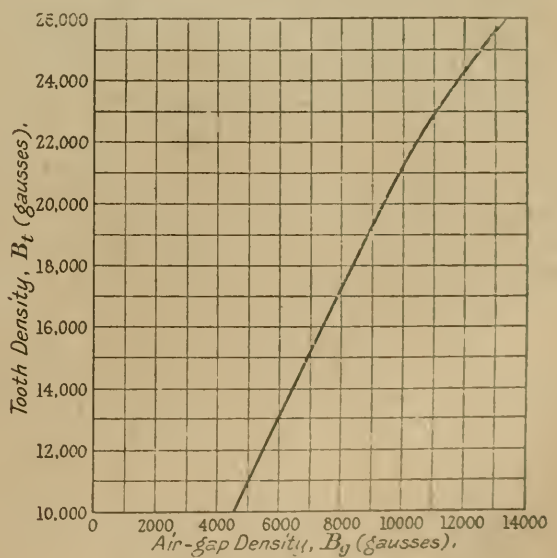

Fig. 6.

gausses the simpler formula (5) may be used, as the difference in the values given by the two formulas is then negligible.

B_t (assumed)	μ	B_y (by formula 4)
12 000	210	5 500 (by formula 5)
18 000	128	8 340
21 000	46·7	9 870
25 000	12·5	12 530

The curve, Fig. 6, which has been plotted from the figures in the Table, gives the relation between the flux density in the air gap and the corresponding density in the iron at the centre of the tooth for any value of the air-gap density.

Ampere Turns for Air Gap and Teeth.

The final step is to calculate the ampere turns required for the air gap and teeth, and plot a curve which shall give this relation for all values of air-gap density. The results of these calculations are given in tabular form. Taking the columns in order, we have :

First column. Any assumed values of air-gap density including the highest value likely to be attained under full load conditions.

Second column. The corresponding values of flux density in the iron at the centre of the tooth (read off curve of Fig. 6).

Third column. The corresponding magnetizing force, read off *B-H* curve (not reproduced here).

Fourth column. The flux density at root of tooth, being values in column 2 multiplied by the ratio $\frac{t_m}{t_r}=\frac{0{\cdot}519}{0{\cdot}466}$

Fifth column. The corresponding value of *H*.

Sixth column. The flux density at top of tooth, being values in column 2 multiplied by the ratio $\frac{t_m}{t_e}=\frac{0{\cdot}519}{0{\cdot}572}$

Seventh column. The corresponding value of *H*.

Eighth column. The average magnetizing force of gilberts per centimetre for the iron in the teeth calculated by applying

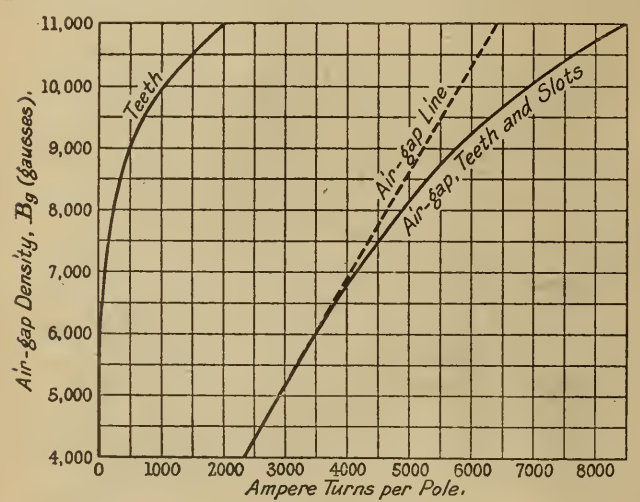

Fig. 7.—Saturation Curves for Air-Gap, Teeth and Slots.

Simpson's Rule (formula 7), except in the case of the last line of figures where this calculation is not necessary because all values of *B* are below the " knee " of the *B-H* curve.

Ninth column. The ampere turns required to overcome the reluctance of the teeth, being :

$$(TI)_t=\frac{Hd_e\times 2{\cdot}54}{0{\cdot}4\pi}$$

where d_e, in this example, has the value $(1+0{\cdot}25)-0{\cdot}288=0{\cdot}962$ in.

B_g	At middle		At root		At top.		H	$(TI)_t$
	B_m	H_m	B_r	H_r	B_e	H_e		
11 000	22 800	900	25 400	2 300	20 700	400	1 050	2 040
10 000	21 200	490	23 600	1 190	19 200	225	562	1 090
8 000	17 300	95	19 250	230	15 600	43	109	212
5 000	10 900	5	12 150	——	9 900	——	5	9·7

The final step in this method of procedure is to plot the curves of Fig. 7. Here the curve marked " Teeth " is plotted from the values in the Table. It gives the ampere turns to overcome the reluctance of the teeth for any value of air-gap density B_g. The ampere turns to overcome the reluctance of the air gap of " equivalent " length $\delta_e=0{\cdot}288$ in. are :

$$(TI)_g=\frac{B_g\times 0{\cdot}288\times 2{\cdot}54}{0{\cdot}4\pi}$$
$$=0{\cdot}582B_g$$

a relation which is represented by the dotted straight line in Fig. 7. All that is now necessary is to add the ampere turns for the tooth to those for the air gap, in order to obtain the final curve giving ampere turns required to overcome the joint reluctance of air gap, teeth and slots for any value of the average flux density, B_g, in the air gap over the space of one tooth pitch.

Hydro-Electric Installations of the Barcelona Traction Light and Power Company.*

By H. F. PARSHALL.

The more important installations are situated on the Pallaresa river at Talarn and Tremp, at Camarasa, and at Seros on the river Segre, a branch of the river Ebro.

The Tremp Power House, which derives its power from the Talarn dam, is equipped with four 7 000 kW horizontal-type turbo-generators, one turbine at each end of the generator. The average annual flow of the river Pallaresa over a period of years is about 49 100 million cub. ft., and the output of this power-house in normal years is about 110 000 000 kWh. At high-water level the working head is 249 ft., and at lowest level it is 118 ft. The results for the year 1917 show an efficiency of 72 per cent., or a water-consumption of 259 cub. ft. per kWh with a head of 196 to 229 ft. The water utilised in an average year at this power-house is 26 593 million cub. ft. The cost of the Talarn and Tremp installation was £1 826 700. The installation at Aytona, or Seros, on the river Segre, of which the rivers Pallaresa and Ribagorzana are tributaries, was the first constructed. The water is taken to the power-house by a canal 12 miles in length, while the diversion dam is at Lerida. The power-house is designed to accommodate five vertical-type generating-units of 8 000 kW (four of which have been installed), and is designed to work with 160 ft. head, the output being in an average year 130 000 000 kWh. The cost of this installation is approximately £1 852 260.

The Camarasa Installation.

The most important and more recent installation described in the Paper is that at Camarasa, sometimes called the " Confluence." The dam at Camarasa is about 105 ft. long at the base, 492 ft. long at the crest, and 318 ft. high from the bottom of the cut-off wall to the footway. It is 246 ft. thick at the base and contains 280 000 cub. yds. of concrete.

The power-house at Camarasa, which is built of reinforced concrete, is designed to accommodate five generating-units of 12 500 kW each, two of which have been installed. The capacity of this power-house completed will be 182 000 000 kWh, and it is designed to utilize the 12-hour discharge at Tremp in 6 hours, should the demand for power so require. The cost of the Camarasa installation, with two units installed, is approximately £1 370 776. With five units installed the cost will be increased by £375 000 and the capital cost per kW will be £27·9. The combined output of the Tremp, Camarasa, and Seros installations is approximately 430 000 000 kWh, and the nominal H.P. is 180 000. The storage capacity of the reservoirs is such that 90 000 000 kWh can be contributed to the combined output of Tremp, Camarasa and Seros.

Phase-Compensation Devices.

Results obtained from phase-compensation by means of synchronous condensers are shown in tabular form. This gives the losses before and after phase-compensation, and shows a gross saving of 24 450 000 kWh per annum, and a net saving, after deducting the losses in the condensers and distribution, of 18 950 000 kWh. The increased revenue derived from the saving in energy effected augments the possible net income by £80 000 per annum. Preliminary calculations showed that, by the use of synchronous condensers, the power-factor could be increased in the ratio of 1 to 1·3, and the terminal voltages increased in the ratio of 1 to 1·2. All the advantages predicted have been fully realised in practice.

Transmission Line Details.

The first transmission lines were equipped with pin type insulators with four petticoats, but these gave a great deal of trouble and were unable to withstand the stress of storms. The line from Seros to Barcelona, which was constructed under the author's direction, is equipped with suspension insulators, seven in series, and has stranded conductors of 250 000 cir. mils section. The line from Camarasa to Igualada has been reconstructed in order to use the suspension type of insulator, and it is equipped with six in series, of the Hewlett type. The standards are designed for straight runs with average spans of 650 ft. They are equipped with two guard wires of $\frac{3}{8}$ in. diameter, and are designed to withstand a wind-pressure due to a velocity of 100 miles per hour with $\frac{1}{2}$ in. of sleet on the wires, the towers to remain stable with two wires broken.

* Abstract of a Paper read before the Institution of Civil Engineers.

The Coming of Age of Witton.

Interesting Developments and Progress at an Important Engineering Works.

On February 7, 1922, the Witton Works of the General Electric Company celebrated their twenty-first anniversary. For on February 7, 1901, the work of building was commenced on what was then nothing more than meadow land. To-day the works occupy many acres of ground and comprise numerous shops of more than ordinary substantial proportions. They employ the labour of some thousands of skilled workers who are engaged in the production of electrical plant and switchgear of every description for all quarters of the globe.

A Broadening Basis.

This development has been accompanied by a broadening basis. For in the very early days the General Electric Company were mainly what would now be called factors. Then they began to manufacture in a limited way and soon became justly celebrated for smaller articles. But in recent years they have turned their attention to the construction of heavy electrical engineering plant and have achieved that success in this wider field which has never been wanting from their endeavours. This expansion, as is well known, has gone hand in hand with useful amalgamations and working arrangements until now the company is a self-contained organisation made up of some twenty large works, each one of which is devoted to the specialised production of a class or classes of electrical or mechanical apparatus. In this co-ordination it will be admitted lies great strength. It is a co-ordination which enables the largest contracts for engineering equipment to be undertaken without it being necessary to use anything but the resources of the Company's own shops.

Prophecy and Realisation.

Mr. Hugo Hirst, speaking at the annual meeting of the Company on July 9, 1918, said, "I have always cherished the hope that I might some day be the instrument of building up an electrical concern of such magnitude that it would be respected not only in this country but all the world over. We have sat still too long and looked admiringly at the progress of our foreign rivals. I see no reason why there should not be two, three, or four great electrical concerns in this country, grouping themselves into big units out of the mass of electrical material at their disposal in order to play a better and more important part in the world's work." With the revival of trade and the obtaining of the important contract for the electrification of the London, Brighton and South Coast Railway there seems no reason to doubt that this ideal is on its way to fulfilment. So wide indeed have become the activities of the General Electric Company, as illustrated at Witton alone, that on the occasion of our visit it was not possible to see more than a little of what was going on, and it is impossible in the space at our disposal more than to touch on the interesting evidences of progress that were displayed.

Recent Extensions.

We may begin by saying that the Witton Works now cover an area of about 100 acres and that recent developments have necessitated the construction of seven new buildings for switchgear work (Fig. 1), standard motor works, administrative offices, a development department, moulded insulation works, and enamelling and plating works. In addition a most luxurious club house has been built and new bays have been added to the foundry, the main engineering works and the small motor works. These extensions have not only rather more than doubled the works in size, but by providing greater facilities for modern organisation have increased the efficiency in a considerably greater ratio. Among these improvements may be mentioned the large number of special machine tools that have been installed, the adoption of the most up-to-date transport methods, the liberal provision of gangways in the shops and roadways between them and the excellent accommodation provided for the staff in the new office buildings.

Fig. 1.—General View of the New Switchgear Works, Witton

The Heavy Engineering Shops.

Taking the main engineering works as our starting point, these are divided into four extensive bays where all classes of electrical machines with outputs exceeding 100 h.p. are constructed, as well as smaller machines if these are of special design or construction. One bay is devoted entirely to the construction of turbo-alternators. This is equipped with a range of specially designed machine tools for turning or milling the solid rotors which have always been a feature in the design of the G.E.C. alternator and for boring and slotting operations on the stators. Subsequently, both stators and rotors pass to the winding section and thence to the assembly, test, and despatch departments. It may be noted that all the G.E.C. turbo-alternators of 6 000 kVA and upwards are provided with embedded temperature indicators. A view in the turbo bay is given in Fig. 2.

We noticed in this bay a 10 000 kVA turbo-alternator for the borough of Marylebone, which will run at 3 000 revs. per min., another for the Bury Corporation with an output of 12 500 kVA at the same speed, and yet another with a capacity of 22 500 kVA, a periodicity of 25 and a speed of 1 500 revs. per min., which is being built for the Birmingham Corporation. G.E.C. activities, however, are not confined to the home market, and as evidence of this we may mention three 3 500 kVA sets which are being built for the city of Pretoria and three others of rather

greater capacity for the city of Auckland. The rotor of one of these machines is shown in Fig. 3.

Rotary Converter Design.

Rotary converter design and manufacture is now a burning question in electrical engineering circles. There is plenty of evidence at Witton of the attention that is being paid to this class of electrical equipment. Four 2 000 kW machines have recently been supplied to the City of London Electric Lighting Company, while two 1 500 and two 2 000 kW sets are now in process of construction for the Charing Cross, West End & City Electric Company. The value of the rotary converter made by the Company is much enhanced by the self-synchronising panel which, it is claimed, offers many important advantages over other types, the operations being extremely simple and mistake proof. A rather unusual machine which we noticed is the rotary converter which is being supplied to the British Mannesmann Tube Company. For this machine a current of 5 000 A is required on the direct current side, thereby necessitating the use of a double commutator. Passing from rotary converters to motors, a large range of motors for rolling mill drive and other steel works equipment were to be seen going through the shops. The features of the design and construction of the motors manufactured by the G.E.C. for this class of work were fully dealt with in our recent Iron and Steel issue.

Fig. 2.—View in the Main Turbo Bay.

The Switchgear Works.

Next in importance and interest to the main engineering shops are the switchgear works, which are conducted under the superintendence of Dr. C. C. Garrard. These works are most spacious. The lay out covers an area of 100 000 sq. ft. and is so situated as to have a main road on two fronts. The stores extend down the centre of the building, and are so arranged that the accommodation and handling of material gives a high degree of efficiency. The grouping of the benches and machines also tends to allow a very rapid progress of work through the shops. This is facilitated by the excellent arrangements for both the natural and artificial lighting. Generally speaking, in one main bay switchboards are erected, while starters and controller gear occupy a second bay on the other side of the stores. Ironclad and heavy switchgear is turned out in a third bay, where a section is also set apart for the many machine tools required. Auxiliary processes, such as plating, enamelling, slate drilling, and cementing, are carried on in a series of small shops, while a fully equipped test room runs across one end of the works with a packing and despatching department adjoining. The universality of the products of the General Electric Company, to which we have referred above, is well exemplified by comparing the orders which were being dealt with in the main engineering shop and in the switchgear shops respectively. This comparison shows that purchasers of motors and other equipment are also obtaining their switchgear from Witton.

An Important Contract.

An important switchgear contract which is now being undertaken at Witton is for the complete equipment of a new switch house for the Metropolitan Railway generating station at Neasden. The main section of the contract calls for 11 000 V gear to control one 12 000 kVA alternator, five 5 000 kVA alternators, and fifteen outgoing 300 A feeders. This switchgear house will be constructed in three storeys with the 'bus bar chambers on the top floor, the oil switches in the middle, and the instrument transformers below. All the switches are to be electrically remote controlled from specially operated panels on the third floor, and the high tension gear will be in brick cubicles. The oil switches will have a breaking capacity of 350 000 kVA. These switches are, however, not the largest which are built by the Company, for only a short time ago a switch with a breaking capacity of 800 000 kVA was sent to a South American mining company for use on 33 000 V circuits. Also on exhibition were the truck type cubicles which are now being made by the Company, and many interesting types of oil immersed switchgear of various kinds. A special type of panel noted on the test bed was that for testing the apparatus of the G.E.C. bias differential system of protection.

The Development Department.

It is hardly necessary to say that those responsible for the policy of the G.E.C. have always realised the need for digging deep in order to build high. Few industrial concerns have paid so much attention to the importance of keeping abreast of the advance of scientific knowledge, and its proper application to practical manufacturing purposes.

Some years ago, therefore, the foundation was laid of what is

Fig. 3.—Rotor of 7 500 kVA Turbo Alternator. Coils being Dropped into Position.

to-day a highly developed organisation for scientific research, with a Central Research Laboratory, which is now being established at Wembley, near London. This organisation undertakes the investigation of the more abstruse manufacturing problems encountered by the various G.E.C. associated factories, whilst to fill the gap between research and production the Company has established Development Departments at its various works, which act as a liaison between the two sets of activities.

Following out these principles, everything that is done at Witton is based on careful experiments carried out in the Development Department, which is situated near the northern border of the Company's estate. Each section of this Department possesses the latest scientific apparatus needed for the development work. Thus the electrical and magnetic section has standards of the highest degree of accuracy for calibration work, and the mechanical branch has a 30-ton Buckton testing machine for tensile and compression tests, a Brinell hardness testing machine, and schleroscope and fabric testing apparatus. There are also two electrically

Fig. 4.—Part of the Electrical Testing Station in the Development Department.

heated ovens, the temperature of which is controlled by adjustable thermostats, which are used for ascertaining the effect of prolonged heating on insulating materials and varnishes.

High Tension Testing.

The workshop has also a suitable equipment of machine tools, and ample bench accommodation, so that models may be expeditiously produced. In this workshop the first model for any new line of manufacture is made.

The Development Department also contains a sub-station with a large distribution board and various motor generator sets from which all voltages, periodicities, &c., likely to be required are available. For high voltages a special transformer cubicle is provided; this gives testing voltages up to 50 000. (In the switchgear works test bed 100 000 V is available.) One most useful accessory is a special photographic dark room, with a photomicrographic camera for investigating the structure of materials. Among the apparatus being tested on the occasion of our visit was the 1 h.p. Pelaphone semi-automatic lighting set. A view of the electrical part of this Department is shown in Fig. 4.

Social and Welfare Work.

Last, but not least, the social work carried out by the Welfare Department at Witton among the workers is on a scale seen in few works, even in these modern days. These activities have for their home the magnificent new Club House, and the playing fields which cover many acres on the eastern side of the G.E.C. estate. The Club was built by the Company, in memory of the many who went from Witton to the Front and did not return.

Some idea of the enormous capacity of the works may be gathered when it is stated that the total combined capital of the company up to date is in the neighbourhood of £8 000 000, inclusive of the cost of post-war developments, while the assets as disclosed in the last balance-sheet are over £11 000 000. With this financial backing and the enterprise which is being shown in the development of all branches of electrical manufacture, the future of the G.E.C. should be rosy.

Comparative Tests on Domestic Heating and Cooking Apparatus.*

By J. RUTISHAUSER.*

Experiments on various types of cooking apparatus were carried out at Davos (Switzerland), and comparisons were made between the costs with different forms of energy. In the first place the efficiency had to be determined—for which purpose tests on heating and on boiling water were made. Representatives of the gas and electricity works at Davos took part in the tests; while practical cookery tests were also made. Good agreement between the results was obtained.

In order to obtain comparative results, the Swiss and German gas and water engineers in 1913 adopted definite standards—as a result of careful experiments—in order to determine the efficiency of gas boilers. These standards have proved to be very suitable and are still in use. They require that in determining the efficiency of a gas boiler, water shall be heated from 20 to 95°C., and that there shall be a definite relation between the size and contents of the pot and the energy supplied (hourly gas consumption of the burner). In Davos the water was heated from 15 to 90°C., because 95°C. at that altitude corresponded to boiling temperature.

Tests on Electrically-Heated Hot Plates.

For the tests, two stoves, each with two hot plates, 22 and 18 cm. in diameter, were used. The rating was 1 460 W and there were three steps. Since no standards were available for boiling tests with hot plates, series of tests were first carried out with different hot plates and pots of various sizes and amounts of water in the pot, in order to determine how the efficiency was affected by the amount of water in the pot. The results are set forth in tables and curves, and it is seen that the efficiency depends largely on the pot-content being very low for small quantities of water. In this respect the conditions with electrically-heated plates are worse than with gas burners. The efficiency also falls off when the current is not cut off until boiling begins. If pots under these conditions are placed on one side when boiling commences the stored-up heat in the plate should be utilised by heating another vessel. Thus it was found that 3·5 litres of water could be heated from 15 to 33°C., thereby increasing the efficiency some 10 to 15 per cent. The cost for heating one litre of water from 15 to 90°C. with 2 kg. of water in the pot was 1·44 to 1·77 centimes (Swiss), corresponding to a consumption of 0·246 to 0·291 kWh. Boiling was cheapest with a medium-sized covered pot when the water was heated with full current on up to nearly boiling temperature. With the hot plate the temperature of the water only begins to rise after a few minutes since time is taken to heat up the plate and the vessel—on the other hand, heat is given off after the energy is switched off. This effect is much less with the gas flame, which is superior as regards regulation.

Tests with Gas Boilers.

For the gas tests a Junker stove with rings of 48 mm. diameter, having a gas consumption per hour of 500 and 300 litres respectively was used. The bottom of the pot was 21 mm. above the burners. With gas at 60 centimes per m³ and electricity at 12 centimes per unit, the average costs of heating a litre of water from 15 to 90°C. and boiling for one hour, are 2·02 centimes for electricity and 2·78 centimes for gas.

Average Efficiencies.

Hot plate (electric), including continued heating after cutting off current, 75·5 per cent.; during period when current was switched on, 66·5 per cent.

Gas boiler, including continued heating after gas is turned off, 56·1 per cent.; during period when gas is burning, 55·5 per cent.

Electric rapid cooker (boiler), 84·3 per cent. In this case the efficiency fell off much less when the pot was only half full than with the hot plate.

Electric ring (a 5 cm. wide ring, enclosing the heating resistance, for clamping outside the pot): efficiency about the same as for hot plate.

Results are also given for radiator-ovens and tip-boilers—the latter being more costly to work with gas than electricity.

Comparative Cooking Tests.

Cooking tests were made in two households. A definite menu was observed for 14 days with cooking by gas and by electricity. All the hot water needed in the first house was heated on the experimental stoves, and the average daily consumptions were 3·54 kWh and 956 litres of gas respectively. This worked out at 14·3 centimes for gas and 10·7 centimes for electricity per person per day. This meant that for equal costs, with electric energy at 12 centimes per unit, gas would have to cost 44·4 centimes per m³; whereas the actual cost was 60 centimes per m³. The costs

*Abstracted from "Schweizerische, Elektrische, Verein Bulletin." Vol. xii., p. 376.

did not differ much so long as stoves (cooking and hot plates) were used, but the gas cost rose rapidly when the oven was used. On the other hand, the electric hot plate was inferior to gas for heating independently small quantities of milk, coffee, &c. For the second household, where the water for domestic requirements was heated independently, the results were very much the same. A pre-war comparison showed that when gas was replaced by electric cooking, the average daily consumption changed from 1·9 m^3 to 8·92 kWh.

With the apparatus tested, it was found that, for boiling water and for domestic cooking, one cubic metre of gas with a calorific value of 5 228 kg.-cal. per m^3 at 0°C. & H. = 760 mm. was equivalent to 3·48 to 3·7 kWh of electricity.

Telephone Line Work in the United States.

Mr. E. S. Byng's Paper on "Telephone Line Work in the United States," which was given in abstract in The Electrician of Nov. 25, was recently discussed at Manchester, Alderman W. Walker being in the chair.

Mr. W. J. Medlyn said that the financial studies of development schemes were undertaken in this country as in America. He enquired whether the Americans used 1 per cent. of antimony in their underground cables as with aerial lines. In this country the lead-antimony alloy was used for the latter, but pure lead for the former. The spacing of poles, 35 to 50 yds., was less than the 60 yd. standard used in this country. It was difficult to appreciate why untreated poles, lasting eight and a half years, should be used in preference to creosoted poles, which lasted thirty-two to thirty-five years. Motor transport and machinery were used less in this country, but, when all factors were taken into account, our telephone rates compared favourably with those in the United States.

American Methods Criticised.

Mr. T. E. Herbert emphasised the difference in climatic conditions between the two countries, and said this influenced open line construction. The methods of construction used in the States would, in this country, lead to utter disaster. The short span adopted was probably the cause of immunity from destruction. A line on Glossop moors with a 20 yd. span failed in two years, because the rate of vibration of the wire was four times as rapid as in a 40 yd. span. They hoped in this country to avoid open routes as much as possible. Glass insulators had never found favour in this country. His experience with aerial cables had been disastrous. He enquired whether the speeds of jointing and pulling in cables were really practical or whether they were spectacular.

Mr. J. Shea thought that the author had brought home the fact that this country could be too conservative in methods of construction. He believed greatly in aerial cable work, and he thought there was a field for that class of work in this country. He agreed with the author as to the high percentage of faults found in the last span in drop wiring.

Telephone and Power Lines.

Mr. G. H. A. Wildgoose thought that the principles underlying construction were the same in the two countries, and that differences were due to differing conditions, not only geographical, but to the volume of work and attitude to the telephone system of the public and the authorities. Underground development schemes were simple in a country where cities and towns were laid out systematically. With reference to the joint use of telephone and power lines, he asked whether any limit to the voltage of power wires was fixed and whether workmen received shocks.

Mr. G. Wallace said that the Manhattan scheme for concentrating testing and localising apparatus would be found unsuitable and uneconomical in cities served by the largest English exchanges. The British method of compiling fault statistics was comparable with that of any other administration in the world. Before comparing English and American fault durations the number and duration of each class of fault should be available.

Speed of American Workmen.

Mr. A. E. White commented on the high speed of jointing and asked for details, the English figures being only one half the American. The cost in England was no greater, and the workmanship would be better. The statement of time given for drawing in cable also needed amplification.

Mr. C. E. Morgan thought that the author described the best conditions, and asked whether any trouble was experienced in working open wire circuits with repeaters through difficulty in maintaining accurate balances.

The Author, in reply, said he held no brief for the Americans. He saw the speeds of working mentioned actually carried out in some cases. Uncreosoted poles were those cut in neighbouring forests. Paint-brush treatment was often adopted and gave a life of five to ten years, the tank treatment giving 15 years. The important point was to protect the wind and water line. The maximum voltage allowed for supply wires was 5 000 V between wires, or 2 900 V between wire and earth.

Electric Vehicle Considerations.

At the last meeting of the Informal Section of The Institution of Electrical Engineers, Mr. R. J. Mitchell, in opening a discussion on "Electric Vehicles," defined the electric vehicle as one driven by accumulators or battery, not by engine-cum-dynamo nor trackless-trolley.

In spite of the simplicity of control the electric vehicle had not made the progress expected of it; in the past this was due largely to the low cost of fuel for the petrol vehicle, while the high first cost of the electric vehicle was to-day made to seem extravagant by the very low prices obtainable for second-hand lorries. Yet the electric vehicle was particularly suitable for town transport. To the objection that it was extremely slow, he replied that this did not matter at all. Nor was it any longer true that the battery did not permit a reasonable day's work from one charge.

Street Widening.

With conditions in most large towns where widening of the streets was a counsel of perfection all too impracticable, the electric vehicle which did not commit the nuisances of smoke, smell, and noise must ultimately become supreme. Another important consideration was its greater conservation of road surfaces. The electric vehicle was easily adapted to special equipment such as tipping gear, cranes, elevating apparatus, &c., which with other vehicles could only be obtained in a roundabout way.

He read testimony to the merits of electric vehicles from the experience of many corporations and large commercial users, showing in some instances most remarkable saving in time and handling, and he appealed for fuller co-operation and help in the matter of charging facilities from supply engineers.

Battery Design.

In regard to improvement in electric vehicles the last word in battery design had not yet been said, and he thought the B.E.A.M.A. should offer £100 000 prize for a battery giving, say, 40 Wh per lb. If a share in the royalties on this battery were stipulated, there would be no need to set aside a reserve for the prize money. The chassis was not perfect either, it could be enormously improved and lightened by better materials. Further, he had found wheels that could with safety, even improvement, be pared down 2½ cwt. per set.

Municipal Virtues.

Mr. A. W. Blake, of Willesden, opened the discussion with a glowing testimony to the virtues of electric vehicles on municipal duties. He spoke from experience of many years and at present was associated with eighteen electric, as well as several petrol, vehicles. Every electric vehicle was working every day, and his figures of working hours showed an astonishingly good service, and freedom from even minor breakdowns. Questions of running cost and of speed could not be answered summarily as conditions and duties varied, but he was able to let out 5 ton electric vehicles on hire to the surveyors' department at 45s. per day (including driver and all charges), and make a profit on it. Mr. Blake thought that one of the first duties of the electric vehicle was to abolish the tramcar; and it was notable how few friends the trams had among subsequent speakers.

Mr. N. Murphy continued the appeal for less apathy from supply engineers. He reminded them that the consumer came to the door for supply and he declared that if this vehicle was not taken seriously, the vehicle makers would perforce provide their own charging facilities.

Mr. A. G. Whyte recalled the statement that the Cleansing Superintendents had done more for the electric vehicle than all the station engineers.

Mr. F. Jackson said the early failures of the electric vehicle that still prejudiced opinion were with cabs and motor buses, requiring relatively higher speeds, but the commercial vehicle was not a touring car and could return to its base. Further, the electric vehicle user would probably employ a fleet and could consequently arrange his own charging. He spoke of the railway companies in London each employing 10 000 to 12 000 horses on local transport.

Mr. W. E. Warrilow did not agree that the station engineer was always apathetic. He recalled a long journey years ago where charging points had been arranged. At one station their arrival was so keenly anticipated that the charging leads were passed out to them already alive.

Mr. R. J. Mitchell, in his conclusion, dealt with the question of regenerative control on electric vehicles. His opinion was that if you can ensure that the driver will take the fullest advantage of the opportunities it may afford, this system may be desirable.

The Royal Commission on Awards to Inventors will, as from March 1st next, sit in two divisions, the second division sitting on Wednesdays during term time at Martlett House, Bow-street, W.C. 2.

Correspondence.

MECHANICAL AND ELECTRICAL EFFECTS OF LARGE CURRENTS ON H.T. SWITCHGEAR.

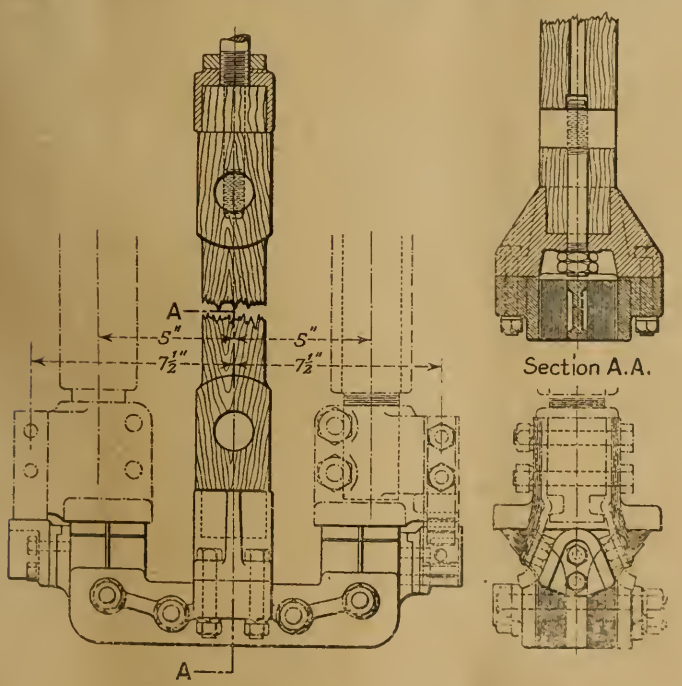
To the Editor of THE ELECTRICIAN.

Sir,—In your issue of January 20th appeared a reproduction of the notes by Dr. C. C. Garrard, dealing with the cinematograph films of Mr. Torchio's tests which Dr. Garrard recently exhibited at the Institution of Electrical Engineers.

Dr. Garrard's comments are very pertinent, so far as they go, but they do not by any means cover the whole subject of burnt contacts on oil switches. Our engineers have had the opportunity of studying the original reports of the New York Edison Company, on which Mr. Torchio's paper was based. In every one of the tests the parallel studs were found to move outwards, frequently to such an extent as to take up a permanent set. In such cases even the mutually attracting wedge contacts do not avail to prevent burning at the contacts, although they are more satisfactory than the brushes in Fig. 1 of Dr. Garrard's paper. It has been found necessary to stiffen considerably the studs of the switches tested, or in the case of the G.E. Company's "pot" switch, to brace the pots.

Since the New York tests, which were taken just three years ago, a great deal of other work on contacts has been carried out. In Mr. Torchio's paper before the American Institute of Electrical Engineers he showed forms of brush contact which were unaffected by heavy currents, other than that in Fig. 2 of Dr. Garrard's notes. These have been tried out and the most successful is undoubtedly that illustrated herewith.

In this contact the main element is a brush, the leaves of which are continuous from one contact block to the other. Internal



A Successful Form of Brush Contact.

I^2R losses are therefore a minimum, and, moreover, the brush type of contact can be bedded in at a higher pressure and gives a lower contact surface drop than the wedge form. The two halves of the brush element take a Y formation in the end view, so that they attract one another, and increase the bedding pressure when heavy currents are carried.

The arcing contacts are of the wedge type, shown in Dr. Garrard's Fig. 3A. We do not agree that the contacts shown in Fig. 3B are an improvement on this, because at the moment the wedge is withdrawn the two controller fingers will spring together and stand a good chance of being welded together by the arc which surrounds them. The fingers on the arcing contact shown herewith are so mounted that it is physically impossible for them to touch and freeze together.

Another factor definitely excluded from Mr. Torchio's programme of tests is the effect on the switch mechanism produced by the repulsion on the moving contact as a whole. In most of the larger switches now on the market, the mechanism would spring during the initial cycles of a short circuit corresponding to the rated breaking capacity of the switch. The current during the first half cycle may be four times the arc amperes.

Finally, it should be clearly understood that given rigid mechanism, rigid studs, and a form of contact which does not deflect under current, burning at the main contacts of a switch is still inevitable unless the resistance of the arcing contact path be kept low. Specific data on this point is not available, but certainly the resistance of the arcing path should not be more than five to ten times that of the main contact path. We are, &c.,

The Metropolitan-Vickers Electrical Company, Ltd.

Manchester,
Feb. 6th.

RATES AND RATE AID.

To the Editor of THE ELECTRICIAN

Sir,—I have read with much interest your article on page 151 of this week's issue of The Electrician in connection with this undertaking.

With reference to your remarks as to reduced charges, I beg to inform you that my Committee have already agreed, subject to the confirmation of the City Council, to reduce the charges for the supply of electrical energy in this city as from the December, 1921, quarter as follows:

1. For ordinary consumers, 25 per cent. off the increased charge over basic rates of 100 per cent., making the net increase 75 per cent.

2. Rateable value consumers, 50 per cent. off the increased charge on the rateable value of 100 per cent, and 25 per cent. off the increased charge on the basic rates per unit of 100 per cent.

3. Consumers taking large supplies and having special agreements containing coal clauses, etc., 15 per cent. off the increased charge of 40 per cent. on the basic rates, making the net increase 25 per cent.

With regard to this latter class of consumer, there will automatically be a large reduction in the charge due to the reduced cost of coal, in addition to the percentage recommended above.—I am, &c.,

H. Dickinson,
City Electrical Engineer.

Liverpool.
Feb. 14th.

[We are glad to learn that the Liverpool Electricity Committee are taking such enterprising action. It is the only right and sound policy.—Ed. E.]

THE REVO ELECTRIC IRON.

To the Editor of THE ELECTRICIAN.

Sir,—With reference to the matter of an 100 V electric iron which was used on a 200 V circuit, and Mr. Davis' reply to my letter appearing in your issue of the 3rd February, it appears that your correspondent chooses to be rather more personal than precise in his remarks.

However, after condensing the statement made by Mr. Davis, we are able to discover the "nigger" in this apparently "wonderful" performance, which is, that the current was only applied to the iron for a few minutes at any time, being switched off before becoming red hot, all of which goes to prove that the performance was not in the least wonderful. In fact, any iron of well-known British make would have given the same or quite probably better results than that attributed to the iron in question.

Your correspondent states that an electric iron "is never in use continuously during ironing operations." The fact that an electric iron *can* be used continuously is one of the prime arguments in favour of using electric irons in preference to any other, since they are usually designed and loaded in order to promote a saving in time and prevention of heat loss in the iron during the process of ironing. It is evident that if an electric iron is to be switched off every few minutes to prevent over-heating and burning of the material, ironing under these conditions would become not only laborious but extremely dangerous.

With regard to the supposed incorrect statements of loading and face area on which my calculations were based, I beg to remind Mr. Davis that the original article on this subject was devoid of any technical details, and some presumption was necessary in order to arrive at a concrete argument. The loading applied, however, to well-constructed irons of 4/5 lb. size is approximately 400 W. As to face area, I agree with him that this was probably incorrect, but the incorrectness was distinctly in his favour—the average face area of this size of iron being 18/20 sq. in, which would bring the loading to considerably more than 64 W per sq. in. Your correspondent does not favourably influence his argument by bickering. It would be very interesting to know what electrical heating appliances (other than water-heating appliances) are loaded to "64 W per sq. in. and more."

It is quite clear that Mr. Davis is availing himself of the opportunity of cheap advertisement to the fullest extent as will be seen by the further "testimonial" included in his letter, which has nothing whatever to do with the subject under discussion. I repeat that many irons of well-known British manufacture could withstand even more strenuous tests than either of those he quotes.

In conclusion, I would like to submit that if every manufacturer

were to inset in your columns the many testimonials they receive from their various customers, there would be very little room left for any real items of interest in your valuable journal. I am, &c.

London, W. 9, February 13. WM. B. SCOURFIELD.

[It is difficult to discuss a subject of this kind without doing a little of the advertising to which Mr. Scourfield objects. He will, however, agree that even with this drawback, the matter is of sufficient interest to be ventilated in the columns of a technical journal.—ED. E.]

ELECTRICAL versus MECHANICAL ENGINEERS.

To the Editor of THE ELECTRICIAN.

SIR,—Neither a mechanical nor an electrical engineer, but an engineer nevertheless, and having I hope the best interests of the profession as a whole at heart, Mr. W. B. Pinching's letter in your last issue gave me much satisfaction, as raising the tone of the discussion to its proper plane.

I have no special knowledge of railway administration, but it seems to me inconceivable that there should not be someone to co-ordinate the mechanical and electrical branches of the engineering organisation, and the great thing is that he should be an "engineer." I fail to see why a man trained as a mechanical engineer should be suspected of inability to hold the balance evenly.

To suggest that the heads of both branches should have direct access to the directors and possibly present conflicting views seems to be asking for trouble. That is the sort of thing which gives the lay "administrator," who is never tired of extolling his impartiality of judgment (which arises from knowing nothing in particular), the opportunity of saying "evidently the 'experts' cannot agree, so you had better let me decide for them," and of getting himself pushed in over both professional men.

It is high time that engineers recognised that the growth of specialisation is a source of weakness to the profession, and made efforts to build bridges rather than open chasms. In your issue of the 27th ult., you call on the Institution of Electrical Engineers to take the matter up. I hope they will and remind their members that they are engineers first and electrical engineers afterwards, and that by strengthening the engineering profession as a whole, they will be strengthening every branch of it including their own.—I am, &c.

NABIA.

The Geddes Penknife.

By ERNEST J. P. BENN.

The Geddes Report and the fuss that has been made about it is only another illustration of the shortness of the public memory.

Mr. Gladstone, in introducing his last Budget, entered upon an elaborate apology for a national expenditure amounting to £95 000 000, and expressed the fervent hope that that sum might never be exceeded. It would be useful if we could compare the value which we as a nation secured for Mr. Gladstone's £95 000 000 with the value which we are now obtaining for rates and taxes which are very little short of £1 500 000 000. The Geddes Axe offers a reduction of £75 000 000, a figure which will be very much reduced when all the vested interests have had full opportunity to work up their agitations. Traders and taxpayers generally will take the view that the much-advertised axe is nothing but a small penknife scratching at the surface of the greatest of modern abuses.

A Seven and a Half per Cent. Reduction.

In a word, what Sir Eric Geddes has done is to knock down public extravagance by 7½ per cent. The tradesman who could show no better reduction than that on the highest war-time figures would have to close his shop. The process of deflation in so far as it has been left to individuals to accomplish has gone ahead with remarkable rapidity. This is obvious from the cost of living index figure, where the war-time advance has been reduced by half. How is it possible for the Government to suggest that wages and prices must continue to fall when everything which they themselves control, from postage stamps to Labour Exchanges, is still on the highest war-price scale? The utter futility of Labour Exchanges was pointed out in THE ELECTRICIAN years ago, and what is true of Labour Exchanges is true of many other Government departments. The best that can be hoped of the Geddes Report is that it will set a fashion and that the public enthusiasm for economy will at last begin to be real and effective.

Economy or Value for Money.

Economy is not altogether a happy word in this connection. Public expenditure is not, after all, so much a matter of economy as of value for money, and sooner or later it will be generally recognised that the most ineffective, the slowest, and the most extravagant way of securing any object is through public action.

It would not be difficult to show that the rate of social progress has been in inverse ratio to the rate of public expenditure. Before the war, thanks to private enterprise and personal initiative, we were achieving general social advancement at a rate which was not generally realised. Within a few days we flew across the Channel, we cut the Atlantic journey down to four days, and we knocked ten minutes off the trip from London to Liverpool, and every day witnessed some big advance in human knowledge and personal comfort. Housing gives us a perfect example of the sort of value which we get from money when it is spent through the public purse. The Geddes Report makes this clear. For every £16 worth of housing provided, there is a deficit of £59, £4 of which comes out of the pocket of the ratepayer, and £55 from the unfortunate taxpayer.

We are all in favour of education, but is there anybody willing to argue that the quality of education to-day is four times better than a few years ago? And yet, that is the measure of its cost. It would be very instructive to compare the operations of the Department of Overseas Trade with a body like the Federation of British Industries. I do not doubt that such an investigation would show that the latter gives better value for a thousand pounds than does the former for a million.

The Geddes Report is a lengthy document, but every line of it should be read by every serious citizen. Practical men know that public activity not only usually achieves nothing, but that it always dries up at the source private activities that are badly wanted in these days.

"Exide" Battery Service.

On Wednesday there was a Press visit to the CHLORIDE ELECTRICAL STORAGE Company's showrooms, Daimler House, Shaftesbury-avenue, London.

Amongst the special features were the unspillable batteries for aircraft, field service and police lamps. The plates in the smallest-sized cell are 1/16 in. in thickness, the grids are staggered, and the active material is laced between them, and the wood separators in these, as well as in the larger batteries, are corrugated, so that acid will run down. The company also supply a miner's safety lamp battery to fit a circular lamp case. It is stated that these batteries will give the necessary 1 c.p. for ten hours and that their life is at least eighteen months. A standard battery for motor-car starting and lighting is the six-cell 12 V XC battery. In these cells the positive and negative peaks stand upon separate feet, to obviate short circuits, which might be caused by deposit in the bottom of the box. The battery boxes supplied include glass, lead-lined wood, lead, ebonite and celluloid. Ebonite boxes are considered the best thing so far for motor-cars, but the Lorival Company's material is also useful, as it can be patched up in case of injury.

At a luncheon which followed, Mr. D. P. Dunne (director and sales manager) said the company had not utilised the Press so much as other battery makers had done because its business had been mainly with engineers and contractors, and until batteries had come to be so much used by motor-car people publicity had not been so necessary. The company had, however, in the last few years done more than any other battery company outside America in spreading the doctrine of electric starting and lighting on motor vehicles. They appreciated the co-operation of the Press, and invited any of its representatives to visit their works at Clifton Junction. At Daimler House they supplied the requirements not only of motor-car users, but of the trade. It was not their intention to supplant their service agents or other people in the trade, but to support them. The history of the "Exide" battery went back many years, to the time when the Electric Storage Battery Company of Philadelphia first co-operated in providing a battery for self-starting of motor-cars. Self-starters were now generally used in America and on the Continent, and he thought few cars would be turned out without them in this country in the coming season. The company found that the necessary service must be supplied practically on the doorstep of the users, and therefore they had appointed over 200 agents in this country, who were tested as to their ability to execute repairs, and also (in addition to the company's establishment in Sydney) distributors in Australia, India, and South Africa, while in the United States and Canada the sister company, the Electric Storage Battery Company, took care of the "Exide" situation. When he was in America the Ford Company used 4 000 "Exide" batteries a day, and the same company in England, when they were somewhat busier than at present, used 1 200 in a week. The batteries were also used on aircraft, on farms, by the Ministry of Munitions, and the Army and Navy. The Admiralty sent the company a letter on Nov. 30, 1918, acknowledging that the use of the company's batteries in submarines was one of the factors which led to their success. The submarines which the company had helped to equip had sunk fifty-four enemy warships and 274 other enemy vessels, and there was no record of any of the batteries failing. The chief cause of the company's success was that they and the Electric Storage Battery Company had made batteries, and nothing but batteries, for thirty years, and no expense for research had been spared.

The Fuel Research Board of the Department of Scientific and Industrial Research have appointed a committee to advise upon the SAMPLING AND ANALYSIS OF COAL. The personnel of the committee is as follows:—Prof. Thomas Gray (chairman), Prof. J. W. Cobb, Messrs. J. T. Dunn, J. S. Flett, G. Nevill Huntly, S. Roy Illingworth, J. G. King, C. H. Lander, R. Lessing, C. A. Seyler, F. S. Sinnatt, and Prof. R. V. Wheeler. It is intended that the methods recommended by the committee shall be adopted in connection with the physical and chemical survey of the national coal resources. Communications should be addressed to the Secretary (Miss N. Renouf), 16 and 18, Old Queen-street, Westminster, London, S.W. 1.

Electrical Imports and Exports.

IMPORTS.—The following are official values of electrical machinery, apparatus and material imported into this country during January, 1922, with increase or decrease compared with January, 1921 :—

Electrical machinery, £46 871 (decrease £64 130); telegraph and telephone cables, submarine, nil; other than submarine, £3 497 (decrease £12 354); telegraph and telephone apparatus, £17 195 (decrease £11 621); other electrical wires and cables, rubber insulated, £4 607 (increase £2 129); with other insulations, £3 533 (decrease £5 827); carbons, £2 647 (decrease £15 460); glow lamps, £19 036 (decrease £683); arc lamps and electric search-lights, nil (decrease £3 902); parts of arc lamps and searchlights (other than carbons), £567 (increase £409); batteries, £3 650 (decrease £14 114); electrical instruments, commercial and scientific, and electricity meters, £5 833 (decrease £10 496); switchboards, £945 (increase £727); other electrical goods and apparatus, £50 200 (decrease £59 741). Total of electrical machinery, apparatus and material (other than uninsulated wire), £158 581 (decrease £195 063).

EXPORTS.—The exports of electrical machinery, apparatus and material during January, 1922, with increase or decrease compared with January, 1921, were as follows :—

Electrical machinery, £567 264 (increase £122 132); including railway and tramway motors, £15 878 (decrease £17 409); other generators and motors, £344 499 (increase £101 102); other electrical machinery, £206 887 (increase £38 439); telegraph and telephone cables, submarine, £3 393 (decrease £90 105); other than submarine, £81 663 (decrease £105 819); telegraph and telephone apparatus, £221 071 (increase £79 218); other electrical wires and cables, rubber insulated, £56 120 (decrease £129 187); with other insulations, £123 966 (decrease £82 977); carbons, £6 743 (decrease £12 032); glow lamps, £29 010 (decrease £13 855); arc lamps and searchlights, £951 (decrease £344); parts of arc lamps and searchlights (other than carbons), £537 (decrease £127); batteries, £33 394 (decrease £52 614); electrical instruments, commercial and scientific, and electricity meters, £36 466 (decrease £12 675); switchboards, £85 975 (increase £63 567); other electrical goods and apparatus, £122 920 (decrease £125 739). Total of electrical machinery, material and apparatus, other than uninsulated wire, £1 369 473 (decrease £370 557).

The Illuminating Engineering Society.

The annual dinner of the ILLUMINATING ENGINEERING SOCIETY, on February 10th, was notable for the variety of aspects of illumination touched on by the guests of the evening. Sir Herbert Jackson, representing the Royal Society, in proposing the toast of the Illuminating Engineering Society, recalled that its President, Sir John Parsons, initiated a discussion on "glare" at one of the first meetings in 1910, and remarked that there was still need for educational effort in this direction. Mr. Lawford, President of the Council of British Ophthalmologists, endorsed the necessity of closer study of the effect of light on the eye, and the number of distinguished ophthalmic surgeons present showed the interest now taken by the medical profession in illumination. Mr. F. W. Goodenough, Mr. Thomas Hardie (President of the Institution of Gas Engineers), and Mr. A. A. Campbell Swinton (Vice-President of the Institution of Electrical Engineers), all referred to the growing recognition of future possibilities of co-operation between gas and electrical undertakings. Mr. L. Gaster, in proposing "The Guests," acknowledged the sympathetic attitude taken by various Government Departments when approached regarding lighting problems. Mr. C. R. Groves, H.M. District Inspector of Factories, and the Right Hon. William Brace (Mines Department), in responding to the toast, spoke appreciatively of the influence exerted by the society in the fields of industrial lighting and illumination in mines. Mr. H. E. Blain, well-known for his work in connection with the "Safety First" Movement, referred to the importance of good illumination as an element in safety, both in connection with traffic, and industrially. Among others present may be mentioned Major-Gen. Sir Frederick Sykes (Controller of Civil Aviation), Sir William Lister, Mr. H. Fisher (President of the Ophthalmological Society), Mr. Joseph Orringe (President of the Electrical Contractors' Association), and Alderman George Clark (Chairman of the Society of British Gas Industries).

Extensions at Stepney.

STEPNEY Borough Council on Monday adopted the recommendation of the Finance Committee that application be made to the Electricity Commissioners to sanction a loan of £300 000 for extensions of the electricity undertaking, made up as follows :—Sub-station plant and switchgear, £27 640; e.h.t. transmission cables and switchgear, £94 543; l.t. feeders and switchgear, £59 150; l.t. distributing mains and street boxes, £45 000; service lines, £20 000; meters, £7 000; buildings, switch gallery, &c, £6 000; machinery, £13 505; contingencies (at 10 per cent.), £27 162. Application is also to be made for £31 650 for additional expenditure incurred over the estimates approved by the Council in 1919 and 1920 for plant at the Milo End, Limehouse and Whitechapel sub-stations. In regard to the items for e.h.t. cables and the l.t. feeders and switchgear, the Commissioners have been allowed to suspend the repayment of capital for five years.

The Council are supplying the London Hydraulic Power Company with electricity for working the motor-driven pumps at their premises in Wapping. Payment is to be made at bulk supply rates, and the company guarantee an annual minimum payment of £1 000.

Novel Applications of Electricity.

Nearly each week sees some new APPLICATION OF ELECTRICITY, and among the most recent uses to which it is put are the making of new mown grass into hay, and an artificial salmon barrage. According to reports, a method has been worked out in Switzerland for preserving newly mown grass without drying it in the sun. The grass is placed on metal sheets in silos of about 400 cubic ft. capacity. The top of the silo is closed by another metal sheet, and the sheets at the top of and bottom are connected with an electric circuit. Alternating current at a pressure of from 200 to 500 V is passed through the grass for several days. It is said that the current kills all the microbes whose presence would cause the damp grass to decay, and it is claimed that the process enables the grass to be preserved in its natural state until required, and that it contains twice the nutriment of an equal quantity of hay. It is claimed that from 130 to 200 kWh are sufficient to treat five tons of grass. If the claims made prove to be correct, then farmers will be rendered independent of the weather for haymaking purposes.

The question of an ELECTRICAL SALMON BARRAGE was dealt with in a recent issue of the "Pacific Marine Review." It is said experiments have been made in order to discover means of keeping fish out of the irrigation ditches on the Pacific Coast. The irrigation ditch, as at present operated, is a considerable menace to the salmon fisheries. It is estimated that each year between 3 000 000 and 4 000 000 young salmon pass into these ditches and are left to die when the water is drawn off. Numerous devices have been tried. Screens, with a fine mesh, placed at the head of the ditches, proved ineffectual. The drift and waste clogged the meshes, and the waters carrying the young fish would flow over the top of the screen and out on to the adjacent ground. Several other means were tried, but only with partial success. After making experiments, Mr. C. D. Hessey, Game Commissioner of Yakima County, in Eastern Washington, worked out an electrical barrier or fish stop, which was placed across the head of the irrigation ditch. A small water-wheel and an electric generator furnish electric current. Small iron bars, set 4 ft. apart on the front of the device, extend down into the water. By a system of wiring and a vibrator to regulate the current, the water is charged with electricity for a distance of about 4 ft. from the bars. Fish coming down stream with the current strike this charged water and immediately whirl around and continue on their way instead of going on into the irrigation ditch. It is claimed that the electric barrage is a successful solution of the problem.

Electricity Supply in Malaya.

Among the developments which have resulted from the transfer from Siam to Great Britain in 1909, of Kedah, one of the native States in the Malay Peninsula, is the introduction of electric lighting in the town of ALOR STAR, the capital of the State. The town is now well lighted, and electricity is also being introduced into public and private establishments. Many of the natives had never seen electric lighting before, and others travelled long distances by boat along the rivers and canals to join till nearly dawn in the parades in the streets which followed the inauguration of the new illuminant.

The installation was supplied by a British firm, and the material and machinery came from England. The generating station is a steel building, designed on the truss principle, and giving a floor space of 4 320 sq. ft. The prime movers consist of four sets of twin-cylinder Tangye semi-Diesel engines, each set being capable of driving the generators to their full rated capacity. Cooling of the engine cylinders is effected by pumping water from the adjacent river through settling and storage tanks. Duplicate sets of Tangye's electrically-driven pumps supply the necessary water. The three E.C.C. dynamos, of 60 kW each 600 revs. per min., generate direct current at 230 V. The dynamos are of the three-bearing type, with commutating interpoles. The Electric Construction Company also supplied the switchboard of oiled slate, mounted on an iron frame, three generating panels and two distributing panels. Power is distributed on the overhead system, the main feeders consisting of heavy stranded bare copper wire fixed on insulators carried on wooden cross arms. The poles (26 ft.) are of tubular steel set in cast-iron bases, and they are also utilised as street light standards.

The street lamp fittings are of a type specially designed by the contractors and were made by the Wardle Engineering Company. The main streets are lit by lamps of 200 c.p. each, the smaller streets by 100 c.p., and in the residential quarters by 50 c.p. Suitable lightning arresters are provided to guard against the heavy lightning discharges experienced in a tropical country. Current is supplied to private houses and Government buildings at 30 cents (about 8½d.) per unit, and to shop-houses at a flat rate per month. A large demand has already arisen for power, and it is anticipated that it will soon be necessary to install additional plant, for which provision is already made in the power-house.

The supply of all the machinery and electrical gear, as well as the work of installation, were undertaken by Huttenbach, Lazarus and Sons, Limited, who operate the plant and generate electricity for distribution to consumers under licence from the Kedah Government.

Owing to the meeting of the Institution of Electrical Engineers taking place on Wednesday afternoon, February 22nd, the BRITISH ELECTRICAL DEVELOPMENT ASSOCIATION have altered the time of their ANNUAL LUNCHEON at the Hotel Cecil, to 1.0 for 1.15 p.m. instead of 1.30 p.m.

Legal Intelligence.

Municipal Omnibus Competition with Tramways.

Pleadings have been closed in the action brought by the Dundee, Broughty Ferry and District Tramways Company to restrain Dundee Corporation from running a motor omnibus service between High-street, Dundee, and Broughty Ferry. Prior to the Dundee Boundaries Act (1913) no part of the company's undertaking was within the city, but in 1913 the city was extended so as to include Broughty Ferry. At present the Corporation, who own and work a tramway system, have limited powers to provide and run omnibuses. Last year they made application for a Provisional Order for (*inter alia*) powers to run omnibuses on any route within the city without restriction and also beyond the city. The clauses relating to omnibuses were struck out of the Order, but in October last the Sub-Committee of the Tramways Committee, with a view of testing the amount of traffic on the route, agreed to run an omnibus service. The company contend that the service is *ultra vires*. The route of the omnibus services extends to over four miles, and part of it would be in competition with the company's tramways, which form a junction with, and act as an extension of, the Corporation system. The Corporation is empowered to purchase the tramway lines at certain specified periods, upon paying the fair market value of the undertaking as a going concern. It is contended that the Corporation motor omnibus service would seriously depreciate the value of the company's undertaking and reduce the price payable by the Corporation when they exercised their power of purchase. The company maintain that the proposed service cannot be a test service to decide if the Corporation should apply for powers to construct a tramway along the route.

The Corporation's contention is that the company, as statutory tramway undertakers, have no right to complain of the 'bus service, and that the service is within the statutory powers of the Corporation. The service is experimental, and is being run solely for testing the amount of traffic on the route. It is also alleged that the company do not possess any monopoly under their statutory powers, and are not entitled, as tramway undertakers, to object.

The Gasfilled Lamp Patent.

Mr. Justice Eve, on Friday, granted an injunction to the British Thomson-Houston Company, restraining the B.T.T. Electric Lamp and Accessories Company from supplying ½-W lamps (which it was alleged were an infringement of the former's letters patent) until further order.

Sir Arthur Colefax made the application, and this motion was opposed by Sir Duncan Kerley on behalf of the B.T.T. Company.

Sir Arthur Colefax explained that the patent was the subject of litigation between the present plaintiffs and the Corona Lamp Works, which subsequently went to the House of Lords. Their lordships' decision had been given in favour of the plaintiffs, supporting the patent and holding it to be valid, and to have been infringed. With regard to the present action, it seemed to him that the infringement was, in fact, admitted. What defendants said was that if certain facts were proved, it would be held that the patent was invalid. It was not said that the facts could be proved, although the question raised was merely that of validity, which had been in question for eight years before being held to be valid after very protracted litigation. It was also said by present defendants that the patent had been declared valid on the assumption that the discovery, on which it was based, was new, whereas they say it was not. With regard to that, Sir Arthur pointed out that he had himself protested against the subject matter of the patent being regarded upon any such limited basis, and on that their lordships had been in his favour. They had looked at the patent irrespective of whether it was new or not. The present defendants were in an extensive way of business; they had branches in all parts of the country, and offered Dutch ½-W lamps for sale. Having referred to their advertisement in the "Electrical Review," counsel said defendant had made an arrangement with the Stella Lamp Works for the latter in future to supply ½-W lamps. He submitted that such action was an infringement of the patent.

Sir Duncan Kerley, for defendants, observed that the patent had been granted as long ago as 1913. These so-called ½-W lamps had been sold ever since by people other than those who claimed to be the patentees. It was perfectly obvious that in the circumstances a great trade had been built up, which plaintiffs now asked his lordship to say must be summarily stopped without any further trial. Furthermore, plaintiffs had waited for six weeks after the decision of the House of Lords before taking any action against defendants. The advertisements were inserted before the date of the House of Lords decision, and counsel thought it only right to say that in those circumstances it was not a case where the matter should be brought to a point which might be disastrous to the people he represented. It was a practice of the court in circumstances such as these not to make any order where the validity of the patent was really going to be contested. In the previous action the whole argument on subject matter was the alleged discovery made by Dr. Langmuir, but the defendants had now ascertained that the alleged discovery had been published before the date of the specification in question. He had not been able to make use of that fact in the arguments of the old ½-W case, but he was now in a position to submit to the court that it would have made an appreciable difference in the way the whole matter had been looked at. On those grounds he contended that no order should be made.

His Lordship said he had no evidence before him that the granting of an injunction would cause irreparable damage to defendants. In the absence of such evidence he could not interfere with the ordinary practice of the court in such cases. There would, therefore, be an injunction granted until further order.

B. T. H. Company v. Corona Lampworks, Limited.

The hearing of this action for an injunction to restrain an alleged infringement of plaintiffs' patent for "improvements in and relating to vitreous containers, having sealed in conductors," has been continued before Mr. Justice Astbury.

Prof. C. Vernon Boys said he had read and considered plaintiffs' specification and the various documents that were relied on in defendants' particulars of objection, and he did not find the two elements in plaintiffs' invention, viz., the feature of proportioning a composite wire so as to get the same coefficient of expansion as glass, and taking a metal for the outside or coating whose oxide was soluble in glass at a relatively low temperature, in any of the prior documents. At the date of plaintiffs' patent there was no common knowledge which would have led one to proportion a composite wire in the way in which the specification did.

Dr. Otho Oberlander, consulting chemist, gave the result of tests he had made with 10 of the alleged infringing lamps, and of the result of analyses of defendants' wire.

Mr. A. E. Gimingham, technical director of the Edison Swan Electric Company, said that for a long time it was most essential, in order that they might make a successful seal, that they should have platinum for a leading-in wire, and platinum or platinum-coated wire was universally used down to the date of the plaintiffs' patent.

On the 9th inst. Sir A. Colefax, K.C., summed up the case for plaintiffs, and said it seemed to him that their specification was a clear and well-drawn document from the standpoint of clearly stating what the invention was, and he did not think any difficulty arose on the construction of the documents. It was not important, however, to notice defendants' particulars of insufficiency in the case. He supposed at one time the issues would narrow down to want of subject matter.

Mr. R. Frost (for defendants) said they were not going to rely on the first three of the particulars of insufficiency.

Sir A. Colefax said in that case defendants were apparently still to place some reliance on the last particular, which was a very curious one. "No directions are given as to whether the expansion of the wire is to be measured in a radial or longitudinal direction." The short answer was that one did not measure the expansion in any direction at all. One would construct a wire in accordance with the specification and its directions.

His Lordship said he supposed what was meant by defendants' plea was that no directions were given in the specification as to whether one was to get the equivalent co-efficient by the ordinary longitudinal test or whether one was to take it on the cross section.

Sir A. Colefax said he believed his lordship's statement was the correct one, but the plea of defendants was a bad one. If, as plaintiffs said, the lateral expansion was what mattered and not the longitudinal expansion or extension, according to the evidence of Mr. Swinburne and Prof. Boys, then the first thing to see was whether or not plaintiffs' patent worked on that basis.

His Lordship said if they were to get into a maze of science over a simple document like plaintiffs' specification, he did not know where they were to get to in the end. The specification was addressed to people who *prima facie* would be able to put it into practice, and it told them to take a core and cover of tungsten and copper, so much of one and so much of the other, so that the average coefficient of expansion would be about the same as glass. If they assumed that, what had the longitudinal or lateral expansion to do with it?

Sir Arthur Colefax next addressed the court on the issue of infringement, and contended that the lamps (12 in number) sold by defendants fell within the claim in plaintiffs' specification.

His Lordship said he was not at present troubled with any of the anticipations, but the thing that did trouble him was the construction of the specification with regard to claim three. Claim one incorporated the proper coefficient of expansion; claim two expressly claimed a coating of copper provided they had got the combination of claim one, but claim three simply claimed a core of tungsten and a sleeve of copper, and it did not say that it had to be proportioned as in the patent.

Mr. Frost, who opened the case for defendants, said the issues were subject matter and infringement. Before that patent wires of nickel iron core covered with platinum were known and worked, and he submitted that at the date of the patent defendants had a perfect right to take that wire and substitute for the platinum something else which was known to have the property of getting the wire to stick.

His Lordship said prior to the patent the common practice was to make the leading in wire of platinum or something covered with platinum, and that was for the reason that platinum was a non-oxidising clear-face metal to which the glass would readily weld, and they thought it would not weld if they had a surface which would oxidise. There were certain alternatives to platinum suggested, but there was not a single document in the case which suggested that one could take off a platinum covering from a composite wire and substitute for it the very thing that platinum was used to avoid.

Mr. Frost said the question was whether the inventor in that case was the first man to place at the disposal of the public the free and unfettered use of metal whose oxide was soluble as a means of sticking glass on a composite wire. If he was not, then he could not have his patent.

The hearing was continued on Tuesday and Wednesday, when evidence was given for the defence.

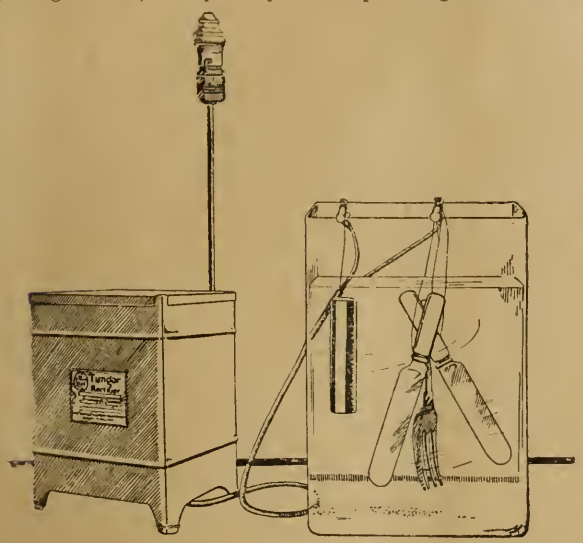
The case had not concluded when we went to press.

A New Electro-Plating Outfit.

The TUNGAR BATTERY CHARGER, which was originally designed for the charging of accumulators on alternating current, is now being employed with success for the operation of electro-plating vats. In the case of the retail jeweller and others who may desire to execute electro-plating on a small scale, the Tungar is a convenient and economical device.

Briefly, the Tungar is a self-contained apparatus, which, when connected to the ordinary a.c. lighting circuit, converts the a.c. into d.c. and transforms it down to a voltage suitable either for battery charging or electro-plating. The conversion to d.c. is effected by means of a special Tungar bulb, which operates on the same principle as the valve used in wireless telegraphy. There are no moving parts in the Tungar, and it does not require oiling.

Several sizes of Tungar are made, ranging from 2 A 7·5 V d.c. to 12 A 7·5 V d.c. For most jewellers, however, the 2 A Tungar is stated to be quite strong enough. The 2 A Tungar set illustrated is of the half-wave type. With the set operating at 2 A, and reckoning 4 oz. of silver to a gross of teaspoons, the operation of plating this quantity takes approximately four hours. A feature of this method of plating is that, due possibly to the pulsating character of the



TUNGAR BATTERY CHARGER CONNECTED ON THE PRIMARY SIDE TO AN ORDINARY LAMP HOLDER AND ON THE SECONDARY TO A SMALL ELECTRO-PLATING VAT.

current, the surface of the finished article is, it is claimed, much more shiny than when plated by the steady current from a battery.

The 2 A Tungar set has also been used with success in gold plating and gold colouring, or washing, such as is required for the insides of cups, &c. In washing cups, a small amount of the solution is poured into the article to be plated. A gold anode is held in the solution and slightly agitated, and the gold is deposited on the inside of the article. A small cup was gold-washed by this method in about a minute. The voltage across the vat ordinarily required for both gold and silver plating is not more than $\frac{1}{4}$ V, so that it is necessary to have a small rheostat connected in series with the set.

Full particulars will be gladly supplied on application to the makers, the BRITISH THOMSON-HOUSTON COMPANY.

Quick-Make Switches.

The rapid growth during the last few years of the use of electricity for industrial purposes, entailing the use of high capacity switches by non-technical persons, has intensified the demand for fool-proof switch gear.

One of the most frequent causes of damage, and sometimes breakdown, has been caused by bad contact. The unskilled person, in switching on, will often slowly "inch" the blades into contact, or will leave the switch in circuit when the blades are in slight or half contact. In either case arcing is liable to be set up, with immediate damage, and eventual breakdown of the switch.

To avoid this trouble, the MIDLAND ELECTRIC MANUFACTURING COMPANY have introduced a range of switches which they call the "Glasgow-Premier" and the "Paragon-Premier," and they claim that in using these switches the above troubles can never arise.

Immediately the operator begins to switch on, the blades "chop in" to instantaneous full contact, quite independently of any action on his part, and in switching off the circuit is just as fully and rapidly broken, so that there is never at any time danger of arcing or damage to contacts or blades. The blades cannot remain in any intermediate position. The quick action in both the make and break is effected by a powerful and unbreakable coil spring, thus removing all operating strain from the switch movement and all possibility of error from the operator. To make assurance doubly sure, the "follow on" of the handle by the operator effects a positive make independent of the spring.

Flood Lighting at Selfridges.

The accompanying illustration, taken at night, shows the first section of the new Selfridge building in Orchard-street, London, W., where a complete system of flood lighting has been recently installed. The floodlights are of a standard design, manufactured by the GENERAL ELECTRIC COMPANY, and consist of a solid copper

PART OF SELFRIDGE'S NEW BUILDING PHOTOGRAPHED AT NIGHT.

body lined with sectional parabolic reflectors of mirror glass. They are equipped with 400 W Osram gasfilled projection-type lamps, with specially concentrated filaments. The installation was designed by the illuminating engineering department of the company, and is the first example of flood lighting as applied to large London stores.

New D.C. Motor Starter.

WILLIAM GEIPEL & COMPANY have recently put on the market a new type of d.c. motor starter which we illustrate herewith. The case and cover are of steel, and no cast iron whatever is used in its construction. The no volt and overload coil magnet frames are of specially annealed steel, with a consequent minimum of residual magnetism to cause faulty working of the starter. The contacts are of very heavy section, renewable from the front, and the contact

WILLIAM GEIPEL & COMPANY'S NEW MOTOR STARTER.

shoe is of large area and has a positive spring pressure directly above the centre of the contact. The resistances are of the firm's well-known patented plate pattern. All back connections are made of copper strip machine-formed to standard size and dimensions throughout.

The complete apparatus is very light and extremely robust, being practically unbreakable, and is claimed to be specially suitable for export.

Parliamentary Intelligence.

Imports from Germany, 1921.

Mr. Baldwin stated in reply to Mr. Doyle (House of Commons, February 13th, 1922) that the imports from Germany in 1921 of electrical machinery amounted to 241 tons, valued at £44 996.

Merchandise Marks Bill.

In reply to Mr. G. Terrell (House of Commons, February 13th, 1922), Mr. Baldwin stated that the Government intended to introduce this Session a Bill based on the recommendations of the Merchandise Marks Committee, but it was not possible yet to have a date for its introduction.

Effect of Increased Telephone Rates.

In reply to Mr. Percy (House of Commons, Feb. 14, 1922), Mr. Kellaway said that since the increased telephone rates were imposed, 61 500 telephone subscribers had discontinued, and 55 000 extensions had been surrendered. More than half of these were due to normal causes, such as removals, death, or bankruptcy. During the same period there had been 67 500 new subscribers and 60 000 new extensions.

Wireless Telegraphy.

In reply to Sir H. Norman (House of Commons, February 13th, 1922), Mr. Kellaway stated that the number of wireless licences issued to amateurs for experiments in reception was 6,986 and in transmission 286. The annual revenue derived from the fees was at present £3 265 and £355 respectively. The annual expenditure incurred in connection with the issue of the licences and the inspection of the stations was about £5 200.

Telephone Cabinets: Euston Station.

Replying to Mr. Gillis (House of Commons, February 13th, 1922), who called attention to the fact that the Post Office telephone service from Euston Station call-box is 4d., Mr. Kellaway stated that the telephone cabinets at the station were the property of the railway company, and the calls were dealt with by the operators at the company's private exchange. The Post Office was not in a position to prevent a railway company or other subscriber from charging more than the Post Office call office fee for the privilege of using the subscriber's telephone installations.

Safeguarding of Industries Act.

In the House of Commons on Tuesday, Capt. Wedgwood Benn presented a Bill to repeal the Safeguarding of Industries Act of 1921. He contended that the Act had done nothing to build up British trade. It had raised prices, diminished employment, created great irritation with France, and impeded the work of European reconstruction.

Sir Richard Cooper contended it was unfair to repeal the Act until it had had a fair chance of getting into operation.

On a division, the motion to introduce the Bill was rejected by 170 votes to 92.

Omnibus and Tramcar Traffic.

Major Glyn asked the Parliamentary Secretary to the Ministry of Transport (House of Commons, February 13th, 1922) whether, in the opinion of the expert advisers to that Ministry, motor-omnibus traffic was preferable to tramcar traffic in all congested cities and areas; and whether the overhead trolley system had any considerable merit in comparison with the slot system?

In reply Mr. Neal said the first part of the question could not be answered without reference to local circumstances; as regards the latter part, if by "slot system" was meant the conduit system of electric traction, the overhead system was, he understood, the cheaper in respect of cost of installation and maintenance.

North Metropolitan Electric Supply Company.

Mr. G. Locker-Lampson asked the Parliamentary Secretary to the Ministry of Transport (House of Commons, February 13th, 1922), whether they had made a permanent Order, which could not be revised for five years, increasing the maximum price of electricity to be charged by the North Metropolitan Electric Power Supply Company in Southgate to 8d. per unit without holding any public inquiry, although the temporary Order had another eighteen months to run, and in spite of the fact that since the temporary Order was made wages and prices had fallen and were still falling, the benefit of which the public might reasonably be expected to share.

Mr. Neal: The Minister of Transport, on the application of the company mentioned, and after considering the representations made against the application by Southgate Urban Council and the County Council of Middlesex has made an Order fixing the maximum price at 8d. per unit. This price is the same as that authorised by the temporary Order which would have expired in August, 1923. In the circumstances, it was not considered necessary to put either the company, the local authorities, or the Department to the expense of a public inquiry. The opportunity for revision of the maximum price will occur in five years' time, or in three years if a Bill similar to that introduced last session is passed into law.

Private Bills.

The following Bills passed their first reading in the House of Commons on Feb. 10:—Birmingham Corporation Bill, Bristol Corporation Bill, Bristol Tramways Bill, Metropolitan Railway Bill, Neath Corporation Bill, Nottinghamshire and Derbyshire Tramways Bill, St. Marylebone Borough Council (Superannuation) Bill, Shoreditch and other Metropolitan Borough Councils (Superannuation) Bill, Swansea Corporation Bill, Worthing Corporation Bill, London County Council (Tramways, Trolley Vehicles, and Improvements) Bill.

The Chairman of Ways and Means of the House of Commons and the Chairman of Committees of the House of Lords have decided that the following Bills, which have been certified as having complied with the Standing Orders, shall originate in the House of Lords:—Black Country Tramways and Light Railways, Bolton Corporation, Doncaster Corporation, Kingston-upon-Hull Corporation, London, Brighton and South Coast Railway, North Metropolitan Electric Power Supply, South Wales Electrical Power Distribution Company, Yorkshire Electric Power.

In the case of the Blackburn Corporation Bill, the Standing Orders have not been complied with.

It is to be regretted that the directors of the London, Brighton & South Coast Railway Company have found it necessary to drop their Bill for further financial powers, as it will mean a postponement of their big scheme for the further electrification of their main line to the south coast. It is understood, however, that arrangements are being made in other directions with a view to settling the financial question, and there is very little doubt that the further electrification scheme will be proceeded with in the not distant future. The postponement will not affect in any way the contract which the General Electric Company has secured for the electrification of part of the Brighton line. The contract is for the provision of the whole of the electrical equipment for twelve additional motor coaches, each of 1 000 h.p., to enable the section of the line from Balham through Thornton Heath to Selhurst and West Croydon to be operated electrically.

I.E.E. Commemoration.

It is announced that the following speakers will contribute to the discussion at the three sessions which are to be devoted to "Reminiscences and Experiences in Electrical Engineering," at the Institution of Electrical Engineers' Commemoration Meeting next week.

On Wednesday, Feb. 22, at 3.30 p.m., Col. R. E. Crompton will open the meeting, and will be followed by Mr. S. Evershed, Mr. E. Garcke, Mr. W. Judd, Dr. G. Kapp, Sir Alexander Kennedy, Sir Oliver Lodge, and Lord Parmoor.

On Thursday, Feb. 23, at 3.30 p.m., the meeting will be opened by Sir Charles Parsons, who will be followed by Mr. Frank Bailey, Sir T. O. Callender, Dr. S. Z. de Ferranti, Mr. J. H. Holmes, Mr. W. H. Patchell, and Mr. J. Swinburne. At the evening meeting on that day Mr. J. E. Kingsbury will open, and will be followed by Mr. Llewelyn Atkinson, Mr. B. M. Drake, Sir William Noble, Mr. G. W. Partridge, Mr. A. A. Campbell Swinton, Mr. A .H. Wharton, Mr. C. H. Wordingham, and A.Wright.

The remarks of the above speakers and written contributions from Mr. Baldwin, Mr. G. Balfour, Sir Charles Bright, Mr. R. A. Chattock, Mr. H. Edmunds, Sir K. Elphinstone, Mr. W. B. Esson, Sir R. T. Glazebrook, Mr. F. E. Gripper, Mr. H. Hirst, Sir J. Kennal, Mr. Faraday Proctor, Mr, A. Siemens, Mr. C. B. Sparks and Mr. J. C. Vaudrey will be published in a special Commemoration Number of the "Journal."

A Devon Electricity Scheme.

An agreement has been reached between Torquay and Newton Abbot Councils in regard to electricity supply, and the Torquay Town Council have decided to proceed with the scheme and to acquire the power station at Newton. The Dart scheme has been definitely rejected. Mr. H. F. G. Woods, the Torquay electrical engineer, explains that the undertaking of the company at present supplying Newton Abbot (the Urban Electric Supply Company) will be purchased, and it is proposed to supply Newton, Torquay, and the intervening rural areas with electricity. The plant at the Beacon Quay generating station will be removed to Newton Abbot and further plant purchased. High tension transmission lines will be carried, partly underground and partly overhead, from Newton to Torquay, terminating in a new sub-station in Lymington-road. The estimated capital expenditure is £143 177 (from which £5 000 may be deducted as the scrap value of the Torquay plant), including £96 277, cost of re-equipment and extension of the power station, £2 500 for transmission lines, and £6 000 for a new main sub-station. The total annual working costs are estimated at £54 150, or an average of 3·9d. per unit for a sale of 3 350 000 units. Taking 4·2d. as the price per unit sold in Torquay and Newton Abbot, although at present it is considerably more, the undertaking would show a credit balance of £4 475 for the year's working. Steps are to be taken to obtain powers to carry out the scheme.

Trolley Omnibuses in Canada.

Six trolley omnibuses are being used by the Toronto Transportation Commission on suburban routes for experimental purposes. The view is held that they are more economical than petrol 'buses where there is an increasing, but not sufficiently dense, traffic for tramways. One of the vehicles has been built by the St. Louis Car Company, and the electrical equipment is by the Westinghouse Company. The body is built directly on to the chassis frame; the wheel-base is 16 ft. 2 in., and the overall length of the 'bus is 26 ft. The driver is located at the front on the left-hand side, and the entrance and exit door is directly at his right. Foot-operated hand brakes are provided on all four wheels, and a separate pair of hand-operated emergency hand-brakes are supplied on the rear wheels. There are two 25 h.p. motors, and the series parallel control apparatus is underneath the hood. The control is operated by means of a foot pedal, pivoted at a point under the centre of the foot, so that a slight rocking motion backwards and forwards controls the various steps.

Electricity Supply.

A Methodist chapel in Grafton-road, Kentish Town, is being converted by the St. Pancras Borough Council into a sub-station.

Lincoln City Council have decided on many salary reductions as from March 1, including a 5 per cent. reduction of the remuneration of Mr. S. Clegg, the city electrical engineer.

The Minister of Transport has extended for one year from July 31, 1921, the periods allowed by the Rickmansworth and Chorley Wood Electric Lighting Order, 1914, for laying mains.

Acting on the advice of the Electricity Committee and the Ministry of Transport, Cardiff Parliamentary Committee has decided to withdraw its opposition to the St. Mellon's Electricity Order.

In submitting the report of the Electricity Committee to the Stafford Town Council on Monday, Councillor Meade stated that the department was now within 5½ per cent. of the maximum output.

Watford Urban Council and Herts County Council will both oppose the Order of the Electricity Commissioners placing a considerable part of the county in the London and Home Counties district.

Southport Town Council has instructed the Borough Electrical Engineer (Mr. E. Moxon) to prepare a report on the electricity undertaking, particularly in regard to the generating plant, and to state what alterations, if any, are required to obviate the constantly recurring breakdowns in the supply.

The Long Eaton electricity undertaking appears to be in need of reorganisation, if the statements made by the chairman of the Electricity Committee (Mr. J. Pegg) are accurately reported. Mr. Pegg alleged that the new Babcock boiler is not required, that many meters have not been registering the consumption of electricity, that no tools are available, and that the works are in a shabby condition. It has been decided to appoint a capable male clerk to assist in costing, &c., and a fitter to maintain the works in a more efficient condition, and to provide necessary tools.

The London County Council have authorised the substitution of gasfilled lamps for inverted arc lamps at the L.C.C. Central School of Arts and Crafts and the London Day Training College. No material saving in the consumption of energy is anticipated as a result of the change, but there will be a great saving in labour, as, apart from the necessity for the occasional attendance of electricians, the trimming of the existing arc lamps occupies from one hour a day in the spring to four hours a day during the winter months. The estimated cost of carrying out the work is £410.

It was reported at a meeting of Cardiff City Council, on Monday, that the number of applications received from proposed consumers of electricity were so numerous that many had been refused, because the generating plant was insufficient. The Electric Lighting Committee recommended that £59 300 be spent on extensions to boiler-house plant at Roath station, including the installation of three new water-tube boilers with mechanical stokers, economisers, coal handling plant, &c. Mr. Morley New, the City Electrical Engineer, said that the proposed expenditure was based on the normal increase of output of electrical energy, and explained that the present plant was inadequate to meet the increase of output, and was partly obsolete. The applications received in the quarter ending December was 20 per cent. more than for the corresponding quarter for the previous year, and he considered that it was desirable to get on with the work during the summer months. The recommendation was then adopted.

New Schemes and Mains Extensions.

Aldershot Urban Council has received sanction to borrow £6 857 for electricity purposes.

Maidenhead Town Council propose to install a 200 kW semi-Diesel engine at the electricity works.

Ashford (Kent) Chamber of Commerce has petitioned the Urban Council to establish electricity works in the town at the earliest possible moment.

Littlehampton Urban Council have decided to sign the agreement with the Sussex Electricity Company for the supply of electricity to the town.

The North Metropolitan Electric Power Supply Company have informed Ware Urban Council that they propose to erect overhead cables for the supply of electricity to the town.

Dunleary (better known as Kingstown) Urban Council has appointed J. P. Tierney and Company, their consulting engineers in connection with the new electrical scheme for that town.

The electricity scheme for Coleraine should soon take definite shape as the Irish Society is giving the use of the water power at the famous "Salmon Leap" on the Lower Bann for generating electrical energy.

With a view to extending the electric light to the smaller houses, Eastbourne Corporation have approved a scheme for wiring and fitting such premises on a rental basis. An experiment will first be made with fifty cottages.

The Electricity Commissioners have informed Boston Rural Council that March next has been fixed as the date for the commencement of the Provisional Order of 1915, which has been held up on account of the war

Crompton & Company have entered into an agreement for supplying electricity to Bideford, Northam, and Westward Ho! and into a provisional agreement to supply Torrington. The estimated charges will be 10d. per unit for lighting, and 3d. for power. It is proposed to use overhead mains.

Truro Town Council have submitted to the Electricity Commissioners an electricity supply scheme, prepared by Dr. Purves, and an amended offer from the Cornwall Electric Power Company to supply electricity in bulk. A canvass of the district is to be made to ascertain the probable demand.

Reporting to St. Annes Council on the extension of mains in the Lytham area, Mr. J. H. Clothier, electrical engineer, stated that 7 000 yards of cable had been laid up to January 30th, and another 2 000 would shortly be completed. One hundred and twenty-five new applications for supply had been received.

Monmouth Corporation have applied to Hereford Electricity Committee for a supply of electricity in bulk on terms to be agreed. The chief electrical engineer of Hereford (Mr. W. T. Kerr) has been authorised to act in an advisory capacity in connection with the erection of the necessary transmission line and switchgear.

The North Metropolitan Electric Power Supply Company have asked Luton Town Council for a supply of electricity in bulk for a period of twenty-one years from Oct. 1 next. The company offer to pay a fixed capital and standing charge of 15s. per quarter per kW of the maximum demand, a charge per unit equal to the actual cost of fuel used per unit generated throughout the quarter, plus 25 per cent. The capital outlay for additional plant needed to provide the supply will be £12 000.

At the monthly meeting of Dover Electricity Committee last week it was suggested in a report by the engineer that something might be done in the way of co-operation between Dover, Deal and Folkestone in connection with the supply of electricity that might solve the financial problem with which Dover was faced. The electricity supply powers of the Deal Gas Company will lapse in three months' time, and the engineer at Dover (Mr. R. C. Harper) has been instructed to see the engineer of the Deal Gas Company, and report.

Wigan Corporation has decided to carry out a scheme of electricity plant extensions in two stages. A 5 000 kW generating set is required at once, which will cost about £50 000. The set will be available in December next, when the load on the station will be about 9 000 kW. There are, however, a number of large firms awaiting supply, but the full scheme which the committee have in view will have to be examined by the expert engineers of the South-East Lancashire District Electricity Committee. It is anticipated that the Bradford-place station will be developed to its fullest capacity, and a new super-power station erected.

Alteration of Charges.

Pending a complete revision of electricity charges at Malvern, the Urban Council has decided to charge consumers of 5 000 units or over per annum for lighting purposes at 1d. less than the price charged to ordinary consumers, but no discount will be allowed.

Newcastle (Staffs) Electricity Committee recommend that as from the March meter readings the price of electricity for lighting be reduced from 66⅔ per cent. to 50 per cent. above pre-war prices. If in May the Committee find themselves in a better position they will make a further reduction.

The following reductions have been made in the prices of electricity in Dudley :—Lighting (including street lighting) from 80 per cent. to 60 per cent. over pre-war prices as from Jan. 1, and power over 600 units per quarter from 80 per cent. to 60 per cent. from March 31 next. No further reductions are to be pressed for at least six months. A reduced minimum charge of 10s. 6d. per quarter for each of the two summer quarters and the present minimum charge of 13s. 4d. for the two winter quarters has also been agreed upon.

Doncaster Town Council have reduced the charges per unit for electricity from Jan. 1 as follows :—Private lighting, from 7⅞d. to 7d. ; theatres and cinemas, from 5¼d. to 4⅜d. ; churches, chapels, &c., from 6⅛d. to 5¼d. ; special rates, from 5¼d. to 4⅜d. ; for a consumption per quarter not exceeding 200 units per kW demanded, from 3d. to 2⅜d. Above 200 units per quarter, 2⅜d. to 2¼d. ; 250 units, 2⅜d. to 2¼d. ; 300 units, 2¼d. to 2d. ; 400 units, 2d. to 1⅝d. ; 500 units, 1⅝d. to 1½d. ; 600 units, 1⅝d. to 1⅜d. ; and above 700 units, 1½d. to 1¼d. ; tramways, 2·1d. to 1⅞d.

G.E.C. Labour-Saving Devices.

The General Electric Company gave special demonstrations of labour-saving devices at their showrooms at Kingsway, London, last week. The efficiency of the wide range of electric drills and other tools made by the company was well demonstrated, and other specialities shown were the "Time-Saver" electric washer, tailoring irons which switch off the current when replaced upon the hot plate, "Magnet" sealing wax heaters, copper electric urns, hot-water radiators with immersion heaters, explosion-proof mining telephone sets, the "Kingsway No. 2" miners' safety lamp, and the "Witton" fractional horse-power motors, from 0·02 to 0·5 h.p.

Apart from the moving-part labour-saving appliances, there were shown "daylight" gasfilled lamps with blue bulbs, which are excellent for colour matching, and have been supplied in considerable numbers to Selfridge's and other stores for the purpose, and also the company's well-known flood-lighting lamps.

In addition to the above-mentioned exhibits, there were splendid displays of alabaster and other lighting fittings, silk shades, heaters, &c.

Electric Traction.

For the nine months ended Jan. 5, READING Corporation tramways receipts showed a decrease of nearly £3 500 compared with the same period last year.

Penny fares for short distances are to be reintroduced on the BURTON-ON-TRENT tramcars for an experimental period of three months, commencing on April 1.

ACCRINGTON tramway receipts for the year ending January showed a decrease of £5 700, but a saving of £7 600 on the permanent way repairs and wages, left a credit balance of £1 900.

At the meeting of the LONDON COUNTY COUNCIL, on Tuesday, Mr. W. J. Squires, Chairman of the Highways Committee, said that from Dec. 31, when penny fares were reintroduced on the tramways, the average loss of revenue worked out at £10 000 a week.

On the recommendation of the Electricity and Tramways Committee, CARDIFF City Council have decided not to proceed with any tramways extensions at present. The Tramways Committee has appointed a sub-committee to consider tramway extensions in every part of the city.

At a dinner attended by members of the House of Commons on Monday evening, the question of the ELECTRIFICATION OF RAILWAYS in the LONDON area was considered, and it was decided to hold a meeting of the Industrial Group of the House on Monday next to give further consideration to the matter.

With the announcement of a large reduction in the price of electricity for all purposes at SALFORD it was hoped that a reduction in tram fares would follow, but at the last meeting of the Council, the Tramways Committee stated that this would still be impossible as the receipts were down by £1 200 a week as compared with the same period last year.

The Joint Industrial Council for the TRAMWAYS INDUSTRY, which should have met in London last Thursday to discuss the report of a special committee appointed to consider the revision of the national agreement of March, 1919, has been postponed until this week. The normal working week of forty-eight hours is to be retained, but the companies seek other modifications, and particularly an examination of the guaranteed week clause, which, they declare, has been found in practice to be unworkable.

A series of accidents, brought about by an electric car getting out of control on an incline, occurred in High-street, GLASGOW last week. The car, which was being driven southward, failed to answer to the brakes when at Rottenrow and rushed down the incline to Duke-street. At that crossing it collided with a railway lorry, and though the front of the car was wrecked and the driver was thrown off, it continued down High-street. When near Glasgow Cross it collided with a heavy motor van.

It is reported that the trial trips on the 55-km. stretch, Bellinzona-Chiasso, of the GOTTHARD LINE, have been satisfactory, and the line is to be opened for public traffic. The section Bellinzona-Chiasso, which formerly took 72 minutes to run, will in future only take 59 to 60 minutes. The section Giubasco-al-Sasso will be opened as a double line probably in September next, the "Railway Gazette" states, as soon as the necessary bridges have been widened. The line Lugano-Taverne is to be doubled.

Seventeen persons were injured in a tramway accident at ROCHDALE last Thursday. A Corporation tramcar, running from Facit to Rochdale, had reached John-street, where there is a steep gradient of 1 in 14, and when half-way down the descent the brakes failed. The driver applied the magnetic brake, but this also failed. At the foot of the hill the car left the rails, mounted the pavement, crashed into a store, and then overturned.

Mr. F. H. Rudd, the borough electrical engineer, who was among the passengers, received injuries to his head, and was unconscious when taken to the infirmary, but happily he soon recovered.

Exhibition Notes.

The DESIGN AND INDUSTRIES ASSOCIATION is holding an exhibition of LABOUR-SAVING APPLIANCES at 6, Queen-square, Bloomsbury. The exhibition, which is entitled "Deliverance from Drudgery," will remain open for a month.

The promoters of the BRITISH EMPIRE EXHIBITION have decided to postpone the exhibition at Wembley Park from the year 1923 to 1924. The decision was come to on account of representations made by India on the short time available to prepare their exhibits. The Dominion Governments were consulted and all have approved of the postponement.

Following upon representations made by the Society of Motor Manufacturers & Traders, the proprietors of OLYMPIA have made arrangements for the CONSTRUCTION OF A NEW HALL on similar lines to the existing one, with which it is to be connected, the entrance being in the Hammersmith main road. When the enlargement is completed, the available floor area will be over 300 000 sq. ft. The intention is to complete the enlargement, if possible, in time for the shows to be held this autumn.

An International Technical Exhibition of Engineering will be held at LIÉGE during June and July under the organisation of the Association des Ingenieurs de l'Ecole de Liége. It is understood that French engineering interests will be well represented, and a certain amount of American participation is anticipated. The exhibits will include machines and machinery equipment, instruments, models, books, plans, diagrams, and all documents relating to engineering. Applications for space should be addressed to the Secretary, 16, Quai des Etats-Unis, Liége, before the end of March.

Personal and Appointments.

Mr. T. A. EDISON celebrated his seventy-fifth birthday last Saturday.

CAPTAIN R. J. WALLIS-JONES, O.B.E., T.D., was present at a Levée held by the King at St. James' Palace last week.

SWINDON Town Council has appointed MR. NICKLIN as electrical and mechanical engineer at a commencing salary of £500 per annum.

Mr. H. CARDWELL DAY has been appointed borough electrical engineer and tramways manager to the Heywood Corporation at a salary of £400 a year.

Mr. LINCOLN CHANDLER has resigned his position as managing director of the Metropolitan Carriage, Wagon and Finance Company, and his seat on the directorate.

Capt. H. HOOPER has been appointed honorary secretary of the South Midland Centre of the Institution of Electrical Engineers, in succession to Mr. J. D. MORGAN, who is relinquishing the post after ten years' service.

The Leyton tramways now form part of the L.C.C. system, and Mr. J. DUNCAN, Leyton traffic superintendent, and Mr. E. J. HAMMETT, Leyton car-shed superintendent, now become L.C.C. district traffic superintendent and car inspector respectively.

The public subscription initiated by the "Echo de Paris" in order to make a presentation to Prof. BRANLY has now been closed. The total sum, which amounted to 218 253 francs (£4 385), is to be applied by the distinguished scientist for research work.

Mr. W. T. UPTON, electrical engineer, of George-street, Oxford, has been elected to the committee of the Oxford branch of the National Citizens' Union. At the annual meeting of the Oxfordshire Provincial Grand Lodge of Freemasons Mr. Upton was decorated by Lord Valentia.

Mr. J. M. CALDER, general manager of Reading Corporation Tramways, has been appointed to represent the tramway undertakings in the east, south-east, and part of the south coast areas on the special consultative committee established by the Municipal Tramways Association to consider the question of revising the agreement of March, 1919, for regulating and controlling the working conditions of tramways.

The position of Mr. J. M. MCELROY, general manager of the Manchester tramways, in relation to his continued ill-health was considered by a sub-committee of the Tramways Committee on Tuesday. Nothing was decided, but it is probable that the sub-committee will again have the matter before it. In the event of Mr. McElroy's resignation from the position of general manager, it has been suggested that it would be to the interest of the tramway undertaking that his services should be retained in an advisory capacity.

Business Items, &c.

SMITH, ROBERTS & COMPANY have started business as electrical engineers at Horsmonden (Kent).

HIGGS BROTHERS announce that they will shortly open a branch at 84, Albion-street, Leeds, to deal with all their sales in Yorkshire.

The LONDON FACTORS & AGENTS, LTD., 39, Parliament-street, London, S.W. 1, announce that their registered cable address is "Lonfacgent, London," and for inland telegrams, "Lonfacgent, Parl."

The WESTINGHOUSE ELECTRIC INTERNATIONAL COMPANY announces the removal of its office in Cuba from Edificio Banco del Canada to Edificio Banco Nacional de Cuba at Havana. Mr. J. W. White is the manager of this office.

The Midland Counties District Office of FERGUSON, PAILIN, LTD., has been removed from Guildhall Buildings, Navigation-street, Birmingham, to Daimler House, Paradise-street, Birmingham. The new telephone number is "Midland 2594."

EDWARD HOLME & COMPANY have removed their electrical department and offices from Moss-lane, Altrincham, to Hartington-road, Broadheath, Altrincham, and have erected an extension to their die casting foundry at Broadheath which will enable them to concentrate the whole of their manufactures under one roof. The new telephone number is "Altrincham 776."

An interesting inexhaustible pocket torch has recently been placed on the market by the LEVERLITE LAMPS COMPANY. Current is generated by a small six-pole alternator, the permanent magnet of which is rotated by hand-power through a train of wheels. The generator supplies energy at 3·5 volts, and a good light is obtained by even a slight pressure on the lever. The chassis carrying the movement is separate from the pressed aluminium case of the lamp.

As the result of research work carried out by Mr. H. H. Ashdown and others at their Openshaw works, Armstrong, Whitworth & Company have produced a steel, known as "VIBRAC," which is claimed to have the property of never tempering brittle and of being absolutely reliable and consistent in its behaviour under any normal treatment. In addition to responding satisfactorily to even higher mechanical requirements, particularly in respect to elastic limit, than those obtained from nickel chrome steels, "Vibrac" may, subject to any normal treatment, after tempering, be either furnace cooled or cooled in air, thus cutting out all risks of distortion, and yet give higher impact values than nickel chrome steel treated under the most favourable conditions

Institution Notes.

Arrangements are being made by the INSTITUTION OF ELECTRICAL ENGINEERS for the erection of a permanent aerial on the roof of the Institution building.

The first WORLD POWER CONFERENCE, which is being promoted by the British Electrical & Allied Manufacturers' Association in co-operation with other associations, will meet in London at the British Empire Exhibition in 1924. Mr. D. N. Dunlop, director of the B.E.A.M.A., 36, Kingsway, London, W.C., is the organising director.

Mr. T. Britten, of Crompton & Company, presided at a meeting of the CHELMSFORD ENGINEERING SOCIETY on Feb. 2, when Mr. H. G. Allen, managing director of Queen's Engineering Works, Bedford, read a Paper on "The Design and Operation of Condensing Plants." An interesting series of lantern slides was shown, and a long discussion followed the lecture.

The first National Committee for India of the INTERNATIONAL ELECTRO-TECHNICAL COMMISSION consists of Mr. A. O. Coubrough, Mr. A. Cochran, and Mr. C. D. M. Hindley, all of Calcutta. It is anticipated that there will be developments in the near future justifying the formation of a committee that can correspond with the Commission on electrical matters of interest to India. In future the newly-constituted Institution of Engineers (India) will make the appointments to the newly-formed committee.

Sir Charles Bright represented the INSTITUTION OF ELECTRICAL ENGINEERS at the recent Air Conference, moving a resolution to the following effect :—That (1) for the purpose of economy, the Navy, Army and Air Force be absorbed under a Ministry of Defence, and (2) that civil aviation—aerial transport in particular—be dealt with by the Ministry of Transport or some other Civil Department. The necessary notice not having been given, this resolution could not be put to the meeting in the usual way. It, however, preceded the publication of the Geddes Economy Report.

A large number of members of the INSTITUTION OF POST OFFICE ELECTRICAL ENGINEERS were present at the meeting of the Institution held at the Institution of Electrical Engineers, Savoy-place, last week, when a series of films were shown illustrating telephone inventions of to-day and other electrical apparatus in operation. Pictures were shown of the first Bell telephone in 1875, the first telephone switchboard for five subscribers in 1877, a present-day switchboard for 10 000 subscribers, and the assembling of the parts (no fewer than 205) which go to make an ordinary house telephone.

At a general meeting of the INSTITUTION OF AUTOMOBILE ENGINEERS on the 8th inst., a large audience listened to a paper on "Engine Lubrication" by Mr. E. L. Bass, a graduate of the Institution. The Paper, which was awarded the Daimler Premium for the 1920/21 session, was followed by an excellent discussion. Lieut.-Col. D. J. Smith, has unanimously been elected president of the Institution for the ensuing session, and Messrs. H. G. Burford and L. H. Hounsfield have been elected to fill the vacancies in the list of vice-presidents. According to present arrangements, the following (among other) Papers will be read during the next session :—"Railless Trolley Traction," "The Electric Vehicle compared with the I.C.E. Vehicle from the Builders' Point of View," the same from the Users' Point of View, "Ignition," "The Present Position of the Diesel Engine in Relation to the Automobile," "Dynamometers," &c.

A Paper was read at the BIRMINGHAM AND DISTRICT ELECTRIC CLUB last Saturday by Mr. G. C. A. McDonald (member), on "Illumination from the Users' Point of View." The lecturer stated that observation of private houses, offices, works, and shop windows showed what a vast and practically untilled field there was for electrical engineers who would specialise in scientific illumination. Many well-known firms had spent large sums in investigation, in the production of scientifically designed fittings, and in the education of the public, but so far as he could see the effect had been small, largely owing to the indifference of electrical engineers, contractors and fittings manufacturers. Mr. McDonald gave a detailed account of recent investigation of the known laws dealing with the use of light reflectors. He emphasised the correct diagnosis of the quantity and quality of light required for each specific purpose, and gave the methods upon which sound lighting schemes could be devised. He dealt at some length with the rival claims of direct, indirect, and semi-indirect forms of lighting, giving relative efficiencies and values for special purposes of each system, his personal view being that for most purposes the indirect system was the best. The lecture was illustrated with lantern slides, diagrams, and mathematical formulæ.

Obituary.

The death is announced of MR. JAMES LIVERSEY DYSON, Chief Engineer of the Rangoon Tramway service since 1905, who carried out the conversion from steam to electric power.

We regret to record the death of Mr. T. W. CLARK, late Chief Electrician of the Telegraph Construction and Maintenance Company, which took place at Worthing, Sussex, on Jan. 19, after a short illness.

The death took place on Sunday, in his 77th year, of MR. GAVIN ALEXANDER CUTHBERTSON, who for more than 30 years was Yorkshire District Manager for the Pulsometer Engineering Company, of Reading.

Telegraph and Telephone Notes.

TRIM Urban Council have applied to the Postmaster-General for a telephone service in the town.

As the result of the economic agreement between ITALY and RUSSIA, telegraphic and wireless communications are to be resumed this week.

In preparation for the GENOA CONFERENCE the Italian Government last week tested a direct telephone between Brussels and Genoa. The conversations were stated to be quite clear.

The Director-General's report of the workings of the INDIAN POSTS AND TELEGRAPHS for the year ended March 31 last states that telephone exchanges and connections numbered 255 and 10 703 respectively.

A Reuter's message from Reval states that the Great Northern Telegraph Company is engaged in RESTORING ITS COPENHAGEN-PETROGRAD-PEKING LINE. Owing to cable defects between Petrograd and Copenhagen communication has been provisionally established by way of Finland and Sweden. The Petrograd-Peking line has been restored as far as Irkutsk.

It is announced that as soon as possible after the conclusion of the debate on the Address, steps are to be taken to set up again the SELECT COMMITTEE on the management and future of the POST OFFICE TELEPHONES, over which the Right Hon. Sir Evelyn Cecil presided. It will be remembered that Sir Evelyn and his expert assessor (Mr. W. W. Cook) conducted personal investigations into the telephone systems of the Scandinavian countries, while Mr. Cook visited Canada and the United States. Sir Evelyn has been engaged for some time in preparing a draft report.

In Italian commercial circles there is a movement in favour of direct submarine telegraph communication with South America, and a project has been put forward by an Italian company for a CABLE FROM ITALY TO SOUTH AMERICA, touching the Spanish coast *en route*. The Barcelona Chamber of Commerce recently asked the Spanish Minister of State whether it could be arranged that the cable should be laid so as to afford direct communication between Barcelona and South America, but the Minister replied that the company's plans did not permit of the adoption of this suggestion. The Italian company will obtain financial support from its government, and the projected cable will start from Fiuminca, at the mouth of the Tiber, and connect Malaga, Cape Verde, Fernando da Noronha, Rio de Janeiro, Montevideo, and Buenos Aires.

Wireless Notes.

A wireless service between Stockholm and Petrograd was inaugurated on Saturday.

It is reported that the Marconi Company in London is in negotiation with the Danish authorities concerning the establishment of a wireless telephone service between LONDON and COPENHAGEN. Experiments are shortly to be carried out.

Mr. Hoover, Secretary of Commerce, is to preside over a conference at Washington this week to discuss plans for the further GOVERNMENTAL CONTROL OF THE WIRELESS TELEGRAPH AND TELEPHONE. It is complained, the "Daily Telegraph" correspondent states, that the amateur and commercial use of wireless has developed to such an extent that the "air is full of chatter," and ether traffic regulations and possible ether policemen, will be required to regulate the situation.

The first of a series of regular WIRELESS TELEPHONE TRANSMISSIONS FOR the benefit of English WIRELESS AMATEURS took place on Tuesday evening. The Marconi Scientific Instrument Company prepared a fifteen-minute musical programme for the occasion. The first telephonic item was radiated from the Marconi station at Writtle at 7.35 p.m. (Greenwich), on a wave length of 700 mètres. This was preceded by a series of telegraphic signals for calibration purposes on 1 000 mètres. The power employed for telephony is limited to 250 W. in accordance with the terms of the Post Office licence.

Imperial Notes.

The formal opening of the new electricity supply station at KROONSTAD (ORANGE FREE STATE) recently took place. The cost of the plant and equipment was about £60 000. The annual output has grown from 75 000 units in 1905 to over 1 000 000 units last year.

It is stated that the AUSTRALIAN GOVERNMENT has decided to RAISE the EMBARGO on the importation of goods from ex-enemy countries on Aug. 1 next, when a Tariff Board will be established to determine the duties to be imposed on goods coming from countries having a depreciated currency, and on goods likely to be dumped to the disadvantage of local traders.

There is distinct evidence of an INCREASE in the EXPORT DEMAND for ELECTRICAL SUPPLIES, especially hydro-electric and traction purposes. It is satisfactory to see that the New Zealand Government have decided to admit electrical machinery for new industries, gold recovery, &c., free of duty, provided it is of British manufacture, and as there is a 10 per cent. duty on imports from foreign countries, British goods will enjoy an advantage. British manufacturers are anxious to see their products dutiable in all overseas markets on a weight instead of an *ad valorem* basis. British and German goods have to pay duties on an *ad valorem* basis, the latter in effect enjoy a great advantage over the more highly valued manufactures. Electric lamps entering Australia are now dutiable on a weight basis, with the result that British lamp producers are competing more successfully.

Foreign Notes.

Four electric cranes are being installed at Abo (Finland) Harbour to expedite loading operations.

The Tyssefaldene Company have purchased the Alby United Company's factories at Odda, Norway, for 50 000 kroner. The Tyssefaldene Company, together with the English syndicate, will restart the factories within six months for the production of ammonium sulphate.

For the past year the gross profit of the Siemens & Halske Aktien-Gesellschaft was 54 480 939m., against 25 778 925m in 1919-20, the net profit being 37 008 494m., against 16 435 763m. A dividend of 20 per cent. has been declared, against 14 per cent., but over 7 500 000m. has been placed to reserve, 1 000 000m. to disposal fund, and 1 000 000m. carried forward.

The net profit of the Siemens Schuckert Werke A.G. was 22 502 195m., against 12 769 752m. The dividend is 16 per cent., against 10 per cent. last year, but 5 000 000m. is put to reserve, 1 000 000m. is credited to disposal fund, and over 2 000 000m. carried forward. The reserve funds of both companies now amount to 94 000 000m.

The Government of French West Africa intends to adopt electric traction on the railway from Kayes to the Niger. It is thought that waterfalls on the Niger and Senegal will be utilised to provide the necessary electrical energy and to supply power for industrial purposes, and the Société Générale des Enterprises has been entrusted with the task of preparing a detailed scheme.

It is stated that five 40 000 kW turbo generators, three of which will be water-cooled, are to be installed in the large power station which is now being built at Gennevilliers to supply Paris. These turbines will work on a steam pressure of 320 lbs. per sq. in. and a super-heat of 350 deg. F. The generators will be connected to 6 000/60 000 V transformers, without intervening low-tension 'bus bars.

The new Spanish customs tariff came into operation yesterday (Thursday). The duty on most articles has been greatly increased, but a feature of the new tariff is the creation of *ad valorem* duties which are applied as follows: Motor-cars and cycles, 25-30 per cent.; agricultural machinery, 10-30 per cent.; internal combustion engines, 15-50 per cent.; and drilling and stamping machines, 15-60 per cent. The duty on coal is unaltered, but there is an increase of 10 per cent. on cables.

The results of investigations, recently made by Drs. Zimmern, Langlois and Balthazard into the electric voltage likely to prove fatal, have been communicated to the French Academy of Medicine. It is reported that there were a dozen fatal cases caused by contact with domestic circuits conveying energy at 110 V a.c, but there were exceptional circumstances to account for the accidents. In one case a girl in a bath, the water of which contained mineral salts, was killed by touching an electric radiator; after washing a floor with potash, a domestic shared a similar fate on touching an electric lamp, and in the Paris Tube a workman, who seized a lamp while standing in water impregnated with mineral matter, was also killed.

A start has at last been made on the big scheme for harnessing the Skagit river, which is to provide electric power for the city of Seattle and neighbouring towns and settlements. The work will cost several million dollars and will take three years. A commencement has been made with the construction of a tunnel through which the waters of the Upper Skagit river will be diverted during the building of a big concrete dam. This tunnel will then be used as a penstock in which turbo-alternators will be installed, but it will not be completed until next winter at the earliest, and will be 2½ miles in length. The scheme includes the construction of about 100 miles of electric railway in and around Seattle, and the work of installing the transmission lines has also been begun.

An important piece of railway electrification work is to be carried out by the Western Railway Company of Buenos Aires, which has recently raised £2 000 000 by means of debentures for adopting electric traction on its suburban services. The short tunnel line between the company's terminus and the port elevators is already operated electrically, but when the suburban railways are converted to electric working the facilities for handling grain and goods will be much greater and increased revenue should be earned. It is also proposed to introduce electric traction on the Great Southern loop line to La Plata, and as there are various other big railway schemes which are likely to be carried out in the near future there should be a good prospect of securing some of the orders for plant and rolling stock by British engineering firms.

The German Patent Office have dismissed the objection of the Fried. Krupp A.G. to the grant of a German patent applied for by H. H. Thompson & A. E. Davies (of the Rapid Magnetting Machine Company) for an invention relating to an electro-magnetic separator for separating feebly magnetic ores from other ores, and from each other, by means of a high-intensity magnetic separator. Patents have already been granted in England, America, France, and other countries. The opposition of Krupps was successful in the Examination Department, but the inventors appealed, and the higher court decided that there was a patentable invention, but they required a practical demonstration of the machine to prove that it was commercially possible to do what was claimed. After a series of experiments the decision of the tribunal was reserved, but it has now been issued, and is in favour of allowing the patent.

Arrangements for the Week.

FRIDAY, Feb. 17th (to-day).

Institution of Mechanical Engineers.

6 p.m. At Storey's-gate, St. James's Park, London, S.W. Annual General Meeting and Paper on "Electric Welding Applied to Steel Construction, with Special Reference to Ships," by Mr. A. T. Wall.

British Electrical Development Association.

7.30 p.m. At the Chartered Institute of Patent Agents, Staple Inn-buildings, W.C. Salesmanship Conference. (No. 4.) "Salesmanship in Relation to Electric Lighting." Speaker, Mr. H. Harrison.

Junior Institution of Engineers.

8 p.m. At Caxton Hall, London, S.W. Lecture on "Water Purification for Boiler Feed Purposes," by Mr. W. J. Leaton.

MONDAY, Feb. 20th.

East India Association.

3.30 p.m. At Caxton Hall, London, S.W. Paper on "Hydro-Electric Power in India," by Mr. A. T. Arnall.

Institution of Electrical Engineers.

Informal Meeting.

7 p.m. At Savoy-place, London, W.C. Discussion on "The Emergency Use of Oil Fuel during the Recent Coal Strike," opened by Mr. E. F. Hetherington.

Liverpool Sub-Centre of North-Western Centre.

7 p.m. At the University, Liverpool. Lecture on "An Oscillograph Investigation of the Gulstad Relay," by Dr. S. S. Richardson.

Royal Society of Arts.

8 p.m. At John-street, Adelphi, London, W.C. Cantor Lecture on "The Mechanical Design of Scientific Instruments," by Prof. A. F. C. Pollard.

INSTITUTION OF ELECTRICAL ENGINEERS.

Commemoration Meeting.

At Savoy-place, Victoria Embankment, London, W.C.

Tuesday, Feb. 21st.

3 p.m. Experimental Lecture on "Michael Faraday and the Foundations of Electrical Engineering," by Prof. J. A. Fleming, F.R.S.

7 p.m. At Hotel Cecil, London, W.C. Annual Dinner.

Wednesday, Feb. 22nd.

3.30-6 p.m. Short discourses on "Reminiscences and Experiences of Electrical Engineering in both its Technical and Legislative Aspects."

8.30 p.m. Prof. Fleming will repeat his lecture of the previous day.

Thursday, Feb. 23rd.

3.30-6 p.m. Continuation of Discourses on Electrical Engineering.

8-10 p.m. Conclusion of Discourses on Electrical Engineering.

TUESDAY, Feb. 21st.

Institution of Electrical Engineers.

(North-Western Centre.)

7 p.m. At the Engineers' Club, Manchester. Discussion on "The Utilisation of Waste Heat from Electrical Generating Stations," with Introductory Papers by Messrs. C. I. Haden and F. H. Whysall.

WEDNESDAY, Feb. 22nd

British Electrical Development Association.

12 noon. At the Hotel Cecil, London, W.C. General Meeting, followed by luncheon.

Institution of Electrical Engineers.

(South Midland Centre.)

7 p.m. At the University, Birmingham. Lecture on "Rotary Converters with Special Reference to Railway Electrification," by Mr. F. P. Whitaker.

Industrial League and Council.

7.30 p.m. At Caxton Hall, London, S.W. Lecture on "A Proposed Solution to the Transport Problem," by Mr. R. Horniman.

THURSDAY, Feb. 23rd.

National Liberal Club: Political and Economic Circle.

8 p.m. At Whitehall-place, London, S.W. Lecture on "Brains in Industry," by Mr. C. J. Melrose.

FRIDAY, Feb. 24th.

Electrical Power Engineers' Association.

7 p.m. At the Engineers' Club, Coventry-street, London, W. Informal discussion on "Boiler Troubles."

North-East Coast Institution of Engineers and Shipbuilders.

7.30 p.m. At the Literary and Philosophical Society, Newcastle-on-Tyne. Paper on "Running Costs of Diesel-Engined Ships," by Mr. T. Madsen.

Junior Institution of Engineers.

8 p.m. At Caxton Hall, London, S.W. Lecture on "Curved Beams, Rings and Chain Links," by Prof. E. G. Coker.

Edinburgh Electrical Society.

8 p.m. At the Philosophical Institute, 4, Queen-street, Edinburgh. Paper on "Some Experiments in Electrical Sound Detecting," by Mr. B. A. Pilkington.

Tenders Invited and Accepted.

UNITED KINGDOM.

Hull Corporation. Feb. 20.—500 or 1 000 tons girder tramway rails. Forms of tender, &c., from the City Engineer.

Dublin Electricity Committee. Feb. 20.—Transformers for one or two years. Specifications, &c., from the City Electrical Engineer, Fleet-street, Dublin.

Great Western Railway. Feb. 20.—Stores for three months from March 1st, including telegraph instruments, electrical apparatus (insulators), &c., electrical wires and cables, telegraph ironwork, and tools, telegraph drysalteries, and electric lamps.

Hammersmith Borough Council. Feb. 22.—Stores for 3, 6, or 12 months, commencing on April 1, including electric light sundries, insulated wire, metals, packing and jointing materials, tools, joint boxes and connections, and meters. Particulars from Mr. G. G. Bell, Borough Electrical Engineer, 85, Fulham Palace Road, W. 6.

Doncaster Corporation. Feb. 22.—Wiring and fitting sixty houses on the Carr House-road site. Forms of tender, &c., from Mr. R. E. Ford, 3, Priory-place, Doncaster.

Burton-on-Trent Corporation. Feb. 22. 6 000 kW three-phase turbo-alternator, with condenser and switchboard; and two 40 000 lb. water-tube boilers, with economisers, coal-handling plant, &c. Specifications from the Borough Electrical Engineer.

Metropolitan Water Board. Feb. 23.—Electric lamps, &c., for three, six, or twelve months. Forms of tender from the Chief Engineer, 173, Rosebery-avenue, London, E.C. 1.

East Grinstead Urban Council. Feb. 24.—Oil engine driven generators, motor balancer, motor booster, steam engine and dynamo, storage batteries, main switchboard, super-heater, feed-water heater, cable system, street lamps and travelling crane. Specification from the Clerk of the Council, 102, London-road, East Grinstead.

Skipton Urban Council. Feb. 25.—Supply, laying, &c., of four core, paper insulated, lead covered, steel tape armoured cable. Specification, &c., from Mr. W. Emmott, 35, Commercial-street, Halifax.

Liverpool Select Vestry. Feb. 27.—Overhead electrical installation at their Olive-mount Institutions, Wavertree. Particulars from the Clerk, Mr. G. W. Coster.

Leeds Corporation. Feb. 27.—One year's supply of stores and materials to the Tramways and Highways Departments, including copper bands, electrodes, electrical sundries, engineers' furnishings, ironmongery, &c. Specifications from the General Manager, Tramways Department, 1, Swinegate, Leeds.

Eston. Feb. 28.—The erecting and providing of plant in connection with the overhead lines, underground cables, transformers, sub-station equipment, and public lighting fittings required under Eston Electricity Special Order, 1921. Particulars from the Clerk, Mr. T. Belk, Cleveland House, Grangetown, S.O., Yorks.

Belfast Tramways Committee. Feb. 28.—Six or twelve months' supply of stores, including electrical accessories, cable, lamps, insulating tapes, carbon brushes, controller fingers, spares for Westinghouse controllers, armature and field coils, trolley heads, trolley wire, galvanised wires, suspension cars, &c. Forms of tender from the General Manager, Napier-street, Sandy-row, Belfast.

Edinburgh Corporation. March 14.—Steel tramway poles. Specifications, &c., from the Tramways Manager, 2, St. James-square, Edinburgh.

Hampstead (London) Borough Council. March 15.—Supply of various stores for six or twelve months, including electrical engineers' stores and oils for the electricity station. Form of tender, &c., from the Town Clerk.

Aylesbury Corporation.—300 kW converter, with e.h.t. and l.t. switchgear. Specifications, &c., from the Borough Electrical Engineer.

Aylesbury Corporation.—1 500 kW or 1 000 kW turbo-alternator, condenser and switchboard. Specification from the Borough Electrical Engineer.

Accrington Corporation.—Supply, delivery, and complete erection of 25 000 lb. water-tube boilers, economisers and brickwork. Particulars from Mr. A. W. Clegg, Engineer and Works Manager.

Cheshire County Mental Hospital.—Six months' supply of electrical goods, ironmongery, &c. Forms of tender from the Clerk.

AUSTRALIA.

Commonwealth of Australia. Feb. 23.—144 tons of copper wire, 30 000 copper tapes and binders. Particulars from the Supply Officer, Australia House, Strand, London, W.C. 2.

Postmaster-General's Department, Brisbane. April 19.—* Supply and delivery of testing and telegraph instruments, including d.c. ammeters, a.c. bridge condenser coil, condensers, cross-talk meters, detectors, milliammeters, polarised relays, and artificial telephone cable boxes. (Stores Schedule No. 549.)

Municipal Council of Sydney (Electricity Department). April 24.—*Supply, delivery, and erection of two 2 000 kW rotary converters; one 10 000 to 12 000 kW turbo-alternator.

SOUTH AFRICA.

Durban Corporation Electrical Department. April 12.—* Two 500 kW rotary converter automatic sub-station equipments. Alternative tenders for mercury arc rectifiers may be submitted instead of rotary converters, the switchgear to be completely automatic and suitable for their proper operation and control.

BULGARIA

Bulgarian Department of Posts. March 8.—*Porcelain insulating tubes for telephones (10 000), insulating tubing (impregnated paper) for telephones (2 200 metres), ebonite caps (1 700), and insulated copper wire (1 000 metres).

Bulgarian Post and Telegraph Authorities, March 15.—* The supply of 1 A fuses, cartridge fuses for protection from lightning, 3 A fuses, line annunciators, carbon lightning arresters.

Bulgarian Postal Authorities, March 21.—*Telephone, pole-line hardware (4-pin carriers for insulators, bolts, etc.).

Bulgarian Postal Authorities, March 27.—*3 000 junction pieces for batteries. Delivery required within four months.

SPAIN.

Spain.—H.M. Consul at Vigo states that the heavy gale recently experienced on the coast there destroyed the commercial wharves of the port, together with the plant, such as hand, steam and electric cranes. He states that tenders will possibly be invited at an early date, and suggests that United Kingdom firms interested should communicate through their agents in Spain with the Ministry of Development (Ministerio de Fomento), Madrid, or to the Port Works Office (Obras del Puerto) at Vigo, the authorities in charge of the reconstruction, giving full particulars of their latest designs. Firms not represented in Spain can obtain the name of a suitable agent on application to the Department of Overseas Trade. (Reference D.O.T. 5 394/F.L./S.C.)

Glasgow Corporation has accepted the tender of D. & J. Gilmour for wiring and fitting houses at Craighton, at £3 769 17s.

Swansea Housing Committee has accepted the tender of W. Alban Richards, of London, for wiring 119 houses, at £65 557.

Stepney Borough Council have accepted the tender of A. Reyrolle & Company for a feeder panel on the switchboard of Wapping sub-station at £384.

Stepney (London) Borough Council have also placed the following orders :—Sutton & Company, one mile 3 in. earthenware pipes, £306, and troughs and covers, £234; G. W. Neale, solder, £106.

Worthing Corporation has accepted the tender of the Enfield Ediswan Cable Works (lowest tender received) for cable, £1 591. Ten tenders were received, the highest being £2 043.

Lewisham (London) Guardians have accepted the tender of the Star Electric Maintenance Company for repairing electric wiring, &c., at the Children's Home, Goat House Bridge, Norwood Junction, at £148.

Alderley Edge Urban Council has accepted the offer of the Alderley & Wilmslow Electric Supply, Ltd., for street lighting in connection with the housing scheme, at £1 18s. per 30 c.p. lamp per annum, and for standards and time switches at £18 2s. 6d. per lamp.

Cannock Urban Council have accepted the following tenders: F. Pickering (lowest tender), for the erection of a new transformer station, £1,650. (Sixteen tenders were received, the highest being £2,332); General Electric Company, for the coupling up of electric cables, £354.

In face of severe competition, Ruston & Hornsby have secured a contract from the South African Government for thirty-eight heavy oil engines. The engines are to be supplied to the South African Railway and Harbour Department for driving grain elevators and for electric lighting purposes in different parts of the Union. The order is understood to amount to 2 500 B.H.P.

Bermondsey (London) Council have accepted the following tenders :—Enfield Ediswan Cable Works, cable, £430; W. T. Henley's Telegraph Works Company, three feeder pillars, £6 6s. 6d. each; Sykes & Sugden, house service boxes, £1 8s.; and end division boxes, £1 16s. each; Pontifex & Company, lamp columns, £3 16s. 6d. each.

Trade Inquiries.

An Englishman in Canada, who is a civil engineer, desires to represent, on a commission basis, United Kingdom manufacturers of equipment, tools, or machinery, particularly applicable to railways, mines, power plants, &c. Agencies would be undertaken for Eastern Canada or the whole of the Dominion, according to the nature of the goods. Particulars from the Department of Overseas Trade. (Ref. No. 160.)

An Englishman residing in Toronto, already representing a Canadian firm for battery separators, desires to represent United Kingdom manufacturers of automobile parts and accessories, hard rubber or glass battery jars, galvanised products, electric meters, fireless cookers, &c., on a commission basis, for the province of Ontario. Particulars may be obtained from the Department of Overseas Trade. (Ref. No. 161.)

---

* *Particulars from the Department of Overseas Trade.*

Companies' Meetings, Reports, &c.

Frederick Braby & Company announce an interim dividend of 5 per cent., less tax, on the ordinary shares.

An interim dividend of 2½ per cent. has been declared by Greenwood and Batley on the ordinary shares.

The North Metropolitan Electric Power Distribution Company has declared a dividend of 4 per cent. on the ordinary shares for the year 1921.

The directors of the Liverpool Overhead Railway Company recommend payment of a dividend of 5 per cent. for the year 1921 on the preference shares.

The Metropolitan District Railway announces a dividend of 1 per cent. on the ordinary stock for the year 1921. This is the first dividend to be paid on this stock since 1882, when the rate was 3-16 per cent. £65 000 has been placed to reserve, leaving £60 550 to be carried forward.

Swansea Corporation are this week offering for subscription £850,000 5½ per cent. redeemable stock at 98. Part of the proceeds will be utilised for extensions of the electricity supply and other municipal undertakings.

Subject to final audit, the revenue of the London and Suburban Traction Company will enable it to pay 3½ per cent. in respect of arrears on its 5 per cent. cumulative preference shares, with a carry forward of £11 523, compared with £1 205 brought in.

Subject to audit, the directors of W. T. Henley's Telegraph Works Company recommend a final dividend on the ordinary shares of 2s. per share, less income tax, making, with the interim dividend of 1s. per share paid on Sept. 1, 1921, 3s. per share for the year.

Mather & Platt, Ltd., recommend a dividend for the year 1921 of 10 per cent., tax free, including the interim distribution of 3 per cent. This is the same as the dividends for the last two years, and the balance carried forward is increased from £105 457 to £287 661.

The income for 1921 of the Montreal Light, Heat, & Power Company, after deducting expenses and taxes, depreciation and renewal reserve, &c., was $4 222 742. The sum of $20 000 has been set aside for pensions, and, subject to income tax, $975 053 is carried forward.

The revenue of the Pennsylvania Water and Power Company for 1921 was $1 962 252, and the divisible balance was $843 028. Dividends amounting to 7 per cent. were declared, $170 125 was added to depreciation, and $75 000 to sinking fund, leaving $3 254 to carry forward.

After providing for interest, sinking fund, income-tax, etc., the profit of the Paisley District Tramways Company for the year ended December 31st, 1921, amounted to £34 736. A dividend of 4 per cent. on the ordinary shares is recommended, leaving £8,032 to be carried forward against £6 545 brought in.

The South Metropolitan Electric Tramways & Lighting Company recommend a dividend on the ordinary shares for the year 1920 of 7½ per cent. The sum of £15 000 has been placed to reserve (an addition of £4 500 compared with the previous year), leaving £2 864 to be carried forward, against £1 556 brought in.

The City and South London Railway recommends a final dividend on the consolidated ordinary stock of 1¼ per cent., making 3¼ per cent. for the year. After placing £36 000 to reserve (an increase of £11 000), £25 000 remains to be carried forward, compared with £18 820 brought in. The dividend for 1920 was 1½ per cent.

The transfer books and register of members of the South Metropolitan Electric Light and Power Company will be closed from the 18th to the 28th inst. (inclusive), for the preparation of warrants for dividends payable in receipt of the 7 per cent. cumulative first preference 6 per cent. cumulative second preference, and ordinary shares.

The final dividend recommended by the London Electric Railway Company on the ordinary shares is 1¾ per cent., making for the year 1921 3¼ per cent. The sum of £65 000 has been placed to reserve (an addition of £20 000 compared with 1920), leaving £39 700 to be carried forward, compared with £22 350 brought in. The dividend compares with 1⅛ per cent. last year.

The County of London Electric Supply Company has declared a final dividend at rate of 11 per cent. on the ordinary shares, making 8 per cent. for the past year, after providing £180 000 for reserves and carrying forward about £21 000. In 1920 the dividend was at the same rate, £50 000 was placed to reserve for renewals, depreciation, &c., £62 500 to general reserve, and £18 595 carried forward.

The Central London Railway Company recommends final dividends on the undivided ordinary and preferred stocks of 2 per cent., making 4 per cent. for the year, and a dividend for the year on the deferred ordinary stock of 4 per cent. It is proposed to place £29 000 to reserve (an increase of £9 000), leaving £59 600 to be carried forward, compared with £15 161 brought in. For 1920 the dividend on the ordinary stock was at 2¼ per cent.

The Metropolitan Electric Tramways, Ltd., recommend a dividend of 7 per cent. on the 5 per cent. cumulative preference shares, being the balance of 4½ per cent. for the year ended Dec. 31, 1919, and 2½ per cent. on account of the year ended Dec. 31, 1920. The sum of £67 500 has been placed to reserve for reconstruction and renewals (an addition of £57 500 compared with previous year), leaving £2 420 to be carried forward, compared with £1 538 brought in.

The accounts of Cambridge Electric Supply Company, Ltd., for the year ending Dec. 31 last show a total profit for the year of £13 064, which, added to £2 112 brought forward from 1920, makes £15 176. After deducting debenture and other interest (£2 379) and placing £5 000 to depreciation, there remains a balance of £7 797. The directors recommend the payment of a dividend of 5 per cent. for the year, which will absorb £4 955 10s., leaving a balance to carry forward of £2 841 10s.

Subject to final audit of accounts, the revenue of the Underground Electric Railways Company of London will enable it to pay the full interest to Dec. 31, 1921, on its 6 per cent. first cumulative income debenture stock and to pay interest at 2 per cent., free of tax, on its 6 per cent. income bonds of 1948 for the half-year ended Dec. 31, 1921, with a carry forward of £26 600, compared with £20 137 brought in. For 1920 interest at 2 per cent., free of tax, was paid on the 6 per cent. income bonds.

After placing £10 000 to general reserve, the North London Railway Company recommend a final dividend to Dec. 31, 1921, of £3 15s. per cent. on the consolidated (ordinary) stock, making £6 per cent. for the year, carrying forward about £14 700. Consequent on the ordinary dividend being at rate of 6 per cent., the holders of the preferential consolidated stock, 1866, become entitled to an additional 10s. per cent. For 1920 the dividend was £5 10s. per cent., with £10 000 placed to general reserve and £14 565 carried forward.

At the annual meeting of the Dublin United Tramways Company in Dublin last week, Mr. L. A. Waldron, who presided, stated that the passenger receipts had increased by £74 063 over the previous year, and in the parcels department by £1 700 odd, and by a similar sum for the carriage of minerals. With regard to the overcrowding of the cars, they were doing all they possibly could to meet the complaints, and to assist the long-distance passengers on the Dalkey line they were running in the rush hours a couple of cars upon which the minimum fare was 3d., with a view to preventing passengers using the long-distance cars for short journeys.

The net revenue of the North Metropolitan Electric Power Supply Company for 1921 was £125 333, compared with £96 174 for 1920. Adding interest and dividends received and the balance of £4·433 brought forward, the total is £136 128, less mortgage and other interest £31 979, reserve fund for 5 per cent. mortgages £2 000, redemption fund for 7½ per cent. debenture stock £1 142, contribution to reserve £25 000, leaving £76 007. The directors propose a dividend on the ordinary shares at the rate of 10 per cent. per annum, carrying forward £5 006.

In the annual report of the South-Eastern & Chatham Railway Companies for 1921, it is stated that the Managing Committee has for some time past been considering the means of providing adequate accommodation for the traffic on its lines, and has arrived at the conclusion that the only method of doing so is by the introduction of electric traction. Up to the present time there has been no opportunity of raising the necessary capital for the work, but the Committee has now approached the Advisory Committee appointed under the Trade Facilities Act, 1921, with the object of obtaining capital under the guarantee of the Government.

The net profits of the St. James' and Pall Mall Electric Light Company for the year ending Dec. 31, 1921, applicable to dividends on shares, amounted to £31 232, to which £5 887 brought in from 1920 was added, making a total of £37 119. From this sum £10 500 was paid out in interim dividends for the half-year ending June 30th, leaving £26 619, which the directors propose to deal with as follows : a dividend at the rate of 7 per cent. on the preference shares for the second half-year, £3 500; a dividend on the ordinary shares for the second half-year of 8s. 6d. per share, making a total distribution of 12 per cent. for the year, £17 000; leaving £6 119 to be carried forward. The connections, which at the end of 1920 were 19 904 kW, have been increased during the year to 21 167 kW, and 13 464 418 units were supplied to consumers.

The report of the London Electric Supply Corporation for the year ended Dec. 31 last shows a profit for the year of £102 286, against £99 487 last year. To this has to be added £14 256 brought in less interest on temporary loan (£2 116), making a total of £114 427. From this sum the following have been deducted :—Interest on debenture stock to Dec. 31, 1921 (£23 494), sinking fund for redemption of debenture stock in 1931 (£16 580), leaving a balance of £74 352 15s. 10d., which the board propose to deal with as follows :—Payment of a dividend of 6 per cent. on the preference shares (of which an interim dividend of 3 per cent. was paid on Sept. 1, 1921), £26 952; payment of a dividend of 4 per cent. on the ordinary shares, £13 320; to reserve, £15 000; to contingencies, £5 000; leaving £14 080 15s. 10d. to be carried forward. The supply has been efficiently maintained during the year. Units sold numbered 47 490 802, as against 47 366 351; the total costs per unit sold being 1·47d. (1·38d.) The average receipt per unit sold (lighting and power) was 1·91d. (1·81d.).

The report of the Metropolitan Railway Company for 1921 shows gross receipts of £2 236 166 and expenditure of £1 727 090. Including miscellaneous receipts (net) from rents, interest, &c., £241 870, and £15 416 brought in, the total net income is £766 362. A dividend is recommended at the rate of £3 5s. per cent. per annum for the half year ended Dec. 31, 1921, making £2 5s. per cent. for the year, leaving £17 797 to be carried forward. The amount transferred to the general renewals fund is £50 000. The surplus land dividend is £3 per cent. for the year, compared with £2 17s. 6d. per cent. for 1920. The number of passengers carried, excluding season ticket holders, totalled 75 172 423, against 95 273 887 in 1920. The additions to the rolling stock include forty-seven new electric

cars. Three of the electric locomotives have been re-equipped with higher-power motors, and all the other electric locomotives are gradually being dealt with in a similar manner. A switch-house to accommodate the new switchgear required for the augmented generating plant at Neasden is being erected, and the work of installing the plant is progressing satisfactorily.

The report of the London & South-Western Railway Company for 1921 states that the expenditure on capital account for the year was £172 004. Gross receipts amounted to £13 354 530, as compared with £13 315 258, and expenditure to £11 497 653 (£11 242 248). Including miscellaneous receipts £216 387, an appropriation from the £1 046 161 received from the Government under the allocation scheme, £250 000, and balance from last account £65 555, the total net income is £2 388 819 (£2 362 358). After deducting the interim dividend of 2 per cent. paid on the ordinary stock and placing £60 000 to the credit of revenue suspense accounts for loss on sale of investments in Government securities, Feltham marshalling sidings and electrification of suburban lines, there remains £652 941, which admits of the payment of a dividend of 4 per cent. for the second half of the year, making 6 per cent. for the year (same as in 1920), and leaving a balance of £71 920 to be carried forward. The dividend on the preferred converted ordinary stock is at the rate of 2 per cent. for the past half-year, and on the deferred converted ordinary stock at the rate of 2 per cent. for the whole year 1921.

For 1921 the net profit of the Yorkshire Electric Power Company amounts to £74 316, against £64 739 in 1920. The 1920 ordinary dividend of 8 per cent. is repeated, £15 000 is again placed to general reserve (raising it to £104 000), and £23 259 carried forward, compared with £20 938 brought in. The report states that the extensions of the Thornhill and Barugh power stations were delayed by the coal stoppage, but are now proceeding satisfactorily, and will be available for supply within the next few months. Extensions of mains and sub-stations have been made for supply in bulk to the Corporations of Dewsbury and Todmorden and the Urban District Councils of Elland and Honley. In this part of the company's area there are two important municipal undertakings, those of the Sheffield and Rotherham Corporations. With both these the company has entered into arrangements for joint working in the interests of cheap production. An inter-connection has already been made with the Sheffield Corporation undertaking for a substantial amount of current. Underwriting arrangements have been made for an issue of £558 360 6 per cent. preference shares of £5 each at £4 per share. The issue will probably be made next week.

The annual meeting of the British Columbia Electric Railway Company was held in London on Tuesday, Mr. J. Davidson (deputy chairman) presiding in the absence, owing to ill-health, of Mr. R. M. Horne-Payne. In moving the adoption of the report and accounts, the chairman said that the gross earnings, which exceeded $9 500 000, constituted a record in the history of the company. In 1920-1921 they carried 71 065 275 passengers, compared with 66 411 030 in 1919-1920. In 1920-1921 they delivered 140 285 620 kW of electricity for light and power, against 120 173 919 kW the previous year. The only department which had fallen backward slightly was the freight department, where 412 534 tons were carried, compared with 430 931 tons. Owing to their purchase in 1920 of the undertaking of the Western Power Company of Canada, they had a present and potential supply of power sufficient to meet the requirements of the communities they served for many years to come. A recent expert examination of their power plants indicated that for a relatively moderate capital expenditure they might reasonably expect to add an additional 10 000 kW to the capacity of the plants. They were erecting an additional unit of 7 500 kW in the Western Power Company of Canada, and it should be possible for them to obtain 80 000 h.p. from the development of the second power site owned by the Western Company. The management were actively considering plans to make available those water-power resources, but the time at and extent to which development work could be undertaken would depend upon the growth of the demand for power.

Social Notes.

A social and dance, on a large scale, organised by the staff of the Edison Swan Electric Company, and open to all the Ponders End employees, was held at the works last Saturday evening. Almost 900 were present, and the girls' dining hall, a building capable of seating about 1 500, was transformed into a palais de dance, and a long programme was enjoyed. The other entertainments provided were two concerts, one by Mr. A. P. Ambler's party and the other by the Edi-wan (girls) Musical Society and Orchestra and an up-to-date cinema which showed two splendid programmes. The side attractions included X-ray demonstrations and a show organised by a party of the foremen, in which the employees were invited to "get their own back" by endeavouring to knock off the hats of the foremen with tennis balls.

The staffs of Pritchett & Gold and E.P.S. Company, Ltd., and of their incorporated firm, Peto & Radford, spent an enjoyable evening at the Grosvenor Hotel on Wednesday last week. During the evening the chairman of the company, Sir Archibald G. Gold, and Lady Gold were presented, in celebration of their silver wedding with a silver rose bowl by Mr. Charles Pritchett, on behalf of the directors and staff. Mr. Pritchett, who is also a director of the firm, said that while the company had sustained a great loss by the death of his brother, Mr. G. E. B. Pritchett, the founder and first chairman of the company, they could not have found a more suitable successor as chairman than Sir Archibald. Sir Archibald Gold said in reply that the very handsome presentation had come as a great surprise to him, and, in thanking the staff for their kindness, he assured them that their gift would always be among the most valued of his possessions. An excellent musical programme was provided by members of the staff and their friends, the items being interspersed with dances, one of which, the "Lucky Spot Waltz," was won by Mr. C. H. J. Allworth, advertising manager of The Electrician, and Miss Emile Smith.

The Brighton Railway Contract.

As announced in The Electrician last week, a contract in connection with the extension of the electrification of the London, Brighton and South Coast Railway Company has been placed with the General Electric Company, who will undertake the necessary manufacture at their Witton Engineering Works, Birmingham. Work will begin within the next two months, and will be completed within twelve months.

It is understood that the contract is one of several which will probably arise out of the grouping system consequent upon last year's Railway Act, and is for the provision of the whole of the electrical equipment for twelve additional motor coaches, each of 1 000 h.p., to enable the section of the line from Balham, through Thornton Heath to Selhurst and West Croydon, to be operated electrically. The equipment is for employment with single-phase alternating current, and as the manufacture of this class of apparatus was formerly mainly in the hands of Germany, the importance of the contract, from the British national standpoint, cannot be overestimated.

It is a matter for congratulation that the enterprise and manufacturing facilities of the G.E.C. have enabled them to secure a contract of this nature, which should open up countless possibilities for the future.

COMMERCIAL INTELLIGENCE.

The following information is taken from printed reports, but we cannot be responsible for any errors that may occur.

London Gazette.

Partnerships Dissolved.

HEATH, Leonard James, RICHARDSON, Alfred Charles, and KETLEY, Leonard, electrical engineers, &c., at Wood-street and Bawtry-road, Doncaster, York, under the style of HEATH, RICHARDSON, & COMPANY, by mutual consent as from Oct. 31, 1921. Debts and claims received by Bell & Watson, 2, St. Sepulchre-gate, Doncaster.

MARSH, Arthur Harold, and SANDERSON, John William, electrical engineers and contractors, &c., Station-road, Ossett, Co. York, under the style of MARSH & SANDERSON, by mutual consent as from Jan. 7, 1922. Debts received and paid by A. H. Marsh, who will continue the business.

OGDEN, Harold, and DYSON, Leonard, electrical engineers, under the style of DYSON & OGDEN, 16, Savile Park-terrace, Halifax, by mutual consent as from Dec. 31, 1921.

Bankruptcy Information.

HURWORTH, Walter, and WATMOUGH, Arthur Appleby, in co-partnership under the style of HURWORTH, WATMOUGH & COMPANY, 41, Town-street, Horsforth, and 1, Back James-street, Harrogate, electrical engineers. First meeting, Feb. 23, 11 a.m., 24, Bond-street, Leeds. Public examination, March 21, 11 a.m., County Court House, Albion-place, Leeds.

INCE, Arthur Courtenay, 21, Fenkle-street, Newcastle-upon-Tyne, formerly under the style of THE NEWCASTLE ELECTRICAL ENGINEERING COMPANY, now with a partner under the style of THE TYNE ELECTRICAL INDUSTRIES, electrical contractor. Receiving order, Feb. 6. Debtor's petition. First meeting, Feb. 22, 11 a.m., Pearl Buildings, 4, Northumberland-street, Newcastle-upon-Tyne. Public examination, Feb. 23, 11 a.m., County Court, Westgate-road, Newcastle-upon-Tyne.

Notices of Intended Dividends.

WATKINSON, Matthew, WATKINSON, Harold, and WATKINSON, Arthur, trading as WATT & COMPANY, 22 and 24, Palmer-road, Sheffield, electrical engineers, &c. Last day for receiving proofs, Feb. 25. Trustee, T. C. Parkin, jnr., 36, Bank-street, Sheffield.

WORMULL, Frederick Alfred Stanley, carrying on business at 273, High-street, Lewisham, as THE LEWISHAM ELECTRIC WIRING COMPANY. Last day for receiving proofs, March 1. Trustee, T. Gourlay, 29, Russell-square, W.C. 1.

WORTHINGTON, Vincent Broughton, Ellesmere-yard, Walkden, co. Lancaster, electrical engineer, &c. Last day for receiving proofs, Feb. 25. Trustee, J. G. Gibson, Byrom-street, Manchester.

Mortgages and Charges on Limited Companies.

[NOTE.—The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, created by a Company after the commencement of the Act, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges which would, if created after the commencement of the Act, require registration. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced since such date.]

LLANELLY & DISTRICT ELECTRIC LIGHTING & TRACTION COMPANY, LTD. Registered Feb. 6. Trust deed dated Jan. 24, 1922, securing £125 000 debenture stock; charged on electricity supply and light railways undertakings of the company and hereditaments as set out in trust deed, also general charge. *£78 331. April 22, 1921.

Satisfaction.

REYROLLE (A.) & COMPANY, LTD., Hebburn-on-Tyne, electricians. Satisfaction registered Feb. 8. £7 500, part of amounts registered June 13, 1907, &c.

Deed of Arrangement.

WILKINSON, Guy, 16, Oxford-street, Harrogate, and Shott House, Spofforth, electrical engineer. Composition of 10s. in the £, payable by three equal quarterly instalments, commencing April 1 next; secured by a surety. Filed, Feb. 8. Trustee, C. H. Baker, 1, Albion-street, Leeds. Liabilities unsecured, £543; assets, less secured claims, £270.

Bankruptcy Proceedings.

FAWCETT, Ernest, 20, St. Anne-street, Liverpool, electrical and heating engineer. The public examination of this debtor was held on February 13th at Liverpool. The statement of affairs showed unsecured liabilities of £349, against net assets 14/11. He served an apprenticeship as an electrical, heating and hydraulic engineer, and afterwards for some years he worked for various firms of engineers. In August, 1920, he became connected with an electrical company, in which he invested £500, and of which he was appointed a director. The company carried on business at 20, St. Anne-street, Liverpool. It was not successful, and went into voluntary liquidation on June 1st last year. Debtor believed that the liquidator had realised the whole of the assets. He stated that he found out that the company was not a success about January or February last year. It had improved considerably when the heating department was taken on, and debtor became surety for a bank overdraft of £500, along with two other directors. He estimated that £250 of that would rank against his estate for dividend. In August, 1921, he commenced business in partnership with another gentleman, who found all the capital of £250. The business was similar to that of the company, and it was successful until January this year. According to the terms of the partnership, it was to be dissolved on the bankruptcy of either partner. The condition was that the surviving partner should take over the business with all the debts and assets. Proper books of account had not been kept. The whole of the household furniture was claimed by debtor's wife. The examination was closed.

FIGGINS, James Victor, 3, Pottery-terrace, Alexandra-road, Newport, electrical engineer. The first meeting of creditors was held last week. Ranking liabilities were returned at £753, while net assets were estimated at £39. Debtor attributed his failure to bad debts, loss on a contract, and strike. He started business in partnership at Newport in November, 1919. Since February last the business had been carried on in his own name. The matter was left in the hands of the Official Receiver as trustee.

Private Meetings.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

GOSS, Frederick Charles, 64, Gloucester-road, Bishopston, Bristol, electrical engineer. The creditors of the above were called together in Bristol a few days ago, when a statement of affairs was presented which showed liabilities of £1 221, all of which were due to the trade. The assets were estimated to realise £339, from which had to be deducted £15 for preferential claims, leaving net assets of £324, or a deficiency of £897. The assets consisted of stock expected to produce £150; book debts valued at £40; cash in hand, £14; furniture, £75; and motor-car, £60. There were also fittings, fixtures and utensils amounting to £22 6s. 6d., on which no realiseable value was placed at the moment. Debtor started in business in partnership with another with a capital of £50. The partnership was dissolved in October, 1919, and a little later the debtor started on his own account with a borrowed capital. The present position was attributed chiefly to the general slump in trade. The drawings had been about £6 a week. An offer had been received for the purchase of the stock, motor-car and furniture for £200. The matter was discussed at some length, and eventually it was decided that attempts should be made to obtain a better offer and one which would enable a composition of 4s. in the £ to be paid. Failing such an offer being forthcoming, the opinion was expressed that the matter should be dealt with in bankruptcy. The following are creditors: Wholesale Fittings Company, Ltd., Bristol, £47; Newtons, Taunton, £82; Mackintosh Cable Company, Derby, £28; Edison Swan Company, Ltd., Bristol, £36; Metropolitan-Vickers, Ltd., Bristol, £52; Petters, Ltd., Yeovil, £37; Simpson Baker & Company, Bristol, £463; London Lamp Company, London, £23.

WILSON-WOLF ENGINEERING COMPANY (THE), LTD. (in voluntary liquidation), 172, Thornton-road, Bradford. At the recent statutory meeting of creditors it was resolved to confirm the voluntary liquidation, with Mr. R. S. Dawson as liquidator, and an advisory committee was appointed, consisting of representatives of Clement Talbot, Ltd., the Hoffman Manufacturing Company, Ltd., and the Concordia Electrical Wire Company, Ltd. The statement of affairs showed ranking liabilities of £9 545 (£3 142 to trade creditors) and a deficiency of £8 138. The present position has been brought about by the moulders' strike and the coal strike.

Liverpool Electricity Accounts.

The total income of the electricity supply department of LIVERPOOL Corporation for the year ended Dec. 31 last was £995 988, including £760 981 from sales of electrical energy for lighting and power and £202 603 for traction. In the expenditure, which amounted to £662 157, are included two items for new services (£15 300) and meters (£15 254). The gross profit was £333 831, out of which interest (£110 335) and sinking fund contributions (£86 550) were paid, and after placing £86 946 to renewal fund, the balance (£60 000) has been devoted to the relief of rates. The capital expended during the year was £392 696, making the gross capital expenditure £3 092 135, but loans amounting to £856 019 have been redeemed. The amount at credit of sinking fund is £690 532, the reserve fund is £209 924, renewal fund £59 572, cancelled debt account £650 445, and cancelled stock account £205 574.

New Companies.

Consolidated Trading & Manufacturing Company, Ltd. (179 577). Private company. Registered Feb. 9. Capital, £500 in £1 shares. Electrical and general engineers, &c. Subscribers (each with one share): J. D. H. Bryant and L. D. Stears. Secretary, C. Nickols. Registered office, Cromwell House, High Holborn, W.C.

Deben Construction Company, Ltd. (179 521). Private company. Registered Feb. 7. Capital, £5 000 in £1 shares. To acquire the business carried on by W. F. Weston, V. J. T. Weston, R. Parr and Frances M. Emuss, at Woodbridge, Suffolk, as the Deben Construction Company, and to carry on the business of civil, mechanical and electrical engineers, &c. First directors: H. J. Emuss (managing director), A. E. Farr (chairman). Qualification, £10. Registered office, Woodbridge, Suffolk.

Engineering & Mercantile Company, Ltd. (179 554). Private company. Registered Feb. 8. Capital, £5 000 in £1 shares. To carry on the business of electrical engineers, &c., including the construction, laying down, altering and maintaining building works and machinery, and to acquire the business carried on at 61-62, New Stone-buildings, Chancery-lane, W.C., as "Rothstein, Izchakin & Company." First directors: Chanaan Izchakin, Samuel Rothstein, and Mordchel Mazower (all permanent, subject to holding £200 shares). Registered office, 61-2, New Stone-buildings, Chancery-lane, W.C.

Engineers' Supply Association (Norwich), Ltd. (179 467). Private company. Registered Feb. 3. Capital, £5 000 in £1 shares. Subscribers (each with one share): F. C. Harbott (first and sole governing director) and S. E. Parish. Registered office: 17-18, Basinghall-street, E.C. 2.

Freeland White and Company, Ltd (179 611). Private company. Registered Feb. 10. Capital, £3 000 in £1 shares. Electrical, telephone and general engineers, electricians, etc. Subscribers: P. F. White (1 000 shares), J. Reynolds (50). Solicitors: Chamberlayne, Hackins and Company, 83, Pall Mall, S.W.

Industrial Intelligence, Ltd., has been registered as a company limited by guarantee, without a capital divided into shares. The objects are:—To promote publicity and propaganda of all kinds, especially such as may be calculated to foster production, manufacture and trade in and between all parts of the British Empire and other countries; to promote and assist the production and distribution of literature, printed matter, photographs, illustrations and advertisements, and billposting of all kinds; to organise meetings, lectures and exhibitions; to establish and conduct commercial agencies, &c. The company is to be governed by a council of not more than six members, two being elected annually at the general meeting and one nominated by each of the following bodies:—The Federation of British Industries, the British Electrical and Allied Manufacturers' Association, the Cable Makers' Association, and the British Engineers' Association. First members:—Llewellyn B. Atkinson, Roland T. Nugent, D. A. Bremner, and D. N. Dunlop. Registered office, 24, Chancery-lane, W.C. File number 179 507.

Irish Automatic Telephone Installation Company, Ltd. Private company. Registered in Dublin Feb. 11. Capital, £10 000 in £1 shares (5 000 8 per cent. cumulative preference). First directors: T. Wm. Delany, K. J. Kenny, and J. P. Dillon. Secretary, A. Channing. Registered office: 8, Nassau-street, Dublin.

Kinecessities, Ltd. (179 589). Private company. Registered Feb. 9. Capital, £500 in £1 shares. Electricians, mechanical and electrical engineers, manufacturers of cinematograph films, dealers in and providers of machines and instruments of all kinds, including automatic machines, seating indicators for theatres, cinemas and railways, and accessories of all kinds, &c. First directors: C. F. O. Hamley and A. B. M. Gray. Qualification, £1. Registered office, 33, Charing Cross-mansions, W.C.

Leicester Electrical Engineering Co., Ltd. (179 533). Private company. Registered Feb. 9. Capital, £2 000 in £1 shares. To acquire the businesses of electrical engineers carried on (1) by T. Baker at 93, Upperton-road, Leicester, as "T. Baker and Company," and (2) by W. H. French at 346, Humberstone-road, Leicester, as "W. H. French," and to carry on the business of manufacturers of and dealers in electrical material, goods and appliances, electrical and other automobile accessories, etc. Permanent directors: T. Baker and W. H. French. Qualification, £100. Secretary, W. C. Quinn. Registered office: 11, Bowling Green-street, Leicester.

Metal Electrical Syndicate, Ltd. (179 561). Private company. Registered Feb. 8. Capital, £7 500 in £1 shares. To acquire interests in any invention relating to electrical deposit of metals, and to carry on the business of electro-platers, &c. Subscribers (each with five shares): A. E. Mawn, S. J. Quin, G. P. Millard, and A. E. Brain. Registered office, Westminster House, 7, Millbank, S.W. 1.

Ossorum Foundry Company, Ltd. (179 537). Private company. Registered Feb. 7. Capital, £15 000 in £1 shares. To take over the business of a manufacturer and caster in brass, gunmetal, aluminium, phosphor bronze, and other non-ferrous metals, carried on by M. T. Higgins at 28-32, Totterdown-street, Tooting, S.W., as the "Alumina Foundry Company," and to adopt an agreement with A. D. Hunter for the acquisition of a secret process for the manufacture of an alloy of alluminium and/or other non-ferrous metals known as "Ossorum Metal." Subscribers (each with one share): A. D. Hunter and F. A. Dandor. Subscribers to appoint first directors. Qualification, £250. Remuneration not more than 5 guineas each per meeting attended. Registered office, 28-32, Totterdown-street, Tooting, S.W.

Rock Safety Geysers, Ltd. (179 512). Private company. Registered Feb. 6. Capital, £300 in 1s. shares. Electricians, &c. Subscribers (each with one share), Ivy E. Fisher and W. T. Hick. Subscribers to appoint the first directors. Qualification, £5. Solicitors, R. S. Shackleford, Broad-street House, E.C.

Skirving Rutherford Institute, Ltd. (179 499). Private company. Registered Feb. 4. £500 in £1 shares. To carry on the business of medical electricians, makers of and dealers in reclining electric light baths, and other apparatus. Subscribers: W. Skirving Rutherford, and Amy Bernard. Registered office: 17, Bishops-road, Paddington, W.

Alfred E. Walker (Loughborough), Ltd. (179 543). Private company. Registered Feb. 8. Capital, £2 500 in £1 shares. To take over the business of a painter, decorator and signwriter, carried on by A. E. Walker at 16, Devonshire-square, Loughborough, Leics., and to carry on the same and the business of electricians, electrical engineers, &c. First directors, A. E. Walker (permanent managing director and chairman whilst holding 200 shares) and A. H. Walker. Remuneration until first general meeting, A. E. Walker £6 per week, A. H. Walker £5 per week. Secretary, A. H. Walker. Registered office, 16, Devonshire-square, Loughborough.

COMPANIES INCORPORATED OUTSIDE THE U.K.

Particulars of the North-East Service Inc. have been filed pursuant to Sec. 274 of the Companies (Consolidation) Act. The capital is $25 000 in $100 shares. The company was incorporated in the State of New York on Nov. 17, 1920, to carry on the business of dealers in electric motors, dynamos, electric supplies, &c. The British address is London. W. Frost, of 179, Queen Victoria-street, is authorised to accept service of process and notices. Directors: J. W. Tracy, C. W. Coopman, J. S. Fitch, and V. M. Swan, all of Rochester, N.Y. File number 2 069 F.

Particulars of Unipressure, Ltd., have been filed pursuant to Section 274 of the Companies (Consolidation) Act. The company was incorporated in Jersey on Oct. 8, 1921, with a nominal capital of £50 000 in £1 shares, to adopt an agreement with G. Le Marchand and to carry on business as financiers, concessionaires, miners, mechanical and electrical engineers, suppliers and transmitters of electricity and electric energy for lighting, heating power, telegraphic, telephonic, or other purposes, general agents, &c. Directors: A. S. Elmore, The Grove, St. Lawrence, Jersey engineer; R. H. Bingham; F. W. Brackett; and Dr. Friedrich Esser. The British address is 701, Salisbury House, E.C. 2, where J. A. Stocker, chartered secretary, is authorised to accept service of process and notices on behalf of the company. File number, 2 066F.

Catalogues, Price Lists, &c.

The Cheltenham Works, Ltd., are circulating a new edition of their illustrated catalogue containing details of Relmac and Super Reno lathes and accessories.

The latest trade price list of M.K. wall plugs and sockets, issued by the Heavy Current Electric Accessories Company, shows a reduction in prices of from 14 to 25 per cent.

Special features of the "Ediswan" primary batteries are given in the leaflet published by the manufacturers, the Edison Swan Electric Company. A useful list of addresses of the company's twenty-four depots is given on the last page.

Peyton & Peyton, Ltd., have issued a supplementary catalogue and price list of their latest electric light fittings. The Sloan Electrical Company, which represent the firm in the London district, the West of England, and on the South Coast, will be pleased to send a copy of the catalogue on application.

An illustrated catalogue of the Kestner Patent Water Tube Boiler has just been brought out by Ransomes, Sims & Jefferies, Ltd., who, as we announced in our issue of Jan. 6, have been appointed sole manufacturers and licensees in the United Kingdom, the Colonies and Dependencies, South America, Dutch Indies, and China.

The Clyde Electrical Company have published a list of their "Clydelco" cable sockets, which are made to conform to B.E.S.A. specifications. The advantages claimed for these sockets are that they are considerably heavier than those at present on the market; they are pressed from solid drawn copper tube, and are heavily tinned all over. The prices range from 1s. 3d. to £4 15s. per dozen.

"Notes on Automatic Telephony," issued by the Relay Automatic Telephone Company, is a nicely got-up pamphlet, setting out some of the advantages of automatic telephones in comparison with the old-fashioned systems still in use in many places. Points to interest the business man are dealt with, demonstrating the reason why the "Relay" automatic telephone is "the system of to-day and of the future." A number of interesting illustrations are given.

Simplex Conduits, Ltd., has issued a supplement (List No. 3) to their general catalogue of conduit and conduit fittings. It is solely a provisional means of giving the current prices, as, in the course of the next few weeks, the firm hope to issue a new and complete edition of the catalogue. Particular attention is drawn to the recent introduction of certain distinctive features in the Simplex conduit. For instance, every length of conduit, after being finally approved, is now marked with a distinctive red label: and every length of screw conduit sent out is fitted at one end with a screwed coupler, and at the other end with a cap of suitable material completely covering and protecting the clean threads which are cut after the enamelling of the conduit.

Patent Record.

SPECIFICATIONS PUBLISHED.

The following abstract from some of the specifications recently published have been specially compiled by MESSRS. MEWBURN, ELLIS & CO., *Chartered Patent Agents, 70 and 72, Chancery-lane, London, W.C.*

COMPLETE SPECIFICATIONS.

140 451 SIEMENS-SCHUCKERTWERKE GES. Means of changing the poles of four-phase windings of alternating current dynamo-electric machines. (30/6/17.
141 364 INDUSTRIAL RESEARCH CORPORATION. Electrical generating systems. (8/4/19.)
142 105 LINCOLN ELECTRIC CO. Electric arc systems, and particularly electric arc welding systems. (26/2/15.)
145 436 SIEMENS-SCHUCKERTWERKE GES. Protective arrangements for alternating-current systems. (20/12/18.) (Additions to 138 867.)
148 964 GES. FÜR NAUTISCHE INSTRUMENTE. Electrical contact device. (11/5/16.)
149 205 MYLO, E. Inclined carbon lamp provided with magnetic regulations of the arc. (28/6/18.)
149 920 AKT. GES. BROWN, BOVERIE ET CIE. Apparatus for starting single armature converters from the alternating current side. (16/8/19.)
151 962 WESTERN ELECTRIC CO., LTD. Repeaters for high-frequency electric signalling systems. (30/9/20.)
160 431 FORSHEE, J. K. Electrodes. (18/3/20.)
160 730 BOUCHEROT, P. Electric relays especially suitable for wireless telegraphy. (24/3/20.)
161 548 MEGERLE, E. Electro-magnetically operated sounding horns and the like. (10/4/20.)
166 518 METROPOLITAN VICKERS ELECTRICAL CO., LTD. Electrical controllers. (15/7/20.)
168 723 CLIFFE, J. W., & RUTTER, T. B. Automatically operated electric switch mechanism for use in connection with cinematograph apparatus to cut off the current in case of breaking of a film. (30/6/20.)
168 741 WEST & CO., LTD., A., & PAGE, G. Contacts for electric switches and other circuit closing devices. (12/7/20.)
168 804 IGRANIC ELECTRIC CO., LTD. (Cutler Hammer Manufacturing Co.). Controllers for electric motors. (2/11/20.)
168 812 WICKETT, J. H. Electrical treatment of ferreous metals during casting. (3/6/20). (Divided Application on 154 711.)
169 191 HOLSLAG, C. J. Electric arc welding systems. (25/3/20.)
169 199 CLOVER, H. K Electric faucets. (18/5/20.)
169 208 BRITISH THOMSON-HOUSTON CO., LTD. (General Electric Co.). Systems of Electrical control for dynamo-electric machines. (20/5/20.)
169 239 TWISS, G. V. Fittings for electric pin insulators and the like. (17/6/20.)
169 243 LAZARUS, S. A. Telephone instruments. (18/6/20.) (Cognate Application 6 285/21.)
169 246 IGRANIC ELECTRIC CO., LTD. (Cutler-Hammer Manufacturing Co.). Charging-appartus for electric-storage batteries. (18/6/20.)
169 250 RADIO COMMUNICATION CO., LTD., & LEA, N. Production of electrical oscillations by means of thermionic valves. (19/6/20.)
169 257 STOCKWELL, E. J., & FALK, STADELMANN, & CO. Method of securing metallic contact or electrical continuity between unscrewed tubes and fitting in conduit wiring systems. (21/6/20.)
169 280 COATES, W. A., DAVIES, D. R., & METROPOLITAN-VICKERS ELECTRICAL CO., LTD. Electrical switch-gear. (22/6/20.)

APPLICATIONS FOR PATENTS

November 19, 1921.

30 907 SULLIVAN. Duplex, &c., telegraphic systems.
30 930 SCHIERWATER. Electric smoothing irons, kettles, &c.
30 935 ASPDEN. Incandescent lamp holders.
30 959 ENGLISH ELECTRIC CO. Packing device for use between fixed and rotating parts.
30 968 B. T.-H. Co. (G. E. Co.). Electric heaters.
30 973 MARKS (S. A. A. E. Soc. Anon.). Protecting devices for electric installations.
30 983 LAWSON. Electric bells, gongs, &c
30 984 AYMARD. Electrically operated horns.
30 993 BROWN. Electrical recording and reproduction of sound.
30 994 MARKS (S. A. A. E. Soc. Anon.). Multiplication of phases of a.c. network.

November 21, 1921.

31 006 HYLAND. Portable electric lamps.
31 014 PILKINGTON. Electric transmitters.
31 021 RAILING, OWEN & QUANCE. Insulated connector for electric conductors.
31 027 SYKES. Electro-magnetic apparatus for recording sound.
31 033 FULLER. Storage battery containers
31 043 SHEARER. Electric ignition timers or distributors for internal combustion engines.
31 057 CRUICKSHANK. Electrodes or anodes for prevention of corrosion in boilers, &c.
31 069 MÜLLER. Excess voltage cut-out.
31 080 CHAMBERLAIN & HOOKHAM & JAMES. Instruments for measuring wattless component of alternating currents
31 083 ELLIS & VINES. Electric heat radiators.
31 095 AUTOMATIC TELEPHONE MFG. CO. Telephone instruments. (7/12/20, U.S.)
31 096 CARLES. Apparatus for overcoming effects produced upon telegraph, &c., lines by vicinity of s.p. currents. (4/3/21, France.)

November 22, 1921.

31 121 FORGES ET ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE JEUMONT. Mounting armatures of electrical machines. (23/11/20, France.)
31 122 FORGES ET ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE JEUMONT. Commutation of d.c. machines. (23/11/20, France.)
31 147 SUMMERS. Terminal ends for electric wires and cables.
31 169 DALGLEISH & SCHATTNER. Electric cookers and radiators.
31 225 B. T.-H. Co. (G. E. Co.). Electric instruments.
31 229 MYERS. Automatic switches.
31 249 WESTERN ELECTRIC CO. Switches. (26/11/20, U.S.)
31 252 HADDAN (Neumeyer Akt. Ges.). Electric starters for internal combustion engines.
31 270 WEEKS PHOTO-ENGRAVING CO. Apparatus for electrical etching. (2/4/21, U.S.)
31 271 SEIDNER. Liquid-cooled electric machines. (29/12/17, Germany.)
31 274 MONNOT. Electrical switching devices for sound warning signals.
31 275 WEEKS PHOTO-ENGRAVING CO. Electrical etching. (25/4/21, U.S.)

November 23, 1921.

31 325 SCHUIL. Fuses or cut-outs.
31 312 TURTON. Electric horns.
31 332 RAILING & WILSON. Liquid rheostats.
31 353 RADIO COMMUNICATION CO. & LEA. Production of unidirectional currents from alternating currents.
31 376 COOMBE & WEBBER. Holders with locking devices for incandescent lamps.
31 387 MEIJER. Coupling a.c. generators in parallel.
31 394 B. T.-H. Co. (G. E. Co.) Switches.
31 395 ENGL & MASSOLE & VOGT Electro-static telephones
31 407 NEUMANN. Accumulators. (17/8/21, Germany.)

November 24, 1921

31 432 HITCH. Motor for utilising electro-magnetic energy of the earth.
31 437 BORLAND. Electrically-driven gear for conversion of hand-operated knitting machines to power driven.
31 461 BULL. Steam wagon electric lighting set.
31 490 SIEMENS BROS. & CO. & HUMPHRIES. Selecting devices for automatic, &c., telephone systems.
31 502 CONTELL. Alternator.
31 509 WESTERN ELECTRIC CO. Applying magnetic material to electrical conductors. (8/12/20, U.S.)
31 510 WESTERN ELECTRIC CO. Electro-magnetic relay.
31 511 WESTERN ELECTRIC CO. Signalling systems.
31 517 KRAUSSER. Electric lamps. (20/12/20, Germany.)
31 536 GES. FÜR DRAHTLOSE TELEGRAPHIE. High frequency telephony. (5/2/21, Germany.)
31 537 GES. FÜR DRAHTLOSE TELEGRAPHIE. Wireless direction finding apparatus. (14/12/20, Germany.)
31 538 GES. FÜR DRAHTLOSE TELEGRAPHIE. Thermionic generators. (11/1/21, Germany.)
31 539 GES. FÜR DRAHTLOSE TELEGRAPHIE. Circuits for electrical oscillations. (25/11/20, Germany.)
31 544 STEELE, MCCARTHY & MARTIN. Arc welding.
31 545 DAVIS. Electric telegraphs.

November 25, 1921.

31 568 BOSCH (R.) AKT. GES Ignition apparatus. (25/11/20, Germany.)
31 572 TANT. Electric wall-plugs, &c.
31 595 IDE & PAINTER. Electric switches.
31 597 SPARKS & TONKS. Electric switches.
31 604 HELMORE. Electric switch locator.
31 622 KRUPP (F.) AKT. GES. Process for producing electrically insulating and mechanically adherent coating on metal. (13/12/20, Germany.)
31 642 BARRINGTON, GOLDFARB & BOTTOM. Fuses.
31 646 HUNT. Battery case carrier for road vehicles.

November 26, 1921

31 664 SIMPSON. Anti-vibration device for electric lamps.
31 730 B. T.-H. Co. (G. E. Co.). Switches

November 28, 1921.

31 754 HOPE. Electric fuses or cutouts.
31 755 & 31 756 HOPE. Ironclad switches.
31 772 LEPINE. Switch and distribution boxes, &c.
31 793 CROMPTON & Co., & HOUSTON. Wooden poles for carrying overhead wires.
31 816 DIXON. Telegraphy.
31 824 NOBLE. Telephone sub-station metering and/or tolling.
31 834 METROPOLITAN-VICKERS ELECTRICAL CO. Electrical measuring instruments. (7/12/20, U.S.)
31 839 SONDURE ANTOGÈONE FRANCAISE. Electric welding of cast iron. (24/12/20, France.)
31 843 SAYERS. Windings for armatures of electric machines, &c.

November 29, 1921.

31 873 FORGES ET ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE JEUMONT. Power integrating and limiting systems. (3/12/20, France.)
31 879 MACAULAY. Electric lighting systems.
31 884 LINFOOT. Electric pipe, &c., lighter.
31 900 WILLIAMS. Electric fuses.
31 927 FULLER'S UNITED ELECTRIC WORKS & WELCH. Galvanic batteries.
31 936 KNAPP (F.) AKT. GES. Overload switches for protection of motors. (30/12/20, Germany.)
31 938 WHITE. Electric motor for gramophones, &c.
31 948 OWEN. Radio receiving systems, &c.
31 950 JENSEN. Multi-wire safety fuse.
31 960 SILICA SYND, KING, & REYNOLDS. Mercury, &c., vapour lamps.
31 976 B.-T.-H. Co. (G. E. Co.) & POLLOCK. Electric motor controllers.
31 982 YERBURY. Cooling apparatus.
31 997 DUCKENFIELD, ROSS, & JUBB. Electro-magnetically locking railway carriage doors, &c.

November 30, 1921.

32 019 TAYLOR. Reducing capacity current losses in cables.
32 025 MONSON. Therapeutic arc light projector.
32 058 BRAMLEY-MOORE. Apparatus for electro-therapeutic use.
32 059 BRAMLEY-MOORE. Instrument to bend rays from an arc.
32 066 & 32 067 DORING. High-frequency transformers.
32 094 PHI-KAPPA SYND. & KLUITJMANS. Electric irons, ovens, hot-plates, &c.
32 101 BAYNHAM. Electric power transmission mechanism.
32 107 FROST. Thermionic valves.
32 122 HOOD. Distributors or commutators of electric ignition systems.
32 139 PRICE. Electric switching or commutating devices.
32 140 PREMIER ELECTRIC WELDING CO. & PATERSON. Electric arc welding.

December 1, 1921.

32 159 HEURTLEY. Working of telegraph cables.
32 160 TURNER. Wireless telegraph receivers.
32 184 MATHER. Gas and electric heaters, &c.
32 188 COX. Apparatus for cooling electric resistances or electrically heating fluids.
32 211 PHI-KAPPA SYND & KLUIJTMANS. Electric fuses.
32 212 PHI-KAPPA SYND. & WATSON. Electric heaters and commutators for use therewith.
32 236 METROPOLITAN-VICKERS ELECTRICAL CO. (Westinghouse Electric and Manufacturing Co.). Switches.
32 241 SEYFFERTH & HANSEN GES. Electro-magnetic devices for heavy current switches. (6/12/20, Germany.)
32 252, 32 253, 32 254, & 32 255. BRYAN. Electric heaters.
32 277 ALLOY WELDING PROCESSES, LTD., & JONES. Electrodes for soldering and depositing metals.

The Editorial, Advertisement and Publishing Offices of "THE ELECTRICIAN" are at 8, Bouverie Street, London, E.C. 4. Telegrams: Benbrotric, Fleet, London. Telephone: City 9852 (5 lines). The subscription to "THE ELECTRICIAN" is £2 12 0 per annum in the United Kingdom, and £2 14 0 per annum Abroad. Advertisement Rates can be obtained on application to the Manager. Advertisement copy and blocks should be received on the Friday preceding date of publication.

THE ELECTRICIAN

ESTABLISHED 1861.

THE OLDEST WEEKLY ILLUSTRATED JOURNAL OF

Electrical Engineering, Industry, Science and Finance.

No. 2284. [Vol. No. 8. LXXXVIII.] FRIDAY, FEBRUARY 24, 1922. Prepaid Subscription U.K., £1 12s. per ann.; Abroad, £1 14s. Price 1/-

CONTENTS.

Notes of the Week.

"The Electrician" Sixpence Again.

Beginning with next issue, the annual subscription to The Electrician will be reduced from 52s. to 25s., and single copies will be obtainable at 6d. instead of 1s. each. Existing subscribers will receive immediate benefit from these reductions by having the unexpired balance of their subscriptions spread over an additional period, the exact length of which will depend on the amount of prepaid subscription standing to their credit on March 1. The Electrician has long been regarded as an impartial mirror of the doings and views of the electrical industry as a whole. The electrical industry, perhaps more than any other, is dependent for its progress on constant research and investigation, and it is felt that the conclusions of scientists engaged in such work, as well as questions of policy and the latest news, should be available to every student of electrical matters at a price suited to his purse, be it fat or be it slender. The Electrician contains, week by week, information which is absolutely indispensable to its readers. Indeed, for the man who takes his profession seriously it is not a question of whether he shall or shall not read it: he knows perfectly well he must read it if he is to keep abreast of the times. The appeal of The Electrician has been greatly widened during the past few years, and abundant evidence reaches us that in its present form the paper provides just the medium of expression which members of the electrical profession and industry everywhere are seeking.

The Institution Jubilee.

Once again The Electrician has distinguished itself by being in advance of the times—in this case nearly twelve months. For in our issue of May 13, 1921, we called attention to the fact that on May 17, 1871, was held a meeting which resulted in the formation of the Society of Telegraph Engineers, and to the development in subsequent years of this small body into the Institution of Electrical Engineers, with a Royal Charter and a membership of over 10 000. We confess that at the time we were surprised that we were almost alone in celebrating this event, and that the Institution itself took no particular steps to mark its birthday. It now appears that though May 17, 1871, was the true date of birth, the first council meeting was only held on June 30 of that year, while several months were spent in collecting materials for the meeting of the opening session, so that the "working life" of the body did not begin until February 28, 1872. While it may be argued that any body has a perfect right to celebrate its anniversaries when and how it pleases, it may also be pointed out that the policy adopted on this occasion creates a new terror for biographers. In accordance with this law a man's career starts, not with his birth, but with the beginning of "his working life"—rather a nebulous milestone. This foreshortening will often deprive us of much entertainment, and will add both simplicity and complication to the preparation of the chronicles of the men and doings of future times.

Fathers of Electrical Science and Industry.

In arranging the Jubilee Commemoration of the Institution the Council took a wise course. For history and tradition were the foundations of the meetings that have been held this week. The lessons that can be learnt from the remarks of the various speakers are that the enterprise, foresight, and optimism of the pioneers—qualities which have assisted much to make the electrical industry what it is to-day—will be required in ever greater measure in future, as the hill we have to climb seems to become ever steeper, and the field that it is our duty to till opens ever more and more upon our view. Prof. Fleming spoke pointedly and instructively on the theme of Faraday, a name which will ever be honoured among electrical engineers as connoting all that is best in human nature, whether it be considered from the point of view of the scientist or the man. Subsequent speakers, while dealing with their

own experiences, did honour to KELVIN, CLERK MAXWELL, BRIGHT and SIEMENS, to take as typical the many names that are household words in the electrical industry. Especially do we commend the remarks of Mr. WORDINGHAM on HOPKINSON, a man who, as FARADAY was the father of electrical science, was the father of the modern electrical industry. It is by considering the work, no less than the personality, of such men that electrical engineers may gain encouragement to deal with the tasks that lie before them. In this connection we should do well to remember, as the "Westminster Gazette" reminds us, that "The Institution of Electrical Engineers is our own," though we welcome the idea that "its celebration of its fiftieth birthday is a matter which the world at large may well be inclined to share with us." In fifty years the Institution of Electrical Engineers has erected a great tradition. It is for electrical engineers of the present to do all they can to increase the brightness of its glory. It may then be said that the commemoration was a great success, and that the only regret of those present was the forced abstention of the PRESIDENT from the proceedings. The commemoration was Mr. HIGHFIELD'S idea. He must console himself with the fact that he is not the only creator who has failed to see the culmination of his work.

The Revision of Electro-magnetic Laws.

IN a Paper recently read before the Franklin Institute, Dr. CARL HERING points out that some so-called "universal" laws require restatement. At all events, experiments can be devised which apparently violate some of the rules of electromagnetism. One old and well-known law, given in every text-book, is that "like currents attract and unlike currents repel.' Dr. HERING contends that the law so stated is incorrect. Interpreted literally, it would lead to the inference that the current density in a conductor was greater at the centre than at the periphery, and, further, that in an electro-plating bath there would be a denser deposit at the centre of the anode that at the edges. This is not the case. The law should accordingly be reworded to state that attracting and repelling forces act on the conductor, not the current *per se*. Another interesting problem is the "pinch effect," *i.e.*, the tendency of a liquid conductor carrying a sufficiently high current to contract at the centre, breaking the circuit. The contraction is accompanied by marked movement of the liquid conductor in the direction of the axis, and there appears to exist a self-produced stretching force, which is utilised in electric furnaces to expel the molten metal. There is also evidence of a force tending to stretch a conductor axially, thereby tending to increase its length, and its existence can be illustrated by experiments with mercury troughs.

Maxwell's Law Doubted.

SOME physicists maintain that all electromagnetic forces influencing a conductor must of necessity be perpendicular to its axis, not axial. The observed effects, however, require some explanation. Dr. HERING also questioned the usual version of MAXWELL'S familiar law, based on the alteration of the magnetic flux in a circuit. He has devised circuits which, when unlinked, give no induction because the circuit cuts the flux, but the conductor does not. This distinction Dr. STEINMETZ has attempted to observe in a new version of the law. A number of other ingenious experiments are described in Dr. HERING'S paper. All indicate some degree of revision in the usual wording of electromagnetic laws. Dr. HERING, however, appears to have evolved one general law, "that a current-carrying circuit will tend to produce any and only such motions of its conductors as will produce a counter E.M.F. somewhere in that circuit" (though not necessarily in the moving part). We commend the Paper to the notice of educationists, who may find some of the experiments, mostly easy to repeat, a valuable aid in promoting knowledge of the principles underlying electromagnetic phenomena, and possibly as an indication that a revision of the customary wording of rules and laws is desirable.

Electric Traction—A Distribution Question.

IN the course of the discussion on Mr. F. P. WHITTAKER'S Paper on "Rotary Converters with Special Reference to Railway Electrification," Major A. M. TAYLOR delivered an oration on single-phase and direct-current traction from what may be called the mains engineer's point of view. It is true that his remarks were not very closely connected with rotary converter design, nevertheless they were highly interesting, and as pressure on our space, caused by the Textile Issue, prevents our dealing with the Paper this week, they may be referred to here. This is Major TAYLOR'S argument: For the section of railway between, say, London and Birmingham, 1 500 V is nothing like a high enough pressure to employ, as, with the present traffic, the natural and proper spacing for the sub-stations would be thirty-six miles, and at that voltage no sub-station could economically feed a length of more than six miles, and even then there would be a transmission loss of 10 per cent. In other words, to deal with a total train load of 6 000 kW, 36 000 kW of sub-station plant would be required, of which, under the worst conditions, only 6 000 kW would be in active operation.

The Advantages of Single Phase.

ON the other hand, by employing single-phase traction at 11 000 V, only three static sub-stations would be required, with an aggregate capacity of 6 000 kW, at one thirty-sixth of the price that would be necessary for direct-current traction. Thus, though a little efficiency on the locomotives might have to be sacrificed, there is every argument for employing single-phase rather than direct-current for main line working. We agree. But we must also point out that Major TAYLOR'S comparisons are not quite fair. According to him, traffic between London and Birmingham consists only of express passenger trains. But at both ends there is a fair, and growing, suburban traffic, while the freight load, a most important factor, must not be neglected altogether. Taking these additional influences into consideration, it could be shown that an aggregate sub-station load factor would be much better than that given by Major TAYLOR, though his arguments in favour of single-phase on the rural sections would equally stand. We are glad this point has been raised, for it is often forgotten in traction discussions. The sub-station and distribution problems are just as important as the locomotive and track equipment, and are more purely electrical questions.

Yorkshire Electric Power Progress.

A SATISFACTORY account of progress and of development was placed before the shareholders of the Yorkshire Electric Power Company at the annual meeting on Tuesday. Though the company, whose area of supply is a mining and industrial one, was seriously affected by the coal strike, yet its net revenue is about £10 000 more than in the previous year. Notwithstanding the strike, the output was practically the same as in 1920, but under the operation of the coal clause there was a decrease in consumers' charges and also in revenue. However, the economies effected in generation and distribution more than counterbalanced this drop in revenue, with the result that the directors have been able to pay the same dividend (eight per cent.) as in 1920

on a largely increased capital. In addition, there is the same allocation to reserve and a larger amount is carried forward. This is an excellent record for a year full of difficulties, and it reflects the greatest credit upon the policy and management of the company.

Projected Extensions.

The chairman, Mr. A. G. Lupton, referred in cautious though confident terms to the inquiry into the organisation of electricity supply in the Aire and Calder district, and he announced that the directors had in mind the provision of a full and economical supply of electricity for all industries in the West Riding and for electric traction when the railway companies needed a supply. The growth of the company will shortly involve the erection of a new power station at Ferrybridge and the laying of heavy trunk mains. For these purposes and for plant extensions at Thornhill and Barugh and other works, the company want more capital, and therefore an issue of preference shares is being made. The terms of the issue are attractive, and as the prospects of the company are so good we have no doubt the public will subscribe the money as readily as for recent electrical issues. In fact, electricity supply securities are now looked upon with particular favour, and we are confident that the investing public will be justified in their choice.

The Company's History.

Though the company's revenue in 1905, the first year of its operation, was only about £1 000, the figure has now grown to nearly £370 000, every year bringing increased revenue and profits. There are now 440 miles of mains, and during the past year extensions of mains and substations have been made for giving a bulk supply to the Corporations of Dewsbury and Todmorden and to the Urban Councils of Elland and Honley. Arrangements have also been made with Sheffield and Rotherham for joint working in the interests of cheap supply. These facts prove conclusively that the company is facing its public responsibilities in the right way and in the right spirit, for with closer co-operation between the various supply authorities in the District the era of a cheap and abundant supply of electricity, so essential to industrial progress, will be brought within reach, and when this happens there will be a reduction of production costs, bringing in its train increased output and prosperity to the West Riding and to the country as a whole.

The Owner's Risk Scandal.

The principle of heads I win, tails you lose, which is generally applied in dealings between Government Departments and private individuals must now be extended to dealings with the railway companies, for the judgment delivered by the House of Lords last week in the case of Smith *v.* The Great Western Railway Company proves conclusively that redress cannot be obtained for the loss of goods carried on railways at the owner's risk rate. The dispute arose over a parcel of goods handed in at Birmingham for delivery at Wilton, but not only did the goods never reach their destination, but all trace of them was lost. As our readers are aware, an owner's risk contract relieves the railway company from all ordinary risks except on proof of wilful misconduct by its servants, so that, as Lord Buckmaster pointed out in the course of his judgment, even the apparent protection of the trader is illusory, for it is exceedingly difficult to prove wilful misconduct, especially as evidence of such misconduct must rest exclusively with the railway company. In practice, therefore, railway companies may carry goods or lose them as they choose, and traders have no redress.

A Premium on Pilferage.

The matter is of more than usual consequence at the present time, when goods pilferage has increased enormously, a practice which is not likely to be suppressed until transport undertakings are compelled to take greater care of the goods entrusted to them. But the present is also an opportune time for a change in legislation, for equitable provisions could be inserted in the amalgamation schemes under the Railways Bill which will shortly be before Parliament. If this is not done we fear that matters will go from bad to worse, as the larger the undertaking, the greater its inertia. The Federation of British Industries, the B.E.A.M.A., the British Engineers' Association, and other trade organisations would do well to take the matter up so as to compel the companies to take some responsibility for their servants' acts. This could best be done by altering the law to throw upon the companies the burden of proving that reasonable care has been taken by them and their servants in the handling of goods.

"Heaviside" Reprinted.

Matured readers of The Electrician will be interested to learn that Benn Brothers, Ltd., have made arrangements to reprint a small edition of Oliver Heaviside's "Electromagnetic Theory." The edition will be limited to 250 copies, and the three volumes will be sold only in sets, at a price of five guineas net. Aeronauts in the upper air of electrical theory are aware that this work has long been out of print in a complete form. Its value, however, is undiminished, and to those engaged in wireless research its unobtainability is a loss which our publishers are now about to make up. It may indeed be said that, like wine, "Heaviside" improves with age, and we are glad to see that the date of its publication figures in the "Brief Chronology of Electrical Discovery and Invention" which has been issued by the Institution in connection with the Jubilee celebrations.

The Industrial Future in India.

Even those who do not take a close and expert interest in Indian matters know that that country is at present a storm centre. That this should be so is not unnatural. For though India escaped from the main influences of the war, the clash of the conflict and the spread of education have in recent years disturbed the even tenor of its immemorial way and are, in fact, the heralds of profound changes in both political outlook and industrial development. Of the political aspect of these changes it is not for us to speak, but as Dr. J. F. Crowley shows, in an article which we publish on another page of this issue, the industrial fact of this change is one which engineers, and especially electrical engineers, will soon have to contemplate and to which, therefore, they should lose no time in giving their undivided consideration. Especially is the problem one of power. For while India is mainly agricultural, in its large towns industry is growing and in this issue it is particularly interesting to note that the production of textiles is rapidly increasing.

Hydro-Electric Power in India.

Now power in India means wealth, and we have, therefore, often wondered at the comparatively slow progress made in the development of hydro-electric power in that Empire. Though vast resources are available, as the hydro-electric survey of the Government has disclosed, only a small percentage is as yet being utilised. Several grave obstacles to progress provide an explanation of this. Among them

are obsolete laws, bureaucratic methods and conservative native customs. This is clearly brought out in the paper read by Mr. A. T. Arnall, before the East India Association, which appears in abstract on another page of this issue, and in the article by Dr. Crowley to which we have already referred.

Legislative Amendments Necessary.

It is clear for instance that amendments of the Acts relating to the acquisition of land and to the supply of electrical energy are necessary to bring about a desirable stimulation of hydro-electric development. At present before a water power concession is granted the Local Government insists upon the submission of a definite scheme, and before land can be acquired there is a preliminary inquiry to ascertain whether the land is " needed for the construction of some work," and whether the work is " likely to prove useful to the public." If both questions are answered in the affirmative the promoting company must enter into an agreement with the Secretary of State for India in Council, which contains the conditions on which the land is held. There is no definition of a public utility undertaking in the Act, and, as usually happens when there is no standard of comparison to serve as a guide, the interpretation of Government officers differs widely, with the peculiar result that it is at present doubtful whether electro-chemical and other subsidiary industries which would greatly assist in the development of a large hydro-electric scheme would be covered by the provisions of the Act. Great obstacles are placed in the way of transmission schemes where power to supply in the area traversed has not been obtained.

Working in the Dark.

As power developments depend upon private enterprise it is necessary that the conditions on which land can be acquired should be quite definite and known to the investing public before the flotation of a company. At present the public are asked to subscribe to a power company on the concession of the Government, and it is only after this that the Agreement with the Secretary of State for the purchase of land can be drafted and signed. It is therefore not surprising to learn that there has been little eagerness on the part of financiers to invest their capital in these enterprises.

Some Other Obstacles to Progress.

Other obstacles in the path of the hydro-electric pioneers in India are the absence of the right to pay suitable interest out of capital during the construction period, and the terms upon which an undertaking can be purchased. At present a registered company may pay interest not exceeding four per cent. on its paid-up share capital, but this rate is quite inadequate under present conditions, and as private bill legislation is unknown in India, the only way out of the difficulty is to amend the Indian Companies Act of 1913.

Compulsory Purchase Difficulties.

As regards purchase, the local authority or the Local Government has the option of purchasing compulsorily a licensed undertaking after a period not exceeding fifty years at the fair market value of the lands, works and plant, but excluding the " generating station," unless the latter is declared in the licence to form a part of the undertaking for compulsory purchase. Apart from the fact that it is not clear what the " generating station " of a hydro-electric scheme would include, this " concession " is quite inadequate to attract capital except in a limited number of cases where there is a good local demand for power. As is well known, it usually requires about five years to construct such works, and subsequently some years are needed to develop the domand for electricity so that the remunerative life of a concession would, under present conditions, be less than forty years. It is clear, therefore, that the Government must revise its policy without delay and grant concessions for water-power development which will be more attractive than they have hitherto been. That is, of course, if they want such development to take place. The best way to do this would be to appoint a Committee upon which would be placed not only those who are familiar with Indian conditions, but those who have had up-to-date experience of modern power generation and transmission problems.

Bombay Cotton Developments.

How necessary this is is shown by the fact that over 130 water-power sites were disclosed by the Government water-power survey, and it is estimated that there is a total of 1 774 000 continuous electrical horse-power in sight, though even this is only a small fraction of the actual available power. The total capacity of the existing hydro-electric plants is only 91 325 E.H.P. and 148 750 E.H.P. is under construction. Out of this total 79 per cent. is for the supply of power to Bombay city, the centre of the cotton spinning and weaving industry in India. Already the great majority of the mills in this area use electric power, and as the hydro-electric schemes promoted and managed by the Tata Company will ensure an abundant supply of cheap power to the city, considerable development is likely to take place in the next few years. The Tata companies will eventually be capable of supplying 915 000 E.H.P. for 3 600 hours a year at a maximum of $\frac{3}{4}$d. a unit. So great is the demand for power that one of the companies (the Andhra Valley Power Supply Company), though not yet in a position to give a supply, has contracted with the mill owners for the whole of its output at 0·735d. per unit. Its generating plant consists of six 8 000 kW sets and energy will be generated at 5 000 V, 50 cycles and transmitted at 10 000 V to the city where it will be transformed down to 2 000 V, the standard pressure for local mill driving.

Further Reasons for Encouragement.

There is a further reason for the encouragement of trade in India in the bold bid which is being made by other countries, especially Japan and the United States, to capture the import market. As it is the curves which Dr. Crowley give show how the textile industries are growing, while even the iron and steel industries and heavy engineering manufacture are on the upward grade. Apart from power, however, sociological conditions need special study. The weavers in the State of Madras claim to be of the Brahmin caste, and cannot be induced under any circumstances to work in factories. This at present rules out the use of the electric drive, though with more education and modified conditions that may come in time. Handspinning is, however, uneconomic, and here therefore lies a great opening for modern methods. There are, it is obvious, ample problems for solution, and it is to be hoped that the Indian Government will tackle them in a public-spirited way. There is the more reason for this as such developments will increase the earning powers of the country, and by increasing prosperity blunt the weapons of the agitators whose only object is to do harm. Given his way on the other hand, the engineer can do the greatest good. There can be no difference of opinion, therefore, on the choice of course to be taken.

Helping the Textile Industry.

This issue of The Electrician is the fourth which we have specially devoted to a consideration of the application of the electric drive to the operation of textile machinery. On this occasion the question is dealt with on the broadest lines by various contributors. Mr. W. J. H. Wood, of Bolton, discusses the various factors which will enable a mill owner under present conditions—which are very different from those of a few years ago—to decide whether he should use the electric drive in his mill, and whether, should he decide in favour of the electric drive, he should obtain his supply from the public supply mains or from private generating plant. Mr. A. W. Stevenson deals with the electric driving of Scottish woollen mills. These mills are a class of textile factory where special conditions rather favourable to the electric drive are present, principally for the interesting reason that water has long been used as a source of power. The presence of water, however, encourages rather than rules out the use of electricity supply, as will be apparent from the article on the installation at Ballantyne and Company's Walkerburn mills, which appears on another page of this issue, and from the details which Mr. Stevenson gives of the equipment in P. and R. Sanderson's mills at Galashiels.

Textiles and Hydro-Electric Storage.

In the former mill water-wheels were used for over sixty years to supply the necessary power, but owing to extensions, the inefficiency of the transmission within the mills and the hydraulic losses it was decided as soon as the necessary rights could be obtained to adopt electricity supply obtained from modern water turbines for driving the machinery. To do this economically meant the solution of a number of interesting problems, and especially did it necessitate the storage of power on lines which the Severn Barrage Scheme has made familiar. Fortunately, topographical conditions made this possible, and the result is a most interesting scheme on which the millowners and the contractors, Boving & Company, are equally to be congratulated. Though this is not primarily a textile question, the way in which this work is carried out is a gratifying indication that the possibilities of the employment of what water power we possess are not being neglected.

Textiles and Daylight Standards.

The problems of the textile manufacturer do not, however, stop at the spinning or weaving of the material, matters with which we have dealt exhaustively in former textile issues. There remains the great difficulty of dyeing the product, and beyond that again the even greater difficulty of selling it. With dyeing, as dyeing, the electrical industry has not much concern, except that we may express the hope that the work and enterprise which has in recent years been put into attempts to recover a lost industry will not fail of success. But one of the chief problems of dyeing is not so much to colour the material, as to colour it to an exact tint which can be reproduced with accuracy as often as may be required. Modern tastes for variegated and brilliant colours, both in dress materials and in furnishing, therefore impose a dual problem on the textile manufacturer—the production of a hard-and-fast colour and its accurate matching with material of the same colour that has been placed on the market or used as a sample. This problem is not simple. For one thing, it is immensely complicated by the limited nomenclature used to identify colours and tints. It is further complicated by the fact that there is no standard illumination for matching purposes, and that fabrics of certain colours present quite a different appearance in artificial light from what they do in daylight.

A Standard of Illumination Necessary.

Some standard of illumination which shall be stable, and shall correspond as closely as possible to "north-sky" illumination is required. The problem has received a good deal of study, and, as Mr. Dow shows in his article, is now in a fair way to be satisfactorily solved. In quite another way than in the matter of driving can electricity be of use to the textile industry, for such artificial daylight can obviously only be obtained by electrical means.

Electricity as a Factor in Production.

The information which we publish in this issue will, we hope, therefore interest, if not convince, the textile manufacturer of the advantages of using the many ways in which electricity can help him to cheapen his production and thereby the more readily to sell his product. As is only too well known, the textile industry is passing through a period of grave depression. The cost of production is high, raw materials and selling prices follow suit, and demand naturally dwindles. Under such conditions, to advise the textile manufacturer to embark on fresh expenditure for motors and other electrical equipment is rather like offering the man who requires bread a suit of clothes. But there is this about a suit of clothes given to a starving man—it can be turned into money. Equally would the adoption of the electric drive mean money to the textile manufacturer, and the relief from burdens which are inseparable from the use of steam plant. Nor must the gain to the amenities of the Lancashire towns and the improvements in the health of the workers which would be made possible by this means be forgotten.

The Electric Heating of Mills.

All this is clear enough from Mr. Wood's careful analysis of the various methods of driving and power production that the textile manufacturer may employ. From the electrical point of view the matter is complicated by the need for steam in the textile factory. To remove the boilers, therefore, is to deprive the manufacturer of a commodity that he needs, and at once mitigates the use of electricity supply, at any rate when it is drawn from the public mains. But as Mr. Wood hints, even for heating textile mills, it is possible to use electricity, and we shall look forward with interest to the publication of the details of the installation in which this is done.

The Electrical Industry in a Strong Position.

Fortunately for real progress, the electrical industry is in a stronger position with regard to the textile issue than it was twelve months ago. For one thing, the prices of supply are falling, though this movement might well be accelerated. For another, the generating plant in the central stations is no longer overloaded, and deficiencies are rapidly being made up. For a third, electrical manufacturers are in a position to give speedy deliveries of the necessary equipment. All these, in conjunction, should result in steady progress. As Mr. Wood points out, there is no need to exaggerate the claims of the electric drive. It is not perfect, but it is a good deal better than anything else, and it can give advantages to the textile manufacturer which are obtainable in no other way.

The Textile Industry and Public Electricity Supply.

By W. J. H. WOOD,
Manager, Bolton Corporation Electricity Department.

The textile manufacturer, Mr. Wood points out, wishes to be convinced that in adopting the electric drive he will gain advantages which cannot be obtained in any other way. The problem has many sides, and Mr. Wood considers the particular cases of an existing steam-driven mill changing over to the electric drive and of a new mill; and in both cases the relative economies of private generation and public supply. The heating problem, which is in many cases the determining factor, is shown to be capable of solution by electrical means.

Only those who dwell in industrial districts, and especially in Lancashire, within a fifty-mile radius of Manchester, can fully realise the advantage it will be to the general community if the long-promised, and so much talked-of, cheap and abundant supply of electricity materialises, and is generally applied, as a form of energy, for all industrial purposes.

It is only necessary to stand and observe, from some of the heights of the beautiful, rugged moorlands, so often to be found within a few miles of the centres of industry in Lancashire, fully to appreciate the enormous advantage it would be, from a health point of view, quite apart from any commercial consideration, to remove that depressing blanket of smoke which hangs like a pall over the vista at one's feet.

Lancashire's Staple Industry.

It must be generally known to readers of THE ELECTRICIAN that the staple industry of Lancashire is cotton spinning and the resultant textile trades. Consequently it must be equally well known that Lancashire, as the home of the textile industry of the world, must also present great possibilities for improvements in power production. The greatest advantages to all are, of course, those resulting from a centralisation of power and a cheap and abundant supply of energy, for all purposes, so essential to every manufacturer. Consequently the subject of electricity supply, as applied to the textile industry, much as we have heard of it during recent years, must be of interest not only to the electricity supply engineer, but to the manufacturer of electrical machinery, and especially to the user of energy—the textile manufacturer.

Those who have had experience in pushing the sale of electrical equipment for textile purposes, and those who have canvassed the manufacturer to become a user of electrical energy, perhaps alone fully appreciate the difficulties that have been overcome, to attain even the present-day demand for electrical driving in this industry.

A Cheap Supply of Power Essential.

The Lancashire textile manufacturer is generally a shrewd business man who knows what he wants. One of the chief things in which he is interested is a cheap supply of power for operating the machinery he uses to manufacture the textile goods he deals in, whether it is cotton or any other industry connected with cotton. Whether this power is supplied to him from an outside source, or whether he produces it himself, depends upon how much it will cost him to produce, compared with how much it will cost him to buy.

Although in very many instances the stumbling-block has been prejudice against something new, yet it must be admitted that, in most cases, it has been due to the cost. It has been impossible for the seller of electrical equipment and the producer of electrical energy to convince the textile manufacturer that it would pay him to buy power rather than to produce it himself. Hence we are still constantly faced with such remarks as: "Yes, I should like to drive my mills by electricity, but it is much too expensive as compared with steam." And yet, is it too expensive as compared with steam driving?

The Proof of the Pudding.

Surely the maxim that the proof of the pudding is in the eating is applicable here, because in every part of Lancashire—and we are dealing with the textile industry, whose home is Lancashire—if there is an efficient public supply authority available, there is an increased demand for electricity for textile mill driving, and the number of factories already equipped is proof that it must pay the user. On this point there can be no possible argument, for if it did not the Lancashire cotton-spinner would have "nowt" to do with it.

Many who are not conversant with the conditions obtaining in a modern well-designed and laid-out cotton mill are inclined to underrate the high standard of efficiency that is obtained from the power-producing plant, and one very often comes up against a snag when negotiating for a supply of electrical energy to drive a modern mill already equipped with a modern steam engine running at its most efficient load and under the most favourable conditions.

It is equally true that in many instances, and especially in the case of old-established concerns, antiquated steam engines and boilers are found still grinding out the energy required for operating the factory. But the conclusion is soon reached that there are many steam-power plants in use whose owners will take a great deal of convincing that it will pay to convert and buy electrical energy from a public supply authority.

Does it Pay to Take a Public Supply?

The question is often asked whether it pays the textile factory owner to drive his works electrically, and to purchase the energy from a public supply authority. In answering this question there are many factors to consider and conditions to investigate, because in almost every case these vary. Consequently the question as to whether it pays depends entirely upon the capital outlay involved, the state and performance of the power plant already installed, the adaptability of the factory to electrical driving, and, most essential of all, the price at which energy can be purchased from the public supply authority.

The Advantages of a Public Supply.

Let us, therefore, consider the advantages of a public supply of electricity for the purpose of textile mill driving. So many articles have been written at different times, and so many arguments have already been used, that it becomes difficult to treat the subject with any degree of originality; but the fact remains, providing a public supply of electricity is available at a figure to-day round about a 1d. per unit, it does pay to use it. Not only will the textile manufacturer find that the annual capital charges on the electrical equipment are less than those on a steam-driven plant, but there is also a saving in operating costs.

In the case of an electrically driven mill the space occupied by the electrical equipment is negligible, as compared with that required for boilers and auxiliaries, engine, buildings, reservoirs, &c. This allows considerably more productive, or manufacturing, machinery to be installed on the same ground space. Another outstanding advantage of purchased energy is that the power is delivered at the point of use, consequently friction losses are cut down to a minimum; and, further, the supply being switched on and off as required, the user only pays for what is productive, all stand-by losses being eliminated. The energy required is always available, and the question of providing spare plant does not concern the user, the supply authority relieving him of that responsibility. The consumer is not interested in the many difficulties that arise in running a central power-producing plant, such as obtaining fuel supply, labour complications, breakdowns and other troubles.

The Reliability Factor.

Reliability must be a main feature of the public supply, and, therefore, the public generating station carries spare plant, which is always ready for use in the event of break-

down. And no matter what happens at the station, or what difficulties the supply authority may have to contend with, it does not concern the consumer. For, as he is prepared to pay for the energy he uses, this must be available whenever he chooses to operate a switch.

It is often difficult to obtain from the textile manufacturer any reliable figures of the operating costs of his power-producing plant, or, rather, of what factors he includes when comparing them with the cost of purchased energy. In comparing the cost of purchased energy with the cost of self-produced power, all capital and standing charges on plant, reservoirs, buildings, &c., must be included, as well as repairs and maintenance costs, wages, stores, insurance, rates, and, of course, fuel, cartage of ashes, and water. The purchase price of electrical energy is the net cost of power delivered at the factory, practically at the point of usage, to which must be added the capital and standing charges, and only those items quoted above which apply.

A Definite Example.

Let us take the case of the manufacturer owning an old-established works, who finds it necessary to replace an obsolete steam engine and boiler-house plant, because, owing to many years of service, these are no longer competent efficiently to supply the power required. Naturally, it occurs to him that, as he has to renew the whole, or anyway the larger part, of his steam-power plant, the time is opportune to consider purchasing electrical energy, and he makes inquiries to determine whether it will pay him.

In order to make a comparison at prices obtaining to-day, let us assume that the net cost of electrical energy purchased is 0·75d. per unit, with coal at 20s. per ton, and for a demand equivalent to 1 000 H.P. indicated on steam engine, and 2 350 running hours per annum. The cost of coal, to the mill owner, being 25s. per ton, including the cost of handling and removing ashes.

Assuming that the existing engine and boiler-house buildings, with minor alterations, will be suitable for housing the new steam plant, then it is reasonable to estimate that the cost of the new engine, boilers, economisers and auxiliaries, together with the cost of alterations to foundations, rope drive, &c., will amount to £18 700.

The complete electrical equipment required for this mill, including the necessary sub-station and motor tower, with switchgear, cables, alterations to gearing, and coupling up, will amount to £10 500. This shows a saving of £8 200 in capital expenditure, or, say, £820 per annum. The estimated running costs, taking into account fuel, labour, oil, stores, water and maintenance and capital charges, amount to £7 032 per annum in the case of the steam plant, as against £6 797 per annum, the cost of purchased electrical energy, plus wages, stores, maintenance and capital charges, showing a saving of £235 per annum, making a total saving in favour of purchased energy of £1 055 per annum.

The Case of the New Mill.

Then there arises the case of the new mill, which it is proposed to build on a suitable site within reasonable distance of a railway siding, with ample land available for condensing water reservoirs, &c. Again a comparison has to be made as to whether it will pay to install steam-power plant or to purchase energy from the public supply authority. The proposition is rather different, although in effect similar to that dealt with above. For comparative purposes let us assume that the horse-power required will amount to 1 500 I.H.P. and the purchase prices of electricity and coal are the same as before.

In this case, starting on an entirely new scheme, it is possible to design the lay-out of the steam-power plant and the electrical installation in such a manner that the greatest efficiency would be obtained from either. In addition to the engine and boilers, &c., the estimated capital outlay will have to include, for engine and boiler house buildings, a chimney and foundations, a rope race, together with rope drive and gearing, a condensing water reservoir and pipe connections, at a total estimated cost of £36 960. The electrical equipment required will be as before, excepting that it will have to be of greater capacity, and plant must be included for steam heating, so that the estimated cost of the scheme amounts to £16 375. So that we show a saving on capital expenditure of £20 585, or, say, £2 058 per annum.

The operating or running costs of the steam plant, taking all charges into account, will amount to £10 700 per annum, as against a running cost of the electrical scheme of £10 218 per annum, showing a saving in running costs, and, added to the annual saving on capital, making a total of £2 540 per annum.

The Private Generating Station.

Then we have a third case, where the manufacturer who is erecting a new factory may already be aware of the advantages to be derived from electrical driving, and is considering installing his own private electrical generating plant. Where an efficient public supply is available there is no difficulty in proving that it will not pay to install a private electrical generating plant. The capital outlay involved in electrical equipment for the actual motive power for driving the manufacturing machinery is the same in both cases, and it is therefore a matter of comparing the purchase price of electrical energy with the standing and capital charges on the complete private generating plant, buildings, &c., plus the running cost of such plant.

If the manufacturer is determined to produce his own power, then by all means let him use the ordinary steam-engine drive, and leave electricity out of the question, always assuming that the alternative of a reasonable public supply is not available.

The Heating Question.

It is assumed that in each of the foregoing comparisons the cost of steam for mill heating has been included, which brings us to consider this most important subject.

When a textile factory, or mill, has been converted from steam to electrical driving, and especially in the case of a new factory, equipped in the first instance for electrical driving from the public supply mains, there is always the difficult problem of heating the factory to be overcome. As readers of THE ELECTRICIAN know, it is essential in the case of cotton spinning that a certain even temperature should be maintained at all times, and, as a rule, this is effected by means of steam heating throughout the factory. There is considerable diversity of opinion with regard to the amount of steam required for mill-heating purposes, and this is quite understandable, as it so much depends upon the design of the factory, its locality, and the particular quality of yarn manufactured, the temperature in some cotton mills having to be maintained higher than in others. The fact remains: textile mills must be artificially heated, and, consequently, if a steam-driven mill is electrified, or if a new mill is built for electrical driving, some provision must be made for heating.

In the case of the converted factory, part of the existing steam-raising plant, as a general rule, is retained for mill-heating purposes, and in the case of the electrically driven mill a special heating boiler has to be provided, so that really the manufacturer, even after deciding to adopt purchased electrical energy for driving purposes, is not entirely free from the inconveniences appertaining to boiler-house plant, which he still has to retain purely for heating purposes.

The Electric Heating of Mills.

The writer is of the opinion that in order to obtain the fullest advantage of purchased electrical motive power in cotton mills it is necessary to go a step further, and heat the mills electrically. Although the ordinary methods of electrical heating, we know, to-day are costly, and may not be comparable with the cost of heating by means of steam, the fact cannot be overlooked that there is an urgent demand for some efficient method of electrically heating electrically driven textile mills, and it is a question requiring the fullest investigation.

The price at which energy can be purchased is certainly

one of the governing factors, but, seeing that mill-heating is chiefly required at night, or after the ordinary running hours of the industrial load on the generating station—in other words, it is a heating load which tends to improve the load factor of the electricity supply undertaking—it would be possible to offer special low rates for a mill-heating supply. As a matter of fact, if electrical energy is purchased on the maximum demand plus unit charge basis, the actual units used for heating purposes after ordinary working hours would be charged for at the unit rate only, as the maximum demand charge would already be provided for during the ordinary working hours, and the effect would be a reduction in the average price per unit for the whole supply to the mill.

An Electrically Heated Mill.

The writer has been concerned in the installation of equipment for electrically heating a cotton mill, and although, owing to the general disorganisation of the cotton trade, it has not yet been possible to obtain reliable figures of the cost of operating the plant over any length of time, the experiment so far has proved to be most satisfactory.

The cotton mill is the usual type of about 68 000 spindles, and special attention has been given to the question of supplying each floor with purified and humidified air, by means of a very complete ventilating and humidifying system, such as is found in any modern well-equipped mill. The electrical heating system has been specially designed to work in conjunction with the ventilating system, and for this purpose specially designed heating elements, or radiators, have been installed on each floor of the mill, in the main air ducts supplying each room.

The heating elements are made up in suitable groups, or units, each of 40 kW capacity, and in sufficient numbers to heat up to the desired temperature the purified air required, special attention having been given to the control of the radiators. These are automatically switched in and out, within certain desired temperature limits, and they are also arranged to switch off automatically in the event of the ventilating fans being stopped for any purpose, to prevent overheating when no air is passing through them. Arrangements have also been made that at night, or during the time when it is not essential to have a supply of fresh air, there is a continuous circulation of heated air throughout the factory, on a closed system, and due to the effect of thermostatic control, a constant temperature is maintained.

The experiment is being watched with keen interest, and, if commercially successful, will overcome what is now a difficulty to the textile manufacturer who electrifies his mill—the question of heating.

Labour Conditions and Electricity Supply.

The tendency during recent years has been to reduce the number of working hours in the textile and other trades, and, in fact, reductions have been made. Whether the result has been, or will be, beneficial to the industry as a whole remains to be seen. It has certainly not tended to reduce the price of electrical energy, which, to a large extent, must be governed by the load factor of the supply, as, naturally, it is more efficient to run the generating plant on a steady, even load, twenty-four hours a day if possible. In this case the capital or standing charges on the plant are covered by the greater number of units generated, consequently tending to cheapen the supply.

Of course, it is known that existing factory regulations do not permit of overtime being worked in cotton mills in this country, but it is difficult to see why shift working, covering twenty-four hours a day, should not operate in the textile industry, especially as cotton spinning is a continuous process. The capital and standing charges on any mill or works must be paid for twenty-four hours a day, so why not work the plant during the same period, and increase its revenue-earning capacity proportionately?

Labour, surely, has nothing to fear, because it will actually increase employment, as it would certainly double the number of hands required, and the output would be doubled, at a considerably lower cost of production.

Advice to the Supply Authority.

In conclusion, let the public supply authority study the requirements of the user, and especially the cotton spinner, to whom a cheap and reliable supply of electrical energy is essential if he is to continue holding the field for cotton goods, in competition with other countries, which are daily gaining ground in the textile markets.

On the other hand, it is the duty of the manufacturer to take advantage of the public supply of energy offered, especially in view of the fact that it will pay him to do so, and to co-operate with the supply authority, so that the latter can use his plant to the greatest advantage, thereby tending to cheapen the price of the commodity.

Centralisation of power production means coal saving, and it is essential, in the national interest, to economise coal, because it is our natural source of energy, and, in fact, the capital of the country, limited in quantity. From the point of view of the health of the people, one has only to observe the clearness of the atmosphere over an industrial area after a holiday week stoppage to realise the better living conditions that would obtain if our industries were supplied with power from central producers instead of from individual plants.

Common Battery Telephony Simplified.*

By W. H. GRINSTED.

Since 1912, when the first edition of Mr. Atkins' book was published, the modern manual exchange plants with which the telephone services of London and all our large towns are conducted have been pretty well standardised. There has been little change in principle, but much has been done to consolidate and unify practice. Mr. Atkins deals with only one branch, namely, the circuits, and has taken the opportunity of a new edition to include the changes in that branch. The scope of his book is thus limited, but the treatment is thorough. As many as 157 diagrams are included illustrating the essential elements of the numerous circuits associated with a common battery exchange.

We feel that there is something lacking in this method of explaining the operation of an exchange plant. The electrical arrangements are brought out clearly, but we are left with a very vague idea of the construction of the various pieces of apparatus and their positions on the switchboard and in the exchange building. Those who are employed in exchanges and are familiar with the arrangement of the plant will probably not experience this difficulty. They will desire to study particularly how the apparatus is associated electrically, and in this respect they will find Mr. Atkins' book most useful. The fact that four editions have been called for is evidence that they have found it useful in the past.

Practically every circuit met with in manual common battery practice is described, including subscribers' instruments, extensions and private branch exchanges. The explanation of the C.B. instrument circuit is better than those given in other text books, but is based, as usual, on direct-current principles. Why not treat this as an alternating-current circuit, as it really is? The circuits of desk and testing equipment are dealt with fully.

Diagrams and explanations are in general clear, but more careful revision, keeping in mind the case of the reader ignorant of telephone practice, would have improved the book. For example, in Figs. 5, 6 and 9 the same lamp is successively referred to as the "home or line lamp," "calling lamp," "home lamp," and in Chapter III., in describing Fig. 6, it is called the "answering lamp." On p. 67 the following sentence occurs: "As this relay is in the speaking circuit it has an additional non-inductive resistance to allow the speech currents to pass." The convention used for the relay in the diagram does not show the windings. The reader without prior knowledge will not easily deduce that the non-inductive resistance is added in parallel with the inductive winding. The examples on p. 128 are by no means clear, and in one case "amperes" is misprinted for "milliamperes." Fig. 64 is incorrectly drawn. These and similar cases of loose expressions and minor mis-statements are small but definite blemishes which should be carefully removed in a future edition.

The printing is very good and the binding excellent, almost too good for a technical work of this class. Is this the cause of the increase in price to 8s. 6d.? For a book of limited scope such as this it is a very high price, which will tend to restrict its sale among junior students of telephony.

* Common Battery Telephony Simplified. Walter Atkins. (London: Benn Brothers, Ltd.) 4th edition; pp. 139. Price 8s. 6d.

Electric Driving in Scottish Woollen Mills.

By A. W. STEVENSON, B.Sc. (Edin.), Wh.Ex.
(British Research Association for the Woollen and Worsted Industries.)

The author generally considers the conditions which obtain in the Scottish woollen mills. This is a localised industry in a district where water-power is often available in sufficient quantities or can be economically supplemented by the public electricity supply. The claims of steam driving under these conditions are considered and the various processes necessary to produce the finished wool product are described in detail.

THE outstanding feature of the Scottish woollen industry is the number of comparatively small mills engaged in the making of high-class cloths, in most cases from pure new wool. The bulk of the product finds its way to West-End tailors, though a considerable proportion is exported to America and to tropical countries, and before the war there was also a large trade with Germany, Austria, and the Balkans.

The majority of the mills are located on the Tweed and its tributaries, but the name of the staple product does not originate from the river, but from the misreading of the word "tweels" on a consignment note many years ago. The mills of the north and west work, as a rule, the rougher tweeds, but vicunas are made at Elgin and best overcoatings at Aberdeen, to name two exceptions.

Sometimes spinning, weaving and dyeing are carried on by separate firms, but a more general rule is to find the whole process, from fleece to fabric, carried on within the same gates.

Power Sources—Water.

At one time water was the only power, and for this reason, and to obtain a supply of scouring water, all the older mills were located on streams. In most cases power requirements have far outstripped the low-fall water supply, though a few mills are still driven mainly by water. There is usually a steam engine as a stand-by for drought or frost, and, in some cases, this engine is run continuously for governing purposes, carrying perhaps 10 per cent. of the load. Many more mills could be driven by water-power at the cost of a few miles of electrical transmission, and last year's strike has made many manufacturers wish to be less dependent on coal.

A firm at Walkerburn,* on the Tweed, has put an interesting scheme into operation recently. The river water being of large volume and low fall, direct storage was out of the question. While the mill is standing, the river turbines are used to pump water to a reservoir on the top of a neighbouring hill, 1 000 ft. up, this water returning when the mill is running to a Pelton wheel, in parallel with the river turbine.

A Hawick firm obtain more from their water-power in a different way. During the day a considerable portion of the mill is driven from the public supply by a large d.c. motor, and at night, when the town lighting load is on, this motor runs as a dynamo in parallel with the power-station engines.

Public Electricity Supply.

In a few towns public electricity supply is available, mostly direct current, which is not too suitable for textile purposes. Nevertheless, Hawick, from its d.c. supply, runs three-quarters of the hosiery warerooms, woollen spinning and weaving mills in the town. Galashiels is more fortunate in having a three-phase supply laid down specially for mill requirements. The supply network has recently been extended to Selkirk, and will in time be extended to some of the other manufacturing towns.

The Position of Steam Driving.

Whether the transmission is mechanical or electrical, steam still holds a strong place as prime mover in woollen mills, for the very good reason that most mills require steam for other purposes than power. Where there is a dye-house the steam for process purposes may exceed that used for power. There is here a good field for the pass-out or heat-extraction engine or turbine, or, where public supply is available to supplement the steam power, a plain back-pressure engine or turbine. As an alternative to a generator in parallel with the public supply, one or more of the larger motors might be of the simplified synchronous type, and a simple two-cylinder high-speed engine coupled to each, the throttle being, of course, controlled by the pressure in the exhaust main.

Existing Millgearing.

While individual driving has strong claims where capital is available, most existing mills, and some new mills, will be group-driven, in the former case by using the existing millgearing as far as convenient. In the older mills the drive was invariably by spur gear from the engine to the second-motion shaft, and from this to the other main shafts

FIG. 1.—MOTOR WITH CHAIN AND BELT REDUCTION DRIVING MILL-HOUSE SHAFT.

by bevel gearing, upright and "lying" shafts. In the newer mills, and, by alterations, in many of the older ones, ropes have superseded gearing. Where the shaft speed is so low that double reduction is already necessary an existing rope pulley may be utilised for the motor drive, but even then the diameter of the motor rope pulley is liable to be much smaller than that given by the well-known "thirty diameter" rule. Silent chains form a good drive when the ratio is suitable, *i.e.*, when the shaft speed exceeds 150 revs. per min., or where the cost of an eight- or ten-pole motor is not objected to. Most shafts will be found to run under this speed, common practice being 130 revs. per min. for weaving and finishing, rather less for spinning, and 80 revs. per min. for carding. Millhouse shafts sometimes run as slow as 55 revs. per min. Such speeds mean double reduction, even with a slow-speed motor, and probably the most efficient combination is that of silent chain and belt. Using a belt for the second drive on to the lineshaft gives both freedom in the original alignment of the motor and protection against subsequent movement.

* *See* page 229 of this issue.

The intermediate shaft should be carried in the base-plate of the motor. Alternatives to the chain are worm- and spur-gear drives, but the former are of doubtful efficiency at low loads, and the latter, unless enclosed in an oilbath, are noisy and far from durable.

Wool Scouring, Willeying and Teasing.

The wool from the bales, after being sorted into its various grades, is passed slowly through long tanks of soap solution, the excess liquor being squeezed out under heavy rollers fixed on the end of each tank. After being dried, either on racks or in a mechanical drier, it is opened out in the willey or teaser before going forward to the carding machines. In some mills, willeying precedes scouring and teasing follows it. Oil is applied to the wool either

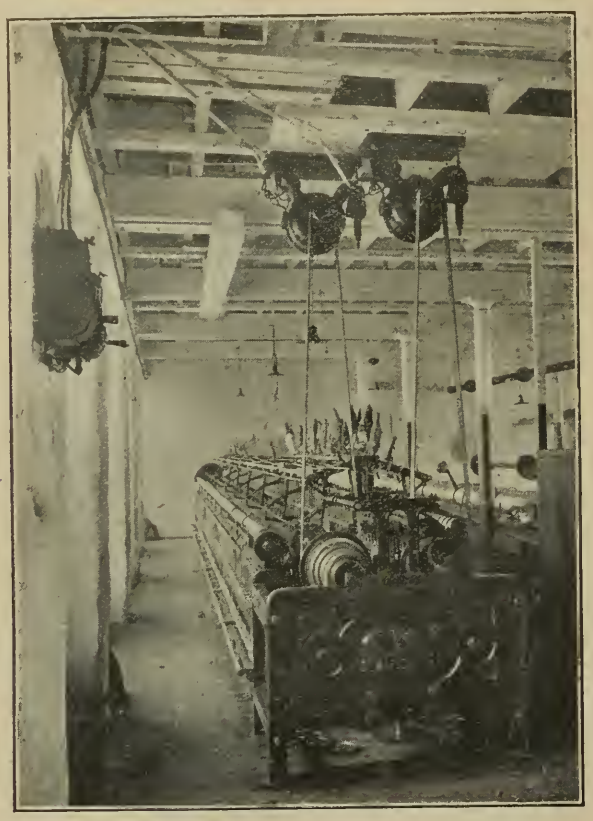

Fig 2.—Individual Driving of two sides of Twisting Frame.

before teasing or by an attachment on the teasing machine, and, for fire prevention, willey and teasers are frequently in a separate building. Direct-current motors and the slip rings of induction motors should be totally enclosed for the same reason. As in carding machines, the drive is heaviest at starting, though the ratio of starting to running torque is not quite so high. Wool scouring is a fairly light drive, but the motors should have damp-proof impregnation.

Carding.

In the carding process the wool fibres are separated from one another, cleaned, remixed and placed more or less parallel, perhaps rather less than more. There are usually three machines in series, the essential feature of each being one or two "cylinders" about 4 ft. in diameter and 5 ft. long, running at 80 to 90 revs. per min., and surrounded by a number of small rollers—"workers" and "strippers." All these are covered with fine wire teeth, and run a few thousandths of an inch clear of each other, the clearance diminishing as the wool progresses. The delivery from the first two machines is in the form of a loose rope or "sliver," which either passes over a small conveyer ("Scotch feed") to the next machine, or is wound in a "ball," sixty balls being placed in a "bank" to supply the next machine of the series. When the ball and bank feed is used the machines are independent of one another, but where the Scotch feed is used the machines so connected must keep the same speed ratio throughout the day. From the third machine of the series the wool is delivered in a large number of small slivers, each containing sufficient wool to make one strand of yarn. To give this small sliver more cohesion it is rubbed between leather aprons, which oscillate cross-wise while travelling forwards, this part of the machine being known as the "condenser." The most modern form, and the heaviest to drive, is that in which the slivers—twice as many as in the older types—are each carried on a narrow leather tape, but it has not found great favour in the high-class trade.

The old millwrights' rule for a set of cards was 10 H.P., but this is well on the top side. Five or six would be nearer the mark, with a starting torque of two to three times normal.

Spinning.

Spinning is almost entirely by mule, the woollen ring frame finding only a limited application. The action of a woollen mule, or, for that matter, any spinning mule, looks almost human in its complexity. The "condenser bobbins"—about 5 ft. long and 8 in. in diameter—from the carding machines are mounted on the stationary part of the mule, part of which is the "headstock" containing the gearing and clutches for the various motions. The moving part or carriage bears the spindles. In the first part of a cycle the carriage runs sharply out, sliver being delivered from the bobbins during the first half of the run. During the second half the sliver, or rather the partially made yarn—for the spindles have been running all the time—is drawn out, the thick parts, curiously enough, stretching most. At the end of the outward travel the speed of the spindles is greatly increased, the carriage remaining stationary or moving slightly inwards in response to the shortening of the yarn as twist is put in. When twisting is completed the spindles are given a few reverse turns to release the loose coils from the spindles, the carriage moving out again a few inches, this time by power. The final operation of the cycle is to return the carriage to the starting point, the spindles being driven slowly in a forward direction to coil on the completed length of yarn under guidance of the faller wires.

An Irregular Power Curve.

It will be obvious that such a cycle of operations gives rise to a very irregular power curve, the highest peak being three or four times the average. Further, steadiness of speed during the spinning period is very important in the high-class fine yarns common in the Scottish trade. Individual driving is well worth while, but, if for reasons of economy group-driving is installed, the groups should be as large as possible. Even with a large group there is always the possibility of a number of mules getting into synchronism, causing severe variations in speed, and even pulling the motor out of step. The practice occasionally adopted of driving the mules in pairs from one motor is the worst possible, as a peak load from one mule, due to the acceleration of the spindles or the running in of the carriage, is bound sometimes to occur during the spinning period of the other mule, when it is essential that the speed should be undisturbed.

Twisting, Winding, Warping.

Twisting or doubling is invariably done on ring frames, usually known as "throstles." The load is a steady one, and fairly heavy. Practically all the yarn is rewound between spinning and weaving, warp yarn being wound in "cheeses" or on large double-ended bobbins, and weft yarn on pirns somewhat similar to those used on the mule, but of smaller bore and more tightly wound. Most winding machines are light, steady drives. Warp mills, which wind the yarn in proper sequence on the loom warp beams, take up a large amount of space, but are quite light.

Weaving.

Space does not permit description of the fundamental mechanism of the loom, and, in any case, it is common to

all textile trades, and familiar to most engineers. The typical loom of the Scottish trade has a 90 in. "reed-space," or maximum width for material, and puts in 90 to 100 picks or "shots" of weft per minute. This is not always the speed of the driving pulley, as there is often a bevel or spur reduction gear embodied in the loom. Shedding, or movement of the warp threads for correct interlacing, is invariably by dobby, this having usually capacity for twenty-four shafts or healds. Picking is always of the "under" variety, and the shuttles for fancy coloured wefts are carried and controlled by drop boxes, usually with four compartments each. The favourite makes are Dobcross, Hattersley and Hodgson. The actual power taken by these looms is sometimes over 1 H.P., but about half this is a sufficient allowance in group driving. For individual drive they are a fairly tough proposition, though less so than the heavy Jacquard looms of the Belfast trade, which have been successfully dealt with by at least one firm. The Scottish field would appear to be a good one, as, in addition to the well-known advantages of regularity, beneficial in so high-class a trade, there may be a substantial saving in power. As pointed out by Dr, Crowley some years ago, the saving in power with individual driving increases rapidly as the percentage of standing time of the machines driven increases. A fancy loom has more and longer stoppages than a loom weaving plain goods, and all the time it is standing its little bit of shafting, its belt and its loose pulley are absorbing power in a group-drive scheme.

FIG. 3.—MOTOR WITH DOUBLE REDUCTION DRIVING WARP MILLS (BACKGROUND) AND WINDERS (FOREGROUND).

Scouring and Milling.

After leaving the loom the "piece" undergoes inspection, also picking and darning—hand processes. From these it passes to the "mill-house" for scouring and milling. Scouring machines take a heavy torque at a slow speed—about 50 revs. per min., the horse-power being about three. Milling machines, or "box mills," take considerably more power at higher speed, and, in addition, are a somewhat jerky drive. In a few mills the old-fashioned fulling stacks, or "wauk mills," large wooden hammers, lifted by cams like tilt hammers, are used, but most firms whose work requires this type of milling use "fast stocks," in which the hammer heads are driven positively. Where both milling machines and stocks are installed they are to some extent alternative processes, and need not be provided for simultaneously in a group drive. Most mill-houses have a hydro-extractor, which is a good case for individual drive, preferably by a self-contained motor.

Mill-house motors must have damp-proof impregnation, starters, slip-rings and d.c. machines being totally enclosed.

Finishing.

Leaving the mill-house partially dried, the pieces are fully dried and stretched to width on the tentering machine. The power taken by this machine is from 2 to 3 H.P., but its location often makes it worth a motor of its own, which should be placed outside the tentering-room, the temperature inside often reaching 180° F.

The finishing house contains an assortment of machines, varying with the class of trade, all very light to drive, and seldom all running. The cropping machine, or "Yankee," which cuts the loose fibres much as a lawn-mower cuts grass, is the chief item in most finishing sequences, some pieces returning to it several times. Other machines are brushes and raising gigs, both of which vary widely in design. Steam blowing machines, fitted with a vacuum pump, are fairly heavy to drive, but not so much so as the pulleys on some would indicate. Pressing is invariably hydraulic, with belt-driven pump.

FIG. 4.—FINISHING FLAT DRIVE WITH RAISING GIG IN THE FOREGROUND.

Photographs.

The illustrations accompanying this article show some of the driving arrangements adopted in the conversion to electric drive of Tweed Mill, Galashiels, belonging to P. and R. Sanderson, one of the leading firms in the Scottish tweed trade. The drive was previously from a Corliss steam engine through the usual gears and ropes, but is now electrical throughout from the mains of the Galashiels and District Electric Supply Company through a 6 600/500 V transformer. It was converted from steam to mechanical drive in 1914 by Dr. J. F. Crowley, the plant being installed by Siemens Bros. Dynamo Works (now The English Electric Company). The installation is remarkable for the arrangement of the drives and the large amount of shafting that was eliminated in the conversion through careful attention to lay-out details. There are over twenty motors in the installation, ranging from 1 to 37 H.P. in output.

Artificial Daylight.

Its Applications in the Textile and Dyeing Industries.

By J. S. DOW.

In this article the author considers the development of "artificial daylight" and how the advances that have been recently made, especially the invention of Chance's "daylight glass" and the Sheringham daylight, are likely to be of use in the textile and dyeing industries.

"Artificial daylight," like many other new developments, was the subject of early pioneering work in this country, was afterwards subjected to comparative neglect, but has recently been taken up *de novo*. The idea of modifying the spectrum of artificial illuminants so as to secure a quality of light closely resembling daylight in colour-revealing qualities was first applied to the arc lamp. The

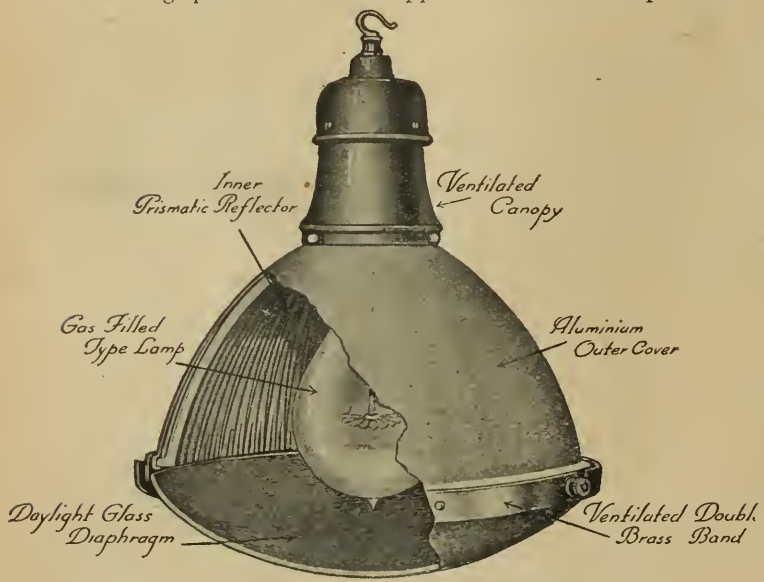

FIG. 1.—SHOWING COMPONENT PARTS OF HOLOPHANE DAYLIGHT UNIT.

Dufton-Gardner lamp, in which light from an arc is transmitted through a special tinted glass, originated in 1895, and is stated to have been used to a considerable extent by dyers. Mr. A. P. Trotter, in a contribution in the "Journal of the Institution of Electrical Engineers" in 1892, also dealt with the problem. The idea of applying a suitable tinted screen to the carbon filament incandescent lamp was obviously scarcely practicable owing to the low efficiency, small candle-power, and the yellow tint of the light, which would involve considerable absorption in the conversion process. However, a metal filament lamp equipped with a tinted gelatine screen, stated to give very faithful reproduction of daylight, was shown before the Illuminating Engineering Society in 1912, and attempts were also made to manufacture metal filament lamps with blue glass bulbs for the same purpose.

Possibilities not Realised.

For some years, however, the idea of obtaining artificial daylight from incandescent lamps was little developed. Probably the candle-power available and efficiency were still inconveniently low, and the possibilities of artificial daylight were not sufficiently realised. With the coming of the gasfilled lamp, with its whiter light, higher efficiency and higher range of candle-powers, the work was taken up again, chiefly in the United States, where quite a variety of "daylight" fittings, equipped with special blue-tinted glass, were developed. According to Mr. Luckiesh, about 15 000 "north-sky" units were already in use in the United States in 1920. The method of grading units in degrees of accuracy had also been adopted.

Chance's Daylight Glass.

In this country the manufacture of suitable "daylight" glass for use with gasfilled lamps has been energetically taken up by Chance Bros. & Company and others, and such glass has recently been incorporated in the Holophane daylight unit, a view of which is shown in Fig. 1.

The lamp is enclosed in a Holophane aluminium-covered reflector terminating in a shallow diffusing tinted glass dish. A curve issued by the company showing the resemblance between the corrected spectrum curve, and that of average daylight, is shown in Fig. 2.

Mr. F. E. Lamplough has recently stated that with a 500 W lamp an efficiency of 40 per cent. is obtained with a thickness of Chance glass giving the correction to average daylight preferred by dyers. Where very great accuracy is desirable, the interior of an upper reflector may be painted with heat-resisting blue pigment, and a somewhat thinner bowl of daylight glass used. This is stated to to have relatively little effect on the over-all efficiency.

Sheringham Daylight.

An entirely different method of obtaining artificial daylight is adopted in the Sheringham daylight, which has been described recently before the Illuminating Engineering Society. In this case the conversion of the light to a resemblance to daylight is effected, not by *transmission* through tinted glass, but by *reflection* from a suitably coloured upper diffusing surface, placed above the lamp. This surface takes the form of a large shallow reflector, all direct rays from the lamp downwards being screened by a bowl, with silvered inner surface, placed beneath it. The Sheringham daylight is thus an indirect lighting unit, with the wide diffusion of light characteristic of such fittings. The design of the coloured surface of the upper reflector involves the use of three pigments, selected with a view to permanency and heat-resisting qualities which have been the subject of much study. The main part of the surface is occupied by ultramarine blue. Originally small discs of emerald green, and a very few discs of vermilion were introduced on the blue field to obtain the desired

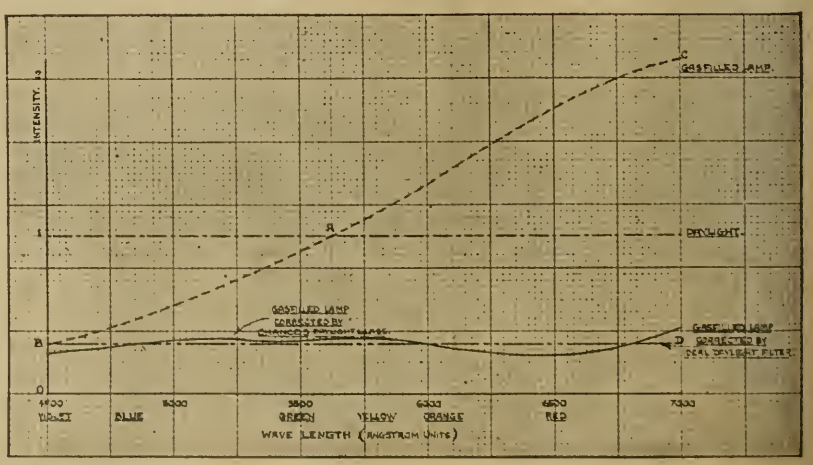

FIG. 2.—CURVES ILLUSTRATING THE APPROACH OF DISTRIBUTION OF LIGHT IN THE SPECTRUM OF THE HOLOPHANE DAYLIGHT UNIT TO THAT OF AVERAGE DAYLIGHT.

colour-correction. Later it was found that by substituting a yellow pigment (about 5 per cent.) for the small amount of red (about 2 per cent.) a more accurate imitation of daylight was secured. At the same time it has been found possible to obtain satisfactory colour effects with pigments

of smaller absorption, with the result that the amount of light obtained for a given consumption of energy has been approximately doubled.

The Fittings Employed.

Fig. 3 shows a general view of the usual pendant type of Sheringham unit. Fig. 4 shows a convenient form of portable unit for demonstration purposes. The small fitting at the side contains an ordinary unscreened lamp. By switching on either light alternately the difference in appearance of coloured objects may be conveniently noted.

The loss of light involved in the conversion of ordinary artificial light into "artificial daylight" is necessarily considerable. But the advantage of having a form of illumination suitable for colour-matching work that can be used at any time, night or day, irrespective of climatic conditions, is so great that this would doubtless outweigh the relative low efficiency in a luminous sense. Much consideration has been given to the degree of accuracy necessary in units of this kind. So far, experience with the best types appears to be favourable. They have been used for such varied purposes as dyeing, colour-printing, grading wheat and tobacco by colour, matching artificial teeth and preparing artificial eyes, &c. In the dyeing and textile industry, where a high degree of accuracy is required, the sacrifice of light in absorption is greater than in the case of units designed for work where only fairly good imitation of daylight is needed. For instance, accurate tests in dyeing works make greater demands in this respect than units employed for demonstration in showrooms and large stores devoted to coloured silks and fancy goods.

Standards of Correctness Necessary.

With a view to the future a common understanding on this point is highly desirable. Standards of correctness for artificial daylight should be arrived at, so that so-called "daylight units" can be graded according to the purpose they are intended to serve. This may be effected by a spectrophotometric examination of the light, supplemented by practical tests of the effect on dyed fabrics by colour-matching experts. One point recently emphasised by Mr. Lamplough is that a light may appear to the eye to resemble daylight very closely, but may nevertheless give quite misleading effects when applied to the testing of delicate shades of colour—especially if there are "kinks" at certain points in the spectrum. It is possible to find dyed fabrics which appear to the eye identical by daylight, but appear widely different under a "spurious" artificial daylight of this description; conversely, tints which are very different by day may be brought into apparent agreement under artificial illuminants.

Fig. 3.—General View of Sheringham Daylight Pendant.

At the same time it must be remembered that we have as yet no absolute standard of white light, and that the quality of daylight differs within wide limits at different times of the day and in different periods of the year. Daylight may be influenced by climatic conditions, and also by the addition of more or less coloured light reflected off surrounding objects, either within or without the room. A room devoted to accurate colour matching should therefore be lighted by a window that receives a clear view of the sky, and does not receive light reflected off the coloured wall of some adjacent building, or trees, &c. The interior of the room should preferably be decorated in neutral tints. Needless to say, windows encrusted with dirt also tend to colour the daylight admitted.

Advantages of Artificial Daylight.

The great advantage of artificial daylight is that, once adopted as correct and properly controlled, it should be subject to much less variation than daylight. Indeed, it has recently been stated that some dyers already consider artificial daylight preferable for this reason. The applications of artificial daylight in the textile industry are probably much wider than is generally supposed. Apart from the evident use of such apparatus in work where dyed fabrics are dealt with, there are some varieties of stain which are not readily detected by artificial light. By artificial daylight, however, it should be possible to distinguish much more easily when the process of scouring crude wool, &c., is complete.

Fig. 4.—Two-Unit Standard. Besides the Sheringham Daylight, a Small Lamp is mounted in a reflector at the side, so that either may be switched on and the effect on coloured objects compared.

Quality and Intensity.

In such processes it should be understood that not only the quality but the intensity of the light should be considered. One reason for the belief that natural daylight is essential for many processes is probably the fact that the intensity of illumination derived from daylight is so much greater than is readily obtained by artificial means. Hence the tendency is towards the use of high candle-power lamps, 500 or even 1 000 W types, with artificial daylight units, as in these circumstances it is practicable to obtain up to 50 foot-candles by bringing the light fairly near the work. Hitherto the flooding of an entire room with artificial daylight has rarely been attempted, though some picture galleries are said to have been lighted in this fashion. Provided considerations of economy are not paramount, general lighting of this kind is feasible. But it is more usual to aim at local lighting in a small booth, set apart from the rest of the room, and devoted to colour-matching. An enterprising merchant, for example, might well provide a series of such booths, equipped with artificial daylight and various forms of ordinary artificial lighting, in order that customers may compare the effect of dresses by daylight and artificial light. This is an important consideration in view of the fact that dresses for evening wear must be selected with a view to their appearance by electric or gas light. Artificial daylight units are now being introduced in a number of London stores, and in the United States their use on the counters of shops devoted to coloured goods of all kinds is already familiar.

The third section of the Report of H.M. Chief Inspector of Mines for 1920 states that 427 445 000 tons of coal were raised, of the value of £116 220 000, compared with 514 113 000 tons, of the value of £116 345 000 in 1919. The coal available for home consumption amounted to 185·8 million tons, and the quantity used for electricity generating stations (not including private stations) was 7 356 757 tons.

The Industrial Future in India.

By J. F. CROWLEY, D.Sc., B.A., M.I.E.E.

Dr. Crowley has recently returned from a twelve months' engineering and lecture tour in India and Egypt, when he visited most of the large industria concerns, hydro-electric plants, &c., and we are glad to have been able to induce him to give his impressions of a country that is so much in the public eye at present.

Remote as India was from the more serious and active operations of the war, it did not escape the many after-effects of that great struggle. Unrest, both political and industrial, interferes to some extent with development, while, at the same time, stagnant waters have been usefully stirred up, and India is to-day probably as alive to industrial development as most European countries.

Reference is made in the important Report* of the Indian Industrial Commission in 1916-18 "to the considerable change in public opinion regarding industrial questions brought about by the war, a change which we also see reflected clearly in the policy of the Government."

In considering the development of a country in accordance with Western ideas the first requisite is power. It has gradually come to be recognised that power is the primary need of an industrial community, and that the limit to the industrial development is usually set by the availability of cheap power.

Power Possibilities.

Generally speaking, the amount of coal available in India, relatively to the size and the needs of the country, is very limited, the chief sources being on the eastern side of the peninsula. To the north and west, on the other hand, lie many fine water-powers, those in the north being, on the whole, too remote from existing industrial activities to be of immediate value to existing industrial centres. There is at present some 95 000 kW of plant installed in licensed electricity supply undertakings in British India, fully 90 per cent. of this being in Calcutta and Bombay. The total number of units generated amounts to 235 millions per annum, and of this total one large hydro-electric undertaking provides nearly one-half. Some 56 per cent. of the electrical energy is generated from water, 41 per cent. being generated from coal. In addition to the installations in British India there are, including a large hydro-electric plant in Mysore, some 30 000 kW of plant for public electricity supply installed in Native States, from which 102 million units are generated per annum. From the above figures it is a natural and safe deduction that outside Calcutta and Bombay, with the addition of Ahmedabad and the great iron and steel works at Tatanaga, there are no really important industrial centres in India.

From the following extract from a recent Report† it would appear that Indian electricity undertakings are, on the whole, not in a flourishing condition:—

> The total working expenses allowing again for Rangoon are some 97 lakhs, or about 50 per cent. of the total revenue. This leaves a balance, before providing for depreciation, reserve, or a return on capital, of 97 lakhs, or 7·6 per cent. only. The report goes on to say that "the wonder is that the undertakings generally have been as successful as they have been."

It is not quite easy to understand this statement, at any rate so far as the larger and better-managed undertakings are concerned, as the Calcutta Electric Supply Corperation, for instance, are paying a dividend of about 11 per cent., the Bombay Electric Supply and Tramway Company pay 18 per cent., while the hydro-electric undertakings generally are doing very well.

Large Hydro-Electric Schemes.

Of these the largest is the Tata Hydro-electric Power Company, which supplies electric power to Bombay from water stored in the Ghats. This company paid a dividend of 7 per cent. in 1920. Small municipal undertakings, on the other hand, are not well managed, and in many cases pay no dividend at all. The existing water-power developments in India total slightly over 90 000 H.P., the Tata-Hydro-Electric Company, to which reference has been made, contributing 50 000 of this, and the Cauvery Power Scheme in the State of Mysore some 22 000 H.P. The remainder is scattered throughout Bengal, Bombay, Kashmir, Madras, the United Provinces, and the Punjab. The Cauvery Falls Scheme, which the writer had an opportunity of visiting, is a well-run undertaking, and the example in initiative it set might well be followed in other Native States. Two further projected schemes in the neighbourhood of Bombay are the Andhra Valley Scheme, totalling 65 000 H.P., and the Tata Power Scheme, with a total ultimate development of 150 000 H.P.

Possibilities of Development.

A systematic survey of the possible water resources of India is now being undertaken under the control of Mr. J. W. Meares, C.I.E., M.I.C.E., and the following estimate of the possibilities based on the so-far published reports, and taken from a recent Paper,‡ may be of interest:—

> The Indian water-power survey has up to the present disclosed the existence of over 130 possible water-power sites, of which, however, only a small percentage have been thoroughly examined. It is estimated that there is a total of 1 774 000 continuous electrical horse-power already in sight in India. This is vastly below the actual available power that the final results of the survey will disclose. Many millions of horse-power could certainly be obtained from the Himalayan Mountains and the great rivers of Burma. For example, the combined minimum discharges of the Indus, Chenab, Jhelum, Sutlej, Beas, Jumna, and Ravi Rivers amounts to over 36 000 cub. ft. a second where they enter the plains, which is equivalent to over 3 000 000 H.P. per 1 000 ft. of fall; and these rivers and the tributaries that feed them rise in mountains up to 20 000 ft. more in altitude.
>
> Similar considerations apply to the Ganges, the Sarda, and many rivers rising outside British India to the east up to the Brahmaputra, and again in Burma to the Irrawaddy and the Salween.

While, of course, it is not possible to agree that the total fall of a river should be taken in combination with its flow where it enters the plains as a basis for the power available, it is, however, equally true that the minimum discharge from the rivers referred to forms but a very small percentage of the maximum discharge, and that in cases where suitable storage can be arranged for, a much higher horse-power than that based on the minimum discharge may be looked for.

The general impressions created by the existing power conditions in India were:—

(*a*) That every encouragement should be given to the development of the available coal resources of India, in connection with which there has recently been some activity, big concessions being opened up in Bihar and Orissa.

(*b*) That steps should be taken in the use of coal to conserve it in the light of experience gained in other countries, and to reserve it, as far as possible, for metallurgical and other processes in connection with which there is no available substitute.

(*c*) That the development of water-power should be facilitated by simplifying and standardising the procedure in connection with the granting of concessions for the sites themselves, and for land acquisition in connection therewith.

(*d*) That a broader policy should be adopted by existing power undertakings so as to popularise to a greater extent the use of electricity from central supply stations.

Further Facilities Necessary.

As regards facilities for water-power development, attention should be drawn to the Paper, to which reference has already been made, in which the important suggestion is made that rules should be drawn up defining—

(*a*) The terms and conditions which properly belong to water-power concessions, and

(*b*) The terms and conditions which should properly be inserted in agreements for the compulsory acquisition of land for water-power schemes.

In connection with this matter, it should be noted that

* Report of Indian Industrial Commission, 1916-18, Superintendent Government Printing, India (Calcutta, 1918).

† Third Supplement to List of Electricity Undertakings in India, October, 1921. Govt. Central Branch Press, Simla.

‡ Hydro-Electric Power in India, by A. T. Arnall, M.I.C.E., East India Association, Feb., 1921.

the usual procedure for the development of a water-power site in India is first to obtain conditional prior claim to the power site for a period of three years, which carries with it the necessary authority to enable the promoters to frame a definite scheme of development for submission to Government with a request for a concession. On obtaining the

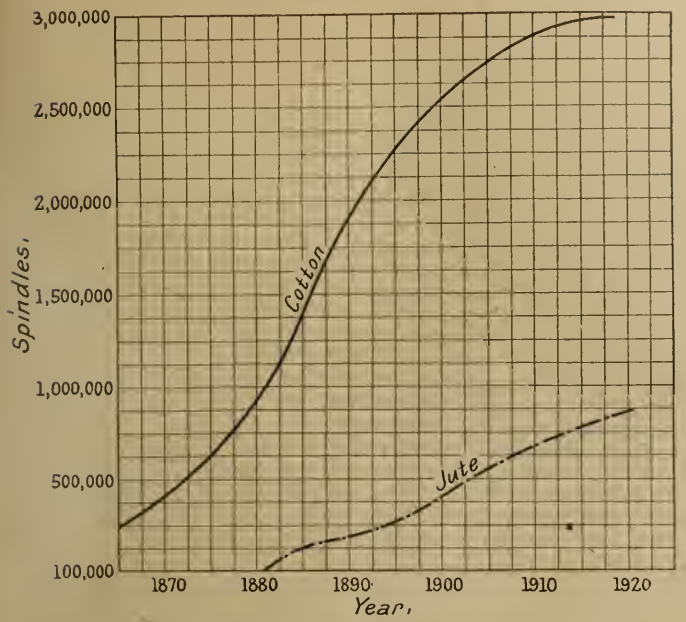

Fig. 1.—The Growth in Jute Spinning in India and in Cotton Spinning in Bombay.

concession the promoter can proceed with the flotation of a company to undertake the work.

Legislative Restrictions.

If, in order to secure the necessary land for the development, it is necessary to apply the provisions of the Land Acquisition Act, the concession should contain some sort of guarantee that the Act will afterwards be applied for that purpose. Further, there should be no doubt as to the terms and conditions governing the compulsory acquisition of the land under the Act, since before the provisions of the Act can be put into force the company must be formed. The company is formed on the basis of the concession granted by Government, and before applying the provisions of the Land Acquisition Act, an inquiry has to be held by an officer appointed by the Local Government to decide—

(*a*) Whether the "acquisition is needed for the construction of some work," and

(*b*) Whether the "work is likely to prove useful to the public."

If the Government officer reports in the affirmative on both points, then, and then only, can the company enter into the necessary agreement with the Secretary of State, so that the powers of the State to acquire land compulsorily can be brought into operation, and the land passed over to the concessionnaire with the terms and conditions it is decided to enforce.

One of the difficulties in connection with the application of this Act is the lack of definition of what constitutes "a work likely to prove useful to the public." This matter, in particular, requires definitely clearing up, and the Act, perhaps, amending, if public developments of this type in India are to be facilitated, and the terms and conditions properly belonging to the Land Acquisition Act Agreement should also be made clear, as well as the terms and conditions that properly belong to the concession.

In addition to the concession, if electricity is to be supplied to the public generally throughout specified areas, a licence is required under the Indian Electricity Act of 1910, but, generally speaking, there is not much difficulty in this connection. It is suggested, however, that the Land Acquisition Act should be made applicable here, even if the transmission of power is not for the purpose of a public utility undertaking in the literal sense of the words, but for a private undertaking of public interest.

A further point militating against the development of water-power is the low rate of interest, viz., 4 per cent., that it is at present permissible by law to pay on the money subscribed during the period of construction. Under the Lochaber Power Act, 1921, which was a private power Act, it is permissible for the directors to pay rate of interest on this money as high as 8 per cent., and this certainly constitutes a distinct advantage in promoting a company for power purposes.

A Bad Practice.

In connection with policy of existing power undertakers, it may be pointed out that some public supply authorities in India so arrange the terms on which they supply current as to offer strong inducements to manufacturers to avoid the installation of transformers and apply high-tension current direct to the motors. This is a practice which, in general, cannot be too strongly deprecated. Motors designed for high-tension work have perforce to be of large size. With such a system it is, therefore, not practicable to install small motors, and the development of a modern system of driving is severely handicapped. Further, because of the element of danger attending the use of high-tension motors, it is not always possible to place them in the best position from a driving point of view. These advantages tend to nullify the flexibility in application of electricity for driving, which, in the author's opinion, forms its greatest claim to consideration.

Penalising the Manufacturer.

The practice also appears to be developing in connection with electricity supply in India of unduly penalising the manufacturer if the power factor of his installation fails to reach a certain figure. This clause in electricity supply contracts works out in practice in a manner which the supply engineers can scarcely have anticipated. The manufacturer, knowing that he is liable to suffer a severe penalty, if not to have his power cut off, if his power factor does not reach the value fixed by the supply undertaking, and, being informed that large motors have a higher power factor than small motors, and high-speed motors than slow, is induced to put down large, and frequently high-speed,

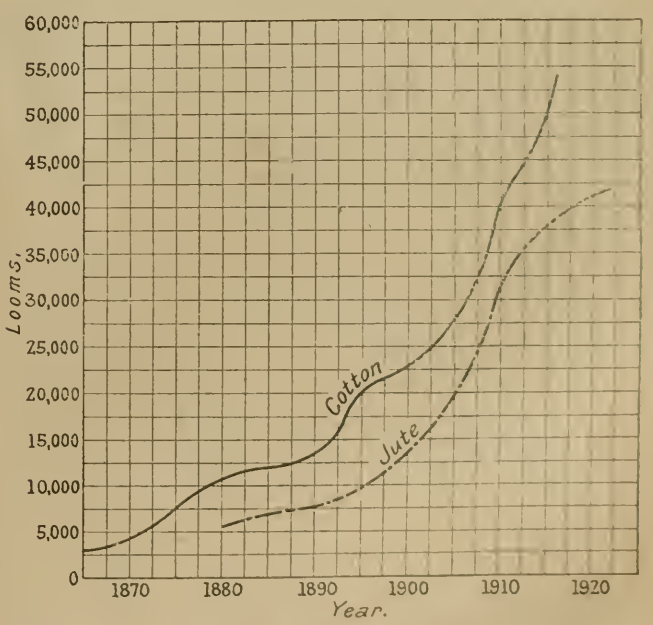

Fig. 2.—The Growth in Jute Weaving in India and in Cotton Weaving in Bombay.

motors where these are not suitable from a technical point of view. This, again, destroys flexibility, and operates indirectly against the more universal employment of electricity on modern lines.

A more general adoption of the system in use in Calcutta by which the reduction in power costs that would

accrue to the supply undertaking from an increase in power factor is calculated, and the greater part of the saving is credited to the customer in the form of reduced charges, is desirable, a corresponding provision being made for an increase in charges for a low-power factor.

The writer was informed that under the present terms of this arrangement it would pay a customer to install apparatus to raise his power factor, since by so doing he would obtain a reduction in current charges sufficient to

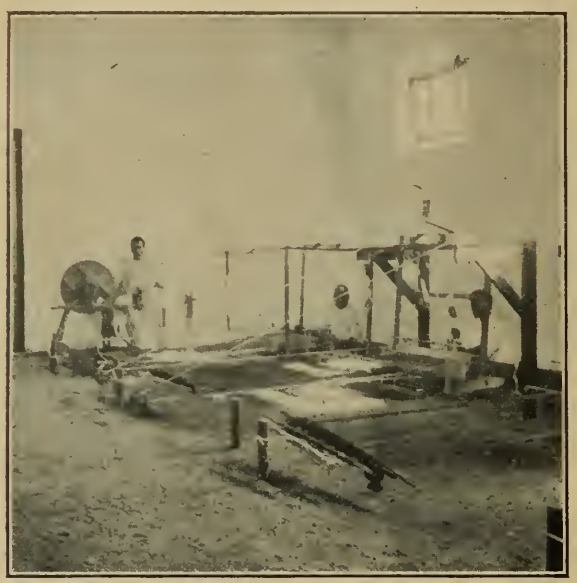

Fig. 3.—Typical Handlooms in the Industrial School, Madura.

pay a dividend on his investment. Without such an equitable contract the supply undertaking stands in a narrow sense to gain, and the manufacturer to lose, by a too rigid adherence to standards which militate against good engineering.

Industrial Developments.

The staple industry of India is agriculture. Of other industries textiles occupy by far the most important position. In 1917-18 raw cotton exports amounted to 18 per cent., and raw jute and manufactured jute exports to 21 per cent. of the total exports, while of the remainder, food, tea, and seeds together amounted to 35 per cent. Of imports in the same year, cotton manufactures, including twist and yarn, amounted to 38 per cent., and machinery to only 3 per cent. of the total.

Of these imports. the United Kingdom supplied 54 per cent., other parts of the Empire 10 per cent., Japan 12 per cent., and the United States 8 per cent., as compared with pre-war figures of 63 per cent. for the United Kingdom, 7 per cent. for other parts of the Empire, 2 per cent. for Japan, and 3 per cent. for the United States.

As indicated in the After-War Report of the Senior Trade Commissioner,* "India was, before the war, and still is, the most important market in the world for United Kingdom manufactured goods."

In 1913, 16 per cent. of the total exports of the United Kingdom of a total value of £70 000 000 went to India, 96 per cent. of this total representing manufactured articles. In 1917, notwithstanding the inflation of prices in the interim, this figure had fallen to £60 000 000, but was still 13 per cent. of the United Kingdom export trade. It is easy to understand in this connection the comment of the Trade Commissioner that "The prosperity of the country and the maintenance of the purchasing power of the Indian people is, therefore, of vital importance to the United Kingdom."

Of British exports to India, textiles amount to not less than £40 000 000, or 60 per cent. of the whole; metals and machinery cover £17 000 000, or a further 25 per cent.

Japan and the United States as Importers.

A notable feature of Indian trade since the war has been the almost complete elimination of the importation of goods from the Central Powers, and the very great development in the importation of goods from Japan and the United States. These latter countries now export to India goods which were formerly obtained exclusively from the United Kingdom. As an indication of this increase, it may be pointed out that in 1913-14 American shipments to India amounted approximately to £3 000 000, while in 1917-18 they stood at nearly £8 000 000.

The improvement in the position of Japan in the Indian markets is still more remarkable. That country now occupies a place in the Indian import and export trade only second to the United Kingdom. The Japanese imports to India in 1918-19 amounted to £22 000 000, as compared with £51 000 000 for the United Kingdom in the same year. In 1913-14 it is the remarkable fact that the Japanese imports amounted only to £3 000 000, as compared with £78 000 000 from this country. There has, on the other hand, of recent years been a very definite development in Indian manufacturing industries, notably in the textile industries. The centre of the cloth industry is Bombay, while the jute industry is almost wholly confined to Calcutta.

Jute and Cotton Developments.

A glance at the curves shown in Fig. 1 will show the growth in the development in jute spindles, and the remarkable development in cotton spindles in Bombay in recent years. Similarly, Fig. 2 shows the growth in jute looms in India, and in cotton looms in Bombay. The more rapid increase in cotton looms as compared with cotton spindles should be noted.

Since nearly one-half of the Indian cotton industry has its centre in Bombay, the curves showing the development of the industry there give quite a good indication of its general development throughout the country. Until quite recently very little engineering work of any kind was carried out in India, practically the whole of the engineering material being imported. The development of the Great Tata iron and steel works at Tatanaga, where some

Fig. 4.—Warp-Sizing in Madura.

10 000 men are employed, has, however, made a difference in this connection, and there now appears to be a definite tendency towards manufacturing heavier engineering machinery in the country and even towards manufacturing the heavier parts of more complicated machines, working in conjunction in this case with the home manufacturer.

There is every reason to think that the development in this direction will continue. Further industrial develop-

* Report on the Conditions and Prospects of British Trade in India at the Close of the War. Cmd. 442, 1919. T. M. Ainscough, C.B.E.

ments in India comprise the putting down of oil mills, sugar plants, cement works, and chemical industries on a small scale.

The Indian Textile Industries.

In connection with the textile industries it must always

Fig. 5.—A Heald Maker in Madura.

be remembered that there still exists in India a large hand-loom industry, and that a certain amount of hand spinning is still done. The writer had an opportunity of visiting this industry as carried on under native conditions, and was very struck with the efficiency of the system so far as the weaving side is concerned, and the good character of those engaged in it.

Madura, in the Presidency of Madras, is one centre of this industry, in which many thousands of weavers are employed, and it is interesting to note that the weavers there claim to be of the Brahmin caste, and cannot be induced, under any circumstances, to work in factories.

Fig. 3 shows the type of native hand loom which is employed in Madura, and is from a photograph taken in the Industrial School, Madura, in which Lord Willingdon has taken a keen interest. Fig. 4 shows cotton warp being sized in Madura, and Fig. 5 shows a native heald maker manufacturing the harness for a loom. The work is carried on in watertight compartments, the spinning being carried on by one group of people, the warping and sizing by another, the weaving by a third, and the dyeing by a fourth.

There is no reason to think that, in the near future, the development of weaving in the factory will destroy the native industry. This is largely because of the small difference in efficiency between power-loom weaving as carried on in an Indian factory and hand-loom weaving as carried out in an Indian cottage. In this connection it does not seem to be fully realised that it is only comparatively recently that the last hand loom was employed in the Scotch woollen industry, and that there are even to-day people who consider that, provided proper arrangements could be made for supplying warps to the weavers and disposing of the finished goods, hand-loom weaving need not die out in this country.

(To be concluded.)

Electricity in the Lace Industry.

By J. F. CROWLEY, D.Sc., B.A., M.I.E.E.

There is a close association between cloth as manufactured in the loom, hosiery as made on the knitting machine, lace on the lace machine, or by hand, and embroidery. In the case of weaving on the loom, weft threads are caused to cross and interlace with the longitudinal and parallel warp threads. In the case of hand-knitting, on the other hand, loop after loop is formed out of a single thread, while in machine knitting the machine, instead of making one loop at a time, makes many loops across the width of the fabric, which is, therefore, manufactured at a more rapid rate.

Evolution of the Knitting Machine.

The first machine for knitting was invented by William Lee, in the sixteenth century. With this machine a flat fabric was made, which had afterwards to be joined together along its length to form a circular hose. Many improvements were subsequently introduced, the most notable of which was the invention by William Cotton, in 1868, of a machine capable of turning out 70 dozen pairs of hose per day, at a cost of fourpence per dozen pairs, instead of twenty-nine pence per dozen pairs, as was previously the case. To-day greatly improved machines are employed, some of them suitable for making flat hose, some for making circular hose, some again designed for hand operation, but the majority for power operation.

Lace in its original and simple form is a cord or narrow band, of which the familiar boot lace may be taken as an example, and in this form it is very old. The real development of lace, however, came in the middle of the sixteenth century, when "needle-point" lace and "pillow lace" are first mentioned definitely, and instructions for making them found.

"Needle-point" lace is so called because it is made with needle and thread, while "pillow lace," or "bobbin lace," as it is sometimes termed when manufactured by hand, is made by twisting and intertwining threads which pass over pins fixed in a hard pillow, or cushion. The two types of manufacture are sometimes employed to produce a combination lace. Embroidery, which is the ornamentation of a cloth or a net base with suitable designs, is a very old

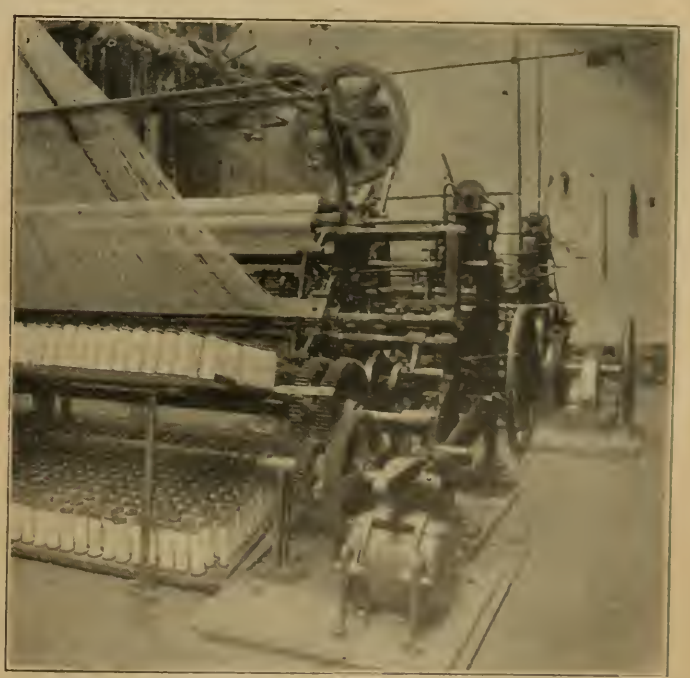

Fig. 1.—View showing Lace Looms driven by 3 b.h.p. Motor.

art, embroidered linen fabrics having been found in the tomb of Thotmes IV., in Thebes (*circa* 1500 B.C.).

Machine-Made Lace.

The first machine-made plain lace net was produced about 1768, upon an adaptation of Lee's knitting frame, the

machine being arranged to form open looped fabrics with the appearance of net, the open spaces being in regular order, and the net-like fabric being afterwards ornamented by the needle.

Frames for making " needle point " nets by machinery were first used at Mansfield about 1786, and later at Nottingham. Later still these machines were modified so as

Fig. 2.—View of 3½ h.p. Cop Winder.

to permit of the introduction of meshes into the point nets, which were then termed " figured nets." It was not until 1809, however, that any real advance was made in the manufacture of machine-made lace. In that year John Heathcoat patented his machine for making " bobbin " net, or " pillow lace," employing for the purpose a simpler mesh and one easier to make than that of the point net just mentioned. The first factory of John Heathcoat was put down at Nottingham, but he removed later to Loughborough, and when, owing to labour troubles, his factory was destroyed, in 1816, Heathcoat transferred his works to Tiverton, in Devonshire, where he installed improved machines, the factory being driven first by water power and afterwards by steam.

This historic factory still exists, and is, to this day, driven partly by water power, improved modern water turbines being now employed. The writer carried out a series of experiments on the driving of lace machines there a few years ago, and installed a number of electric motors for the individual driving of lace and auxiliary machines. Most of the lace machines used were designed on the premises, and, in many cases, even made there.

A Complicated Machine.

The making of lace by machine presented many difficulties to the inventor, and the lace machine to-day is, undoubtedly, one of the most complicated in use in industry. Heathcoat's own comment on one single aspect of the problem he had to face may be of interest —

> The single difficulty of getting the diagonal threads to twist in the allotted space was so great, that if now to be done, I should, probably not attempt its accomplishment.

Heathcoat was also responsible for inventions for making ornamental designs in the net during the course of manufacture.

In 1813 the lace machine was improved by Levers, and later by other inventors, but it was not until the Jacquard, which enabled complicated pattern and design work to be done, had been introduced to lace machines that real progress was made, and lace manufacturers were able to produce designs of all kinds, and so imitate the best hand-made lace. The Jacquard, prior to its introduction into lace work, had already become a familiar feature in the production of woven fabrics on the loom, and the success it met with there has been continued in the lace industry.

Machines of the Levers type for " needle point " lace are largely used in this country, and employ flat bobbins to enable them to pass between the stretched warp threads, the bobbins being designed to carry a large quantity of thread.

When the last Census of Production for the United Kingdom was taken, in 1907, from replies received from 85 per cent. of the lace manufacturers in the country, it was found that they employed 1 438 lace net machines, 2 147 Levers lace machines, 692 lace curtain machines, 294 warp lace machines, 669 muslin and other looms, and 248 embroidery machines. The gross output of the lace industry in the United Kingdom, according to the census referred to, was £10 718 000, employment being given to 36 840 operatives. The total horse-power installed was 10 399 h.p., of which approximately one-third was converted into electricity for driving motors and for lighting, while, in addition, 586 000 units of electricity per annum were purchased. The net output of the industry was £3 595 000, or £98 per operative employed. Of the above United Kingdom figures, approximately one-tenth would represent the figures for Scotland.

Details of Lace Machines.

The principal features of a lace machine from the point of view of the power engineer are: (*a*) The high starting torque required; (*b*) the great cyclic variation in the torque; and (*c*) the delicacy of the mechanism of the machine, and the liability to serious and expensive " smashes."

Largely because of these conditions, the drive *par excellence* for a lace machine is the individual electric drive. The machine is usually long, occasionally as much as 40 ft., and has heavy reciprocating parts. For such machines a steady drive, unaffected by causes external to the machine tending to produce variations in torque or speed, is essential to

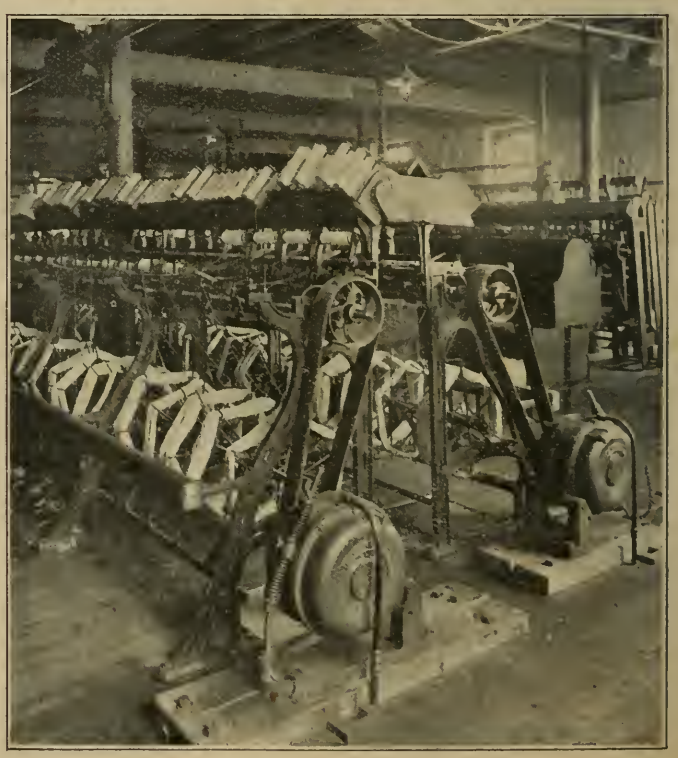

Fig. 3.—2½ h.p. 86-Spool Winder.

good production. The electric drive with three-phase motor provides this, and if the application is correctly made the conditions produced by the cyclic variation in torque of the machine itself can be satisfactorily met. Attempts have been made by Continental engineers to meet this latter

condition by providing springs which cushion the motor through a gear drive and permit it to adjust itself for varying torque during the cycle. So far, however, this arrangement, a feature of which was the frequent breaking of the springs, has not proved satisfactory. Experiments carefully carried out show that with a suitable design of motor and a mounting designed to meet the difficult driving conditions, such cushioning is not necessary.

Fig. 1 shows the type of drive designed by the writer for an important lace factory in the Scottish lace centre of Darvel, Ayrshire. The motor is strongly mounted on a specially designed support, the adjustable mounting being through the end-shields, so that any shocks due to driving are communicated direct to the supports, and not through the register between the motor and its end-shields, as would be the case if the motor were mounted from the stator frame in the ordinary way. This arrangement has the further advantage that the points of support are almost in the same plane as the point of application of the driving torque. The drive is by machine-cut gears, and full provision is made for the ready changing of pinions if different speeds are required. The whole of the motor mounting is

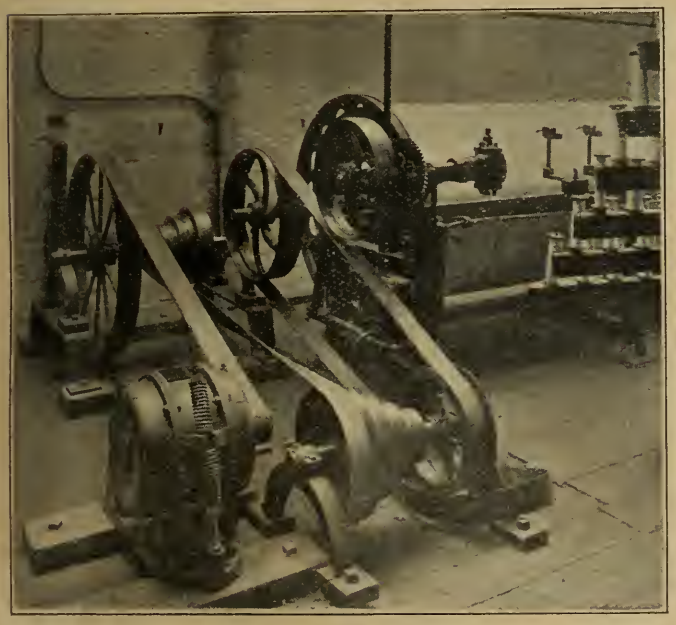

Fig. 4.—160 Beaming Machine driven by 2 b.h.p. Motor.

arranged to be rigidly bolted to the frame of the lace machine to prevent any relative movement.

"Smash" Difficulties.

As regards the third condition, it should be pointed out that the bobbins in a lace machine frequently number from 10 to 30 per inch, while a single lace machine may have as many as 30 000 threads. The carriages and bobbins generally pass through a slotted comb, and if through any irregularity in the drive, or fault in the mechanism, a bobbin misses its allotted path at entry to the comb, the result is a "smash," which, apart from loss of production, is generally an expensive matter to put right. It is, therefore, essential to arrange that the power is cut off at the earliest possible moment if such a "smash" arises. This is secured in the installation in question in two ways. A patented slipping coupling is inserted between the motor and the driven machine, and graded fusible cutouts designed to have a uniform rating are also employed. Should the fuses not cut the power off with sufficient rapidity when the excess load caused by a "smash" comes on, the coupling slips until the operator shuts the motor down, or until the fuse melts on the continued overload. It can also be arranged that the motor is shut down through an independent mechanical automatic trip on the no-voltage release of the starting switch.

It may be pointed out here that it is not possible to "anticipate" a "smash," and so no part of the frame mechanism can be brought into play to shut off the power before the "smash" actually occurs. The stopping

Fig. 5.—View of Sewing Machine Benches arranged in Groups of 12, driven by 1 b.h.p. Motor.

mechanism, however, responds with such rapidity that little or no advantage would accrue from such "anticipation," even if it were possible.

Advantages of the Individual Drive.

In addition to the steadier drive and consequent increase

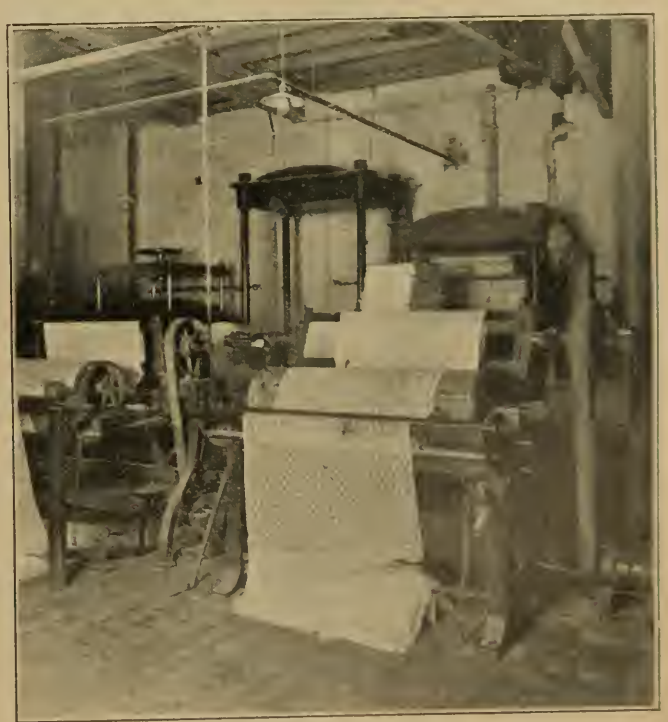

Fig. 6.—½ b.h.p. Rolling Machine Motor in top right hand corner driving Hydraulic Pumps to supply Presses behind.

in production which follows from a proper application of the individual drive principle to lace machines, there is also a considerable saving in power. With machines of

unusual length it is, in the majority of cases, difficult to arrange a shafting drive without employing shafting of considerable length.

With the individual drive, on the other hand, shafting and belting are eliminated, and power is only taken during the period when the machine is actually running.

Individual drive also lends itself very well to the driving of the other machines in a lace factory.

Illustrations.

As regards illustrations, Figs. 2 and 3 show an individually driven cop winder and spool winder respectively. A beaming machine 160 in. wide is shown in Fig. 4. This is driven by an individual motor through cone pulley reduction gear, the whole being mounted on the floor. Fig. 5 shows the driving of sewing machine benches, twelve sewing machines being driven from one motor. In Fig. 6 is shown a rolling machine driven by an individual motor, while at the back can be seen a motor driving hydraulic pumps for the operation of the baling presses. A folding machine is shown in Fig. 7. This is also driven by an individual motor.

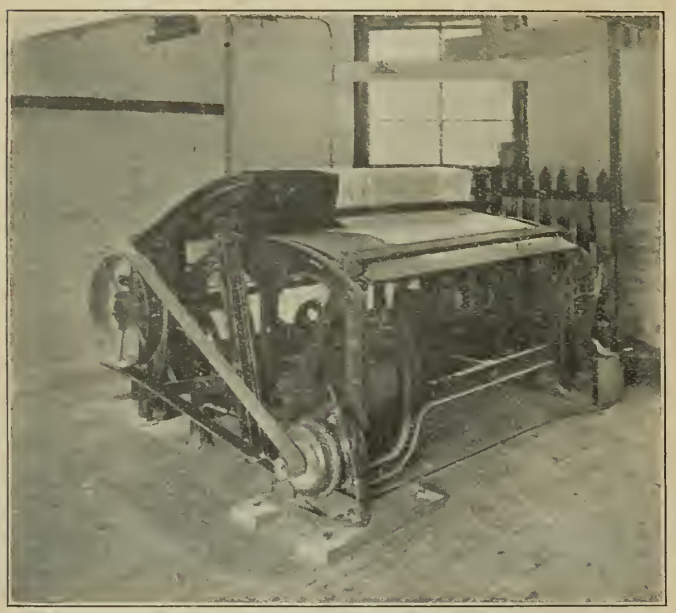

Fig. 7.—Folding Machine driven by 1 b.h.p. Motor.

Embroidery Machines.

The driving of embroidery machines is an even more complicated matter than the driving of lace machines, two motors being generally employed for each machine in Continental practice.

The driving of lace machines furnishes one more example of the importance of a detailed study of the peculiarities of particular machines if the application is to bring all the advantages that should follow from it. On the Continent, and latterly in the United States, considerably more attention has been given, in making electrical applications to industry, to the study of the conditions of the industry, of the peculiarities of design, and of the operating conditions of the individual machines, than has been the case here. It is to be hoped that the problems associated with the correct application of electricity to industry will meet with greater attention than has hitherto been the case in this country, and so help to secure that in this connection also we attain the high reputation that the manufacturers of industrial machinery, and particularly of textile machinery, have maintained for the country.

The writer wishes to acknowledge his indebtedness to The English Electric Company for the use of the photographs illustrating the plant.

Ball Bearings for Textile Works.

As evidence of the advantages to be gained from the employment of ball bearings in textile work, Mr. John Squires of the Skefko Ball Bearing Company sends us details of a series of tests conducted some months ago on two 80 spindle jute frames spinning 7½ lb. jute warp yarn. Both frames were by the same maker, but one was fitted with ball bearings on the tin roller and spindles, while the other was equipped with ordinary bearings. The ball bearing frame had been running for five months and was lubricated with grease, which is replenished every three months. This had been done fourteen days previous to tests and the frame had not been prepared in any way for the tests. The plain bearing machine had been in operation nine months, so was right at the top of its form, and to make the comparison still more favourable to plain bearings it was thoroughly flushed with oil before the tests started, and was oiled twice during each day's run. After four hours running the plain bearing frame recorded an increase of 15 per cent. in power consumption:—

	Ball Bearings.	Plain Bearings. Thoroughly flushed with oil	Plain Bearings. Good average condition.
Cyl. and spindles only	1·5 h.p.	1·8	2·5
Frame empty ..	1·8 h.p.	2·2	2·8
Spinning empty to full bobbin	25·23 spindles per h.p.	23·18 spindles per h.p.	16 to 18 spindles per h.p.

It was unfortunate, Mr. Squires points out, that the auxiliary or band tension cylinder of the ball bearing frame was on plain bearings, which rather detracts from the value of the figure for cylinder and spindles only in comparison with the plain bearing frame. Production tests were also run using the same spinner, and rove from the same machine in each case. Speed was increased from 2 700 to 2 850 revs. per min., and the ball bearing frame produced 23·5 lb. of yarn in 37 min. against 27 lb. in 38 min. in the case of the plain bearing frame—average figures being given in each case.

Of course, tests of short duration have little practical significance except to point the way, and encourage installations on a reasonably larger scale. Production must be recorded over a long period to establish so great an increase definitely. The smooth easy start on ball bearings is claimed to be of great value. For no matter whether the operation is spinning, winding, dressing or weaving, a smooth jerkless start is of the first importance.

Ball Bearing Motors.

As is well known, the development of electric motors has reached such perfection that even small motors of ½ h.p. and less are made having a very high efficiency. This has largely been made possible by ball bearings. The extreme accuracy of the bearings and their resistance to wear, reduces vibration to a minimum and permits a very narrow air gap. In effect these motors are greatly superior to the usual commercial motor. The efficiency and power factor of a 1 h.p. loom motor so equipped is 87 per cent. and 0·8, as against 66 per cent. and 0·59 of the commercial motor of the same type. The starting torque in addition is 2 times greater.

The temperature rise of the loom motor is only 35 deg. as against 50°C of the same type of commercial motor. In addition, their greater compactness recommends their installation in places where space is at a premium, as the overall length of the ball bearing motor is from 10 to 20 per cent. less—a very material saving in floor space or aisle room.

Individual Driving of Machines.

The individual motor drive of most types of textile machines, Mr. Squires continues, will develop sooner or later—the sooner the better for the textile trade. So far, the electrical engineer has been handicapped by the high capital cost involved, due principally to the fact that the textile machinist has given very little consideration to the matter of making machines suitable for such driving. On all, or nearly all, of them the effort required to start is from three to five times greater than that required to keep running, and most of the machines running light (without material in process) require 75 per cent. of the power required to maintain them in full operation, *i.e.*, the design and construction of the machine is responsible for 75 per cent. of the power consumption, and of two machines of the same type one may require 35 per cent. more power than the other, and one machine may vary as much as 30 per cent. in mechanical efficiency during a day's run. The electrical engineer either has to risk overloading his motor for considerable periods and risk a very heavy overload at starting, or sacrifice his power factor by providing a motor of far greater capacity than should be necessary.

Mechanical Storage of Water Power as a Factor in Textile Production.

This article describes the hydro-electric installation at Henry Ballantyne & Sons' Tweedvale and Tweedholm Mills. A special feature of the equipment is the method adopted for water storage, whereby, during non-working hours, water is pumped into the high level reservoir, whence it drives the turbines during the day. In this way the 220 H.P. *available by ordinary methods is increased by* 230 H.P. *Attention is called to the advantage of an hydro-electric supply from the textile manufacturer's point of view.*

A water power installation which possesses many novel features has lately been put into operation, and is now supplying the necessary power for driving the Tweedvale and Tweedholm Mills at Walkerburn, Peebles-shire. It is interesting to note that this village became a thriving community when these two mills were established in 1854, and that they owe their existence to the water power which was available in the Tweed. For a long time this was the only power used in the mills.

The fall available was divided between the two mills, the water leaving the wheels of the upper mill and passing through the wheels of the lower mill before returning to the river. The falls utilised were respectively 5 ft. 3 in. and 5 ft., for although a total head between the intake and the point of return to the river was 15 ft., nearly 5 ft. was lost in the long head and tail races. The mills, which covered a considerable area, had long grown beyond the power available from the old breast wheels, which together yielded only about 110 H.P., and other means of driving had from time to time been added to supplement this water power. A great loss of power in transmission to the scattered buildings by means of long lines of shafting and bevel gearing was also unavoidable

Utilising the Power to Advantage.

Full development of the water power was impossible until the ownership of the rights for the whole of the fall passed into the hands of one owner. Henry Ballantyne & Sons, Ltd., owners of the Tweedvale Mills, purchased the Tweedholm Mills in July, 1918. They decided to utilise the water available to the best advantage and to eliminate the heavy losses of transmission by introducing electrical drive. Boving & Company (London), Ltd., were asked to prepare a suitable scheme, and their proposals were adopted.

The first point decided was that the head available should be developed in one place. The obvious advantages of this are that an economical head is available for driving the turbines, and the duplication of plant and operating staffs is avoided. It was decided to concentrate the fall at the upper mill by deepening the race between the two mills, as it was impossible to concentrate it at the lower mill in view of the flooding of the intermediate buildings which would have occurred. This involved a considerable amount of excavation. The head anticipated was 10 ft. 6 in., but further improvements in the hydraulic conditions have been made, and the operating head is now, under normal conditions, slightly over 11 ft. The size of the existing races is such that their carrying capacity is limited to about 240 cub. ft. per second, and it was not found economical to increase this. Whilst this quantity is normally available throughout the year, there are especially dry years when the flow falls below this figure, so that further expenditure in increasing the capacity of the races was not desirable.

The power available under these conditions was 220 H.P., which, it will be noted, is exactly double that given by the old breast wheels. A survey of the power requirements of the two mills showed that a total of 450 H.P. was required, and the problem was then to find the balance required, *i.e.*, 230 H.P.

Mechanical Storage of Power.

The mills work for about 50 hours a week, so that for two-thirds of the week the power available would not have been used. With the low head of 10 ft. 6 in. the storage of the water was quite impossible, as the quantity would have been so great it would have involved the flooding of valuable lands. Electrical storage of the surplus power was also deemed impracticable, and it was finally decided to store the power mechanically in the following way: During the idle hours the turbines were to be run for the purpose of driving pumps. The water from these was to be delivered to a high level reservoir and stored for use during the working hours. During these working hours the water would run down from the high level reservoir through the same pipe as it flowed up, and by driving a Pelton wheel would generate the extra power required.

A survey of the conditions proved this to be quite feasible, for the hills immediately behind the mills rose up steeply to a height of over 1 000 ft., offering an ideal site for the reservoir in contemplation. Fig. 1 shows the general plan of the site; the two mills standing on the mill lade close to the bank of the Tweed are clearly shown, as are the positions of the reservoir, 12 in. cast iron pipeline, surge tank, and steel riveted 9 in. pipeline.

Pipeline and Reservoir.

The 9 in. high pressure pipeline, to save expense, was brought as steeply as possible down the hillside. The reservoir had to be placed on a saddle some little distance away, and it was connected to the top of the high pressure pipeline by a 12 in. cast iron pipe running practically on the level round the contour of the hill. A surge tank is necessary at the junction point to provide or absorb water at times of change of load, for the 9 in. pipe being on a steeper slope will more readily accommodate itself to changes of load, and on increasing loads will draw off more water than the 12 in. pipe can immediately supply.

This scheme provides the extra 230 H.P. required, for in spite of the fact that a good deal of the energy available during the idle hours is absorbed in the pumps, in pipe friction and in losses in the Pelton wheel, the fact that the idle hours are more than the working hours fully compensates for this and enables the effective power to be more than doubled.

Power-Station Arrangements.

The general arrangement of the power station is shown in Fig. 2, whilst side and end elevations are given in Figs. 3 and 4. The low pressure turbines consist of two large double runner, horizontal

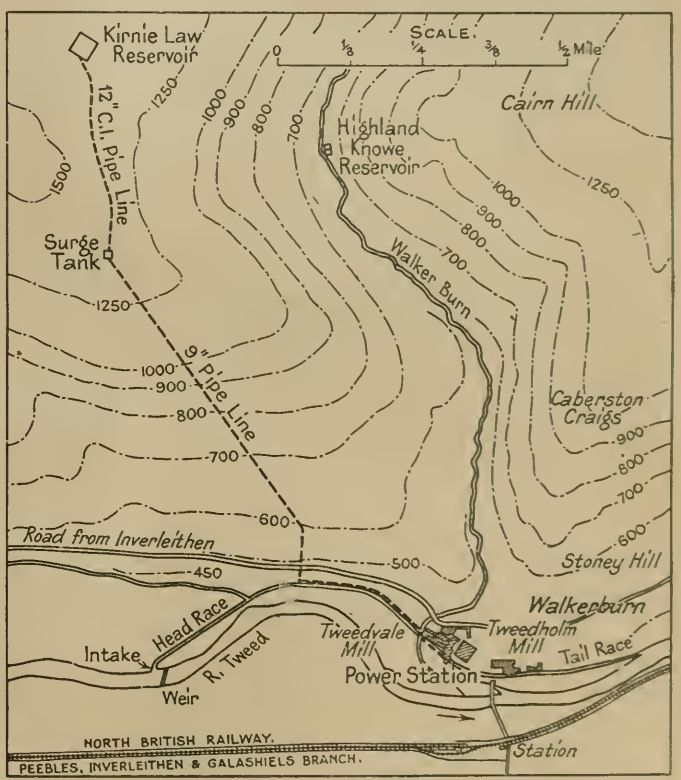

Fig. 1.—Plan of Hydro-Electric Power Scheme, Walkerburn, Peebleshire.

Francis turbines of 110 H.P. each, running at a speed of 200 revs. per min. It will be seen that between these turbines is left a water-tight chamber.

Each turbine is furnished with a large flat-faced belt pulley of double width, the diameter being 100 in. The outlets from these turbines are inclined at an angle to reduce the amount of disturbance to existing buildings, and also to give a cleaner exit for the water. Both these low pressure turbines drive on to a single generator of 145 kW running at 600 revs. per min., each end of the generator shaft having an overhung crowned pulley for the purpose. Under normal operations the low pressure turbines are run on hand control. During the day all variations of demand are met by the high pressure turbine. Thus the low pressure turbines run on full load, and only the balance of power is drawn from the reservoir. At night, since the pumping load is constant, hand control suffices.

The duplication of the low pressure turbines has a considerable advantage apart from that of overhaul. On occasions it is necessary to work overtime: the central generator would be driven by one low pressure turbine, and for this purpose one turbine is

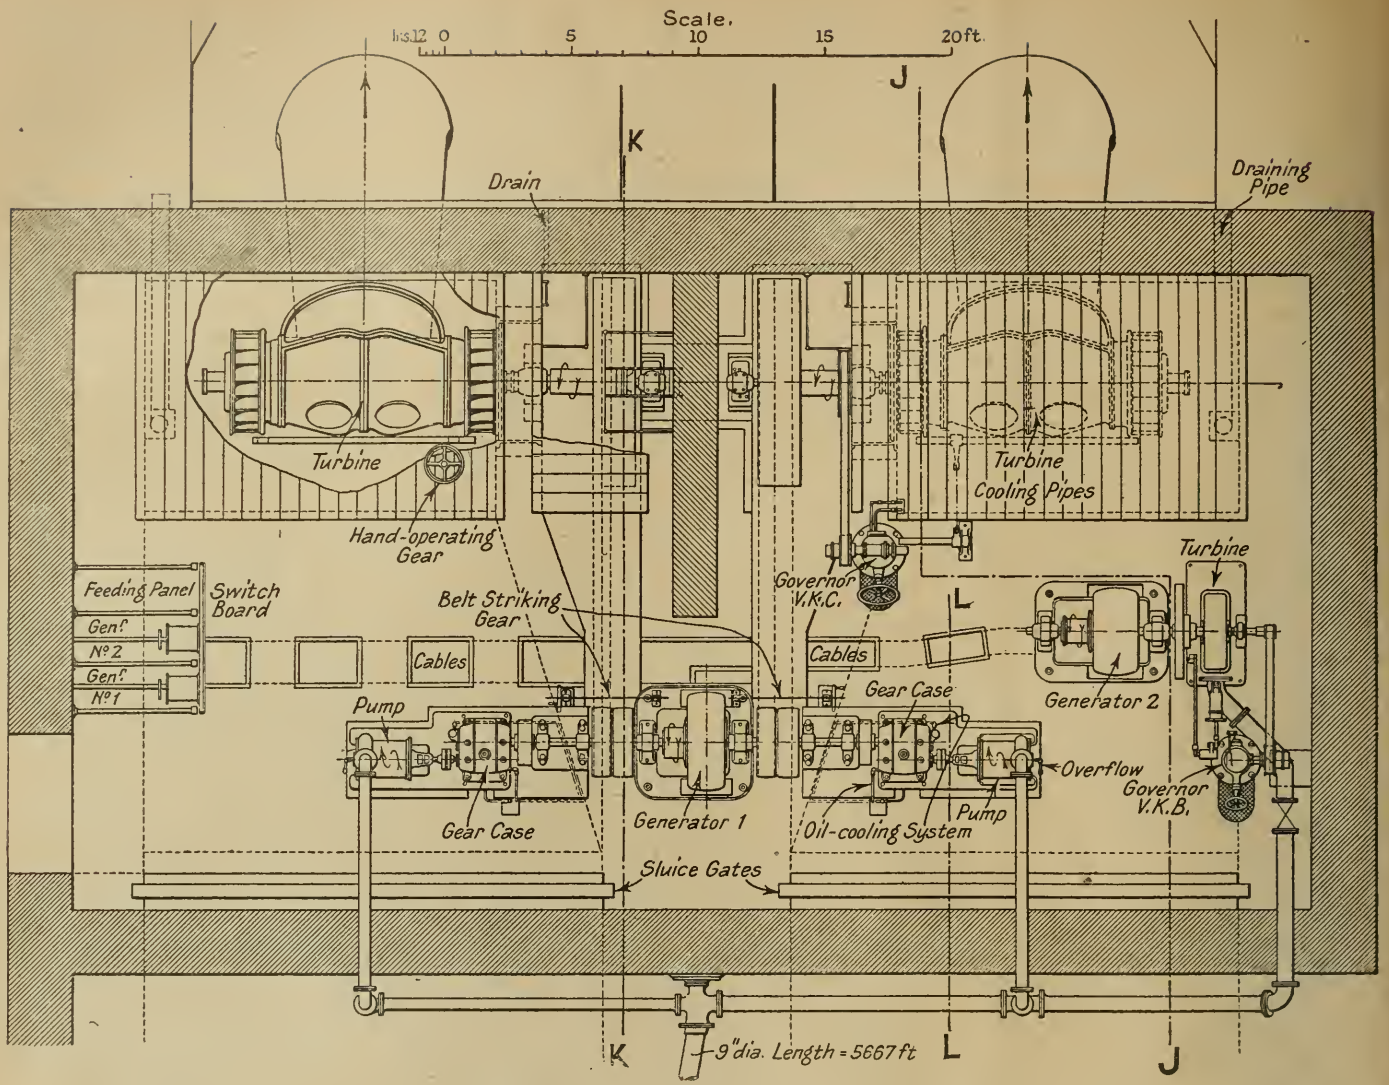

FIG 2.—PLAN SHOWING GENERAL ARRANGEMENT OF PLANT.

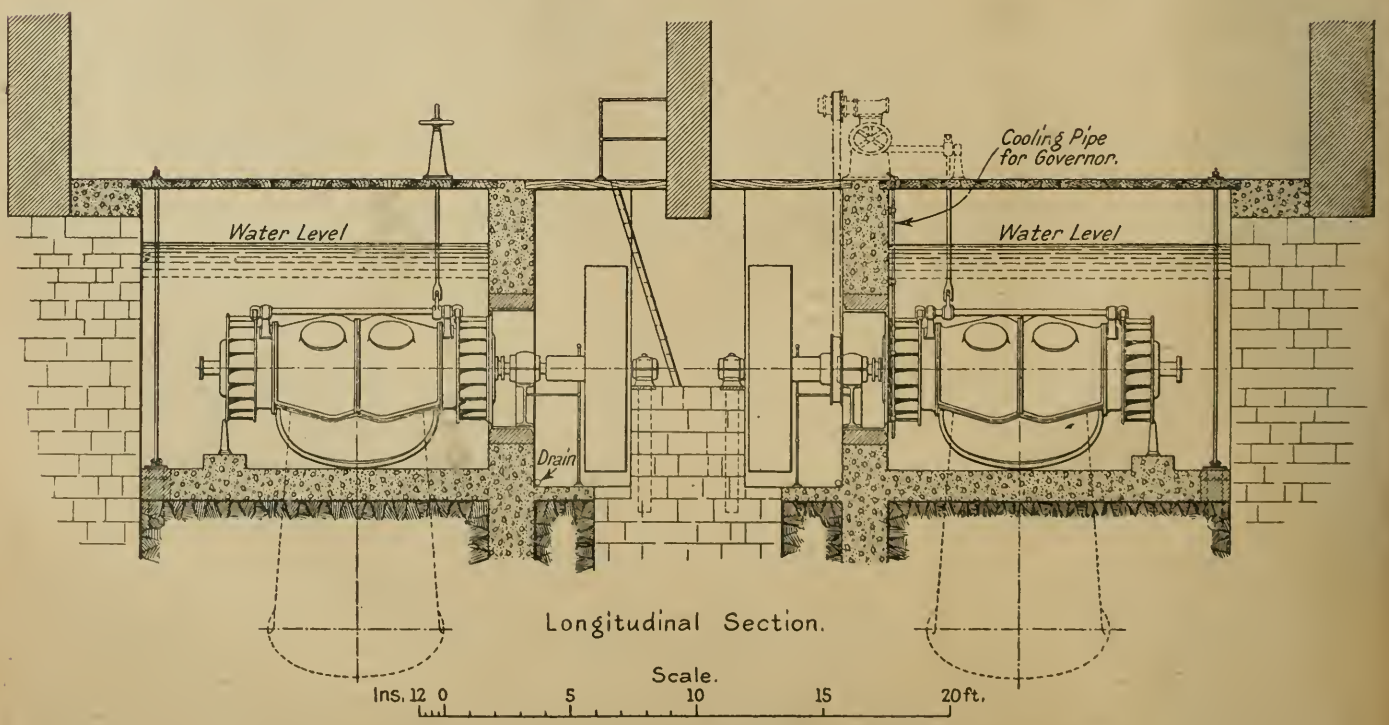

FIG. 3.—LONGITUDINAL SECTION OF HYDRO-ELECTRIC AND ACCUMULATING POWER PLANT.

provided with a governor, the other turbine on hand regulation drives its pump all the time.

In line with the generator driven by the low pressure turbines are shafts carrying crowned pulleys exactly similar to those on this generator. These shafts drive the high pressure pumps which are necessary to create the head of 1 050 ft. which is required. During the idle hours the belts are changed over from the generator pulleys to the pump pulleys.

The Pump Drive.

Since the quantity of water delivered by each pump is relatively small, *i.e.*, 220 gallons per minute, it would have been quite impracticable to have run at a speed of 600 revs. per min., and therefore a gear drive had to be resorted to, and the pumps themselves run at 3 000 revs. per min. To isolate the gear case and prevent any side pull interfering with the correct meshing of the gears, flexible couplings are provided on each side of the gear boxes.

These pumps deliver through 4 in. pipes into a bus pipe immediately outside the power-house wall, and this bus pipe is connected both to the 9 in. high pressure pipe leading up the hill to the reservoir and to the 6 in. pipe for supplying the high pressure turbine. This high pressure turbine is of the Pelton type, and under an effective head of 897 ft. develops 230 H.P.

Owing to the long pipeline, precautions had to be taken for dealing with the water hammer effect on shutting down the turbine suddenly in the event of the load coming off, and Boving's patented system of combined needle and deflector regulation has been incorporated. On the load coming off, the deflector cuts into the jet of water issuing from the nozzle and throws the power off the wheel. The needle is then allowed to move slowly forward to reduce the jet to the size corresponding with the new load, the deflector meantime taking up its position immediately above the reduced jet. In this way the waste of water only takes place during the few seconds of the regulating period. The rapidity of the action of the deflector and the economic control by means of the needle are thus combined.

The Pelton wheel runs at 1 000 revs. per min., and is coupled direct to a 155 kW. generator. The whole electrical system is direct current, the pressure adopted being 250 V. The switchboard for distributing this is accommodated at the end of the machine room.

Figs. 2, 3, and 4 make the general lines of the scheme clear, but the interior view in Fig. 5 will be of some interest. This shows a view taken from the switchboard end; the belts coming up from the low pressure turbines and driving the central generator can be clearly seen. On the right hand side will be seen one of the high pressure pumps and the gear box through which this is driven.

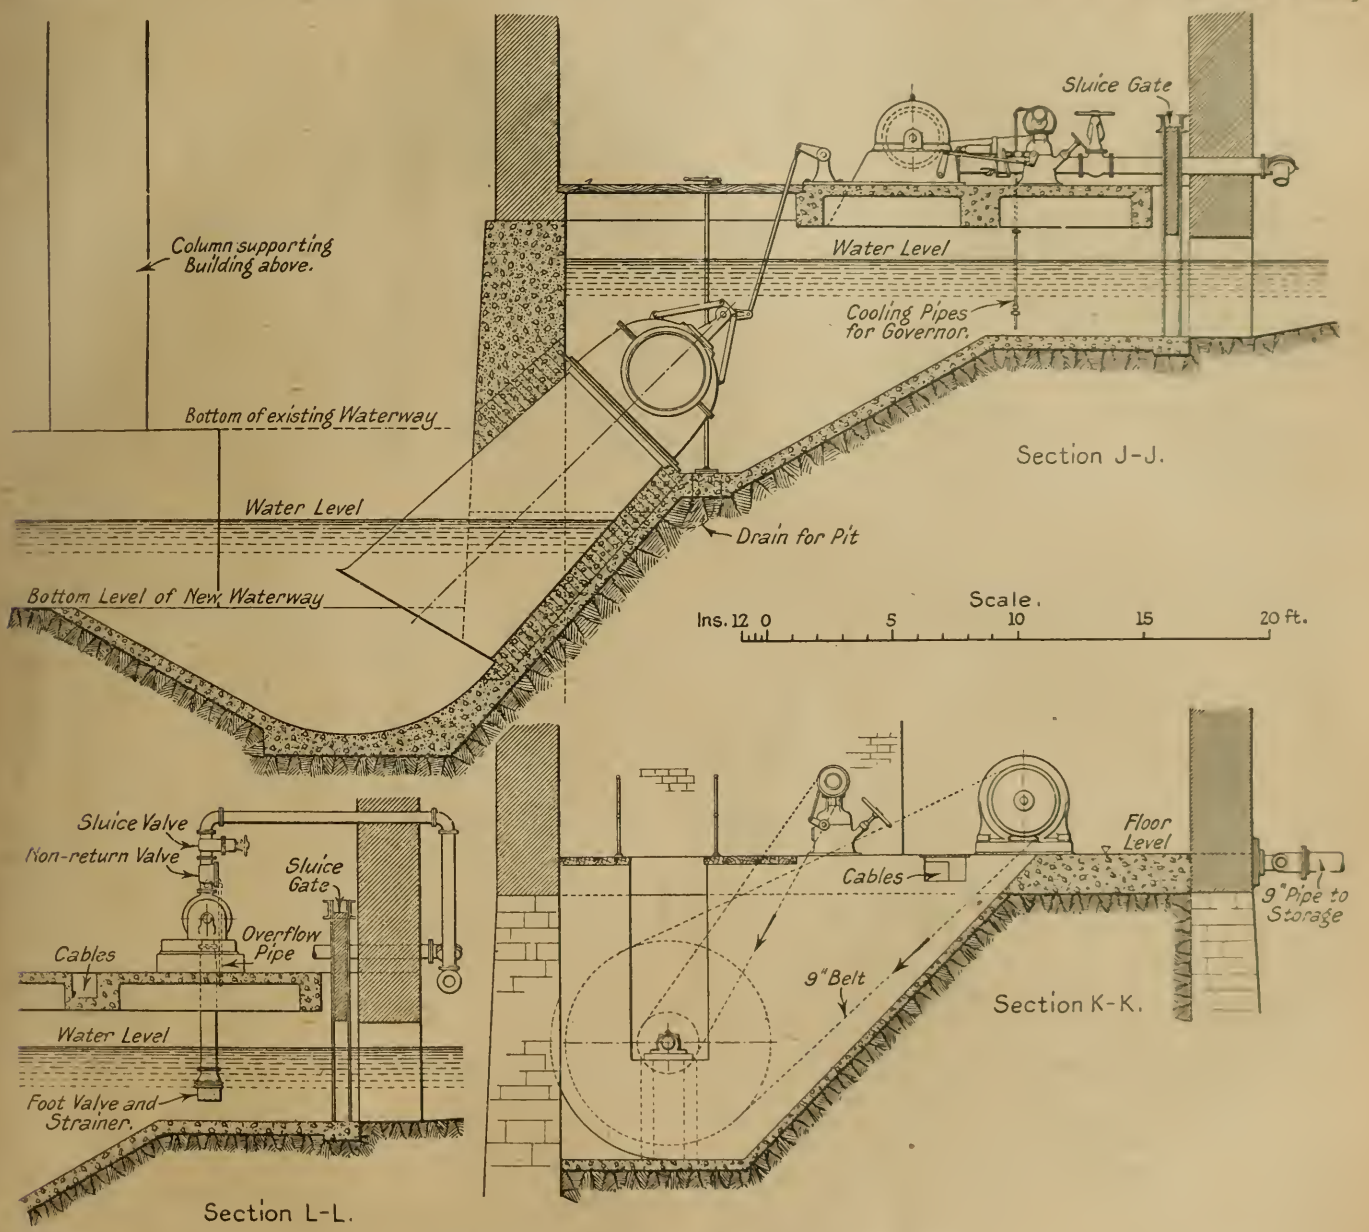

FIG. 4.—CROSS SECTIONS OF THE WALKERBURN STATION.

It is interesting to contrast the size of the 230 H.P. Pelton wheel, with its generator and governor, with that of the low pressure turbines, each of which is only half the H.P. of this small Pelton wheel.

Constructional Pipeline Work.

Leaving the interior of the little power-station, we come to the 9 in. pipe through which the water is pumped to the reservoir, and which brings the water down to the Pelton wheel. Fig. 6 shows this pipeline being laid in the trench up the hillside. For

the upper portion where the head is less than 300 ft. an ordinary slip joint is satisfactory, but as seen in the photograph, for higher heads the pipes are flange jointed, the faces of the flanges being machined and rubber packing rings provided to make the joints watertight. The static pressure at the lower end amounts to 455 lb. per sq. inch. As the pipes are buried underground except for a small portion near the mill, and as the water will either be flowing up or coming down through the pipe, practically the whole time, no danger from frost is anticipated.

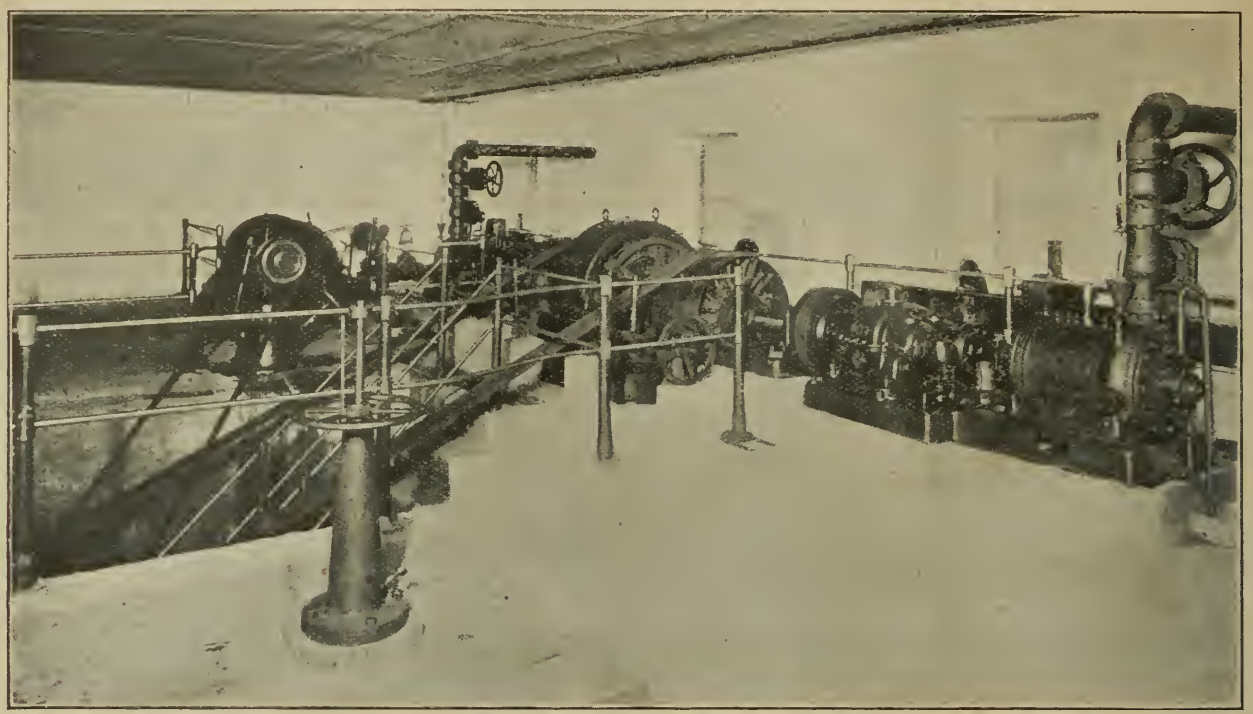

Fig. 5.—Interior View of the Walkerburn Station.

Fig. 6.—View of the Pipe Line.

At the outlet from the surge tower an automatic butterfly valve is fitted. If by any accident a burst should occur in the 9 in. pipe this valve is operated by the increase of velocity; the valve is tripped and slowly closes under the control of a dashpot, thus cutting off the waste of water and preventing any possibility of a washout occurring. The surge tank and 12 in. cast iron pipe going to the reservoir have already been noted. In the design of the surge tank, which is 4 ft. 6 in. square, a 12 in. rectangular gauge has been incorporated through which the whole of the discharge from the pumps can be diverted by closing down the valve to the reservoir. In this way the efficiency of the pumps can be checked from time to time. The top of this surge tank has been covered in with expanded metal to provide against the possibility of children throwing in stones, which might work down the pipe and damage the Pelton wheel.

The Reservoir.

One of the biggest works in connection with the whole installation is the reservoir, and a few figures may be of interest. The longest period of pumping is from midday on Saturday till Monday morning, *i.e.*, 42 hours, and at their rated capacity the pumps will in this time deliver 1 108 800 gallons. During the working hours of any one day, if the Pelton wheel were kept continuously on full load it would consume 546 750 gallons in 9 hours. Allowing that one hour of the remaining 15 hours is lost each day in changing over and at mealtimes, the pumps could run 14 hours and replace 369 600 gallons, the deficit being 177 150 gallons per night. This, with the 5 hours' draw off on Saturday, would lead to a total deficit when the week's work was finished of 1 189 500. It will thus be seen that the water used during the week in the reservoir would slightly exceed the quantity pumped into it. It must be noted, however, that this would only occur if the Pelton wheel was kept on full load during the whole of the working hours, which is a contingency that cannot normally arise.

Theoretically, then, a reservoir capacity of slightly under 1 200 000 gallons would be adequate. A certain margin has to be allowed to provide against the pumps being stopped for overhaul of any part of the plant, and in times of exceptional drought it might not be possible to run the pumps at full capacity. It was therefore decided to enlarge the reservoir so as to provide a surplus storage to carry over from favourable to unfavourable weeks, and a reservoir of 3½ million gallons was ultimately decided upon. The reservoir is 192 ft. square by 15 ft. 6 in. deep.

Constructional Details.

Owing to the possibility of the ground not being watertight, the bottom of the reservoir was formed of a 9 in. slab of reinforced concrete laid directly on the solid ground. This slab contains a light mesh of steel reinforcement to provide against any upward stresses due to changes of temperature or to hydrostatic pressure from the outside when the reservoir was empty.

The walls, which vary from 8 in. thick at the top to 21 in. at the bottom, are heavily reinforced, the reinforcement being tied into

the floor, so that the walls can distribute their load on the cantilever principle. The taper of the walls was increased near the foot to provide against the bending moment which increases more rapidly as the floor is approached. The tensile stress in the vertical rods of the wall was limited to 6 tons per sq. in., with a view to minimising the possibility of surface cracks taking place. A mixture of 1 to 2 to 4 was used, and great care was exercised in the selection, grading, and mixture of the constituent parts. During the recent test no leakage or sweating in any part of the reservoir was observed. This is particularly satisfactory in view of the very difficult conditions obtaining at this altitude during construction.

The plant has been in successful operation now for several weeks. As has already been pointed out, the scheme was proposed by Boving & Company, Ltd., who have acted as main contractors for the supply of the hydraulic equipment, including turbines, governors, generators, pumps, gears, pipes, and valves. The generators were supplied to them by Bruce Peebles, the pipes by Mechans, Ltd., and the valves by Glenfield & Kennedy. The reservoir was designed in detail by the Considere Construction Company, Ltd. Melville, Dundas, & Whitson, Ltd., were contractors for the construction work. Mr. J. Sharp, of Glasgow, acted as consulting engineer during the construction and erection of the whole of the scheme.

From the Textile Manufacturer's View Point.

From a textile manufacturer's point of view the main advantage of a hydro-electrical scheme of power generation, such as the foregoing article describes, is steadiness of drive in the highest obtainable degree. This steadiness of drive is one of paramount importance to manufacturers of fine woollen goods. It is well known in the trade that an irregular drive produces not only defective yarn, but a very high proportion of waste; the one affecting the quality of the cloth, the other, as may easily be seen, the price or profit.

In comparing this power (the hydro-electrical drive) with that generated by other means it will be apparent that departments such as carding, spinning, weaving, finishing, &c., can be worked individually much more economically than where it is necessary to start up, or maintain the running of a plant consisting of steam, gas and other engines.

The firm who have had the enterprise to install the particular system that we describe, Henry Ballantyne & Sons, Limited, of Walkerburn, Peeblesshire, have already realised these advantages in a very marked degree. Being manufacturers of only the highest class Scotch suitings they use a large proportion of very fine yarns. These, under the old drive, were apt to come from the spinners "pointy" and defective, and no amount of subsequent picking or mending of the cloth would bring it to the same state of perfection as that in which it is now being produced. At present the taste in tweeds, being largely in the direction of "pick and pick" styles in strongly contrasting shades, level yarns are of the utmost importance.

The Effect of Short Time.

To take the second point. The woollen trade is suffering at present from very acute depression in sympathy with most other trades, and it is, unfortunately, frequently necessary to run short time. This is most effectively done by running departments in rotation, and producing only the electric current necessary for the time being; a great source of economy and tending to minimise the loss in running short hours.

Water power being very reliable, the comparative immunity from breakdowns is a great boon. In finishing operations a piece may be seriously damaged by a machine stopping at an inopportune moment.

It may be added that this scheme is the only one of its kind in Great Britain, and there are probably not more than two or three others in operation in the world.

Recent Developments in Textile Drives.

The requirements of the textile industry have always been closely studied by the Société Anonyme Brown, Boveri & Cie., and a considerable amount of research and experimental work has been carried out by this concern with the object of evolving designs of textile driving machinery which will give the most economical working results commensurate with low initial costs and unfailing reliability in service.

The Economics of the Electric Drive.

As an example of the saving that can be effected by taking advantage of recent progress in electrical design, the case of the S. A. Tissage Mécanique de Soie may be quoted. This firm recently decided to extend its mill, and, on completion of the extension, tests were made to ascertain the efficiency of the newly-installed Brown-Boveri motors as compared with that of the motors supplied for driving the original plant, which, although they have seen over twenty-two years' service, representing three quarters of a million working hours, are operating to-day in a perfectly satisfactory manner. It was found by the engineers of the S. A. Tissage Mécanique that the current consumption of the new motors was no less than 42 per cent. lower than that of the old ones working under the same conditions.

The Application of the A.C. Commutator Motors.

The improved economy effected in recent installations is largely due to the use of alternating-current commutator motors, which possess the great advantage of a high starting torque combined with economical and easy speed regulation by moving the brushes. The efficiency of these motors is almost constant for any working speed.

The principle of speed control by brush displacement was first embodied in the single-phase Deri motors built by Brown, Boveri, but this firm has for many years been building three-phase motors which embody the advantages of the Deri type, and are so wound that the phases of the circuit to which they are connected are as equally balanced as when induction motors are employed.

Having regard to the fact that no hard and fast rule can be laid down in the matter of textile drives, so much depending on the individual case, Brown, Boveri have developed a number of different types of motor, to cover the whole range of the requirements of the industry. Although it has been found that individual drive of looms, ring frames, and presses has often resulted in more economical working and the avoidance of a large amount of millwrights' work in erection, it has always to be considered, the firm points out, whether the saving thus effected will compensate for the higher initial costs involved. Very often it is found that a combination of individual and group drive gives the best results. Again, in certain cases, it may pay to construct special motors to meet the prevailing conditions.

An Efficient Textile Motor.

It so often happens that the speed of the machine to be driven is at variance with that at which the most suitable motor will

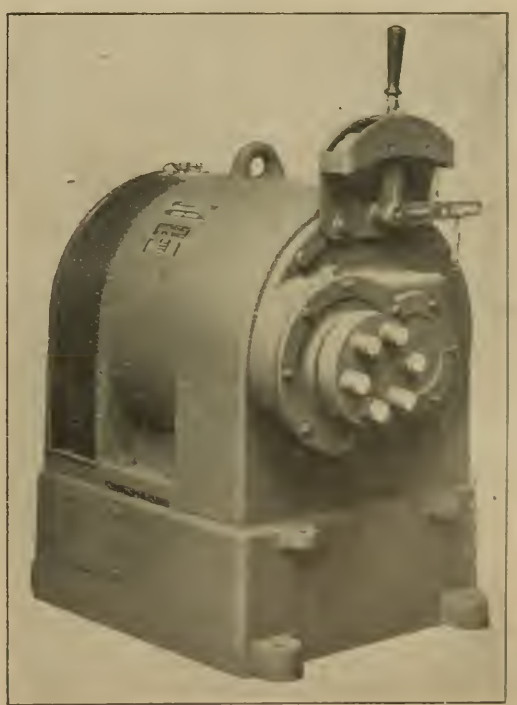

Fig. 1.—Single-Phase Commutator Motor, with Built-on Reduction Gear.

run economically, that Brown, Boveri have developed a type of motor in which an enclosed reduction gear is built on to the frame. This gear has ground pinions and runs in an oil bath, and has an efficiency of 98 to 99 per cent. Although originally designed for motors to be direct coupled to ring spinning frames, it has proved

so satisfactory in service that similar gears are about to be designed for loom and other motors. The gain in safety and cleanliness over the crude open reduction gear is obvious. Fig. 1 shows a single-phase commutator motor with a built-on gear of this type, and Fig. 2 a 4 in. lift dry-spinning machine (constructed by Fairbairn, Naylor, Macpherson & Company), in the mill of the S. A. Industrie Linière Suisse at Niederlenz, driven by two three-phase commutator motors in this way. Another advantage of

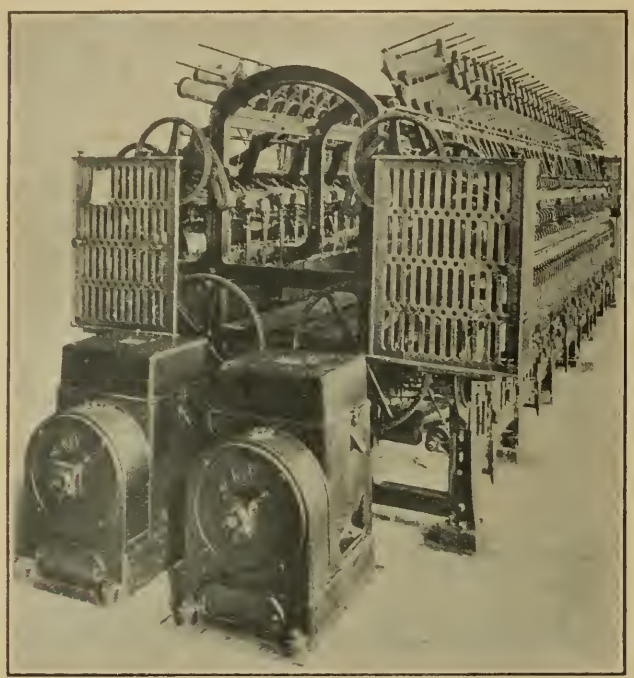

Fig. 2.—4 in. Lift Dry-Spinning Machine with Two Spindle Shafts, driven by Two Independent Three-Phase Commutator Motors, with Built-on Reducing Gear.

this type is that it permits of the independent drive of each shaft of the ring spinning frame, as motors with built-on gears take up far less space than if they were not so fitted. This is illustrated by Fig. 3, which shows two single-phase commutator motors with reduction gears and a hand speed-controlling device built-on.

Ring Spinning Drives.

Automatic variation in speed has proved to be of great advantage in the case of ring spinning machine drives, and some 4 000 motors

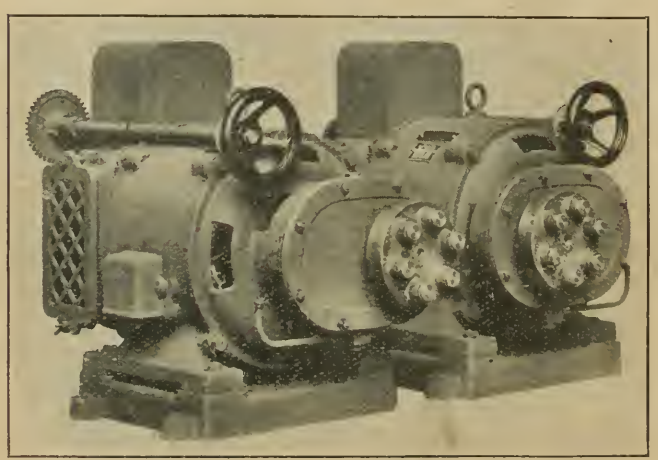

Fig. 3.—Two Single-Phase Commutator Motors, with Built-on Gears and Hand Speed-Controlling Device.

have been supplied to various mills on the Continent and elsewhere equipped with Brown, Boveri automatic speed-regulating gear. This gear ensures that the tension on the thread is kept constant, the motor speed being kept low during the initial stages of the formation of the cop, and gradually increased as the diameter grows by altering the position of the brushes, thus giving a very evenly-wound cop, and minimising the breakages of the thread. For driving machines in which only an occasional decrease in speed is required, a very much cheaper and simpler arrangement can be made use of. The motor is belted to the machine to be driven, and the belt is kept taut by means of a jockey pulley which is kept pressed against the belt by means of a weight. If it is desired to decrease the speed of the machine, it is only necessary to lift up the pulley and allow the belt to slip. It has yet to be seen whether this very simple device will always give good results, but it has operated with complete success in a number of cases. Fig. 4 shows an induction motor driving a frame in this way in a Swiss mill.

It is not too much to say that no Continental mill of recent construction employs anything but the electric drive, and, in some cases, mill owners themselves generate locally the necessary power. For instance, the mill of the S. A. Industrie Linière Suisse has its own power house, the equipment of which comprises a three-phase alternator of 150 kVA, distribution panels, and panels for the alternator and incoming line from the Argovie power station. This Company recently reconstructed its mill, and converted its equipment to independent, instead of group, drive. For this purpose Brown, Boveri three-phase commutator motors with built-on reducing gears were ordered, together with a number of motors for the direct drive of the frames.

These alterations have resulted in a vast improvement in the

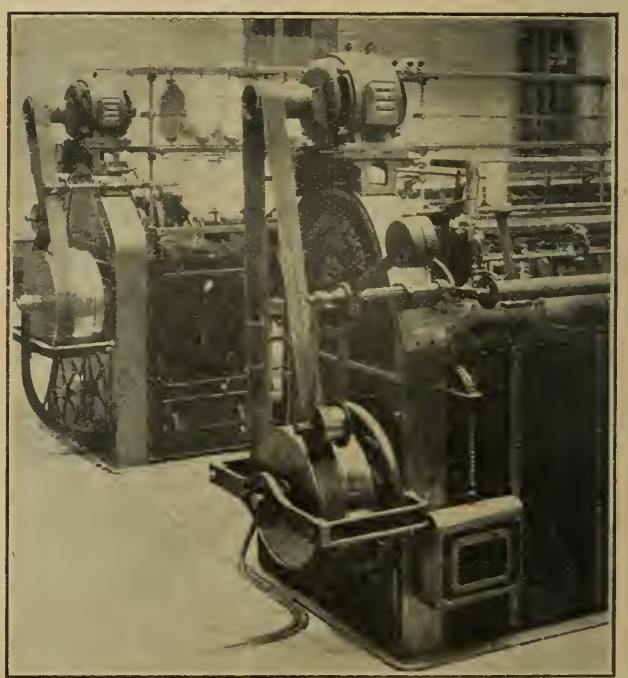

Fig. 4.—Belt Drive of Spinning Frame, with movable Jockey Pulley.

working efficiency of the mill, and the S. A. Industrie Linière Suisse have reported that not only has a large increase in production been obtained, but also the amount of skilled attention necessary for the operation of the various frames, &c., has been considerably reduced.

British Non-Ferrous Metals Research Association.

Of the several research associations, which, apart from the British Electrical and Allied Industries Research Association, interest the electrical industry, none is more important than the British Non-Ferrous Metals Research Association. The annual report of this association for 1921 has recently been issued, and shows a gratifying record of progress achieved during the year. Several important electrical firms are members of the association, and users as well as manufacturers are admitted to membership.

Apart from the researches, of chief interest to those in the non-ferrous industry, even to those possessing small foundries, such as the investigations on brass casting and on the electrical melting of non-ferrous metals, we note a number of investigations in progress of particular interest to electrical manufacturers, notably those on metal polishing and grinding, the jointing of metals, including soldering, brazing and welding, the last named being conducted by the Metropolitan-Vickers Electrical Company. Of fundamental importance is the investigation being conducted by Dr. W. Rosenhain at the National Physical Laboratory on the influence of impurities up to 1 per cent. on the working properties of copper. The increased speeds and stresses in modern electrical apparatus are such as to render increased knowledge of non-ferrous metals and alloys of enormous importance to electrical manufacturers, and we trust that the association will continue to show its present interest in electrical affairs.

The New Oerlikon Geared Individual Drive for Looms.

In this article is described a geared individual drive for textile work which has been devised by the Oerlikon Company to combine the advantages of ordinary gearing and at the same time to eliminate the difficulties which occur when the loom is suddenly stopped. The device employed consists of a centrifugal coupling with a fast and loose part which, at starting, begins only to grip when approximately normal speed is reached and when running adjusts itself automatically to the normal torque.

In general, it may be said that the speed of looms ranges between 80 and 220 revs. per min., the actual speed depending upon the construction of the loom and the class of fabric it is to produce. Consequently, with a loom motor running at 950 revs. per min., the speed ratio between loom and motor will have any value between 1 to 12 and 1 to 4·3. In view of the limited space available for driving, it is not advisable, as a rule, to exceed a ratio of 1 to 6 in the case of belt drives, otherwise the angle of contact of the belt on the motor pulley would be too small. This would not only render the drive unreliable, but would also mean large losses due to belt slip and friction in the bearings. It therefore follows that the overall efficiency of an individual drive by a belt decreases rapidly as the speed ratio increases. Attempts have been made to obviate to a certain extent the disadvantages encountered with this type of drive when used for high speed ratios, by utilising large pulleys and belt tightening pulleys. No success has, however, been attained in this direction, for the provision of larger pulleys has proved impracticable owing to the short distance between the shafts. On the other hand, it has been found that, in the case of drives fitted with a belt tightening pulley, the strain thrown upon the loom, in the event of the latter coming to a sudden standstill through the shuttle being trapped in the shed, is sufficient to break both the loom frame and shaft.

Fig. 1.—New Oerlikon Geared Individual Drive, with Motor arranged symmetrically between pillars.

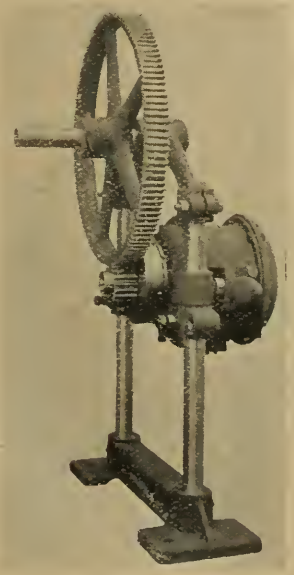

Fig. 2.—New Oerlikon Geared Individual Drive, with Motor projecting on outer side of gear support.

Fig. 3.—Drive with Motor swung out and loose part of coupling removed.

Gearing the Most Rational Solution.

Under these circumstances, the adoption of a gearing instead of a belt drive seemed the most rational solution of the problem, more especially in view of the fact that very efficient gearing can be built for the speed ratios in question. Furthermore, such an arrangement ensures sharp and reliable starting up, and perfectly steady speed, owing to absence of slip between the motor and the loom.

All these advantages, which are obtainable by the use of gearing, have, it is true, been universally known for some time, but the design of a geared individual drive presented very serious difficulties. It was found quite possible to build such drives, under the most favourable conditions, for looms fitted with a loose reed arrangement or for ribbon looms. These drives were, however, found entirely inadequate for looms of heavy construction, and more especially for the type of loom with a fast reed as are most generally used. The following considerations will explain wherein resided the main difficulty.

Difficulties of the Gear Drive.

In all looms it is necessary, in the event of a shuttle failing to reach a shuttlebox, to bring the loom to rest immediately so as to avoid damage to the warp lying above and below the shuttle. In the case of looms with the fast reed arrangement, the loom is brought to rest by a stop rod and tongue engaging in the shoulder of the frog, the latter releasing the starting handle and rendering the drive inoperative. When the loom is stopped in this way the kinetic energy in the rotating parts of the loom and motor is abruptly degraded so that a heavy and sudden strain is thrown upon the gearing. This check inevitably results, especially in the case of looms with a fast reed, in the ripping off of the gearing teeth or in the deformation of the shaft or even in the breaking of the loom frame. It will, therefore, be obvious that when the motor and loom are rigidly connected together by means of gearing, it is impossible to ensure the flexibility required for the safe operation of the loom and drive that can be attained with belt drives.

The Oerlikon Coupling.

The Oerlikon Company has, however, been successful in overcoming the difficulties mentioned above in a very simple and satisfactory way, and has brought out a geared individual drive which constitutes a notable advance in this class of design. This type of drive is shown in Figs. 1 to 5. It has, we understand, been in continuous service for a period of two years under severe working conditions and has given excellent results. The main feature about this drive is the Oerlikon patent automatic centrifugal coupling, which is illustrated in Fig. 3. This coupling consists of a loose and fast part and is mounted on the motor shaft. On the loose portion is fitted a pinion working with a gear wheel on the main shaft of the loom. The motion of motor is communicated to the loose part of the coupling, and consequently to the loom, by means of two shoes on the fast portion of the coupling, which are pressed against the friction surface of the loose portion by the centrifugal action of two weights.

Operation of the Coupling.

At starting, the coupling begins to grip only when approximately normal speed is reached. The loom, therefore, starts up very quickly, with the result that the same tension is obtainable for the first pick of weft as for any of the others. When the loom is running, the coupling adjusts itself automatically to the normal torque, which is about 1·8 to 2·5 times less than the starting torque. With this coupling, it is claimed, the stresses in the gearing between the motor and the loom never exceed those encountered in normal service, even though shocks should occur or the loom should stop suddenly; this is due to the fact that whenever these stresses tend to increase, a slip takes place in the coupling. If any temporary

irregularity in the movement of the loom takes place, there will be a slip between the motor and the loom as long as these conditions obtain. In this way the necessary flexibility of drive is ensured. This coupling also affords effective protection for both motor and fuses, as, in the event of an overload lasting any length of time, the speed of the loom drops and the irregularities in its motion

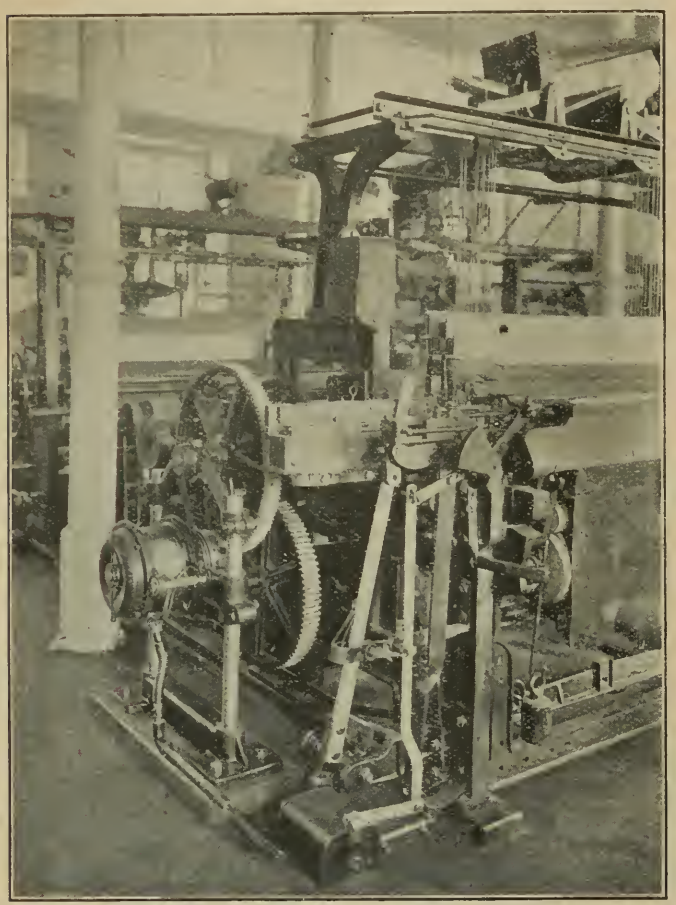

Fig. 4.—Loom fitted with the New Oerlikon Geared Individual Drive.

are thus brought to the notice of the weaver before the fuses melt or the motor is damaged. In cases of sudden stoppage, where the motor circuit is broken at the same time, the coupling slips until the rotating masses of the motor come to rest. During this gradual slowing down, which takes place without shock, the various parts of the coupling gear return to their original position. The coupling, therefore, ensures a very rapid starting up of the loom and effectively prevents breakage of the gearing teeth or distortion of the shaft in the event of the loom being stopped suddenly. It is claimed for the Oerlikon coupling that it is extremely simple and requires no attention during operation, as it acts entirely automatically after having been set once for all.

Arrangement of the Equipment.

In spite of its very substantial construction, the new Oerlikon geared individual drive has a pleasing appearance, as will be seen from the illustrations reproduced herewith. The motor is mounted on two strong pillars of best quality steel, which are pressed into a wide base. At the top of pillars is fitted a yoke, which is provided with bearings to serve as the end bearing for the loom shaft. This yoke has also the effect of strengthening the whole structure supporting the motor and gearing. Both motor and yoke can also be clamped, independently of each other, at any level. In this way this type of individual drive can be mounted at any desired distance between the loom and motor shaft and with any height of motor shaft above floor level, these dimensions varying necessarily with the type of loom and the speed ratio. Furthermore, the arm fitted to the motor frame is provided with a slot, by means of which it is possible to ensure that the pinion and gear-wheel are engaging exactly. This slot is so dimensioned that four consecutive pinion sizes, between which there is a difference of one tooth, can be fitted, and the speed of the loom thus altered. In this way the same looms can be used for various fabrics, and the speed necessary in each case can be obtained. The pinion can be replaced rapidly and without trouble; this is done by means of a simple device for drawing out and driving in of the key. It will be seen from Figs. 3 and 5 that by unscrewing a nut it is possible to make the motor pivot about one of the pillars, so that, even when the space available is limited, the coupling and pinion can be inspected, without dismantling the whole drive. Furthermore, by removing a screw, the loose portion of the coupling on which the pinion is fitted can be withdrawn from the motor, the whole coupling gear being thus entirely uncovered (see Fig. 3). As will be seen from Figs. 1 and 2, the motor can be arranged symmetrically or unsymmetrically on its support, this being, in many cases, a further advantage when adapting this drive to various types of looms. It is, therefore, possible, even in weaving sheds where looms of different types are in use, to have individual drives similar in design and appearance, thus greatly facilitating their supervision and maintenance.

Efficiency Figures.

Owing to the high efficiency of the gearing and the low friction losses in bearings, the current consumption of this type of drive is, it is claimed, considerably less than that of a belt drive, all conditions being equal. Even in the case of the most favourable speed ratio for belt driving, a saving in current of 6 to 10 per cent. can be effected by using the geared drive, while with a speed ratio of 1 to 9·5 tests have shown that a saving of about 26 per cent. could be ensured. Furthermore, as the motor starts up light, it reaches normal speed very rapidly, and then sets the loom in motion immediately.

In the foregoing, only the main features of the new Oerlikon geared individual drive have been considered, as a complete study of its various parts would hardly be possible within the limits of this article. A detailed description of this interesting drive will, however, appear shortly in one of the numbers of the "Bulletin Oerlikon," where full particulars of the Oerlikon patent automatic

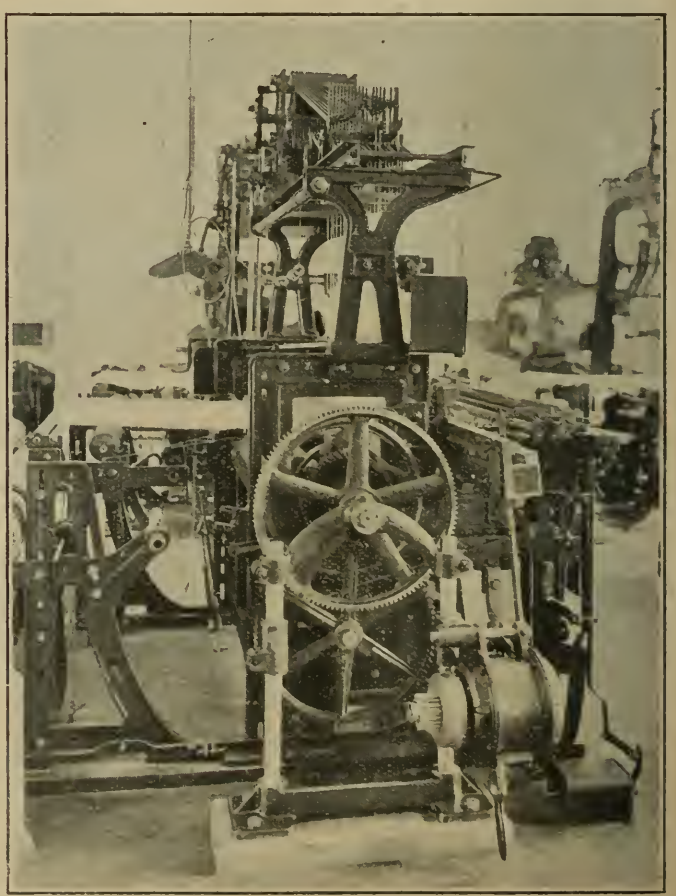

Fig. 5.—View showing Loom Motor swung out for Inspection of Gear.

centrifugal coupling will be found. Mr. G. Wüthrich, M.I.E.E., General Manager and Chief Engineer of Oerlikon, Ltd., 34-35, Norfolk Street, London, W.C. 2, will be pleased to forward this Bulletin to all interested in the matter and also to give any information that may be desired regarding the textile specialities of the Oerlikon Company.

Hydro-Electric Power in India.*

By A. T. ARNALL.

The development of the water-power resources of a country depends not only on the facilities provided by Nature, but also on the facilities afforded by its Government for the exploitation of this national asset. It also depends on the demand that exists for power within an economic transmission distance of the power sites. But many successful schemes have been promoted where no demand existed for power and an outlet was provided for the energy by the establishment of new industries. In British India the necessary authority to develop water power is obtained in the form of concessions from the Local Governments; and the Native States, speaking generally, have power to grant water-power concessions within their territories on their own terms. Before a concession for a water-power scheme is granted, the applicant must submit a definite scheme, and for this purpose the Local Government will usually grant a conditional prior claim to the power site for three years. In order to put the provisions of the Land Acquisition Act into force, there must be an enquiry by an officer appointed by the Local Government into (*a*) whether the proposed acquisition is needed for the construction of some work, and (*b*) whether such work is likely to prove useful to the public. If the officer reports affirmatively on both points, the company must then enter into an agreement with the Secretary of State for India in Council. The interpretation of the words "likely to prove useful to the public" has been the subject of much discussion and it would also appear desirable that rules should be issued on (*a*) the terms and conditions which properly belong to water-power concessions, and (*b*) the terms and conditions which should properly be inserted in agreements for the compulsory acquisition of land for water-power schemes.

Licence for Supply of Electricity.

In addition to the concession and the land acquisition agreement, the power company in most cases will need a licence under the Indian Electricity Act of 1910. Such a licence would be required by a company supplying electric energy to the public generally within specified areas, but it would not be required by an undertaking supplying power exclusively to a number of electrochemical factories located adjacent to the generating station. For transmission lines from the generating station to distant areas of supply, the Governor-General in Council has authority to confer upon a licensee such powers as may be necessary. These powers cannot be conferred upon non-licensees, and if a company desires to transmit power in bulk to distant towns and electrochemical factories, it may be necessary for the company to obtain a licence, although it does not contemplate the actual distribution of the power to the public. For important lines, transmitting power to large industrial centres or to railways, it will generally be found desirable to purchase a strip of land on which to erect the line.

Interest During Construction.

The Local Government has power under the Indian Companies Act to sanction the payment by a registered company of interest out of capital during the period of construction, on the share capital paid up, at a rate not exceeding 4 per cent. per annum. The Act now requires amendment to permit of a higher rate of interest being paid.

Compulsory Purchase.

The local authority, or, in certain circumstances, the Local Government, has the option of purchasing compulsorily a licensed undertaking after the expiration of a period not exceeding fifty years, at the fair market value of the lands, buildings, works and plant of the undertaking, but excluding the generating station, unless it be declared in the licence to form part of the undertaking for compulsory purchase. The Indian Electricity Act is not clear as to whether the term "generating station" includes all the lands, reservoirs and other hydraulic works of a water-power undertaking. The author believes the more expeditious way of encouraging the development of India's water-powers lies in inducing Government to review its policy regarding water-power concessions, with the object of seeing how it can be stablised and how water-power concessions can be made more attractive in future. If the Government is in a position to render financial assistance in the development of the country's water-powers, that assistance could best be given in the construction of the roads and railways, which are usually in any large scheme.

Water Power Resources.

The Indian water-power survey has up to the present disclosed the existence of over 130 possible water-power sites, of which only a small percentage have been thoroughly examined. It is estimated that there is a total of 1 774 000 continuous E.H.P. already in sight, but this is much below the actual available power that final results will disclose. Many millions of horse-power could certainly be obtained from the Himalayan Mountains and the great rivers of Burma. For example, the combined minimum discharges of the Indus, Chenab, Jhelum, Sutlej, Beas, Jumna, and Ravi Rivers amount to over 36 000 cub. ft. a second, where they enter the plains, which is equivalent to over 3 000 000 H.P. per 1 000 ft. of fall; and these rivers and the tributaries that feed them rise in mountains up to 20 000 feet or more in altitude. Similar considerations apply to the Ganges, the Sarda, and many rivers rising outside British India to the east up to the Brahmaputra, and again in Burma to the Irrawaddy and the Salween. In a table the author gives a list of the existing hydro-electric plants in India, totalling 91 325 E.H.P. installed, and in another table a list of plants being installed, totalling 148 750 E.H.P. Out of a total capacity of 240 075 E.H.P. of plant installed and under construction, 189 000 E.H.P. or 79 per cent. of the total for India, is for the supply of power to Bombay City, and is due to the enterprise of Tata, Sons & Company.*

Objects of the Survey.

The objects of the survey for the present are limited to ascertaining—(1) where water-power can be developed, (2) how much power can be developed, (3) on what lines the development should proceed, and (4) whether a particular development will be (comparatively speaking) a cheap one, or otherwise. Information valuable to the water-power engineer already exists in India, in maps published by the Government Survey, and in the rainfall and river gauging records of the Meteorological and Irrigation Departments. The new survey sheets give definite contours from which, generally a rough idea can at once be formed of the possibilities of a water-power site when studied in conjunction with available rainfall records. In a few years all essential information for the development of India's water-powers should be available in a concise form for general public use.

Western Ghats Schemes.

The hydro-electric schemes constructed and under construction in the Western Ghats constitute about 80 per cent. of the total hydro-electric undertakings in hand in India and Burma. There are four hydro-electric schemes under the managing agency of Tata, Sons & Company—namely, the Andhra Valley Power Supply Company, the Tata Hydro-Electric Power Supply Company, the Tata Power Company, and the Koyna River project. These four schemes completed would be capable of supplying Bombay City and neighbourhood with 915 000 E.H.P. (for 3 600 hours each year) at a maximum of three-farthings per unit. The Igatpuri project, which is not as yet designed in detail, may find an outlet for its power in the electrification of the Thull Ghat section of the G.I.P. Railway near Igatpuri, and in providing power for industries at Igatpuri, in the Deccan. The writer believes that a catchment area of about 60 square miles can be utilised, with a head of 1 000 ft. on the turbines and an available storage capacity of some 3 000 million cub. ft. in the proposed reservoirs. The scheme is probably capable of an output of 20 000 E.H.P. *ex* power-house for 3 600 hours per annum. The Andhra Valley Power Supply Company's undertaking which has been under construction about five years is now nearing completion. The entire project was designed by Mr. H. P. Gibbs, and the generating plant consists of six 8 000 kW sets, generating current at 5 000 V, 50 cycles. The energy will be transmitted to Bombay City at 100 000 V, over a transmission line 53 miles in length, where it will be transformed down to 20 000 V and distributed at that pressure to consumers by underground cables. The company was able through co-operation with the Bombay mill-owners to secure a contract price of 0·725 anna per unit for the supply at 20 000 V. The mill-owners will bear the cost of transforming from that pressure to 2 000 V, the standard pressure for mill-driving in the city, and provide and install their own electrical equipment for driving the mills. The whole output of the undertaking is sold and the success of the enterprise well assured.

The Tata Company and the Textile Load.

The Tata Hydro-Electric Power Company's undertaking has been in operation for six years, and was designed by Mr. Alfred Dickinson, consulting engineer to the company. It was the first scheme of such magnitude to be undertaken in India, and its success is largely responsible for the extensive development of water-power in the Western Ghats now in progress. It is supplying the cotton industry of Bombay with an average load of about 40 000 H.P. A charge of 0·5 anna (½d.) per unit is made for the supply at 2 000 V, and 0·55 anna per unit for supply, including the equipment of the mills by the power company with motors, cables, switch-gear, &c., and their complete upkeep. The company is paying a dividend on its ordinary shares of from 7 to 8 per cent. per annum. The construction of the Tata Power Company's undertaking, also originated and designed by Mr. Gibbs, was commenced in 1919, and is being carried out by the company's own constructional

* Abstract of a Paper read before the East India Association.

* Particulars of these plants have been published in THE ELECTRICIAN.

staff under the advice of the Tata Engineering Company. It is designed for the ultimate supply of 150 000 H.P. to Bombay, but for the present only sufficient plant will be installed for the supply of 75 000 H.P. Applications aggregating 50 000 H.P. have already been registered on the waiting list of the undertaking, which, inter-connected with the Andhra Valley and Tata Hydro-Electric schemes, will assist in the supply of power for the electrification of the Bombay City, suburban and Ghat sections of the railways. An unfortunate delay has occurred owing to the opposition of the inhabitants of the lands that will be submerged by the storage reservoir to the acquisition of their properties.

The Koyna River Project.

The Koyna River project, originated and investigated by the writer, is capable of an output of 650 000 E.H.P. (for 3 600 hours each year), and is intended to provide energy for electrometallurgical and electrochemical industries near the power stations, for public electric supply in Bombay City (as an extension to the supply by the existing three power-supply companies) and for public electric supply to all towns within economic range of transmission. The proposal to establish electrometallurgical and electrochemical industries at Koyna is the first comprehensive scheme of its kind thoroughly investigated in India.

Development of Bombay.

Bombay City is the premier port of India, has a population of about 1 200 000, and is by far the most important centre of cotton spinning and weaving in India. The chief industry of the city is the spinning and weaving of cotton, but there are many important woollen and flour mills, general engineering and railway workshops, oil-mills and chemical factories. In 1916 there were 266 cotton mills in India, containing 6 839 877 spindles and 110 268 looms, and employing on an average 274 361 hands daily ; of these, Bombay City possessed eighty-six mills, containing 2 984 575 spindles and 53 205 looms, and employed 118 303 hands. If this number of spindles and looms, in Bombay City in 1916 had been driven electrically, they would have required a supply of approximately 100 000 E.H.P. At present about 1 000 000 bales of cotton are consumed annually by the city mills, and in addition about 1 700 000 bales are exported from its port. It is obvious that this industry will expand indefinitely, if proper industrial town-planning schemes are carried out, for Bombay City and its neighbourhood offer all necessary facilities in an abundant and cheap supply of raw materials, cheap power, a suitable climate, experienced labour, low transport charges by sea and land, and in possessing one of the largest markets for cotton goods in existence.

Textile Mill Motors.

As we show in other articles published in this issue there is every reason to suppose that the future hydro-electric development in India will be very great. Some progress is, however, being made at the present time in which we are glad to learn British electrical manufacturers are taking part. As an example we may quote a recent order obtained by BRUCE PEEBLES & COMPANY for textile mill type slip-ring induction motors which are to form part of a complete hydro-electric installation of an important mill in India.

Fig. 1 shows these motors which collectively have an output of 400 H.P. Each machine is fitted with textile mill enclosing covers, and Peebles' patent short circuiting and brush lifting gear.

The motors are all of Peebles standard construction, the stator and rotor cores being of electrical steel laminations of the highest permeability, each carefully insulated while the slots are of nearly closed form. Each core is rigidly clamped between heavy cast-iron end-plates, and spacing discs are inserted at frequent intervals to provide ventilation channels. The end-plates are secured by keys the use of through bolts being thus avoided.

The windings of both stator and rotor (the motors illustrated are all of the slip-ring type) are either of the wire or bar type, depending on the amount of current ; the core slots are lined with insulating tubes of such composition that ample mechanical strength is combined with the best insulating properties. All windings are thoroughly treated with insulating varnish by a special process which ensures every part of the windings being thoroughly impregnated.

All motors are provided with air gap adjusting arrangements, each end cover being fitted with four set-screws, by means of which a very fine adjustment can be obtained at each end of the machine. The motor shafts are of special mild steel designed so as to operate safely under the most severe working conditions.

All the motors on the installation in question are fitted with Peebles patent short circuiting and brush lifting gear, which is claimed to be the most efficient and simple device of its kind on the market. Both the functions are performed with one continuous movement of the lever handle, a safety catch being provided, by means of which the operating lever is locked in either the " starting " or " running " position.

The Coming Electricity Bill.

Speaking at the annual luncheon of the BRITISH ELECTRICAL DEVELOPMENT ASSOCIATION on Wednesday, Mr. Arthur Neal, Parliamentary Secretary of the Ministry of Transport, made the interesting announcement that Lord Peel would shortly introduce a further Electricity Bill in the House of Lords. This would be a non-controversial measure designed solely to clothe the joint authorities with the necessary financial powers, and to deal with other matters upon which the electrical industry desired legislation. Mr. ATKINSON speaking earlier had said that one of the things that the electrical industry most earnestly needed was stability. Rumours that electrical legislation on a drastic scale was in contemplation made it impossible for those concerned with the larger issues to move. It had been amply demonstrated recently that capital was plentiful for the development of the electrical industry, and that, given stability, there was no reason why it should not move forward more quickly than any other. Mr. ARTHUR NEAL also remarked that given good will no further legislation was contemplated by the Government, and that the industry had nothing to fear from Government interference.

The B.E.A.I. Research Association.

The annual general meeting of the BRITISH ELECTRICAL AND ALLIED INDUSTRIES RESEARCH ASSOCIATION was held on Feb. 3, at the Institution of Electrical Engineers.

Mr. W. O. SMITH (elected to the chair) expressed regret at the unavoidable absence of Mr. C. H. Wordingham, and appreciation of his many services in the past. During the course of his remarks in introducing the first annual report he referred to the good work done by some fifty committees, and the indebtedness of members to those gentlemen who gave so much of their time to this service.

Mr. D. N. DUNLOP, in seconding the adoption of the report, referred to Mr. Wordingham's indefatigable interest and assistance in all the work of the Association, and the indebtedness of members to those firms who had allowed members of their staffs to give so much time to the work of the Association. He mentioned Mr. A. R. Everest in particular, without whose help the B.E.A.M.A. Research Committee would have laboured under great disadvantages. Whilst a good beginning had been made—and the manufacturers had agreed, in a public-spirited way, to find £8 000 per annum for co-operative research for five years for the benefit of all concerned with the electrical industry—it was becoming exceedingly difficult to find money for such purposes whilst orders were being placed with foreign competitors. He thought that purchasers did not properly appreciate what manufacturers were doing to advance the common interests, and how difficult the position was, due to the conditions of international exchange and foreign competition.

Mr. C. P. SPARKS, in seconding the adoption of the accounts and balance-sheet, which had been moved by the chairman, expressed appreciation of the continuous services of the Finance Committee, of which Mr. W. O. Smith was chairman, and of the invaluable assistance of the B.E.A.M.A. in finding the sinews of war, and the personal services of Mr. D. N. Dunlop in establishing the Association.

FIG. 1.—BRUCE PEEBLES TEXTILE MOTORS FOR INDIA.

Institution of Electrical Engineers' Dinner.

The annual dinner of the INSTITUTION OF ELECTRICAL ENGINEERS was held at the Hotel Cecil on Tuesday night in connection with the Jubilee Commemoration. In the absence of the President, which everyone deplored, the chair was taken by Dr. W. H. ECCLES, F.R.S.

Among those present were the Postmaster-General (Mr. F. G. Kellaway), Lord Southborough, Air-Marshal Sir H. M. Trenchard, Mr. Justice Sargant, Sir Charles Parsons, Sir A. Bowlby (President of the Royal College of Surgeons), Dr. H. S. Hele Shaw (President of the Institution of Mechanical Engineers), Sir William Pope (Acting President of the Society of Chemical Industry), Sir A. Durrant (Office of Works), Sir W. H. Bragg, Sir R. T. Glazebrook, Dr. S. Z. de Ferranti, Prof. E. Barker (Principal of King's College), Prof. A. W. Porter (President of the Faraday Society), and Prof. J. W. Nicholson (President of the Rontgen Society).

At the commencement of the proceedings a telegram was sent from those present to Mr. Highfield, and an answer reciprocating the wishes expressed for his speedy recovery was received during the course of the evening.

Congratulatory Messages.

A letter from H.R.H. the Duke of York regretting his inability to be present was read by the President. The DUKE expressed his hope that the Institution would continue to prosper and render the same yeoman service in the future as it had done in the past for the benefit and advancement of the science, commerce and industry of the country.

Greetings were also read from kindred societies in America, Italy, France and Holland, from Mr. T. A. Edison and from the Institution of Gas Engineers.

Fifty Years' Progress.

The POSTMASTER-GENERAL proposing the toast of the "Institution of Electrical Engineers," said that it was not unfitting that the head of the Post Office should propose this toast, because during the fifty years of the Institution's existence the relations between it and the Post Office had been close and nearly always friendly. In that short period the membership had not only grown from 100 to over 10 000 but the science and art of the electrical industry had made one of the most remarakble developments in the whole history of human endeavour. At the time when the Society of Telegraph Engineers was founded nothing was known of telegraphy, and nothing of course of wireless telegraphy and telephony; and no man in those early days, however audacious his imagination, could have foreseen the changes which that period of fifty years had produced.

If such advances had been made in fifty years no limits could be placed on the progress of the science and the art in which the Institution of Electrical Engineers was engaged. They had a right to be proud of the fact that the greatest contributions to the science of electricity had come from Britons, and comparing the electrician's work with that of the politician's he had to admit that the electrician had the more excellent part to play, a sentiment with which his listeners uproariously agreed. The politician's task in relation to electrical engineers was to see that their energy and genius was set free to develop under the most favourable conditions.

Dr. W. H. ECCLES, in reply, called attention to the fact that this was the first dinner which had been held since the Royal Charter was granted and the King had become their patron. The Institution of Electrical Engineers was the largest professional institution in the country, and the reason perhaps was that electrical engineering had many more varied applications than any other kind.

Electricity and the Air Services.

In replying to the toast of the "Visitors" which was proposed by Mr. LLEWELYN B. ATKINSON, Air-Marshal SIR HUGH TRENCHARD remarked that the youngest of the nation's armed services depended entirely for its development upon electricity, for without wireless it would be impossible to develop all the power there was in the air, and they therefore hoped to receive in the future the most valuable assistance from the Institution.

Mr. JUSTICE SARGANT, who also replied, said he had come very closely into contact with electrical engineers as chairman of the War Inventions Board. His difficulty had been to hold the balance between claims of the inventors and the claims of the taxpayers, and he hinted that both as regards scientific and financial ability there was not much to choose between electrical engineers and other classes of the community.

The evening concluded with a crowded reception in the Victoria Hall, and it may also be noted that the cloak room arrangements were rather worse than they were last year.

On Wednesday next (March 1) Princess Alice will open the "DAILY MAIL" IDEAL HOME EXHIBITION at Olympia at 3.30 p.m., when admission will be by invitation only. The building will be opened to the public at 5 p.m., but each other day (until March 25) the exhibition will be open from 10 a.m. to 10 p.m., at a charge of 2s. The varied display includes a vast working demonstration of newest devices and inventions for houses and gardens.

Duke of York at Osram Lamp Works.

The DUKE OF YORK paid a visit last week to the Osram lamp works of the General Electric Company, Ltd., at Brook Green, Hammersmith. He was attended by Wing Commander Louis Greig, and was received on arrival at the works by Mr. C. Wilson and Mr. J. Y. Fletcher, directors of the company (in the unavoidable absence through illness of Mr. Hugo Hirst), and other members of the Board and officials of the company.

The Duke of York proceeded to make a tour of the works, displaying throughout the keenest interest in the workpeople, 1 500 of whom out of a total of 2 100, are girls. All the principal processes connected with the making of Osram lamps were inspected, from the making of the filament from scheelite, through the various departments to that in which the finished article was seen. Of all the processes none appeared to impress him more than the ease and skill with which the work girls handled the extraordinarily fine tungsten wire for use in the lamps.

Throughout his tour the Duke chatted freely with the workpeople and asked them about their length of service, their hours, and their general conditions of employment. Noticing an invalid-carriage, he inquired what possible use they could find for an appliance of that kind in their lamp works, and learned with satisfaction that wherever it was possible to do so disabled ex-service men were employed in the works, and the invalid carriages were provided for them. His Royal Highness' attention was called

DUKE OF YORK AT THE OSRAM WORKS.

to two volumes prepared by the firm, a Roll of Honour giving the names, short histories, and the photographs of the men who fell, and a record of the various war activities of the G.E.C., a copy of both of which he accepted.

As President of the welfare movement he emphasised the importance of welfare work in so extensive an industrial concern; at the same time expressing his appreciation of the admirable arrangement which he had inspected during his tour. His Royal Highness went to the Red Cross department, to the dining rooms, and to various other departments connected with the welfare of the workers.

When he was about to leave the Duke of York told Mr. Wilson that he had inspected many industrial concerns, but never one that afforded him greater interest than these works. He expressed regret that he could not go into every section, but explained that he was due to leave London for hunting in Warwickshire. He hoped, however, that opportunity might arise for a further visit. Hundreds of girls thronged the exit and gave an enthusiastic farewell to the Prince. So persistent were they that it was found difficult to get his car away.

"Sweet are the uses of advertisement." One of the first remarks passed by the Royal visitor to Mr. C. Wilson, upon arrival, was "Your lamp is the one advertised with the Elephant, is it not?"

At the GLOUCESTER SPRING ASSIZES recently the manager of Messrs. Pearks' branch shop at Cheltenham, who was prosecuted by the G.W.R. Company for causing an attempt to be made to obtain certain sums of money, with intent to cheat and defraud, was found guilty and sentenced to three months in the second division. Railway companies have been frequently the victims of misrepresentation and fraud, and it has been found necessary to inaugurate a system whereby these malpractices are brought to light. In the case in question the accused made claims upon the company for loss and pilferage, but a special examination and check of the consignments prior to delivery proved that such claims were false.

The Wimbledon Emeute.

There is evidence that public opinion in WIMBLEDON has been roused by the Council's action in summarily dismissing their chief electrical engineer, Mr. Tomlinson Lee. As soon as the decision became known, a petition was started asking that a town's meeting should be called to consider the subject, and in a short time over 1 600 signatures were obtained.

This illustration of public opinion has, however, failed to move the MAYOR, who, in a letter acknowledging the petition, gives it as his opinion that public discussion upon the question whether the Council should or should not dispense with the services of one of their officials can lead to no useful results, and he does not think it desirable in anybody's interest to debate in public an official's qualifications for his office, or the reasons which have led up to and culminated in the decision complained of. He goes on to point out that the members of the Council are elected by the ratepayers to look after the town's business, including the electricity undertaking. If the actions of the Council do not meet with the approval of the electors, the latter may exercise their constitutional rights and refuse to re-elect them when they next offer themselves for re-election. But whilst they are the representatives of the town they must act according to their best judgment, and they must face the consequences, pleasant or unpleasant.

The Mayor points out that the termination of Mr. Lee's engagement was unanimously decided upon by the Electricity Committee, in consultation with the General Purposes Committee, and that the decision was carried into effect in a way which would give rise to the least possible friction. Mr. Lee refused to resign except upon financial conditions which were impossible, and no other course was, therefore, left open to the Council.

A Public Meeting.

This restatement of the case, which throws a little further light on the inner workings of a municipal body, has, however, failed to satisfy the petitioners, who have issued a notice calling a public meeting to discuss the whole question. This meeting will be open to all, and will be held in the Baths Hall, Wimbledon, at 7.45 p.m. on Monday next, Feb. 27. We shall be interested to see the result, but in the meantime we call attention of the electors of Wimbledon to the hint given by the Mayor on how to deal with the matter. The procedure suggested, though slow, will be nevertheless sure, and is one which should be more widely adopted in local affairs than has often been done up to the present.

Post Office Engineering Progress.

Proposing the toast of the "POST OFFICE ENGINEERING DEPARTMENT" at the annual dinner in London last Friday, Mr. H. Pike Pease, M.P., said the Department had made great strides in the past year, and the future seemed very bright. There had been increased efficiency all round. With regard to main underground wires, good progress continued to be made. Seven hundred and twenty miles of single duct were laid, and 116 730 miles of double wire drawn in. In connection with the extension of local telephone facilities, 1 000 miles of single-way duct were laid and 100 000 miles of double wire drawn in. About 500 overhead trunk telephone circuits were provided, involving the erection of approximately 10 000 miles of double wire. Referring to automatic telephones, Mr. Pike Pease said automatic exchanges were of an enormous advantage, and plans had been prepared for six new exchanges with 11 000 lines, and 3 500 extensions to four other exchanges. With regard to the telegraph development, the chief feature had been the installation of machine printing apparatus. He had no hesitation in saying that the telephone system in this country to-day was far ahead of any other country in the world. A new method of automatic through-switching on telegraph circuits had been devised on the same principle as the automatic telephone switching. This was being developed and promised good results.

Trade Terms and Conditions.

An informal meeting between representatives of the PRINCIPAL ASSOCIATIONS WITHIN THE ELECTRICAL INDUSTRY, which was recently convened by the E.D.A., took place last week at the Engineers' Club. Some of the more important commercial issues between the different branches were discussed freely, and although the proceedings were private, we are able to say that the representatives went away with something of interest to report to their associations. There is also reason to believe that negotiations now in progress will be assisted by the interchange of views which took place.

It is possible that this conference may be followed by others of a similar character, and it is hoped that problems which may occasionally be beyond the "give and take" limits of a purely sectional meeting will appear less difficult after they have been examined for further points of view of the whole industry.

This method of handling the more obstinate difficulties will increase understanding and sympathy between the several groups who after all must, to enjoy individual success, achieve a common end.

After further considering the application for a reduction of 6s. per week in wages, the Joint Industrial Council for Electrical Workers in SOUTH WALES AND MONMOUTHSHIRE, meeting at Cardiff last week, decided to forward it to the National Joint Council. The application had previously been referred to arbitration, but this was found to be the wrong procedure.

Legal Intelligence.

Dispute About a Petrol-Electric Lighting Set.

In the Shoreditch County Court, on the 16th inst., Louis Newmark sued Semco, Ltd., for the recovery of £99 15s. for fraudulently misrepresenting that a 2 kW air-cooled petrol electric generating set was practically new, and had only been run for two hours, whereas it was old, and in an unfit condition. It was explained that the set was required for a house plaintiff was having built at Rickmansworth, and was sold at the end of December, 1920, for £80.

HERBERT NEWMARK, plaintiff's son, said that early in December, 1920, he went to defendants' premises with a Mr. Jay, an electrical engineer, and saw the generating set. He was told it was practically new, and had been run for only two hours. After it was installed it was continually misfiring, and usually stopped. He was never told it was second-hand. Later, after his visit to defendants, his father saw it with an architect and an electrical engineer, and the purchase was decided upon. When it was supplied it was guaranteed to carry a full load. In April, an unsuccessful attempt was made to work the engine. A second attempt was made in May, when it was found that, owing to faulty wiring there were some dead shorts. Captain Wood had the matter in hand for defendants, and in August there was a fairly successful trial. After that, witness (aged seventeen years) was running the plant. He denied that Captain Wood told him constantly that it was under-lubricated. About this time the fly-wheel broke, and later the crank shaft. He agreed that Captain Wood complained that the concrete bed was not right, but he understood it was put right.

Mr. H. BRINE, architect, said he heard the representative of defendants say it was practically new, and run only two hours; and Mr. King, electrical engineer, gave similar evidence, the latter stating he put the faulty wiring right in half an hour.

Mr. L. NEWMARK said he understood the plant to be unused war stores. Before buying, he asked if it was in perfect condition, and got the same said to him as the other witness had deposed to. The machine had never done its full load. He concluded he had been defrauded when the crank shaft broke.

Mr. WM. PAYNE, general manager to Jones & Sons, electrical engineers, said he was asked to look at the set, and advised a lot of things to be done, which would certainly not have been necessary had it have been in perfect running order. Defendants had those carried out by Messrs. A. Thompson & Son, electrical engineers.

For the defence, Mr. CLARENCE RAPSON, managing director of defendants, said the set was purchased in September, 1920, and he had never authorised anyone to make the representations suggested; and ERNEST ANDERSON, the salesman, denied using the words attributed to him.

Captain N. WOOD said that not a word was said by him about guaranteeing the set. He gave directions as to the concrete bed which were not carried out, so that it was impossible to ensure sufficient cooling. In April, when started up, the engine back-fired, and so hurt his arm that he was unable to go on with the work for some time. On Aug. 9 he got a perfect test, and it took a full load for the required time. After that the Newmark family took it over. He saw it after, and it was under-lubricated. On Oct. 1 he gave it an economy test, when it ran well for twelve hours on paraffin.

In giving judgment, Judge Cluer said he did not think defendants had satisfied their guarantee that it was in perfect running order, and although it was tested up to two hours, that did not mean it was to just do that and stop. On those grounds only he should award plaintiff £35 damages and costs.

B.T.-H. Company v. Corona Lamp Works.

The hearing of this action was concluded on Thursday last, and Mr. Justice Astbury reserved judgment.

Mr. HORATIO BALLANTYNE gave evidence for defendants. He had read the plaintiffs' specification, and it certainly conveyed to him the meaning of obtaining a coefficent of expansion corresponding to that of glass. He thought he appreciated what the patentee had in view in aiming at getting the same coefficient of expansion in the wire and glass, and he knew what to do to carry that out. The procedure, as he understood it, was to ascertain the co-efficient of expansion of the wire—that was to say, to take a length of wire, heat it, measure it, and note its increase in length throughout the period of heating. That was the standard method of ascertaining the co efficient of expansion of the wire. That was what he supposed was intended to be done in that specification.

HIS LORDSHIP.—In taking a metal or an alloy there is absolutely no difference in measuring the co-efficient, whether you do it longitudinally or laterally?—No.

In answer to Sir D. KERLY, witness said, assuming that the specification was addressed to a lamp-maker, the latter would be familiar with the fact that wire and glass might have different expansions. It was common knowledge that one must have a wire with the appropriate expansion of glass. Cross-examined by Sir A. COLEFAX, K.C., for plaintiffs.—Do you agree with this, that you do not find disclosed in any of the alleged anticipations the subject-matter of the plaintiffs' patent?—I certainly do not find in them anything about proportioning so as to get the coefficient of expansion of a certain kind.

The answer is that you do not find the subject-matter disclosed?—If that be part of the subject-matter, I do not.

Dr. HOLST, head of the physical laboratory of Messrs. Phillips' Lamp Works at Eindhoven, Holland, said they began making copper-clad nickel-iron core leading-in wire for their lamps in 1914. He did

not know at that time of plaintiffs' specification. They came to use copper-clad nickel-iron core leading-in wire in consequence of a communication they had that it was used by other factories, and so they began to try it themselves, without any assistance as to how they were to make it.

Mr. Augustus C. Hyde, a maker of leading-in wires, said he was with the late Sir Joseph Swan. He and the Vactite Company worked on friendly terms with the Société Fourchambault, whose patent had also been put in, and they were both concerned with nickel-iron leading-in wires.

Mr. Cecil M. Masters, stores manager of the Corona Lamp Works, gave evidence as to identifying certain lamps complained of as infringements. They had been dealt in by his company, and they had been got from America, being delivered to them by the Express people.

Edison Accumulators, Ltd. v. Cox Bros.

In the Outer House of the Court of Session (Edinburgh) on Saturday last, Lord Blackburn delivered judgment in this action for the recovery of £702. 7s. 5d., the price of an electric tractor and other apparatus which defendants purchased from plaintiffs on May 6, 1920. The tractor was intended to be used for transport purposes within defendants' works, for which hitherto they had used horse traction. An essential and important part of the work for which the tractor was desired consisted in the backing of wagons or lorries into bays. Defendants said that some time after the tractor was delivered it was found that it could not push an ordinary horse-drawn lorry backwards into the bays, which, they alleged, was contrary to what plaintiffs' representative had led them to believe, and they rejected the tractor. Plaintiffs submitted that the machine was sold as a tractor, and could not be used for backing, for which it was not intended.

Lord Blackburn gave judgment for plaintiffs, with costs. He held that no warranty was given that the tractor would be suited for pushing ordinary lorries into the bays.

Charges of Alleged Fraud.

At Leeds, on Tuesday, Wm. Aaron Davis, electrician, of Farnley, was committed for trial on five charges of obtaining money from persons in different parts of the country for investment in alleged bogus companies. It was stated for the prosecution that about £10 000 was involved, and at the previous hearing the magistrate had decided to convict on four charges of obtaining sums, ranging from £2 to £250. On Tuesday he decided to commit on a fifth charge of obtaining £10, and he declined an application for bail.

Exhibition Notes.

One of the features of the exhibition of modern homes, which was opened at Harrods on Monday, is a model laundry, in which all the work is done by electricity.

Special excursions at greatly reduced fares are to be run by the railway companies in connection with the British Industries Fair, which will be held concurrently at the White City, London, and Castle Bromwich Aerodrome, Birmingham, from Monday next, February 27th to March 10th. The fare will in most cases be approximately the price of a single ticket for the double journey where passengers making use of the special excursions, return on the same day. For passengers who desire to make a stay of from two to six days the cost of a return ticket will be about one-third more than the usual single fare.

Obituary.

The death is announced, from pneumonia following influenza, of Dr. James Francis Bottomley, at the age of forty-seven.

We regret to record the death of Mr. H. Eeles, secretary of the Oxford Electric Company, Ltd., which took place suddenly while he was addressing a meeting at Oxford on Tuesday.

The death is reported, at the age of seventy-seven years, of Mr. Wm. E. Kenway, who formerly, for eleven years, was generat manager of the Birmingham and Midland Tramways.

Trade Inquiry.

A Canadian Company desire to receive quotations, with samples and particulars of delivery, from United Kingdom manufacturers of the following materials :—½-in., ¾-in., 1-in., 1½-in. cotton tapes, in 36-yd. rolls. (Approximate quantity at a time, 100 gross yards); 0·005-in., 0·010-in., 0·015-in., 0·020-in. press-board or press pahn insulating paper. (Quote in 100 lb. lots); 0·005-in., 0·010-in., 0·020-in., 0·030-in. sheet flexible mica, for moulding purposes, also for commutator use. (Quote in sheets, giving dimensions, 50 lb. lots.) Red and black fibre sheets and tubes in all sizes. (Varying quantities required); 0·005-in., 0·010-in. oiled cambric cloth and tapes cut on bias. (Quote per gross yards.) Particulars may be obtained on application to the Department of Overseas Trade. (Reference D.O.T.7 866/E.D./S.C.2.)

The Stock Exchange Committee have ordered the following securities to be quoted in the Official List :—£750 000 6 per cent. second mortgage debenture stock of the Newcastle-upon-Tyne Electric Supply Company, Ltd., and £300 000 7½ per cent. debenture stock of the Shropshire, Worcestershire and Staffordshire Electric Power Company. Dealings in 200 000 £1, fully paid, 8 per cent. cumulative preference shares of the Scottish Power Company have been specially allowed.

Parliamentary Intelligence.

Scottish Private Bills and Orders.

It has been decided that the following Scottish Provisional Orders are to be proceeded with as private Bills :—The Grampian Electricity Supply and the electricity part of the Ayr Burghs Order.

The following Provisional Orders have complied with the Standing Orders :—Aberdeen Corporation, Ayr Burgh (Electricity, Tramways, &c.), Glasgow and Rutherglen Corporations, and Grampian Electricity Supply.

In the case of the Glasgow Corporation Order the general orders have not been complied with, as the consent of the local authorities beyond the city of Glasgow has not been proved as regards the whole of the proposed tramways Nos. 6 and 7, and so much of tramways Nos. 1 and 5 as are beyond the city of Glasgow.

Railway Electrification Schemes.

A meeting of the Industrial Group at the House of Commons on Monday discussed railway electrification schemes in the South of England from the point of view of providing employment. Sir William Pearce presided, and among those present were Sir William Forbes, representing the Brighton Railway, and Mr. Tempest, representing the South-Eastern Railway. After a long discussion a committee was appointed to investigate the proposals put forward, and report to a further meeting of the group to be held on Monday. The committee consists of Sir Alexander Richardson, Mr. A. M. Samuel, Mr. Frederick Wise, and Mr. P. J. Hannon.

Tramcar and Omnibus Stopping Places.

In reply to Mr. Gilbert (House of Commons, Feb. 20), Mr. Neal stated that it had been suggested that a regulation should be made requiring vehicles passing on the near side of a stationary tramcar to slow down whilst so doing, but it was doubtful whether the Ministry of Transport had power to make such a regulation, and in any case it seemed undesirable to do so. It would be difficult to enforce it effectively in view of the large number of tramcar stopping places, and in the opinion of the police authorities it would probably increase the number of accidents rather than prevent them, and would also lead to further congestion.

Telephone Service (Isle of Man and Jersey).

In reply to a question by Mr. R. Richardson, the Postmaster-General (Mr. F. G. Kellaway) stated that as the telephone systems in the Isle of Man and in Jersey are self-contained, it was not essential that they should be administered by the Post Office in common with the telephone system of the United Kingdom. The terms on which he was prepared to issue a licence to the Insular Government for the conduct of telephone business in the Isle of Man were communicated to the Lieut.-Governor some months ago; but an application for a licence had not yet been received.

The Telephone Service.

On the motion of Colonel Gibbs, the House of Commons have reappointed the Select Committee to inquire into the organisation and administration of the telephone service and the method of making charges. The members of the Committee are Sir Evelyn Cecil, Mr. Hayward, Mr. Hodge, Mr. Hohler, Mr. Holmes, General Sir Archibald Hunter, Sir Evan Jones, Mr. Lynn, Sir W. Lane-Mitchell, Capt. Moreing, Mr. Perring, Sir Alex. Richardson, Mr. Rodger, Mr. Royce, and Mr. Waterson.

Social Notes.

Mr. W. E. Warrilow will take the chair at the third Annual Smoking Concert of the Institution of Electrical Engineers (Informal Section) on Monday next, at the Engineers' Club, Coventry-street, London, W.

The Faraday House Old Students' Association will give a smoking concert on March 17, at 8 p.m., at the Queen's Hotel, Leicester-square, London. In view of the fact that the accommodation is limited, members are advised to apply early to the hon. secretary of the F.H.O.S.A., Faraday House, W.C. 1. for tickets.

The foremen of Johnson & Phillips, Ltd., held their annual dinner at the Shakespeare Hotel, Woolwich, last Saturday, the proceedings being presided over by Mr. J. Bayne. This year, for the first time, the managing director with his departmental heads and other staff members were invited. Between fifty and sixty members of the company were present, and after dinner an excellent musical programme was given.

In connection with the recent transference of the Airdrie and Coatbridge tramway system to Glasgow Corporation, a luncheon was given in the North British Hotel, Glasgow, last week by Mr. P. N. Gray, a director of the Tramway Company. The guests included Provost Lavelle, Coatbridge; Provost Kennedy, Airdrie; Mr. James Dalrymple, tramway manager, Glasgow; Bailie M'Whirr, convener; and Bailie Laing, sub-convener, of Glasgow Tramways Committee; and Mr. Archibald Robertson, ex-manager of the Airdrie and Coatbridge Tramways. A number of speeches were made, in the course of which it was pointed out that within the last decade the tramway receipts in the Airdrie and Coatbridge district had increased threefold, and the hope was expressed that when through running was established with Glasgow this expansion would be maintained. In the evening at Coatbridge Mr. Archibald Robertson, who has been manager of the Airdrie and Coatbridge Tramway Company for twelve years, was presented by the staff with a silver rose bowl, suitably inscribed.

Electricity Supply.

Preston Electricity Committee recommend that Mr. J. A. Robertson be retained as consultative engineer for the construction of the new generating station.

Douglas (Isle of Man) Electricity Committee has adopted the two-rate system of payment, a smaller charge being made during the daytime, in order to encourage the use of electricity for power and other purposes.

An amendment that the proposal to transfer £60 000 of the electricity supply profits to the consolidated rate be referred back, as being a financially unsound move, was defeated at last week's meeting of Liverpool City Council.

Mr. H. A. Howie, electrical engineer and manager of Walsall Electricity Department has intimated to the General Purposes Committee his willingness to accept their proposal of a 10 per cent. reduction on his salary as from April 1 next.

The London County Council have decided to oppose the application of Stepney Borough Council for a Special Order so far as it relates to the provision to exempt the Borough Council against proceedings for nuisance created by the operations of its generating station.

The Electricity Commissioners have practically concluded the task of provisionally determining the area of the East of Scotland Electricity District which will include the county and city of Edinburgh, the county of Midlothian, East Lothian, and certain parts of the counties of Linlithgow and Peebles.

Mr. G. Morley New, the Cardiff City Electrical Engineer, Mr. R. L. Horsfield, the City Tramways Manager, and Mr. O. S. Hosgood, the Station Superintendent, conducted a large number of delegates of the Cardiff Trades and Labour Council over the Roath Power Station last Thursday, and explained to them the plant and machinery.

Colonel Sinclair, Chairman of Swansea Electricity Committee, at the Council meeting last week stated that during the year 1920-21, Swansea generating station held the record for the lowest consumption of coal per unit generated (2·501b.) for all the towns in the Kingdom whose consumption was between three and fifteen million units.

The Carlisle Electricity Committee have made unsuccessful attempts to purchase coal direct from the collieries. The chairman, Mr. Dalton, states that four collieries refused to deal with them direct, but the Committee have entered into a couple of contracts with two firms for a six months' supply of coal at a reduction on previous rates of 14s. a ton.

At Wolverhampton on Tuesday the Electricity Commissioners (Sir John Snell, Sir H. Haward, Mr. H. Booth, and Mr. W. W. Lackie) opened the inquiry into the proposals for the reorganisation of electricity supply in the North-West Midlands Electricity District. Mr. Tyldesley Jones, K.C., appeared for the Conference of Authorised Undertakers, and after counsel's opening statement, Ald. H. Leese, of Stoke-on-Trent, gave evidence. The inquiry is proceeding, and a report will appear in our next issue.

A serious condition of affairs has arisen in connection with the Hull Corporation Electricity undertaking, which, it is stated, shows a big loss on the year. When the report of a special subcommittee, appointed to consider the matter, was discussed by the Electricity Committee, the Chairman (Ald. J. Pybus) tendered his resignation, and that of his son (Mr. H. Pybus), a member of the clerical staff, was also accepted. The sub-committee recommended that the whole committee should resign, but this was rejected by seven votes to four. The assistant engineer was asked to resign on purely personal grounds, and a consulting engineer will be called in to report on the undertaking

New Schemes and Mains Extensions.

Aylesbury Town Council has applied for loans of £5 000 for meters, and £2 400 for the wiring of houses.

Llandrindod Wells Urban Council are in negotiation with the local Electric Light Company with a view to purchasing the undertaking.

Rochdale Electricity Committee is making application to the Electricity Commissioners for sanction to borrow £36 198 for mains and house services.

Shoreditch Borough Council have decided to lease their electric light standards for the display of illuminated advertisement signs at an annual rental of £30 each.

The Ministry of Transport have granted the Westgate and Birchington Gas & Electricity Company an extension of fifteen months, to May 26, 1922, to carry out their statutory electric supply powers.

Swadlincote Urban Council has authorised Burton-on-Trent Town Council to lay electric cables for the supply of electricity to the Britty Colliery, the Hearthcote Potteries, and Thomas Wragg & Sons.

Experiments are to be made in the illumination of the great clock in the City Hall tower at Cardiff, and Mr. G. Morley New, the City Electrical Engineer has been authorised to instal two projectors for throwing light on the dials.

Chasetown Parish Council has, subject to the sanction of the Electricity Commissioners and the approval of County Council, accepted the offer of the Cannock Chase Colliery Company to supply electricity for public lighting at £3 per 120 c.p. lamps per annum.

Barry Urban Council held a private meeting last Thursday to receive a letter and report from Sir Charles Bright on the proposed electricity schemes, and to meet the electrical engineer of the Barry Railway Company on the question of the provision of a supply of electricity for the district.

Runcorn Council has approved of plans for a new electricity sub-station to be erected at Latchford Without. Some members took exception to the building being erected in a residential district and although the plans were passed, it was decided to ask the Warrington Corporation to consider erecting the building on an alternative site.

Lynn Town Council has approved a cable extension from the Docks main to Pattrick and Thompson's, at a cost of £368, and is considering the extension of a cable from the Customs House to a sub-station in Saddlebow Road, at £4 812, so that the overhead cable can be removed. It is also proposed to lay a distributor along High Street, fed from a sub-station at Purfleet Quay, at a cost (less buildings) of £2 592 10s.

In connection with a big coal development scheme in Ogmore Valley, estimated to cost about one million pounds, Messrs. Cory Brothers propose to erect a large power-house and transmission lines for conveying electricity to three or four new pits. For the supply of electricity from the Ogmore Vale power station electric light cables will be carried on concrete standards to the various collieries. Steel transmission lines, claimed to be the first example of the kind in the United Kingdom, will run from Ogmore Vale through the mountains for a distance of about six miles. Electricity will be used to drive the haulage plant, elevators, fans, &c., and will also provide the energy for the steel lattice tower carrying an aerial rope with buckets for tipping rubbish. In the Rhondda a rubbish aerial road is in course of construction at Pentre.

Alteration of Charges.

Taunton Electricity Committee announce a reduction of 10 per cent. on the price of electricity.

Newport (Mon.) Chamber of Commerce passed a resolution on Friday asking the Corporation to follow the Gas Company's example and reduce the price of electricity, which is at present 100 per cent. above pre-war rates.

Rochdale Electricity Committee recommend the following reduction in the charges for electricity, as from April next. Lighting from 7d. to 6d., heating and domestic purposes from 2½d. to 1¼d. per unit, and power, over 15 h.p. 0·55d. to 0·5d. per unit.

Huddersfield Town Council have decided to reduce by 2d. a unit the price of electricity for lighting supplied from the single-phase circuits, but firms under power agreements for 3-phase current are excepted. The reduction takes effect from the December meter readings.

Farnborough Urban Council has decided to protest against the action of the Aldershot Gas, Water, and District Lighting Company, in increasing their charges for electricity for power and heating to 6d. per unit, and also against the manner in which the notification was made. It is alleged that this was only given in an advertisement in the local press.

Darlington Electricity Committee recommend the following reductions in electricity charges, amounting to about £6 000 in yearly revenue: lighting ½d. per unit decrease from April 1st, which will bring the price down to 3½d. per unit, the pre-war charge; power, 12½ per cent. reduction, which will leave the figure 12½ per cent. above the 1914 standard, or ⅓d. against ¾d. The Committee also recommend a reduction of ¼d. per unit to consumers for heating purposes.

Telegraph and Telephone Notes.

A new telephone call office has been opened at Cholsey, Oxfordshire.

It is stated that the proposed international conference to consider the allocation of the Atlantic Cables formerly owned by the Deutsch Atlantische Telegraphen-Gesellschaft will be convened at Washington this week.

Subject to legal formalities, the Commercial Cable Company has received permission of the Cork Harbour Commissioners to establish a cable base at Queenstown, where a cable ship with a crew of sixty-five will be permanently stationed for repairs to the company's Atlantic cable.

As from March 1, the prices of official telephone directories will be as follows:—"London Directory" (Vol. I.), cloth bound 2s. 6d., paper cover 1s. 6d.; Provincial directories, East, South, and West of England (Vol. II.), 2s. 6d.; North of England and Midlands (Vol. III.), 5s.; Scotland (Vol. IV.), 2s. 6d.; Ireland (Vol. V.) will remain at 2s. The charge for the complete set of five volumes will be reduced from £1 to 10s.

The telegraph cable connecting the Outer Hebrides with the mainland having been interrupted during recent storms, the Postmaster-General announces that arrangements have been made for the establishment of a temporary wireless service between the wireless stations at Tobermory, Mull, and Loch Boisdale, South Uist. Post office wireless stations are also available for use in the event of cable difficulties at Guernsey and Lerwick for communication with corresponding stations on the mainland.

Electric Traction.

Tipton Urban Council have decided to oppose the Bill now being promoted by local tramway companies.

Since penny fares were reintroduced on the Birmingham tramways at the beginning of this month, the returns show an average decrease of £765 per week of six days.

Kirkcaldy Corporation has approved the recommendation of the Tramways Committee to borrow £93 000 for new plant. This sum includes £7 000 already spent and £4 000 for d.c. feeders to relieve the overloaded Porthhead district.

The London County Council have put on record an expression of regret at the decision of the Minister of Transport not to take any practical steps at the present time for dealing with the regulation of omnibus and other traffic at tramway stopping places.

Newcastle-on-Tyne Corporation are applying to the Light Railway Commissioners for an amendment of their application for a Light Railway Order in respect of which a local inquiry was held on July 22nd, 1921, by providing for the construction of an additional line.

The deputation recently sent by Dover Corporation to Yorkshire towns to inspect the railless trolley system have reported favourably on it, especially for opening out routes for traffic not covered by the present electric tramways. The Corporation are applying for a Provisional Order to instal the railless system.

The Sunderland district tramcar men who went on strike nearly three weeks ago are still holding out. A new staff has been engaged by the company, and it was expected that the strikers would in consequence want to resume work, but the miners' lodges in the area now threaten to boycott services run by men who have taken the place of the strikers. The directors have, therefore, decided to reconsider the position.

Walsall Tramways Department is able to contribute £8 500 to the relief of the rates, in spite of the fact that the number of passengers carried since last April has shown a decrease of 3 023 137. So far the results of the recent reintroduction of the penny fare has not proved successful from the financial point of view, and the situation is to be reviewed in three months' time. The undertaking was one of only five in the country which managed to pay its way last year.

Traffic receipts on the Cardiff electric tramways from April 1, 1921, to the 11th inst. show a decrease of £10 269. At a meeting of the Committee last Friday, Mr. R. L. Horsfield, the tramways manager, attributed the loss entirely to trade depression. If it had not been for football matches the decrease would have been very much greater, as a home match meant an increase of £150 to £200. The distress tickets sold in the cars had produced £694 for the Lord Mayor's Fund.

Personal and Appointments.

We are pleased to learn that Senator Marconi, who has been suffering from bronchial trouble, is progressing favourably.

Mr. Douglas Hay has been appointed to the Chair of Mining at Sheffield University, rendered vacant by the death of Prof. E. F. Armstrong.

Mr. T. M. Johnson, late of the English Electric and Siemens Supplies, Ltd., has been appointed branch manager of Drake & Gorham Wholesale, Ltd., at their Liverpool office, 61a, Bold-street.

M. Gaston Roux, directeur du Bureau de Contrôle des Installations Electriques of Paris, has resigned in order to be able to devote his whole time to consulting work. M. Leon Arnand succeeds M. Roux.

Capt. A. R. H. Morrell, of the West India and Panama Telegraph Company's service, has been elected acting Elder Brother of Trinity House, in the vacancy caused by the retirement of Capt. A. S. Thomson.

The Rouville quinquennial prize of 10 000 frs. for the most important technical work has been awarded by the French Minister of Public Works for the years 1916-20 to M. Blondel for his work and discoveries in optics, sound and electricity.

Manchester Tramways Committee on Tuesday accepted with regret the resignation, owing to ill-health, of Mr. McElroy, manager of the department since 1899. Mr. J. A. S. Wood, the assistant manager, is retiring on superannuation after forty-nine years' service.

Hackney Borough Council have appointed Councillor C. W. Jackson, chairman of the Electricity Committee, and Mr. L. L. Robinson, borough electrical engineer, to represent the Council at the forthcoming annual convention of the Incorporated Municipal Electrical Association.

Owing to ill-health, Mr. Ernest Hatton has decided to retire in three months time from the position of manager of Newcastle-on-Tyne Corporation Tramways, which he has held for seventeen years. Under his management the undertaking has contributed materially to the relief of the rates, a sum of £14 000 having been given in this way for several years in succession. The system has been greatly extended during his tenure of office. When the war broke out a considerable number of the staff joined the army, and Mr. Hatton organised a system of volunteer drivers and conductors to assist in the transport of the thousands of munition workers employed in the district.

H

Institution Notes.

On Saturday, March 4, Sir Ernest Rutherford will begin a course of six lectures on Radioactivity at the Royal Institution.

The Electrical Federation (Victoria) was formed in December last, and Mr. T. Malcolm Ritchie, managing director of Electric Equipment Manufacturers Pty., Ltd., of Melbourne, was elected President.

A general survey of what wireless telegraphy and telephony is doing and is capable of doing was given by Major J. Erskine Murray last week in the course of a lecture on "The Uses of Wireless, Past and Future," which he delivered in Glasgow to the Scottish Centre of the Institution of Electrical Engineers.

The Association of Engineers-in-Charge is holding an informal discussion on Saturday, Feb. 25 (to-morrow), at 7.30 p.m., at St. Bride's Institute, Bride-lane, Fleet-street, E.C. 4, to discuss "Mechanical Stokers v. Hand Firing, both with forced draught." Visitors are invited to be present and take part in the discussion.

Owing to the growth of the organisation and the work entailed, Mr. A. G. Beaver, who has been hon. secretary of the Electrical Wholesalers' Federation for the past seven years, finds that he is no longer able to devote the time necessary to look after the Federation interests. Mr. Reginald Cooper, who has had considerable experience in association work, has, therefore, been appointed general secretary, and the registered offices will now be located at 19-21, Hatton Garden, E.C.

Dr. S. S. Richardson read a paper on "An Oscillograph Investigation of the Gulstad Relay," before the Liverpool Sub-Centre of the Institution of Electrical Engineers, on Monday. The paper was illustrated by lantern slides of oscillograms and details of circuits. Dr. Richardson also exhibted and operated a Gulstad relay and a new form of frequency meter. Mr. T. E. Herbert, Dr. Marchant, and Mr. Reeve were among those who contributed to the discussion.

At the annual meeting of the Physical Society of London, held on Feb 10, the following officers and members of council were elected :—President, Dr. A. Russell; Vice-Presidents, Lord Rayleigh, Prof. T. Mather, Mr. T. Smith, and Prof. G. W. O. Howe; Secretaries, Mr. F. E. Smith, "Redcot," St. James's Avenue, Hampton Hill, and Dr. D. Owen, 62, Wellington Road, Enfield; Foreign Secretary, Sir Arthur Schuster; Treasurer, Mr. W. R. Cooper; Librarian, Dr. A. O. Rankine; other members of Council, Mr. C. R. Darling, Prof. C. L. Fortescue, Dr. E. Griffiths, Dr. E. H. Rayner, Mr. J. H. Brinkworth, Mr. J. Guild, Dr. F. L. Hopwood, Dr. E. A. Owen, Dr. J. H. Vincent, and Dr. G. B. Bryan.

Wireless Notes.

A "Central News" message states that a powerful radio station, capable of direct communication with Germany, England, Denmark, and Norway, is nearing completion at Dietskoye Selo. It has been planned entirely by Russian engineers and erected by Russian labour.

A meeting of the Wireless Section of the Institution of Electrical Engineers will be held in the Lecture Theatre of the Institution, Savoy Place, Victoria Embankment on Wednesday, March 1, at 6 p.m., when a paper on "The Thermionic Triode as Rectifier." by Messrs. E. B. Moullin and L. B. Turner (member) will be read.

A new radio-telegraph office was opened on Sunday by Marconi's Wireless Telegraph Company at Radio House, 2-12, Wilson-street, E.C. 2. This will be the principal office for the receipt of Marconigrams, and will also be the company's traffic headquarters. Radio House, which is claimed to be the most up-to-date office of its kind in the world, is in direct communication with all the company's wireless stations, and also with its telegraph offices at Marconi House, Fenchurch-street, and the Baltic Exchange.
